COMMONLY USED ACRONYMS AND SHORT FORMS

AAC	Anticipated Accumulation of Cash
ACNR	Accumulated Calibrated Net Revenue
ACS	Ancillary and Control Area Services
AF	Advance Funding
AFUDC	Allowance for Funds Used During Construction
AGC	automatic generation control
aMW	average megawatt(s)
ANR	Accumulated Net Revenues
ASC	Average System Cost
BAA	Balancing Authority Area
BiOp	Biological Opinion
BPA	Bonneville Power Administration
BPAP	Bonneville Power Administration Power
BPAT	Bonneville Power Administration Transmission
Bps	basis points
Btu	British thermal unit
CAISO	California Independent System Operator
CIP	Capital Improvement Plan
CIR	Capital Investment Review
CDQ	Contract Demand Quantity
CGS	Columbia Generating Station
CHWM	Contract High Water Mark
CNR	Calibrated Net Revenue
COB	California-Oregon border
COI	California-Oregon Intertie
Commission	Federal Energy Regulatory Commission (see also “FERC”)
Corps	U.S. Army Corps of Engineers
COSA	Cost of Service Analysis
COU	consumer-owned utility
Council	Northwest Power and Conservation Council (see also “NPCC”)
COVID-19	coronavirus disease 2019
CP	Coincidental Peak
CRAC	Cost Recovery Adjustment Clause
CRFM	Columbia River Fish Mitigation
CSP	Customer System Peak
CT	combustion turbine
CWIP	Construction Work in Progress
CY	calendar year (January through December)
DD	Dividend Distribution
DDC	Dividend Distribution Clause
dec	decrease, decrement, or decremental
DERBS	Dispatchable Energy Resource Balancing Service
DFS	Diurnal Flattening Service

DNR	Designated Network Resource
DOE	Department of Energy
DOI	Department of Interior
DSI	direct-service industrial customer or direct-service industry
DSO	Dispatcher Standing Order
EE	Energy Efficiency
EESC	EIM Entity Scheduling Coordinator
EIM	Energy imbalance market
EIS	environmental impact statement
EN	Energy Northwest, Inc.
ESA	Endangered Species Act
ESS	Energy Shaping Service
e-Tag	electronic interchange transaction information
FBS	Federal base system
FCRPS	Federal Columbia River Power System
FCRTS	Federal Columbia River Transmission System
FELCC	firm energy load carrying capability
FERC	Federal Energy Regulatory Commission
FMM-IIE	Fifteen Minute Market – Instructed Imbalance Energy
FOIA	Freedom of Information Act
FORS	Forced Outage Reserve Service
FPS	Firm Power and Surplus Products and Services
FPT	Formula Power Transmission
FRP	Financial Reserves Policy
F&W	Fish & Wildlife
FY	fiscal year (October through September)
G&A	general and administrative (costs)
GARD	Generation and Reserves Dispatch (computer model)
GDP	Gross Domestic Product
GI	generation imbalance
GMS	Grandfathered Generation Management Service
GSP	Generation System Peak
GSR	Generation Supplied Reactive
GRSPs	General Rate Schedule Provisions
GTA	General Transfer Agreement
GWh	gigawatthour
HLH	Heavy Load Hour(s)
HYDSIM	Hydrosystem Simulator (computer model)
IE	Eastern Intertie
IIE	Instructed Imbalance Energy
IM	Montana Intertie
inc	increase, increment, or incremental
IOU	investor-owned utility
IP	Industrial Firm Power
IPR	Integrated Program Review

IR	Integration of Resources
IRD	Irrigation Rate Discount
IRM	Irrigation Rate Mitigation
IRPL	Incremental Rate Pressure Limiter
IS	Southern Intertie
kcf/s	thousand cubic feet per second
kW	kilowatt
kWh	kilowatthour
LAP	Load Aggregation Point
LDD	Low Density Discount
LGIA	Large Generator Interconnection Agreement
LLH	Light Load Hour(s)
LMP	Locational Marginal Price
LPP	Large Project Program
LT	long term
LTF	Long-term Firm
Maf	million acre-feet
Mid-C	Mid-Columbia
MMBtu	million British thermal units
MNR	Modified Net Revenue
MO	market operator
MRNR	Minimum Required Net Revenue
MW	megawatt
MWh	megawatthour
NCP	Non-Coincidental Peak
NEPA	National Environmental Policy Act
NERC	North American Electric Reliability Corporation
NFB	National Marine Fisheries Service (NMFS) Federal Columbia River Power System (FCRPS) Biological Opinion (BiOp)
NLSL	New Large Single Load
NMFS	National Marine Fisheries Service
NOAA Fisheries	National Oceanographic and Atmospheric Administration Fisheries
NOB	Nevada-Oregon border
NORM	Non-Operating Risk Model (computer model)
NWPA	Northwest Power Act/Pacific Northwest Electric Power Planning and Conservation Act
NWPP	Northwest Power Pool
NP-15	North of Path 15
NPCC	Northwest Power and Conservation Council (see also "Council")
NPV	net present value
NR	New Resource Firm Power
NRFS	NR Resource Flattening Service
NRU	Northwest Requirements Utilities
NT	Network Integration

NTSA	Non-Treaty Storage Agreement
NUG	non-utility generation
OATT	Open Access Transmission Tariff
O&M	operations and maintenance
OATI	Open Access Technology International, Inc.
ODE	Over Delivery Event
OS	oversupply
OY	operating year (August through July)
P10	tenth percentile of a given dataset
PDCI	Pacific DC Intertie
PF	Priority Firm Power
PFp	Priority Firm Public
PFx	Priority Firm Exchange
PNCA	Pacific Northwest Coordination Agreement
PNRR	Planned Net Revenues for Risk
PNW	Pacific Northwest
POD	Point of Delivery
POI	Point of Integration or Point of Interconnection
POR	point of receipt
PPC	Public Power Council
PRSC	Participating Resource Scheduling Coordinator
PS	Power Services
PSC	power sales contract
PSW	Pacific Southwest
PTP	Point-to-Point
PUD	public or people's utility district
RAM	Rate Analysis Model (computer model)
RAS	Remedial Action Scheme
RCD	Regional Cooperation Debt
RD	Regional Dialogue
RDC	Reserves Distribution Clause
REC	Renewable Energy Certificate
Reclamation	U.S. Bureau of Reclamation
REP	Residential Exchange Program
REPSIA	REP Settlement Implementation Agreement
RevSim	Revenue Simulation Model
RFA	Revenue Forecast Application (database)
RHWM	Rate Period High Water Mark
ROD	Record of Decision
RPSA	Residential Purchase and Sale Agreement
RR	Resource Replacement
RRHL	Regional Residual Hydro Load
RRS	Resource Remarketing Service
RSC	Resource Shaping Charge
RSS	Resource Support Services

RT1SC	RHWM Tier 1 System Capability
RTD-IIIE	Real-Time Dispatch – Instructed Imbalance Energy
RTIEO	Real-Time Imbalance Energy Offset
SCD	Scheduling, System Control, and Dispatch Service
SCADA	Supervisory Control and Data Acquisition
SCS	Secondary Crediting Service
SDD	Short Distance Discount
SILS	Southeast Idaho Load Service
Slice	Slice of the System (product)
SMCR	Settlements, Metering, and Client Relations
SP-15	South of Path 15
T1SFCO	Tier 1 System Firm Critical Output
TC	Tariff Terms and Conditions
TCMS	Transmission Curtailment Management Service
TDG	Total Dissolved Gas
TGT	Townsend-Garrison Transmission
TOCA	Tier 1 Cost Allocator
TPP	Treasury Payment Probability
TRAM	Transmission Risk Analysis Model
Transmission System Act	Federal Columbia River Transmission System Act
Treaty	Columbia River Treaty
TRL	Total Retail Load
TRM	Tiered Rate Methodology
TS	Transmission Services
TSS	Transmission Scheduling Service
UAI	Unauthorized Increase
UDE	Under Delivery Event
UFE	unaccounted for energy
UFT	Use of Facilities Transmission
UIC	Unauthorized Increase Charge
UIE	Uninstructed Imbalance Energy
ULS	Unanticipated Load Service
USFWS	U.S. Fish & Wildlife Service
VER	Variable Energy Resource
VERBS	Variable Energy Resource Balancing Service
VOR	Value of Reserves
VR1-2014	First Vintage Rate of the BP-14 rate period (PF Tier 2 rate)
VR1-2016	First Vintage Rate of the BP-16 rate period (PF Tier 2 rate)
WECC	Western Electricity Coordinating Council
WPP	Western Power Pool
WRAP	Western Resource Adequacy Program
WSPP	Western Systems Power Pool

1. INTRODUCTION AND OVERVIEW

1.1 Introduction

The Power Loads and Resources Study (Study) contains the load and resource data used to develop Bonneville Power Administration's (BPA's) wholesale power rates. This Study illustrates how each component of the loads and resources analysis is completed, how the components relate to each other, and how they fit into the rate development process. The Power Loads and Resources Study Documentation (Documentation), BP-24-FS-BPA-03A, contains details and results supporting this Study.

This Study focuses on fiscal years (FYs) 2024-2025 and has two primary purposes: (1) to determine BPA's monthly and annual energy load and resource balance (load-resource balance); and (2) to provide specific results that are used as inputs in other rate case study processes and calculations. To ensure that BPA has sufficient firm generation to meet its firm load obligations, BPA bases its resource planning on hydro generation estimates under P10 (10th percentile) firm monthly generation from the recent 30 year historical stream flow record. *See* § 3.1.2.1.3 below.

This Study provides inputs for various other studies, processes, and calculations in the ratemaking process. The results of this Study provide data to (1) the Power Rates Study, (2) the Power Revenue Requirement Study, (3) the Power and Transmission Risk Study, and (4) the Power Market Price Study and Documentation.

1.2 Overview of Methodology

This Study includes three main components: (1) load data, including a forecast of the Federal system loads and contract obligations; (2) resource data, including Federal system generating resource and contract purchase estimates, total Pacific Northwest (PNW)

1 regional hydro resource estimates, and the estimated power purchases that are eligible for
2 Section 4(h)(10)(C) credits under the Pacific Northwest Electric Power Planning and
3 Conservation Act (Northwest Power Act), 16 U.S.C. §§ 839–839h; and (3) the Federal
4 system load-resource balance, which compares Federal system loads, contract obligations,
5 and sales to the Federal system generating resources and contract purchases.

6
7 The first component of the Power Loads and Resources Study is the load data, which is the
8 Federal system load obligation forecast, or the firm energy that BPA expects to serve
9 during FY 2024-2025 under firm requirements contract obligations and other BPA contract
10 obligations. The load estimates are discussed in Section 2 of this Study and are detailed in
11 the Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A.

12
13 The second component of this study is resource data, which includes the forecast of
14 (1) Federal system resources, (2) PNW regional hydro resources, and (3) power purchases
15 eligible for 4(h)(10)(C) credits. The Federal system resource forecast includes hydro and
16 non-hydro generation estimates plus power deliveries from BPA contract purchases. The
17 Federal system resource estimates are discussed in Section 3.1 below and are detailed
18 in the Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A. The PNW
19 regional hydro resources include all hydro resources in the PNW, whether Federally or
20 non-Federally owned. The regional hydro estimates are discussed in Section 3.2 below and
21 are detailed in the Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A.

22 The resource estimates used to calculate the 4(h)(10)(C) credits are discussed in
23 Section 3.3 below, and the estimated power purchases eligible for 4(h)(10)(C) credits are
24 detailed in the Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A.

1 The third component of this Study is BPA’s load-resource balance, which is calculated on an
2 annual average energy basis for each year of the rate period, FY 2024 and FY 2025. BPA’s
3 firm energy load-resource balance is calculated by subtracting BPA’s load and contract
4 obligations from the Federal system resources. The load-resource balance is discussed in
5 Section 4 below and is detailed in the Power Loads and Resources Study Documentation,
6 BP-24-FS-BPA-03A.

7
8 Throughout the Study and Documentation, the load and resource forecasts are shown using
9 three different measurements. The first, energy in average megawatts (aMW), is the
10 average amount of energy produced or consumed over a given time period, in most cases a
11 month. The second measurement, heavy load hour energy in megawatthours (MWh), is the
12 total megawatthours generated or consumed over the heavy load hours of a given time
13 period. Heavy load hours (referred to as HLH) can vary by contract but generally are clock
14 hours 06:00 to 22:00 Monday through Saturday, excluding North American Electric
15 Reliability Corporation (NERC) holidays. The third measurement, light load hour energy in
16 megawatthours, is the total megawatthours generated or consumed over the light load
17 hours of a given timeframe. Light load hours (referred to as LLH) can also vary by contract
18 but generally are clock hours 22:00 to 06:00 Monday through Saturday, all day Sunday, and
19 all day on NERC holidays. Resource forecasts are shown using an additional measurement,
20 one-hour capacity. One-hour capacity in megawatts (MW) is the single highest one hour of
21 forecast generation per month and represents the peak forecast capacity that a resource
22 can be expected to generate in that month. These measurements are used to ensure that
23 BPA will have adequate resources to meet the variability of loads.

This page intentionally left blank.

2. FEDERAL SYSTEM LOAD OBLIGATION FORECAST

2.1 Overview

The Federal System Load Obligation forecasts include (1) BPA's projected firm requirements power sales contract (PSC) obligations to consumer-owned utilities (COUs) and Federal agencies (together, for purposes of this Study, called Public Agencies or Public Agency Customers); (2) PSC obligations to investor-owned utilities (IOUs); (3) PSC obligations to direct-service industries (DSIs); (4) reserve power delivery obligations to the U.S. Bureau of Reclamation (Reclamation); and (5) other BPA contract obligations, including contract obligations outside the PNW region (Exports) and contract obligations within the PNW region (Intra-Regional Transfers (Out)). This section summarizes BPA's forecasts of these obligations.

2.2 Public Agencies' Total Retail Load and Firm Requirements Power Sales Contract (PSC) Obligation Forecasts

In December 2008, BPA executed PSCs with Public Agencies under which BPA is obligated to provide power deliveries from October 1, 2011, through September 30, 2028. These contracts are referred to as Contract High Water Mark (CHWM) contracts. Three types of CHWM contracts were offered to customers: Load Following, Slice/Block, and Block (with or without Shaping Capacity). Of the 135 BPA Public Agency CHWM customers, 122 have Load Following contracts, 10 have Slice/Block contracts, and three have Block contracts. These numbers include the product change elections from Slice to Load Following that three customers (Benton County PUD, Grays Harbor PUD, and Pacific County PUD) made in October 2022 that will be effective October 1, 2024.

BPA's obligation to serve Public Agency Customers under their CHWM contracts incorporates the following: Tier 1 System Capability; updated forecasts of each customer's

1 total load obligation; individual customers' dedicated resource amounts; and individual
2 customers' elections for Above-Rate Period High Water Mark (Above-RHWM) load service.
3 The Tier 1 System Capability is determined for each rate period in the RHWM Process.
4 Above-RHWM load is determined for each rate period in the RHWM Process; any
5 Above-RHWM load service placed on BPA is Tier 2 Load Service. *See* Power Rates Study,
6 BP-24-FS-BPA-01, § 1.4.2.

7
8 Under the CHWM contracts, BPA's load obligation to each customer can consist of RHWM
9 load and Above-RHWM load. The RHWM Process sets the maximum amount of power that
10 a customer may purchase each year of the rate period at the Priority Firm Power (PF)
11 Tier 1 rate, subject to that customer's calculated Net Requirement net of its New Large
12 Single Loads (NLSLs). *See* Tiered Rate Methodology (TRM), BP-12-A-03, § 4.2.
13 Above-RHWM load for each year of the rate period is calculated by subtracting the
14 customer's RHWM from the difference between its forecast Total Retail Load (TRL) (less
15 NLSLs) and its existing resources.

16
17 Each customer elects how to serve Above-RHWM load by (1) adding new non-Federal
18 dedicated resources; (2) buying power from sources other than BPA; and/or (3) requesting
19 BPA to supply all or a part of this power. *See* TRM, BP-12-A-03, § 4.3. Under the terms of
20 the CHWM contract and the TRM, the first two options are identified as self-supply and
21 result in a change in the dedicated resource amounts for that customer. If a customer
22 elects for BPA to serve all or part of its Above-RHWM load, BPA will first serve this load
23 from federal surplus generation, then, if needed, purchase power or acquire the output
24 from non-federal generating resources in order meet the customer's Above-RHWM load at
25 a PF Tier 2 rate. Non-federal power purchased or acquired to serve Tier 2 load is separate
26 and distinct from BPA's Tier 1 System Capability. *See* Power Rates Study, BP-24-FS-

1 BPA-01, §§ 1.4.2, 4.1.2. Above-RHWM load served by BPA is identified as Tier 2 Load
2 Service, and non-federal power purchases and acquisitions above firm Federal surplus
3 generation to serve Tier 2 load are identified as Tier 2 Augmentation.

4 5 **2.2.1 Load Following PSC Obligation Forecasts**

6 The Load Following product provides firm power to meet the customer's total retail load,
7 less the dedicated power from the customer's non-Federal resource generation and
8 purchases from other suppliers. The total monthly firm obligation forecast for Public
9 Agency Customers that purchase the Load Following product is based on the sum of the
10 utility-specific firm requirements PSC load obligation forecasts, which are customarily
11 produced by BPA analysts. The method used for preparing the load obligation forecasts is
12 as follows.

13
14 First, using BPA's Agency Load Forecast (ALF) model, BPA analysts produce utility-specific
15 forecasts of total retail load by applying least-squares regression on historical monthly
16 energy loads, and for a growing number of customers, a statistically adjusted end-use (SAE)
17 model. The least-squares regression-based models may include several independent
18 variables, such as a time trend, heating degree days, cooling degree days, and monthly
19 indicator variables. The SAE models replace typical independent variables used in load
20 forecasting with calculated indexes for structural measures associated with heating
21 equipment, cooling equipment, and other energy-consuming technologies. Heating and
22 cooling degree days are measures of temperature effects to account for changes in
23 electricity usage related to temperature changes. Heating degree days are calculated when
24 the temperature is below a base temperature, such as 65 degrees F; similarly, cooling
25 degree days are calculated when the temperature is above a base temperature. The results
26 from these computations are utility-specific monthly forecasts of total retail energy load.

1 The energy value for total retail load is split into HLH and LLH time periods using recent
2 historical relationships.

3
4 Second, estimates of customer-owned and consumer-owned dedicated resource generation
5 and contract purchases dedicated to serve retail loads (including those to serve Above-
6 RHWM load) are subtracted from the utility-specific total retail load forecasts to produce
7 BPA's total firm load obligation forecast for each utility. These load obligation forecasts
8 provide the basis for the Load Following product sales projections incorporated in BPA
9 ratemaking.

10
11 A list of the 122 Public and Federal Agency Customers that will be purchasing the Load
12 Following product during the BP-24 rate period appears in Power Loads and Resources
13 Study Documentation, BP-24-FS-BPA-03A, Table 1.1.1. BPA's total PSC load obligation
14 forecast including Federal agencies is summarized in *id.*, Tables 1.2.1 for energy, 1.2.2 for
15 HLH, and 1.2.3 for LLH, on Line 3 (Load Following). The components of this forecast are
16 also included in the calculation of the load-resource balance, *id.*, Tables 9.1.1 for energy,
17 9.1.2 for HLH, and 9.1.3 for LLH, on Line 1 (Load Following).

18 19 **2.2.2 Block PSC Obligation Forecasts**

20 The Block product provides a planned amount of firm requirements power to serve the
21 customer's retail load up to its planned net requirement. The Block product provides a
22 planned amount of firm requirements power in a fixed monthly shape. The customer is
23 responsible for using its own non-Federal resources or unspecified resources to meet any
24 load in excess of its planned monthly BPA purchase.

1 The three Public Agency Customers that have selected the Block product are identified in
2 *id.*, Table 1.1.2. BPA's forecast of the total Block Obligation is summarized in *id.*,
3 Tables 1.2.1 for energy, 1.2.2 for HLH, and 1.2.3 for LLH, on Line 14 (Tier 1 Block). This
4 forecast is also included in the calculation of the load-resource balance, *id.*, Tables 9.1.1 for
5 energy, 9.1.2 for HLH, and 9.1.3 for LLH, on Line 6 (Tier 1 Block).

7 **2.2.3 Slice/Block PSC Obligation Forecasts**

8 The Slice/Block product provides firm requirements power to serve the customer's retail
9 load up to its planned net requirement. For each fiscal year, the planned annual
10 Slice/Block amounts are adjusted based on BPA's calculation of the customer's planned net
11 requirement under the contract. The Block portion of the Slice/Block product provides a
12 planned amount of firm requirements power in a fixed monthly shape, while the Slice
13 Output from the Tier 1 System portion provides planned amounts of firm requirements
14 power in the shape of BPA's generation from the Tier 1 System.

15
16 The annual Slice/Block forecast and the monthly shape of the Slice/Block product for
17 FY 2024-2025 are calculated by multiplying (1) the Tier 1 Block Monthly Shaping Factors
18 in the customer's CHWM contract by (2) the customer's planned annual net requirement
19 in aMW less its annual forecast Critical Slice Amounts, as defined in the CHWM contract.
20 Critical Slice Amounts are forecast to equal the customer's Slice Percentage, adjusted as
21 described in the TRM, BP-12-A-03, § 3.6, multiplied by the applicable annual RHWMTier 1
22 System Capability.

23
24 BPA's Slice Output obligation for the Slice/Block customers is forecast by multiplying the
25 monthly forecast of Tier 1 System output by the sum of the individual customers' Slice
26 Percentages as listed in the Slice/Block CHWM contracts. The Tier 1 System output is

1 comprised of specific Federal system resources and contracts identified in the TRM. *See*
2 Section 3.4 below.

3
4 A list of the 10 Slice/Block customers appears in Power Loads and Resources Study
5 Documentation, BP-24-FS-BPA-03A, Table 1.1.3. BPA's forecast of the total Slice/Block PSC
6 Obligation is summarized in *id.*, Tables 1.2.1 for energy, 1.2.2 for HLH, and 1.2.3 for LLH, on
7 Line 8 (Slice Block) and Line 11 (Slice Output from T1 System). This forecast is also
8 included in the calculation of the load-resource balance, *id.*, Tables 9.1.1 for energy, 9.1.2
9 for HLH, and 9.1.3 for LLH, on Line 8 (Slice).

10 11 **2.2.4 Tier 2 Load Service PSC Obligation Forecasts**

12 The Tier 2 product provides the portion of Above-RHWM load for which customers have
13 elected BPA to serve. Under the CHWM contracts, each customer's load is separated into
14 load that is eligible to be served at Tier 1 rates, and Above-RHWM load, which can be
15 served by BPA at Tier 2 rates or self-supplied by the customer. The RHWM Process sets the
16 maximum amount of power that a customer may purchase each year of the rate period
17 under Tier 1 rates, subject to that customer's calculated Net Requirement exclusive of its
18 New Large Single Loads (NLSLs). *See* TRM, BP-12-A-03, § 4.2. Above-RHWM load for each
19 year of the rate period is calculated by subtracting the customer's RHWM from the
20 difference between its forecast Total Retail Load (TRL) (less NLSLs) and its existing
21 resources, if positive. Each customer elects how to serve Above-RHWM load. If the
22 customer elects to purchase all or part of its Above RHWM load from BPA, it is called
23 Tier 2 load.

24
25 BPA's forecast of the total Tier 2 Load Service Obligation is summarized in Power Loads
26 and Resources Study Documentation, BP-22-FS-BPA-03A, Tables 1.2.1 for energy, 1.2.2 for

1 HLH, and 1.2.3 for LLH, on Line 17 (Tier 2 - Load Growth) and Line 22 (Tier 2 – Short
2 Term). This forecast is also included in the calculation of the load-resource balance, *id.*,
3 Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3 for LLH, on Line 16 (Tier 2 Load Service).
4

5 **2.2.5 Sum of Load Following, Slice/Block, Block and Tier 2 PSC Obligation** 6 **Forecasts**

7 The sum of the projected firm requirements PSC obligations, for customers with CHWM
8 contracts, comprises the Public Agencies Preference Customers’ portion of the Priority
9 Firm Public (PFp) load obligation forecast. Each customer’s load obligation forecast
10 accounts for the reported amount of conservation the customer plans to achieve during the
11 FY 2024-2025 rate period. These forecasts do not include additional BPA-funded
12 conservation beyond what the customers have reported they plan to achieve. As individual
13 customers achieve conservation measures in addition to what they already committed to,
14 the customers will receive credits on their power bills reflecting lower loads due to the
15 additional conservation measures. The annual average energy PF load obligations for
16 FY 2024-2025 are presented, by product, in Table 1 of this Study.
17

18 **2.3 Investor-Owned Utilities Sales Forecast and Other Load Served at NR Rate**

19 The six IOUs in the PNW region are Avista Corporation, Idaho Power Company,
20 NorthWestern Energy Division of NorthWestern Corporation, PacifiCorp, Portland General
21 Electric Company, and Puget Sound Energy, Inc. Most of the IOUs have signed BPA power
22 sales contracts for net requirement service for FY 2011 through 2028; however, no IOUs
23 have chosen to take service under these contracts. If requested, and eligible by contract,
24 BPA would serve any net requirements of an IOU at the New Resource Firm Power (NR)
25 rate. No net requirements power sales to regional IOUs are forecast for FY 2024-2025
26 based on BPA’s current contracts with the regional IOUs.

1 In addition, BPA makes power available at the NR rate to any public body, cooperative, or
2 Federal agency to the extent such power is used to serve any NLSL as defined by the
3 Northwest Power Act, 16 U.S.C. §§ 839–839h. BPA also offers products at the NR rate for
4 public agency customers electing to serve their NLSLs with their own dedicated resources.
5 No sales at the NR rate are forecast in the FY 2024-2025 rate period.

7 **2.4 Direct Service Industry Sales Forecast**

8 BPA will make power sales deliveries to one direct service industry customer, Port
9 Townsend Paper Corporation (Port Townsend), during the FY 2024-2025 rate period.

10
11 Port Townsend’s current contract with BPA runs through September 30, 2028. BPA
12 deliveries under this contract will provide Port Townsend with a maximum contract
13 demand of 15.75 MW through September 30, 2028. Jefferson County PUD serves Port
14 Townsend’s wheel-turning load (load not integral to the industrial process) and Port
15 Townsend’s Old Corrugated Containers (OCC) recycling plant load, totaling 8.5 aMW.
16 Jefferson County PUD’s load forecast reflects this service arrangement. In this study, BPA
17 assumes that it will continue to serve the remainder of Port Townsend’s load during the
18 entire FY 2024-2025 rate period, approximately 11 aMW.

19
20 BPA’s DSI contract obligation is included in the Federal system load-resource balance in the
21 Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A, Tables 9.1.1 for
22 energy, 9.1.2 for HLH, and 9.1.3 for LLH, on Line 11 (Direct Service Industries).

24 **2.5 Reclamation Irrigation District Obligations**

25 BPA provides power from the Federal system for Reclamation project loads and to serve
26 several irrigation districts associated with Reclamation projects. These irrigation districts

1 have been authorized by Congress to receive reserved power from specified Federal
2 Columbia River Power System (FCRPS) projects as part of the Reclamation project
3 authorization. Reclamation also may purchase power from the FCRPS if reserved power is
4 not sufficient to serve irrigation loads. BPA does not contract directly with these irrigation
5 districts; instead, there are several agreements between BPA and Reclamation that provide
6 details on the power deliveries.

7
8 A list of Reclamation obligations appears in the Power Loads and Resources Study
9 Documentation, BP-24-FS-BPA-03A, Table 1.1.4. BPA’s forecast of the total Reclamation
10 load is summarized in *id.*, Tables 1.2.1 for energy, 1.2.2 for HLH, and 1.2.3 for LLH, on
11 Line 27 (USBR Obligation). This forecast is also included in the calculation of the
12 load-resource balance, *id.*, Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3 for LLH, on
13 Line 4 (USBR).

14 15 **2.6 Other Federal System Contract Obligations**

16 BPA provides Federal power to customers under a variety of contract arrangements not
17 included in the Public Agencies, IOU, DSI, or Reclamation forecasts. These contract
18 obligations are categorized as (1) power sales, (2) power or energy exchanges, (3) capacity
19 sales or capacity-for-energy exchanges, (4) power payments for services, and (5) power
20 commitments under the Columbia River Treaty. These arrangements, collectively called
21 “Other Contract Obligations,” are specified by individual contract provisions and can have
22 various delivery arrangements and rate structures. BPA’s Other Contract obligations are
23 considered to be firm and are assumed to be served by the Federal system resources
24 regardless of weather, water, or economic conditions. These contracts include obligations
25 delivered to entities outside the PNW region (Exports) and obligations delivered to entities

1 within the PNW region (Intra-Regional Transfers (Out)). These contract obligations are
2 modeled individually and are specified for monthly energy in aMW, HLH, and LLH.

3
4 BPA's Export contract obligations are detailed in the Power Loads and Resources Study
5 Documentation, BP-24-FS-BPA-03A, Tables 2.1.1 for energy, 2.1.2 for HLH, and 2.1.3 for
6 LLH. BPA's Intra-Regional Transfers (Out) contract obligations are detailed in *id.*,
7 Tables 2.3.1 for energy, 2.3.2 for HLH, and 2.3.3 for LLH. These forecasts are also included
8 in the calculation of the load-resource balance, *id.*, Tables 9.1.1 for energy, 9.1.2 for HLH,
9 and 9.1.3 for LLH, on Line 14 (Exports) and Line 15 (Intra-Regional Transfers (Out)).

10
11 BPA's load-resource balance in this Study is used to help set the Priority Firm Tier 1 rates.
12 Trading floor sales are included in BPA's load-resource balance. Revenue impacts of
13 trading floor contracts are reflected as presales of secondary energy and are included as
14 secondary revenues credited to non-Slice customer rates.

3. RESOURCE FORECAST

3.1 Federal System Resource Forecast

3.1.1 Overview

BPA markets power and provides transmission services to serve the firm electric load needs of its customers. BPA does not own generating resources; rather, BPA markets power from Federal and specific non-Federal generating resources to meet BPA's Federal load obligations. In addition, BPA purchases power to serve firm requirements load through contracts that add to the Federal system resource capability. These resources and contract purchases are collectively called "Federal system resources." Federal system resources are classified as hydro resources (regulated, independent, and small hydro projects); other resources (large thermal and renewable resources); and contract purchases. Federal system resource forecasts are adjusted to take into account reserves and transmission loss estimates, which reduce the Federal system resource capability.

3.1.2 Hydro Generation

The Federal system hydro resources are comprised of the generation from regulated, independent, and small hydro projects. Regulated hydro projects and the process used for estimating the generation of regulated hydro projects are detailed in Section 3.1.2.1 below. Independent hydro projects and the methodology used for forecasting the generation of independent hydro projects are described in Section 3.1.2.2 below. BPA also purchases the output from two small hydro projects. The generation estimates for these small hydro projects were provided by the individual project owners and are assumed not to vary by water year; they are included in Section 3.1.2.3 below.

1 **3.1.2.1 Regulated Hydro Generation Forecast**

2 BPA markets the generation from the Federal system hydro projects. These projects are
3 primarily owned and operated by either the U.S. Army Corps of Engineers (Corps) or
4 Reclamation.

5
6 This Study uses the recent 30 years of historical streamflows from BPA’s hydrosystem
7 simulator model (HYDSIM) to estimate the energy production that can be expected from
8 specific hydroelectric power projects in the Columbia River Basin when operating in a
9 coordinated fashion and meeting power and non-power requirements. The hydro projects
10 modeled in HYDSIM are called regulated hydro projects.

11
12 The hydro regulation study, which is comprised of three steps, uses individual project
13 operating characteristics and conditions to determine the energy production expected
14 from each individual project. Physical characteristics of each project come from annual
15 Pacific Northwest Coordination Agreement (PNCA) data submittals from regional utilities
16 and government agencies involved in the coordination and operation of regional hydro
17 projects. The HYDSIM model provides project-by-project monthly energy generation
18 estimates for the regulated hydro projects for each water year modeled. HYDSIM
19 incorporates and produces data for 14 periods per year: 10 calendar months and two
20 periods each for April and August. April and August are modeled differently because the
21 hydro system generation can differ significantly between the beginning and end of these
22 months due to changes in streamflows and operating constraints. This 14-period data set
23 is referred to as monthly data for simplicity.

24
25 There are three main steps of the hydro regulation studies that estimate regulated hydro
26 generation. First, the Canadian operation is determined based on the best available

1 information from the Columbia River Treaty (Treaty) planning and coordination process.
2 The Treaty calls for an Assured Operating Plan (AOP) to be completed six years prior to
3 each operating year and a Detailed Operating Plan (DOP) to be completed, if necessary, the
4 year prior to the operating year. The DOP reflects modifications to the AOP if agreed to by
5 the U.S. and Canada and is usually completed a few months prior to the beginning of the
6 operating year. These official DOP studies from the Treaty process are not available in time
7 for use in BPA's ratemaking process. Therefore, "surrogate DOP" studies are used to
8 represent the best available estimate for Canadian Treaty operations. The "surrogate DOP"
9 studies include the official AOP study assumptions plus the most recent plant data and
10 constraints available from project owners through the PNCA planning and coordination
11 process.

12
13 Second, an Actual Energy Regulation study (AER step) is run in HYDSIM to determine the
14 operation of the hydro system under each historical water condition while meeting the
15 Firm Energy Load Carrying Capability (FELCC) produced in the PNCA final hydro
16 regulation. In this step, the Canadian operation is first determined by the "surrogate DOP"
17 study, and then the U.S. Federal, U.S. non-Federal, and Canadian reservoirs draft water to
18 meet the Coordinated System FELCC while meeting individual reservoir non-power
19 operating requirements.

20
21 Third, an operational study (OPER step) is run in HYDSIM with the estimated regional firm
22 loads developed for each year of the study and with any deviations from the PNCA data
23 submittals necessary to reflect expected operations during the rate period. In the OPER
24 step the non-Federal projects are fixed to their operations from the AER step, and the
25 Federal projects operate differently based on the deviations from PNCA data and the
26 estimated regional firm load.

1 In summary, a “surrogate DOP” is used to determine the Canadian operations; an AER step
2 is run based on PNCA data to determine the operation of the non-Federal projects; and an
3 OPER step is run to determine the operation of the Federal projects based on PNCA data
4 plus additional assumptions needed to reflect expected operations. The end result of these
5 three steps is generally referred to as the hydro regulation study. *See* Power Loads and
6 Resources Study Documentation, BP-24-FS-BPA-03A, § 8.

7
8 For this Study, separate hydro regulation studies are performed for each year of the rate
9 period. Completing hydro regulation studies for each year allows the hydro generation
10 estimates to capture changes in the variables that characterize yearly variations in hydro
11 operations due to firm loads, firm resources, markets for hydro energy products in
12 better-than-critical water conditions, and project operating limitations and requirements.
13 These variables affect the amount and timing of energy available from the hydro system
14 and are updated annually to reflect current expectations. Sections 3.1.2.1.1-4 below
15 contain additional details on the process of producing the regulated hydro generation
16 estimates used in this Study.

17
18 Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A, Tables 3.1.1 for
19 energy, 3.1.2 for HLH, 3.1.3 for LLH, and 3.1.4 for one-hour capacity, Lines 1-14, list the
20 Federal hydro projects included in BPA’s Regulated Hydro Generation forecast. The
21 regulated hydro HLH/LLH split and one-hour capacity is based on the Federal system
22 regulated hydro generation estimates produced by BPA’s RiverWare-based hourly model
23 analyses, which utilize the HYDSIM hydro regulation studies as their base input. *See*
24 Section 3.1.2.1.4 below.

1 The net regulated hydro energy generation provides inputs for the Power and
2 Transmission Risk Study, BP-24-FS-BPA-05, and the Power Market Price Study and
3 Documentation, BP-24-FS-BPA-04. The HLH and LLH Federal system regulated hydro
4 generation estimates are later combined with the Federal system independent hydro HLH
5 and LLH estimates, in the Power and Transmission Risk Study.

7 **3.1.2.1.1 Assumptions in the HYDSIM Hydro Regulation Study**

8 The HYDSIM studies encompass the power and non-power operating requirements
9 expected to be in effect during the rate period, including those described in the *Biological*
10 *Assessment of Effects of the Operations and Maintenance of the Federal Columbia River*
11 *System on ESA-Listed Species* (2020 BA) and any modifications that arose during the
12 development of the associated biological opinions issued by the National Oceanic and
13 Atmospheric Administration (NOAA) Fisheries and the U.S. Fish and Wildlife Service
14 (USFWS). The HYDSIM studies also include operations described in the Northwest Power
15 and Conservation Council's (NPCC) Fish and Wildlife Program published October 2014 and
16 amended in 2020. The aforementioned assessments are summarized in the Columbia River
17 System Operations (CRSO) Environmental Impact Statement (EIS) Record of Decision
18 (ROD) released in September 2020. The hydroregulation studies in this rate proposal
19 reflect the Selected Alternative operational measures in this ROD. Operational measures
20 include seasonal flow objectives, minimum flow levels for fish, spill for juvenile fish
21 passage, reservoir target elevations, ramp rate restrictions, and turbine operation
22 requirements. Measures that are physical structural modifications (*e.g.*, upgrading spill
23 weirs) were typically excluded from the rate period based on estimated project
24 implementation and completion timelines. Specific assumptions for the HYDSIM hydro
25 regulation studies are detailed in the Documentation, BP-24-FS-BPA-03A, § 8.

1 HYDSIM uses hydro plant operating characteristics in combination with power and non-
2 power requirements to simulate the coordinated operation of the hydro system. These
3 operating requirements include but are not limited to: storage content limits determined
4 by rule curves; maximum project draft rates determined by each project owner as provided
5 by the annual PNCA data submittals; and flow and spill objectives described in applicable
6 NOAA Fisheries and USFWS biological opinions. Some limited deviations from the 2021
7 PNCA data submittals for Operating Year 2022 were necessary to accurately model
8 anticipated operations for the rate period, such as fine-tuning the study to reflect typical in-
9 season management decisions that are not reflected in the 2021 PNCA data submittals.

10
11 The following is an overview of the HYDSIM input updates and modeling changes that have
12 been made since the BP-22 Power Loads and Resources Final Study (see Power Loads and
13 Resources Study Documentation, BP-24-FS-BPA-03A, § 8 for more detail).

- 14 • 2020 Level Modified Streamflow data (unregulated flows, adjusted for irrigation
15 withdrawals corresponding to 2020) are used as the basis of the
16 hydroregulation studies.
- 17 • The AER is based on PNCA data submittal updates for Operating
18 Year 2022. The notable AER updates are:
 - 19 ○ Canadian project operations have been updated based on the
20 “surrogate 2024 DOP” using the Corps’ water supply forecast.
21 Because there is not an agreed-to Assured Operating Plan for the year
22 2025, the the 2024 study is carried forward for 2025. The surrogate
23 DOP studies are the same within the FY 2024 and FY 2025 HYDSIM
24 studies.
 - 25 ○ The water supply forecast was updated to correspond to the 2020
26 Level Modified Flow data.

- 1 ○ 2020 CRSO EIS Selected Alternative flood controls were updated from
2 the Corps.
- 3 ○ Juvenile Passage operations (spill schedule and project operating pool
4 limits) are based on the CRSO EIS Selected Alternatives as outlined in
5 the 2021 PNCA Data Submittal.
- 6 ○ 2020 EIS Selected Alternative sliding scale flow augmentation at Libby
7 and Hungry Horse were modeled. This operation balances local and
8 downstream flow augmentation needs based on a local water supply
9 forecast, rather than only the downstream water supply forecast.
- 10 ● In the OPER study, the regional residual hydro loads (RRHL) used in
11 HYDSIM were updated to include current forecasts of loads, contract
12 sales and purchases, and non-hydro generation. The RRHL are calculated
13 by subtracting the regional firm non-hydro resources from the total
14 regional firm load. The RRHL in the BP-24 HYDSIM study are about
15 1,550 aMW higher than in the BP-22 HYDSIM study when averaged over
16 the two-year rate period.
- 17 ● Updates to the OPER study were associated with the change to the 2020
18 modified flows. Operations continue to reflect the 2020 CRSO EIS
19 Selected Alternative as in the BP-22 final proposal.
- 20 ● Spill modeling was refined based on observations from actual operations
21 in the 2020 spill season. The refined modeling accounts for the impact of
22 project outflows on the maximum amount of spill possible during the
23 16 hour 125 percent TDG target operation under low-flow conditions.
- 24 ● The lack of market spill has been updated based on estimates from the
25 Aurora production cost model.

26

1 These changes generally increase firm annual average generation (explained in Section
2 3.1.2.1.3 below) over the two-year rate period relative to results of the final BP-22 Power
3 Loads and Resources Study. The BP-24 rate period annual average of monthly weighted
4 P10 Firm Federal generation increases about 413 aMW compared to the BP-22 rate period
5 firm generation. The BP-24 rate period 30-year annual average Federal generation
6 increases about 53 aMW compared to the 80-year annual average for the BP-22 rate
7 period. The Federal generation increase is largely attributable to modeling changes,
8 including moving from the 2010 Modified Flows to the 2020 Modified Flows, updates to the
9 flex spill methodology, and PNCA Data updates. Planning assumption changes also impact
10 these values. These planning assumption changes, which use the 30-year water record and
11 the monthly P10 for firm planning, are detailed in the letter to the region available at:
12 [https://www.bpa.gov/-/media/Aep/power/hydropower-data-studies/climate-change-](https://www.bpa.gov/-/media/Aep/power/hydropower-data-studies/climate-change-update-to-the-long-term-hydro-generation-forecast-letter.pdf)
13 [update-to-the-long-term-hydro-generation-forecast-letter.pdf](https://www.bpa.gov/-/media/Aep/power/hydropower-data-studies/climate-change-update-to-the-long-term-hydro-generation-forecast-letter.pdf).

14
15 The assumptions used in the hydro regulation studies were the same for both years of the
16 rate period, FY 2024 and FY 2025, except for the following:

- 17 • The hydro availability factors used to model anticipated unit outages
18 apply specifically to each year of the studies.
- 19 • Arrow trout spawning operation was modeled as every other year and
20 was included in FY 2025.
- 21 • The RRHL forecasts were calculated specifically for each study year. The
22 loads incorporated in the FY 2025 hydro regulation study are about
23 439 aMW higher than the loads projected for the FY 2024 hydro
24 regulation study on an annual average basis.
- 25 • The amounts of spill due to lack of market were different in the two hydro
26 regulation studies. These differences come from the Aurora® model

1 which simulates the different anticipated market conditions in FY 2024
2 and FY 2025.

3 4 **3.1.2.1.2 2020 Level Modified Flows**

5 The HYDSIM model uses streamflows from historical years as the basis for estimating
6 power production of the hydroelectric system. The HYDSIM studies are developed using
7 the 2020 Level Modified Flows data set, and the presented results reflect the generation
8 from the recent 30 years of historical stream flows (1989-2018) . Historical streamflows
9 are modified to reflect the changes over time due to the effects of irrigation and
10 consumptive diversion demand, return flow, and changes in contents of upstream
11 reservoirs and lakes. In HYDSIM, the unregulated flow data include updated estimates of
12 Grand Coulee irrigation pumping using data provided by Reclamation in its PNCA data
13 submittal for Operating Year 2023.

14
15 The recent 30 years of streamflow data capture observed and emerging climate change
16 trends in the Columbia River Basin and thus provides the best available basis for
17 forecasting near-term future generation. Approximately 80 percent of BPA's Federal
18 system resource stack is comprised of hydro generation, which can vary annually by about
19 4,000 aMW depending on water conditions. HYDSIM estimates regulated hydro project
20 generation for varying water conditions and takes into account specific flows, volumes of
21 water, elevations at dams, biological opinions, and many other aspects of the hydro system.

22 23 **3.1.2.1.3 Firm Power Planning**

24 To ensure that the agency has sufficient generation to meet load, BPA bases its resource
25 planning on firm generation conditions. Firm generation is defined as the monthly 10th
26 percentile (P10) generation of the Federal system. The monthly P10 is a consistent

1 statistical definition of firm power across the year derived from the full distribution of
2 generation outcomes that result from the regulation of a wide range of run-off volumes and
3 shapes under current operational assumptions. The annual firm hydro generation estimate
4 is calculated from the weighted average of the monthly P10 (of the recent 30-year
5 historical generation record) of and independent hydro projects.

6 7 **3.1.2.1.4 Regulated Hydro HLH/LLH Split and One-Hour Capacity Calculations** 8 **using RiverWare**

9 The monthly energy produced by HYDSIM for each regulated hydro project is split between
10 HLH and LLH and provide inputs for RevSim in the Power and Transmission Risk Study,
11 BP-24-FS-BPA-05, Section 4.1.1.1.2. To calculate the HLH/LLH regulated hydro splits, BPA
12 completes an hourly simulation of the regulated hydro projects' operation using the
13 RiverWare computer model.

14
15 To simulate hourly Federal "Big 10" regulated hydro generation, the RiverWare model uses
16 HYDSIM monthly project flows, monthly reservoir content, and other power and
17 non-power constraints discussed in Section 3.1.2.1 above. RiverWare studies also
18 incorporate current forecasts of monthly Regulating Reserve, Operating Reserve, Load
19 Following Reserve, Dispatchable Energy Resource Balancing Service (DERBS) Reserve, and
20 Variable Energy Resource Balancing Service (VERBS) Reserve.

21
22 The resulting RiverWare studies shape the monthly energy from HYDSIM into HLH and
23 LLH Federal hydro generation for each of the recent 30-water-year conditions of the study.
24 These projections are the basis for the Federal system hydro energy relationships that
25 provide the monthly HLH and LLH energy splits that are shown in the Power Loads and
26 Resources Study Documentation, BP-24-FS-BPA-03A, Tables 3.1.2 and 3.1.3, and are inputs

1 to the Power and Transmission Risk Study, BP 24-FS-BPA-05, Section 4.1.1.1.5.1. These
2 forecasts are also included in the calculation of the load-resource balance, which is
3 included in the Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A,
4 Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3 for LLH, on Line 25 (Regulated
5 Hydro - Net).

6
7 The same RiverWare studies provide the hourly peak Federal hydro generation values for
8 each month of the 30-water-year conditions. The monthly one-hour capacity values are
9 shown in the Power Loads and Resources Study Documentation, BP-24-FS-BPA-03A,
10 Table 3.1.4.

11 12 **3.1.2.2 Independent Hydro Generation Forecast**

13 Federal independent hydro includes hydro projects whose generation output typically
14 varies by water condition; however, the generation forecasts for these projects are not
15 modeled or regulated in the HYDSIM study. BPA markets the power from independent
16 hydro projects that are owned and operated by Reclamation, the Corps, and other project
17 owners. Federal independent hydro generation and one-hour capacity estimates are
18 provided by Reclamation and the Corps. Independent hydro generation is evaluated over
19 the same recent 30-year study period as regulated hydro projects (1989-2018). These
20 estimates also include power purchased from the Cowlitz Falls hydro project owned by
21 Lewis County Public Utility District. Power Loads and Resources Study Documentation,
22 BP-24-FS-BPA-03A, Tables 3.2.1, 3.2.2, 3.2.3, and 3.2.4, Lines 1-18, list the hydro projects
23 included in BPA's Independent Hydro Generation forecast.

24
25 The energy estimates for Federal independent hydro generation used in this Study are
26 summarized in *id.*, Tables 3.2.1 for energy, 3.2.2 for HLH, 3.2.3 for LLH, and 3.2.4 for

1 one-hour capacity, Line 20. This forecast is also included in the calculation of the load-
2 resource balance, *id.*, Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3 for LLH, on
3 Line 26 (Independent Hydro - Net).

4
5 The HLH/LLH splits and the one-hour capacity for the independent hydro generation
6 estimates are developed based on historical generation data. This Study provides the
7 monthly HLH and LLH generation for the Federal system independent hydro resources
8 used in the Power and Transmission Risk Study.

9 10 **3.1.2.3 Small Hydro Generation Forecast**

11 BPA's small hydro resource purchases are from the Dworshak/Clearwater Small Hydro
12 project and Rocky Brook hydro project. Generation estimates for these small hydro
13 projects are provided by each individual project owner and are assumed not to vary by
14 water year. Small hydro resources are detailed in the Power Loads and Resources Study
15 Documentation, BP-24-FS-BPA-03A, Tables 3.3.1 for energy, 3.3.2 for HLH, 3.3.3 for LLH,
16 and 3.3.4 for one-hour capacity. This forecast is also included in the calculation of the load-
17 resource balance, *id.*, Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3 for LLH, on Line 27
18 (Small Hydro - Net).

19 20 **3.1.3 Non-Hydro Renewable Generation Forecasts**

21 Non-hydro renewable generation includes the purchased output from non-Federally
22 owned wind and solar resources (Federal purchases of shares of the Klondike III Wind
23 Project, and Stateline Wind project). The generation and capacity forecasts for these
24 resources take into account historical generation values. These projects are detailed in *id.*,
25 Tables 4.2.1 for energy, 4.2.2 for HLH, 4.2.3 for LLH, and 4.2.4 for one-hour capacity. This

1 forecast is also included in the calculation of the load-resource balance, *id.*, Tables 9.1.1 for
2 energy, 9.1.2 for HLH, and 9.1.3 for LLH, on Line 28 (Non-Hydro Renewable).

3 4 **3.1.4 Thermal Generation Forecasts**

5 Thermal generation forecasts include the purchased output from non-Federally owned
6 projects and project generation that is directly assigned to BPA. The only thermal resource
7 is the Columbia Generation Station project. Forecasts for this project include a two-year
8 refueling cycle. The generation and capacity forecast incorporates facility and equipment
9 improvements made since the final BP-22 Power Loads and Resources Study. The
10 generation forecast for Columbia Generating Station is shown in the Power Loads and
11 Resources Study Documentation, BP-24-FS-BPA-03A, Tables 4.1.1 for energy, 4.1.2 for HLH,
12 4.1.3 for LLH, and 4.1.4 for one-hour capacity. This forecast is also included in the
13 calculation of the load-resource balance, *id.*, Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3
14 for LLH, on Line 32 (Thermal).

15 16 **3.1.5 Contract Purchases**

17 BPA purchases or receives power under a variety of contractual arrangements to help meet
18 Federal load obligations. The contracts are categorized as (1) power purchases, (2) power
19 or energy exchange purchases, (3) capacity-for-energy exchange contracts, (4) power
20 purchased or assigned to BPA under the Columbia River Treaty, and (5) transmission loss
21 returns under Slice/Block contracts. These arrangements are collectively called "Contract
22 Purchases." The transmission loss returns category captures the return of Slice
23 transmission losses to the Federal system by Slice customers under Slice/Block contracts.
24 BPA's Contract Purchases are considered firm Federal system resources that are delivered
25 to the Federal system regardless of weather, water, or economic conditions.

1 BPA's expected Contract Purchases are detailed in the documentation as follows. Power
2 purchases from delivery points outside the PNW region are termed Imports, which are
3 found in *id.*, Tables 2.2.1 for energy, 2.2.2 for HLH, and 2.2.3 for LLH. Non-Federal Canadian
4 Entitlement Return (CER) deliveries are found in *id.*, Tables 2.4.1 for energy, 2.4.2 for HLH,
5 and 2.4.3 for LLH. Power purchases from delivery points within the PNW region are called
6 Intra-Regional Transfers (In) and are found in *id.*, Tables 2.3.1 for energy, 2.3.2 for HLH,
7 and 2.3.3 for LLH. Slice Transmission Loss Returns to BPA do not have their own detailed
8 table but are included in the Federal system load-resource balance in the forecasts of
9 "Contract Purchases." See *id.*, Tables 9.1.1 for energy, 9.1.2 for HLH, and 9.1.3 for LLH, on
10 Line 40 (Imports), Line 41 (Intra-Regional Transfers (In)), Line 42 (Non-Federal CER), and
11 Line 43 (Slice Transmission Loss Return).

13 **3.1.6 Uncommitted Purchases**

14 Uncommitted Purchases include estimates of any Tier 1 system augmentation purchases
15 required to meet any annual deficits of the Federal system to meet Tier 1 load service, and
16 Tier 2 augmentation to meet Tier 2 load service that is greater than the forecasted available
17 Federal System, in order for the Federal System to be in load-resource balance. Calculation
18 of augmentation purchases are discussed in Section 4.2 below.

20 **3.1.7 Federal System Transmission Losses**

21 Federal system transmission loss estimates are treated as generation reductions in this
22 Study. These losses are calculated monthly and vary by water conditions. The loss factors
23 used have several components that combine to give the estimate of losses typically
24 associated with Federal system generation: (1) step-up transformers from generation to
25 the high-voltage transmission network, (2) high-voltage network transmission,
26 (3) transfers to Federal loads over non-Federal transmission systems, and (4) step-down

1 transformers from high-voltage transmission to low-voltage delivery. The Federal system
2 transmission loss factors used in this Study are:

- 3 • Energy is 3.11 percent, October thru May; 3.16 percent, June thru August; and
4 3.11 percent in September.
- 5 • Capacity is 3.16 percent, October thru May; 3.43 percent, June thru August; and
6 3.16 percent in September.

7
8 The estimated magnitude of each loss factor component for energy and capacity is as
9 follows:

10 (1) Step-up transformers between the Federal generation and the transmission
11 network: average losses of 0.31 percent for energy and 0.36 percent for
12 capacity.

13 (2) High-voltage network: uses a monthly factor set by season, as shown in table
14 below.

October	November	December	January	February	March	April	May	June	July	August	September
2.04%	2.04 %	2.04 %	2.04 %	2.04 %	2.04 %	2.04 %	2.04 %	2.09%	2.09%	2.09%	2.04 %

15 (3) Transfer service to Federal system loads over non-Federal transmission
16 systems: average losses of 0.49 percent for energy and 0.43 percent for
17 capacity.

18 (4) Step-down transformers: average losses of 0.27 percent for energy and
19 0.33 percent for capacity.

20
21 These transmission loss factor components were developed in 1992 and reaffirmed by
22 Transmission Services in 1994, 2000, and 2011. In 2014, BPA updated the transmission
23 loss factor for the third component, transfer service to Federal loads over non-Federal
24 transmission systems; this update was first included in studies for the BP-16 rate case. In

1 addition, BPA is proposing revised High-voltage network losses, which are used in this
2 Study. *See* Motion to Modify Procedural Schedule and Establish Deadline for Objections to
3 TC-24 Settlement Agreement, TC-24-M-BPA-01, Appendix A, Attachment 2 at A-161
4 (Bonneville’s Open Access Transmission Tariff). The Power and Transmission Risk Study
5 and the Power Rates Study also use these transmission loss factors.

6 7 **3.2 Regional Hydro Resources**

8 **3.2.1 Overview**

9 This Study produces total PNW regional hydro resource estimates for FY 2024 and
10 FY 2025. Additionally, it provides the hydro resource inputs for the Aurora model, which
11 provides forecasts used in the Power Market Price Study and Documentation, BP-24-FS-
12 BPA-04.

13 14 **3.2.2 PNW Regional Hydro Generation**

15 PNW regional hydro resource estimates are one of the inputs to the Aurora model and are
16 comprised of all PNW regulated, independent, and small hydro resources for FY 2024 and
17 FY 2025. Regulated hydro generation estimates for this study are developed for each of the
18 water years from 1989 through 2018 using the HYDSIM study described in Section 3.1.2.1,
19 above. Independent hydro generation estimates are provided by the project owners for the
20 same water years. *See* Section 3.1.2.2, above. Small hydro generation estimates are
21 provided by the project owners and are assumed not to vary by water year. Small hydro
22 projects are described in Section 3.1.2.3, above.

23
24 The total regional regulated, independent, and small hydro energy is summarized for each
25 of the 30 water years for FY 2024-2025 in the Power Loads and Resources Study
26 Documentation, BP-24-FS-BPA-03A, Section 5.

1 **3.3 4(h)(10)(C) Credits**

2 **3.3.1 Overview**

3 The Northwest Power Act directs BPA to make expenditures to protect, mitigate, and
4 enhance fish and wildlife affected by the development and operation of Federal
5 hydroelectric projects in the Columbia River Basin and its tributaries. These expenditures
6 are to be made in a manner consistent with the Power Plan and Fish and Wildlife Program
7 developed by the NPCC and consistent with other purposes of the Northwest Power Act.
8 16 U.S.C. § 839–839h.

9
10 Section 4(h)(10)(C) of the Northwest Power Act requires that the costs of mitigating these
11 impacts be properly accounted for among the various purposes of the hydroelectric
12 projects by making sure that when BPA funds mitigation on behalf of both power and non-
13 power project purposes, ratepayers recoup the non-power share. The non-power purposes
14 include flood control, irrigation, recreation, and navigation. The percentage of costs
15 attributable to non-power purposes is 22.3 percent. This percentage is the systemwide
16 average of cost allocations for non-power purposes of the FCRPS provided by the
17 Reclamation and the Corps for their hydropower projects.

18
19 Following the Northwest Power Act’s requirement for appropriate cost allocation, BPA
20 annually recoups the non-power portion of costs associated with fish measures through
21 “4(h)(10)(C) credits” against BPA’s payments to the U.S. Treasury. This Study estimates
22 the replacement power purchases resulting from changes in hydro system operations to
23 benefit fish and wildlife. These power purchases are part of the calculation of 4(h)(10)(C)
24 credits in the Power and Transmission Risk Study, BP-24-FS-BPA-05, § 4.1.1.1.5.6. The
25 operations to benefit fish and wildlife are described in this Study in Section 3.1.2.1.1.

3.3.2 Forecast of Power Purchases Eligible for 4(h)(10)(C) Credits

The power purchases eligible for 4(h)(10)(C) credits are estimated by comparing power purchase estimates between two HYDSIM hydro regulation studies. The first hydro regulation study, termed the “with-fish” study, models hydro system operations using current requirements for fish mitigation and wildlife enhancement under 30 historical water year conditions (October 1988 through September 2018). The HYDSIM study completed for this Study serves as the “with-fish” study for the power purchase estimates. The second hydro regulation study, called the “no-fish” study, models the hydro system operation assuming no operational changes were made to benefit fish and wildlife using the same 30 historical water year conditions.

BPA estimates the power purchases required to meet a specific firm load (described below) under the with-fish study and the power purchases required to meet the same firm load under the no-fish study. The 4(h)(10)(C) credits do not pertain to the entire generation difference between the with-fish study and the no-fish study; instead, the credits pertain to only a portion of the additional power purchases in the with-fish study. BPA receives 4(h)(10)(C) credits for the non-power portion (22.3 percent) of the additional power purchases it must make in the with-fish study relative to the no-fish study.

The specific firm load used in the calculation of 4(h)(10)(C) credits was a part of the original negotiated arrangement between the Department of Energy and the U.S. Treasury allowing BPA to claim the credits. A fundamental principle of this arrangement for claiming 4(h)(10)(C) credits is that the calculation must not be affected by BPA’s marketing decisions. To separate the credit calculation from BPA marketing decisions, 4(h)(10)(C) credits are calculated using the load that could have been served with certainty while drafting the system from full to empty without fish operations under the worst

1 energy-producing water conditions . This FELCC is the amount of firm energy that BPA
2 would have been entitled to sell without fish operations and is used as the firm load in the
3 4(h)(10)(C) power purchases analysis.

4
5 The differences between the Federal FELCC and the Federal generation in the with-fish
6 study determine the power purchases under the with-fish study. Similarly, the differences
7 between the Federal FELCC and the Federal generation in the no-fish study determine the
8 power purchases under the no-fish study. The instances where power purchases are
9 greater in the with-fish study compared to the no-fish study result in power purchases
10 eligible for 4(h)(10)(C) credits. Alternatively, when power purchases are less in the
11 with-fish study than in the no-fish study, the difference constitutes a negative
12 4(h)(10)(C) credit.

13
14 The differences in energy purchase amounts between the with-fish and no-fish hydro
15 studies are calculated for each period and water condition used for planning. The
16 differences are shown for the rate period in the Power Loads and Resources Study
17 Documentation, BP-24-FS-BPA-03A, Tables 6.1.1 and 6.1.2. These power purchases are
18 used as inputs to the Power and Transmission Risk Study, where, combined with Aurora
19 market price estimates, they are used to calculate the 4(h)(10)(C) credits for power
20 purchases. The non-power portion (22.3 percent) of the average expense for these
21 purchases is used as the forecast of 4(h)(10)(C) credits for Federal hydro system fish
22 operations.

23 24 **3.4 Use of Tier 1 System Firm Critical Output Calculation**

25 The forecast Tier 1 System Firm Critical Output (T1SFCO) used in the ratemaking process
26 was calculated for the FY 2024–2025 rate period in the BP-24 RHWM Process. Power

1 Rates Study, BP-24-FS-BPA-01, § 1.4.2. The T1SFCO adds forecasts of hydro generation,
2 thermal generation, and contract purchases together, and subtracts specified system
3 obligations as shown in Tables 3.1 through 3.4 in the TRM, BP-12-A-03. RHWMTier 1
4 System Capability is the sum of the T1SFCO and RHWMTier 1 Augmentation. TRM, BP-12-A-03,
5 § 3.1. The BP-24 RHWMTier 1 Process rescaled the CHWMTier 1s to this RHWMTier 1 System
6 Capability to arrive at individual customers' RHWMTier 1 values for the FY 2024–2025 rate
7 period.

8
9 Supporting tables for the T1SFCO used in this Study for the calculation of the Tier 1 System
10 output are provided in the Power Loads and Resources Study Documentation, BP-24-FS-
11 BPA-03A, Section 7. T1SFCO is 6,993 aMW when averaged over the two-year rate period,
12 FY 2024–2025. *Id.*, Table 7.1.1. RHWMTier 1 Augmentation is 70.748 aMW, and RHWMTier 1
13 System Capability is 7,063 aMW over the two-year rate period, FY 2024-2025. The BP-24
14 RHWMTier 1 Process calculated an adjusted Slice Output of 19.74071 percent of the RHWMTier 1
15 Tier 1 System Capability.

4. FEDERAL SYSTEM LOAD-RESOURCE BALANCE

4.1 Overview

For BPA to plan operations and set power rates, the Federal system must be in load and resource balance; that is, BPA must produce an annual forecast showing that it has enough resources available to meet its forecast firm loads under firm generation conditions characterized by the monthly P10. The load-resource balance is composed of the monthly energy amounts of BPA's resources, which include hydro, non-hydro, and contract purchases, less BPA's load obligations, which are comprised of BPA's power sales contract obligations and other contract obligations.

4.2 Firm Load-Resource Balance

To determine whether the Federal system is in load-resource balance, the forecast amount of BPA's annual firm energy resources under the monthly P10 conditions is estimated and compared to BPA's total firm energy loads. If BPA's expected firm energy resources are equal to BPA's total expected load obligations on an annual basis, then BPA is considered to be in load-resource balance. If the load-resource balance is not zero, BPA calculates adjustments to its loads or resources to maintain BPA in load-resource balance.

If BPA's annual firm energy resources are estimated to be greater than BPA's forecasted firm load obligations, BPA is considered to be annual firm energy surplus. If surplus, BPA would calculate the amount of surplus sales needed to increase load obligations to keep the Federal system in load-resource balance: first by serving Tier 2 loads and then by identifying firm surplus sales if still surplus after serving all of BPA's Tier 2 loads.

Conversely, if BPA's annual firm energy resources are estimated to be lower than BPA's forecasted load obligations, BPA is considered to be in annual firm energy deficit. If deficit, BPA would calculate the amount of system augmentation purchases needed to keep the

1 Federal system in load-resource balance. If deficit, BPA calculates the amount of system
2 augmentation needed to meet Tier 1 loads (Tier 1 System Augmentation) and any
3 additional augmentation needed to meet Tier 2 loads (Tier 2 System Augmentation)
4 separately so that it can allocate augmentation costs to the appropriate rates.
5

6 Annual firm surplus sales and system augmentation purchases may not fully balance
7 monthly Federal system HLH or LLH energy surpluses or deficits. Purchases made to meet
8 individual monthly HLH or LLH energy deficits are called balancing purchases and are
9 presented in the Power and Transmission Risk Study Documentation, BP-24-FS-BPA-05A.
10

11 **4.3 Firm Federal System Energy Load-Resource Balance**

12 Table 2 in this Study shows a summary of the Federal system annual energy load-resource
13 balance for FY 2024-2025. Under monthly weighted P10 firm conditions, the Federal
14 system is expected to be in firm energy load-resource balance for each year of the rate
15 period. For FY 2024, 184 aMW of firm surplus sales are forecast to achieve load-resource
16 balance; for FY 2025, zero (0) aMW of firm surplus sales are forecast to achieve load-
17 resource balance. Table 2, Line 7. The individual components that make up the Federal
18 system annual energy load-resource balance for FY 2024-2025 are shown in Table 3 of this
19 Study and presented monthly in the Power Loads and Resources Study Documentation,
20 BP-24-FS-BPA-03A, Tables 9.1.1 (energy), 9.1.2 (HLH), and 9.1.3 (LLH).
21

22 **4.4 Federal System 30 Water Year Load-Resource Balance**

23 To determine the load-resource balance for the Federal system under each of the 30
24 historical water years 1989 through 2018, the forecast amount of resources for each year is
25 estimated and compared to loads. The 30 Water Year monthly Federal System
26 surpluses/deficits for FY 2024 and FY 2025 are found in the Power Loads and Resources

1 Study Documentation, BP-24-FS-BPA-03A, Tables 10.1.1 for energy, 10.1.2 for HLH, and
2 10.1.3 for LLH. These are used by RevSim in the calculation of secondary energy revenues.
3 See Power and Transmission Risk Study, BP-24-FS-BPA-05, § 3.1.2.1.
