

Whistling Ridge Energy Project

Final Environmental Impact Statement

Appendix H

August 2011

DOE/EIS-0419

Cooperating Agency:
State of Washington, Energy Facility Site Evaluation Council

Appendix H: COMMENT LETTERS

Note to Reader: This Appendix presents all the comments received by both the Bonneville Power Administration and the State of Washington Energy Facility Site Evaluation Council. In attempt to protect the privacy of the commenters, BPA has redacted personal information such as email and mailing addresses. Additionally, BPA has removed sensitive cultural resource information from this Appendix pursuant to the laws and orders related to cultural and historic resources that have been identified in Chapter 4 of the FEIS for this proposed Project.

COMMENT LETTER 1

Don Morby
[REDACTED]

Attached is submitted as a comment on the EIS draft for whistling Ridge wind power.....

Why the big push on no wind mills in Underwood ?

Diversity can be defined in many different ways.

Diversity is a commitment to recognizing and appreciating the variety of characteristics that make individuals unique in an atmosphere that **promotes** and **celebrates** individual and collective achievement !

Examples of these characteristics are: age; cognitive style; culture; disability (mental, learning, physical); economic background; education; ethnicity; gender identity; geographic background; language(s) spoken; marital/partnered status; physical appearance; political affiliation; race; religious beliefs; sexual orientation.

There is another diversity just as powerful and that is the natural diversity of mother nature in the form of

Wind power, or wind energy, it is a renewable resource; it is from the sun. The intensity of solar radiation is diverse across the globe. Some areas receive intense amounts of sunlight, while others receive much less. The result is a temperature gradient; a gradient which is mediated by the flow of air to and from areas of dissimilar temperatures and pressure systems in our atmosphere. Uneven heating of the earth's atmosphere, in addition to irregularities on the earth's surface and the rotation of the earth create wind. Terrain, water bodies, and vegetation then shape flow patterns.... in other words Diversity !!!

Although, the wind is not constant, and may blow at a variable pace, it can become difficult to rely upon this source of power on the quieter days, when there's no breeze. Not much different than we human beings, we are not constant, we may blow at anytime, we can be difficult to be relied upon, and we do have quieter days.

As far as the space occupied by these turbines is concerned, they hardly take considerable space. What's more, due to their height, even the land below these turbines can be used for other purposes, such as farming. When we humans build a house or barn on a lot or acre are we not also denying the use of that small portion of land to anything but a house or barn? And God forbid anyone who tells you that you have no right to build a home or barn on your land !!

1. The wind is free and with modern technology it can be captured efficiently.
2. Once the wind turbine is built, the energy it produces does not cause green house gases or other pollutants.
3. Although wind turbines can be very tall each takes up only a small plot of land. This means that the land below can still be used. This is especially the case in agricultural areas.
4. Many people find wind farms an interesting feature of the landscape.
5. Remote areas that are not connected to the electricity power grid can use wind turbines to produce their own supply.

6. Wind turbines have a role to play in both the developed and third world.

7. Many people see large wind turbines as unsightly structures and not pleasant or interesting to look at and they disfigure the countryside and are generally ugly (In our current world some people see other people this way). If being Ugly becomes a deciding factor in this country then I will probably be out of a job real soon ! In a diverse world this ability too not see eye to eye on everything is what makes us so unique.

Unlike fuels that must be drilled for and then processed and eventually depleted, wind power is naturally created and to one degree or another is always being produced. Therefore there is an unlimited supply of this source of power and the environment does not suffer from the use of the energy.

So what does all this mean? Here is what I have gotten from all the rhetoric...We as humans are as diverse and fickle in our opinions as mother nature is in hers. On the one hand you have a Company who has agriculture and forestry down to a science.....On the other hand

you have special interest groups arriving in the area concerned about environment, mother nature, rivers, and views and they too have agriculture and

the fruits of their labors down to a science. So with these two groups who both profess to be "Green" and stand for all things "Green"

why are they bickering ?- Money? The one group thinks the windmills will detract from the value of their property, destroy the view, ruin business, and

will apparently stop at nothing to convince you of their opinion,

while the other group thinks wind power is an alternative to energy besides fossil fuels (I believe in this). They have done their convincing

with truth, facts, and openness to convince you of their opinion. A quote from J. Ollie Edmunds: " This country was not built by men who relied on somebody else to take care of them. It was built by men who relied on themselves, who dared to shape their own lives, who had enough courage to blaze new trails with enough confidence in themselves to take the necessary risks. This self-reliance is our American legacy. It is the secret of that something which stamped Americans as Americans. "

In conclusion I believe that company's like SDS are made up of men and women who shape their own lives, have good morale character, rely on themselves,

and blaze new trails toward making our community and our environment a better place to live. They have proved themselves as good

stewards of our land for the last 60 years.....more so than any special interest

group todate!!! So, please let us move forward and get on with building the windmills at whistling ridge.....

Subject: Governor Gregoire must deny Whistling Ridge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Governor Gregoire must deny Whistling Ridge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Governor Gregoire must deny Whistling Ridge

I am opposed to putting wind turbines in the gorge. There is conflicting opinions about wind technology and the negative impacts are mounting. This is a beautiful part of OUR states, a scenic wonder, compared to the ALPS. It is a favorite spot of many for hiking, boating, recreating, and enjoying the natural peace. Please don't allow these wind turbines! I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. Subject: Governor Gregoire must deny Whistling Ridge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Governor Gregoire must deny Whistling Ridge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Governor Gregoire must deny Whistling Ridge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Governor Gregoire must deny Whistling Ridge

Categories: Yellow Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. Wife and I just drove thru the Gorge on Hwy 84 from near Arlington to Portland and it is a magnificent journey, with incredible hills, basalt beauty and remarkable water. Let us keep this gift for our children, and for everyone who comes to visit.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Governor Gregoire must deny Whistling Ridge

Categories: Blue Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Please deny Whistling Ridge Wind Farm

I am writing as a resident of the Columbia River Gorge and as a small business owner. Many fellow business owners depend on the natural beauty of the Columbia River Gorge for their livelihoods. It is also the reason many of us choose to live here. I am also writing as a strong supporter of green energy and having a PhD in environmental engineering, I understand the importance of eliminating carbon based energy.

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure. There are plenty of areas outside the Columbia River Gorge National Scenic Area that are far more suitable for such a development.

Subject: Wind Turbines should be painted to blend with the landscape

We were hiking along the Deschutes River a couple weeks ago, and we could see the giant white wind turbines over on the Washington side of the Columbia. What an eyesore! It looks like "War of the Worlds". Wind energy is great, but why paint them glaring white? They should be a color that blends with the hills - a simple (partial) solution to the destruction of everyone's scenery, and it would not cost any more than painting them white.

Thank you for considering this idea.

Dear Mr. Posner and Mr. Montano,

We have reviewed the recent Draft Environmental Impact Statement (DEIS) compiled for the Whistling Ridge Energy Facility. In doing so, we noted under section 3.10.2.2 no mention has been made of the finding of the Yakama Nation Cultural Resources Program study which resulted in the findings of Traditional Cultural Property within the proposed wind project lands. The DEIS states that:

"A field investigation by Yakama Nation cultural resources specialists occurred in December 2009. The Yakama Nation's findings, currently in preparation, will supplement the information contained in this EIS."

However, the results of the field investigation were reported to SDS Lumber and the Department of Archaeology and Historic Preservation in December of 2009, shortly after the site visit was completed. We, therefore, are taking this opportunity to resubmit this report to the Energy Facility Siting Evaluation Council (EFSEC) and the Bonneville Power Administration (BPA). It is our directive that this report be included in the Final Environmental Impact Statement as a portion of the consultation responsibilities held by BPA and EFSEC.

Sincerely,

Ruth Jim

We have reviewed the recent Draft Environmental Impact Statement (DEIS) compiled for the Whistling Ridge Energy Facility. In doing so, we noted under section 3.10.2.2 no mention has been made of the finding of the Yakama Nation Cultural Resources Program study which resulted in the findings of Traditional Cultural Property within the proposed wind project lands. The DEIS states that:

"A field investigation by Yakama Nation cultural resources specialists occurred in December 2009. The Yakama Nation's findings, currently in preparation, will supplement the information contained in this EIS."

However, the results of the field investigation were reported to SDS Lumber and the Department of Archaeology and Historic Preservation in December of 2009, shortly after the site visit was completed. We, therefore, are taking this opportunity to resubmit this report to the Energy Facility Siting Evaluation Council (EFSEC) and the Bonneville Power Administration (BPA). It is our directive that this report be included in the Final Environmental Impact Statement as a portion of the consultation responsibilities held by BPA and EFSEC.

Sincerely,

Ruth Jim
Chairman, Yakama Nation Roads, Irrigation, and Lands Committee

Tammy and Kayce,

Attached is a public comment on the WR EIS. I expect that we will start receiving more of these soon, not to mention those we will get at the public meetings. I want to make sure we are ready to go with numbering and saving these in an appropriate manner. Let's talk about this after Sonia's party. Thanks.

Subject: Whistling Ridge EIS Comment

Dear Mr. Posner:

I have a comment on the impact of the Whistling Ridge wind project; it includes photos and is online at [REDACTED] I am the author of the online article.

Nestor Peak is a key viewing area used by hikers, mountain bikers, ATV enthusiasts, and horseback riders. If this project is built, the view of Mt. Hood from this peak will be permanently spoiled. In addition, the onslaught of wind turbines will continue to encircle the Columbia Gorge and destroy once-pristine views of the ridges and horizon that were one of the primary reasons the National Scenic Area was created. Please deny the project application. It is not suited for the proposed location.

Sincerely,

Chris Carvalho

The Windmills Are Coming

Entry 1: June 6, 2010

The Columbia Gorge faces many development threats. This one wasn't even on the radar screen ten years ago. But in the past few years as I hike and even drive the roads something is slowly creeping into my conscious perception, bit by bit. As I drive east starting near Hood River, in the far distance there's now a white jagged appearance to the horizon. At the top of the McCall Point trail on any clear day the wind turbines are visible. Eastward from there, on just about any high peak one can see a forest of white pinwheels is growing.

The shot above was taken from the top of Stacker Butte, also called Columbia Hills State Park. It is just a small piece of a much larger panorama. I am providing the full image so you can appreciate the impact. Remember that it is copyrighted, so any publication or non-educational use must be licensed by contacting me. To download it, [\[redacted\]](#). This is a 1.7 MB file, so it may take some time to load. The view is toward the east with the farms of the Klickitat River valley in the foreground.

Once you open it, you will see thousands of turbines. My camera isn't good enough to show the most distant ones, but if you look closely they extend almost to the left (north) and right (south) edges of the view. They are getting closer to the edge of the Scenic Area boundary. In fact, a project called Whistling Ridge is in the approval process right now just north of Hood River on the Washington side of the Gorge, and it will be on the edge of the boundary and visible from Nestor Peak and Mitchell Point. It is a galling insult to the spirit of the Scenic Area Act to place a wind energy project a stone's throw from the regional boundary and call it compliant with the Act.

Now I'm a big fan of renewable energy, but something about this march of the turbines reminds me of what happened when The Dalles Dam was built and drowned Celilo Falls. We didn't appreciate what we lost at the time, and now it's unlikely we'll ever get the falls or the salmon back for decades to come, maybe never. Early research is documenting how these turbines kill birds and bats (1), and it's obvious what they do to the view. They also create noise pollution that aggravates nearby residents as well as

jams the communication calls birds and other creatures use for breeding, finding food, and predator avoidance. We've got to stop building them so close to the Scenic Area until we know more about their long-term effects, and also come to an understanding about how much visual impact we should tolerate. In the meantime, we can look at something proven to meet our growing demand for energy that doesn't have any negative impacts. It's called conservation.

Few of us realize the rapid pace of this change. Soon it won't be possible to go on a hike to a viewpoint anywhere in the eastern end of the Gorge and see a pristine east horizon. Most of it is already gone. The view of the horizon was something I took for granted. Today I realized it's been taken from us and might never come back.

To comment on the Whistling Ridge wind energy project, go to <http://www.efsec.wa.gov/whistling%20ridge.shtml>

The project contact person is currently Stephen Posner, his information is located at the very bottom of the page.

Your comments will likely carry more weight if submitted to the Bonneville Power Administration (BPA). The Washington EFSEC typically defers to the wishes of rural counties, which are hungry for the tax dollars these projects provide. The counties have a history of ignoring the environmental impact when corporations wave money at their officials.

Comments to the BPA can be submitted at

<http://www.bpa.gov/applications/publiccomments/OpenCommentListing.aspx>

Scroll the page down to find the section on the Whistling Ridge Energy Project and click the "Make Comment" button.

Subject: Comments on Whistling Ridge proposal

Categories: Blue Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project could cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but not at the cost of our natural and scenic treasures.

As residents of the area that will be able to see some of the turbines of this proposed project, we are in favor of it. We can't continue the practice of saying "Yes, we need it but not here". This will not get us where we need to be down the road. SDS is a good and responsible Company that cares. It is their land, they have the right to this project and will do it in an responsible manner.

Les and Dee Dewey

dear sirs

As a small local business located in Bingen, WA - not far from the proposed location - we would like to offer our support for the approval of this project. The turbines are located outside the gorge scenic area, are environmentally acceptable and will provide needed energy for the region.

SDS should be complemented for its concern to safeguard the local economy and the environment

I believe people who are taking the 'not in my backyard' position are both selfish and short-sighted

To EFSEC Members,

Two observations.

1. Wind turbines and transmission lines are incompatible with forests. Maintenance requires roads, clear cutting and ongoing brush removal.
2. Solar is an alternative, abundant, clean, renewable source of energy that does not require large transmission lines.

One question.

Do we need local forests or money from sales of electricity to California for survival?

One comment.

It is not the highest use of our forested environment in the Cascade mountain range to dedicate land to energy production if that means it will never have the potential again to produce a forest.

The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

I was raised in Hood River and spent my youth enjoying the White Salmon, Carson, Cascade Locks and Stevenson area natural beauty. I have been traveling and hiking the Gorge all of my life. Other states have sacrificed priceless treasures for expediency. Notably Hetch Hetchy valley to provide water for San Francisco. While the percentage of power/water supplied by this source has been reduced over the years, it is almost impossible to undue the dam and the infrastructure because of the entrenched interests in the system. The same will be true when it is understood that this power conveyance is not needed in the future. Until the country puts a sincere effort into energy conservation, which it has not done, I am opposed to sacrificing an irreplaceable treasure for expediency.

I was born and raised in Skamania County, Washington and my husband and I have lived in the Columbia River Gorge most of our adult lives. We love this area and can think of no place that we would rather live.

We are not always thrilled with the constant winds we receive at our house but can not change the fact that we live in a very windy location. It seems foolish not to harness this abundant energy and use it to our advantage. We ABSOLUTELY SUPPORT the Whistling Ridge Energy Project and applaud SDS Lumber for trying to bring clean energy to Skamania County.

EFSEC
905 Plum Street SE
Olympia, WA 98604-3172

To those conducting public hearings on The Whistling Ridge Energy Project:

We are part of that silent majority who do not like to attend meetings where people argue and make us feel intimidated. We feel that our voice does need to be heard on this matter, it is very important to us.

We support the Whistling Ridge Energy Project. Not only does it give a alternative source of clean energy, but it also will provide new jobs and tax revenues to our county which has been devistated with so many land set asides and regulations that our children have to leave the area in order to find jobs.

Wind energy is a clean, quiet source which uses the natural winds of the Gorge. In our opinion, the people who are causing the obstacles in implementing this natural resource are the same people who have opposed most everything else that is proposed in the Gorge. They have personal agendas which are not for the good of the community but for their selfish interests.

Wind Energy is a Good thing for the Gorge, a Good thing for the economy of the Gorge and a good, clean alternative that all the environmentalists have been insisting on. Lets move forward and let a Good thing happen.

Sincerely,

John Peyrollaz

I finally saw a picture of what this development was going to look like throughout the central Columbia River Gorge area.

I am shocked to think that we are going to spoil the wonderful vistas and view of the Columbia River Scenic area by more wind mills. Just look to the Eastern gorge.....once out of the scenic area you are bombarded with literally thousands of wind mills. Why now, should we start placing these within view of the prime area in the Columbia River Gorge??

Once these are built, they will forever be a backdrop to this pristine area.

Why, are the turbines 400' tall? This is nearly double the size of other installations. Could more and smaller turbines be used that would not be so visible? These issues are not merely cost/benefit decisions - they will impact the natural beauty of the Columbia River Gorge Scenic area for lifetimes to come. The decision should not be made lightly and should be scrutinized from every perspective.

Ask the developers WHY, five times.

Why did you decide this was the best spot?

Why are other spots not as desirable?

Why are the turbines so tall?

Why are they placed so that the majority of the central gorge will be seeing them?

Why is your profit more important than the sacred beauty of the Columbia River Gorge?

We all know that huge subsidies are paying for these developments. Why can't they be placed where the majority of tax payers are benefited and not impacted negatively?

Sincerely,

Don Garner

I strongly endorse the Whistling Ridge Wind Energy Project. The Project has gone through the EIS process and found no significant impacts to wildlife, the scenic value of the Columbia Gorge Corridor or to other resources. The Northwest is in desperate need of other power sources and we can't be reliant on hydro-power in the decades to come. I am appalled that many of the groups who are opposed to this project are the same people calling for removal of dams on the Snake River. Where will we get our power in the future. Many of our AFRC members have located cogeneration power plants on their sites as efforts to supplement needed clean power here in the Northwest and we strongly support this effort by SDS Lumber to provide more green energy. Please help bring some common sense to the process and support the Whistling Ridge Wind Energy Project.

We are writing because we will be out of area for the meetings in Underwood and Stevenson. We are against the proposed Whistling Ridge Project for these following reasons:

The proposed site of these 400+ feet wind turbines is very close to the well populated communities of Underwood, Willard, and Mill A. We have read the concerns and complaints of the people of Bend, OR where a wind farm is already established. They are alarming and serious. People in this area have lived for generations with agriculture and forest production. Tourism and wineries have grown and flourished in the Gorge Scenic area in the past 25 years. The change of having a forest (even with logging) for a neighbor to having the zoning change to industrial use will have a devastating affect on the whole community. While the winds here can be strong, they are unpredictable and unreliable. We're sure that the temptation of federal dollars for "green energy" is tempting to the state and county – but the few dollars that will trickle down to Skamania County are small when compared to the problems that will most likely arise. The jobs produced will be temporary construction jobs – the maintenance jobs to follow will be few. No tax money will come to Skamania County schools. Wind power is undergoing much research and development. To jump on the band wagon with the existing technology of HUGE turbines in populated areas is a mistake. In the future, we're sure there will be sleeker, smaller, more efficient turbines that will be more "user friendly" to local populations.

On a recent drive through the mid section of our country (Kansas, Colorado, Wyoming) we saw ONE wind farm the whole way – and it looked smaller than the ones already existing in eastern Oregon and Washington. The Norwest has done its part – we're given up our rivers to power production – we've given up land for thousands of wind turbines in the eastern parts of our states. The power produced by Whistling Ridge will be controlled by a power company located in Europe and the power will be exported to other parts of the country. We'll be left with the headaches and the hundreds of acres denuded to make space for these wind behemoths. Fire dangers will increase in this forest area. We demand that a hard, long look be given the decision to sanction this project. SAY NO!!! Pat & Linda Farrell

Categories: Yellow Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would not have negative impacts to the environment. The project is located on commercial timberland that have been subject to decades of intensive harvesting operations under a sustain yield forestry program regulated by the Washington Department of Natural Resources. I have reviewed the wildlife baseline studies and I have visited the site. There are no significant sensitive wildlife and plant habitat areas associated with this project area. The ecology of this area is typical of a highly altered timber management property. Timber management operations will continue in this area for decades to come which is also evidence that the area is not currently or will it every evolve to a significant ecological resource area. It is a timber management area for industrial forest practices. Siting a wind farm in this area is an intelligent and appropriate compatible land use which will diversity the economic value of these timber lands and help to preserve these lands for timber production for decades to come. There is no evidence that the installation and operations of the proposed facility will have any significant impacts on sensitive or special status animal or plant species. The data and analysis by qualified third parties indicates that no significant impact will occur.

The Whistling Ridge Wind Farm is also outside of the Columbia River Gorge National Scenic Area. The Congressional intent of the Gorge Scenic Act was to allow for ongoing economic activity in areas adjacent to the Scenic Area regardless of the affect that these adjacent areas may have on the view from the scenic area. In other words, there was to be no buffer zones to the buffer zone already established by the Gorge Scenic Area boundary. Also I believe that the construction of the Whistling Ridge Wind Farm would not degrade the scenic beauty of the Columbia River Gorge National Scenic Area. As a point of law, EFSEC does not have the authorization to establish new exclusion zones such as buffers to the Gorge Scenic Area without additional authorization from either the legislature or the US Congress. Visual Impact on the Columbia River Gorge National Scenic Area should be an issue of consideration in any Environmental Impact Statement review, but the determination of significance of any impact is not capricious or arbitrary, it must be based on the rules that are in place today. Development outside of and adjacent to the Columbia River Gorge National Scenic Area is allowed under the law and as such visual impacts to the National Scenic Area are allowed because the proposed facility is not located within the Scenic Area.

I support renewable energy. I also supported and participated in the creation of Columbia River Gorge National Scenic Area which is national scenic treasure. The creation of the Scenic Area involved a significant public involvement process that carefully consider the location of the boundary of the Scenic Area. The potential for wind energy development in the Columbia River Gorge area was a consideration when those of us who put pen to paper and drew the boundary participated in the creation of the Scenic Area. This boundary was established to buffer the significant resources of the Scenic Area and the legislation that created the Columbia River Gorge National Scenic Area clearly consider potential affects from development outside of the boundary and determined that such

development would not be subject to the Scenic Act. It is not EFSEC's role to substitute its judgment for that of the US Congress on this issue.

EFSEC must recommend that Governor Gregoire approve this project.

Sincerely,

David W. McClain

We are asking that you don't make the Whistling Ridge Energy Project in Skamania County WA a testing ground for impacts on coniferous forests. The potential for devastating impacts to this area are real. This is not an appropriate site for a large scale wind project.

The 426 foot turbines will be seen in the center of the Columbia River Gorge National Scenic Area during the day and also at night because of the red blinking lights on the top of the turbines.

SDS has *understated* the visual affect on their maps which are meant to appeal to the public for support.

Land values in the surrounding area will decrease because of the visual pollution of 426 foot wind turbines and the noise, which studies have shown is a potential health hazard.

We ask you to please reject this SDS project.

I am writing to support the wind project at Whistling Ridge.

This is an industrial forested area and has been subject to harvesting for decades and will continue in that capacity.

It is not sensitive habitat and it will not become sensitive habitat--it is industrial timber lands. There are no sensitive species and no sensitive habitat in or adjacent to the lands in question, so the impact of the wind farm will be insignificant.

The NIMBYs are concerned with the project being "near" the Columbia Scenic Gorge area. But, it isn't within the Gorge Area. And, thus, isn't subject by attack by the Friends of the Gorge on that account. With the mess in the Gulf and President Obama's speech last night, we have to support non-fossil clean renewable sustainable energy like the Whistling Ridge wind project.

EFSEC
Washington State

We are writing in opposition to the Whistling Ridge Wind Energy Project. We live in Husum, Washington which is in the impact area of the project. We oppose the project for a number of reasons:

- Visual impact – Not only will it be an eyesore for residents of this area, it will also negatively impact tourism.
- Noise – The noise impact will be detrimental to the rural environment
- Impact on raptors - The wind turbines will negatively impact raptor habitat – some of which are listed as endangered species

We oppose the industrialization of rural areas especially an area that is designated as a national scenic area.

From an economic perspective, the wind farm is supposed to generate power for 20,000 homes. This seems like very few homes for the cost, environmental impact, and degradation of a rural landscape. What would the cost be of conservation efforts to save the equivalent amount of energy? We would assume that it would cost far less to save an equivalent amount of power by practicing state of the art energy conservation measures than by generating new energy using wind turbines. Let's look at the real costs of wind power!

We are residents of the Columbia Gorge and we oppose this project.

Subject: Governor Gregoire should support Whistling Ridge

Categories: Yellow Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause NO significant negative impacts to sensitive wildlife and plant habitat and would not degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire support this project.

This proposal is not likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, even though this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. Whistling Ridge has been studied for seven years and found to pose no wildlife impacts.

Whistling Ridge is located outside the National Scenic Area and should not be subject to NSA concerns. Few if any turbines will be visible and this area of the Columbia River Gorge should be available to produce clean renewable energy.

I support renewable energy and I support the Whistling Ridge development adjacent to the Columbia River Gorge National Scenic Area.

I SUPPORT WHISTLING RIDGE AND WIND ENERGY IN THE GORGE.

Subject: Governor Gregoire must approve Whistling Ridge

Categories: Yellow Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. I support the proposed project because it will provide alternative energy so necessary should we hope to one day not have to rely on fossil fuels for our power. The EFSEC should recommend that Governor Gregoire approve this project.

Some other reasons that I support this proposal are that it will provide a broader tax base for the community benefitting all property owners and even benefitting those who rent their residences. Additionally, by lowering property taxes for individuals it would make special levies for schools, park districts and libraries more palatable to residents who otherwise might feel overtaxed.

Also, this project will provide jobs to many locals who have taken classes at Columbia Gorge Community College specific to the wind energy field in hopes that they could remain in the area and find a family wage job.

I was happy to learn that the US Department of Fish and Wildlife has found that there would be no significant impact on wildlife as a result of this project.

The turbines and the handfull of lights from this development would be visible from the deck of my home which faces due west but these lights are minimal compared to the lights from downtown Hood River and the Heights of Hood River that are also in my viewscape. In other words OKIMBY.....
OK in my backyard

I support renewable energy and I support this wind energy development.

Sincerely,

Charles Hinman

To Whom It May Concern:

I am writing to comment on the Whistling Ridge Energy Project Draft Environmental Impact Statement (DEIS). Please include my comments in the public record, and include my name on the mailing list for all future notices and decisions.

I have lived in the area of this proposed project for 18 years and have followed wind energy developments closely for most of that time, both here in the Columbia Gorge and nationally. I serve as an environmental representative on the technical advisory committees of three wind power projects in the area. I have participated in field visits to wind projects all over the West. I have a degree in biology and have read a great deal of the scientific literature pertaining to wildlife-turbine interactions. As someone who is well informed about both wind power and ecology, I have a number of concerns regarding the DEIS prepared for the Whistling Ridge Energy Project.

1. The evaluation of cumulative impacts is inadequate.

Under SEPA, EFSEC is required to consider whether multiple incremental impacts when considered together may cumulatively result in a significant adverse impact. WAC 197-11-792(2)(c)(iii). Unfortunately, the cumulative impacts analysis done for the Whistling Ridge DEIS only considered the impacts of 10 existing wind projects and three proposed wind projects. In fact, there are at least a dozen major wind projects constructed or proposed in Klickitat County alone, and more than 40 major wind projects constructed or proposed along the Columbia River east of Whistling Ridge.

The pace and scale of wind turbine construction in this region has been unprecedented. Only five years ago, an EIS prepared by Klickitat County (which lies immediately to the north and east of the Whistling Ridge site) predicted the construction of four major wind projects, with a total installed capacity of 1,000 megawatts, over a 20-year period. In actuality, 10 major wind projects with a total installed capacity of more than 1,100 megawatts have already been constructed in Klickitat County, and permits are pending for another 500 megawatts. In other words, Klickitat County has seen twice as much wind development in five years as was predicted for 20 years.

Besides the many projects in Klickitat County, the BPA's interconnection queue shows approximately 35 additional projects in other nearby counties that are either permitted or awaiting permits. Other projects are proposed but not yet shown in the BPA queue. From Whistling Ridge to Walla Walla, wind developers are erecting (or proposing to erect) strings of turbines that stretch for more than 100 miles along the ridges on both sides of the Columbia River.¹

In Klickitat County, almost every inch of ridge-top land above the Columbia from Dallesport eastward is already under lease to wind developers.² Additional projects are proposed but not yet shown on this map because permit applications have not been filed.

The environmental impacts analysis for Whistling Ridge must consider the regional impacts of more than 40 major projects within the Columbia Plateau ecoregion. The scale and sprawl of this wind development has significant cumulative impacts on wildlife, habitat, scenic values and other natural resources.

The notion that projects in eastern Klickitat County are "too far away...to result in cumulative impacts" is mistaken. Many birds and bats travel long distances during migration, foraging, and other components of their life cycle. Also, genetic exchanges between individuals of any given species are essential for maintaining population viability.

More important, the notion that projects are too far away to have cumulative impacts is mistaken because significant adverse impacts typically occur at the population level, rather than at the level of individual animals affected by a particular wind project. While different wind projects may affect different individuals, the cumulative effect of combined mortalities at many contiguous sites can be population-level impacts—and perhaps even local extinctions over time.

The DEIS erred in relying on a cumulative impacts analysis published in 2007 for the Mid-Atlantic Highlands. Not only is the Mid-Atlantic region completely different from the Whistling Ridge site in habitat and species composition, but the 2007 study was published before the pace of wind development began to rapidly accelerate. It is inappropriate to base any cumulative impacts analysis for Whistling Ridge on a study done under very different circumstances and in a very different place.

It is also inappropriate to dismiss the cumulative impacts of wind turbines on wildlife because of other man-made effects such as mortalities from buildings and cats. These mortalities don't necessarily affect the same species as wind turbines do: For example, cats do not kill golden eagles, and skyscrapers do not kill species that make their homes

¹ **Current and Proposed Wind Project Interconnections to BPA Transmission Facilities**, Bonneville Power Administration, last updated May 10, 2010, http://www.transmission.bpa.gov/PlanProj/Wind/documents/BPA_wind_map_2010.pdf

² **Klickitat County Wind Projects**, Klickitat County, last updated June 7, 2010, <http://klickitatcounty.org/Planning/default.asp?fCategoryIDSelected=1258566697>

in remote rural areas. More important, these man-made impacts do not justify placing additional pressures on sensitive bird and bat populations from new man-made structures in more remote areas where wind projects may be the leading source of avian and bat fatalities. They merely illustrate the importance of minimizing any additional mortalities caused by wind projects. Two wrongs do not make a right.

The DEIS provides no evidence to substantiate the applicant's assertion that the proposed Whistling Ridge wind project will not cause mortality to birds and bats in sufficient quantities to affect population viability. The analysis does not include any reasonable estimates of current population levels of sensitive species, nor of the threshold population levels required to maintain viability.

2. The WEST report prepared for the Klickitat County Planning Department is not applicable to the proposed Whistling Ridge Energy Project, and cannot be relied on to evaluate cumulative impacts.

The report prepared by Western EcoSystems Technology, Inc. (WEST) purports to be a cumulative impacts analysis for Klickitat County.³ Unfortunately, this report sheds little light on the cumulative impacts of wind power development on wildlife in Klickitat County, and it is even less relevant to a project proposed for Skamania County.

As the WEST report's title suggests, the Columbia Plateau Ecoregion is located in eastern Washington and Oregon, which have completely different plant and animal communities than the western Washington site proposed for the Whistling Ridge wind project. All of the projects evaluated in the WEST report are located in arid and un-forested lands, whereas Whistling Ridge is located in a coniferous forest that receives much more precipitation and has a much different plant and animal population. Impacts of wind projects on birds and bats are extremely site-specific, and because of that the WEST study has little applicability to the Whistling Ridge proposal. It is no more applicable than studies from the Altamont Pass Wind Resources Area in California, where significant population-level impacts on birds have been documented; or from the forested Mountaineer wind project in Appalachia, where significant population-level impacts on bats have been documented.

The WEST report contains fatality monitoring data from 12 projects around the Columbia Plateau Ecoregion. Only *one* of those projects, Big Horn, is actually located in Klickitat County—and the results from Big Horn show much higher raptor fatality rates than anywhere else in the Pacific Northwest. In other words, the WEST report underestimates the impacts of wind projects in Klickitat County by merging the Big Horn data with results from less lethal projects elsewhere in the region.

³ **Avian, Bat and Habitat Cumulative Impacts Associated with Wind Energy Development in the Columbia Plateau Ecoregion of Eastern Washington and Oregon**, Prepared for Klickitat County Planning Department by Gregory D. Johnson and Wallace P. Erickson, Western EcoSystems Technology, Inc., February 2010

The WEST report also looked at 24 projects in the Pacific Northwest for which pre-construction estimates of avian use are available. Here too, the results from Klickitat County show a much higher likelihood of avian impacts than elsewhere in the region. Of the 24 projects evaluated in the report, the seven projects located in Klickitat County had much higher estimated use by both raptors and by birds of all types. For example, the highest raptor use estimated anywhere in our region is at the Linden Ranch in Klickitat County. Raptor use there is estimated to be 2.5 times the average for the Columbia Plateau ecoregion.

In other words, the WEST report does *not* give an accurate picture of cumulative impacts from expanding wind power here in Klickitat County, much less any indications of cumulative impacts to be expected in Skamania County. To the contrary, the WEST report uses data from projects in other parts of Oregon and eastern Washington to underestimate how many birds—especially raptors—are likely to be killed here.

The WEST report has another fundamental flaw. To arrive at a prediction of cumulative fatalities, the report's authors averaged existing fatalities in the region and then compared those averages with estimates of regional population size based on breeding bird surveys provided by the Partners in Flight North American Landbird Conservation Plan. However, the Partners in Flight estimates include relatively large standard errors, and are not accurate enough to serve as reliable population indicators. The estimates used in the WEST report were designed for detecting long-term population trends but not for estimating population size.

As Dr. K. Shawn Smallwood, an ecologist who is one of the nation's leading experts on the interactions between wildlife and wind turbines, points out in a review of the WEST report, the estimates from Partners in Flight are "unsuitable for the use that Johnson and Erickson made of them."⁴ Other researchers have pointed out this flaw but WEST continues to rely on these unsuitable estimates.

Smallwood further writes: "No studies or monitoring programs have been designed or implemented in the US to document wind energy-related population declines of any bird species. Most fatality monitoring programs have been much too brief to document declines, lasting one or two years. All monitoring programs have been too crude to document declines, and the majority of post-construction studies have not been designed to estimate population size of any bird species. Therefore, Johnson and Erickson's statement about wind energy impacts was misleading."

3. The DEIS underestimates the impacts of wind projects on long-lived raptor species.

Research on wildlife-turbine interactions in the Pacific Northwest and elsewhere has focused almost exclusively on estimating mortality rates. Although studies dealing with

⁴ **Review of Cumulative Impacts Analysis of Wind Energy Expansion on the Columbia Plateau**, K. Shawn Smallwood, May 18, 2010.

impacts on rare and endangered species are scarce, there is growing evidence that wind projects increase the extinction probability of long-lived species through incremental increases in mortality rates. In other words, while wind turbines may kill a relatively small number of individual birds during any given year, for rare and endangered species this increase can quickly add up to population extinction. A recently published study found that even though wind projects may cause only slight reductions in the survival of birds living in an area associated with wind turbines, those reductions can strongly impact the population viability of long-lived species—and can greatly reduce the time to extinction for those species.⁵

That is the situation we are currently seeing in Klickitat County with species such as ferruginous hawks. Wind projects have already killed at least three ferruginous hawks locally, and there are very few of these animals remaining. There have been no studies in Skamania County, Klickitat County, or anywhere else in the Pacific Northwest to determine the long-term impact of wind projects. Such studies are necessary in order to determine the cumulative impacts of continued industrial wind energy development at the scale now being proposed for Klickitat County.

As mentioned above, wind projects pose a threat to long-lived raptors that are already rare or endangered. There are ways to mitigate this problem, as pointed out in the scientific study cited above: “Unlike other non-natural causes of mortality difficult to eradicate or control, wind-farm fatalities can be lowered by powering down or removing risky turbines and/or farms, and by placing them outside areas critical for endangered birds.”

The applicant has provided insufficient evidence to determine that the project will not have any impact on species viability. Currently, the Whistling Ridge proposal includes no provisions for temporary or permanent shutdowns of problem turbines, nor does it place turbines at a reasonable distance from important bird areas such as Spotted Owl Special Emphasis Areas. These provisions must be included to ensure that long-lived raptors and other species of concern are not driven to extinction locally.

In response to unavoidable impacts to wildlife, the applicant proposes “mitigations” including raptor nest surveys, post-construction monitoring studies, and the formation of a Technical Advisory Committee to oversee these activities. None of these actions qualify as mitigation measures. Mitigations are measures that remedy a problem. The applicant is merely proposing to study the problem, not to remedy it.

Mitigation cannot be left to a Technical Advisory Committee that is organized and overseen by the developer. I have served on several Technical Advisory Committees, and

⁵ **Large Scale Risk-Assessment of Wind-Farms on Population Viability of a Globally Endangered Long-Lived Raptor Species.** Martina Carrete, José A. Sánchez-Zapata, José R. Benítez, Manuel Lobón, and José A. Donázar in *Biological Conservation* 142:2954-2961, 2009.

while such committees may recommend mitigation measures they are not typically empowered to require implementation of any of these measures.

4. Pre-construction estimates of avian and bat fatalities have not proved reliable.

Although no scientists have done a thorough comparison of pre-construction and post-construction mortality estimates, there is plenty of anecdotal evidence that post-construction mortalities often greatly exceed pre-construction estimates made using the same methodology as has been employed for the Whistling Ridge wind project.

For example, the Environmental Impact Statement (EIS) prepared prior to adoption of the Energy Overlay Zone in Klickitat County grossly underestimated the level of wildlife fatalities likely to result from wind development. At all of the wind projects in Klickitat County where monitoring has been completed or is under way, reports prepared by wildlife consultants show that fatalities of raptors and bats are far in excess of what was anticipated by the EIS. Whistling Ridge is using the same consultants and methodology as Klickitat County for its pre-construction fatality estimates.

At Big Horn, the first large wind project built in Klickitat County, the developer's wildlife consultants did a full year of monitoring at 100 percent of the turbines, which makes this one of the most comprehensively monitored wind projects anywhere in the United States. The results of that monitoring study show that raptor fatalities are at least eight times higher than what the developer, PPM/Iberdrola, projected.⁶

An independent study of Big Horn's monitoring results written by Dr. Smallwood concluded that raptor fatalities are up to 16 times higher than predicted prior to construction.⁷ Big Horn also kills twice as many bats as anticipated, according to fatality monitoring reports. Monitoring studies at other wind projects in Klickitat County are not yet completed, but the preliminary results from those projects suggest even higher fatality rates.

The above-cited independent scientific analysis based on the results from Big Horn (the only project in Klickitat County where fatality monitoring has been completed) reported a conservative estimate of 243 raptor fatalities annually in Klickitat County. That estimate of 243 raptor fatalities is for a level of development that does not exceed 1,000 megawatts. At its current rate of wind development, Klickitat County is likely to reach a level of 2,000 megawatts or more within the next year or so. For raptors in Klickitat County, these numbers are rapidly approaching population-level impacts. "There is probably no other human source of mortality that comes close to these levels," writes Dr. Smallwood.

⁶ **Big Horn Wind Power Project Wildlife Fatality Monitoring Study 2006-2007.**

Prepared for PPM Energy and Big Horn Wind Project Technical Advisory Committee by Northwest Wildlife Consultants, Inc., 2008.

⁷ **Avian and Bat Mortality at the Big Horn Wind Energy Project, Klickitat County, Washington.** K. Shawn Smallwood, 2008.

5. The DEIS underestimates potential impacts on northern spotted owls and other avian species.

The proposed project falls within critical habitat for the northern spotted owl, a species that is not only endangered but has continued to decline since the adoption of the Washington Department of Natural Resources' Habitat Conservation Plan for the species. This species has continued to decline on federal lands, which makes the state's HCP more important than ever. There are only an estimated 500 northern spotted owl pairs remaining in all of Washington state.

Even as the state's Habitat Conservation Plan is failing miserably, the applicant is proposing to undermine that plan by allowing commercial-scale energy development within a Spotted Owl Special Emphasis Area. A commercial wind energy project is *not* appropriate for habitat that is designated as a nesting, roosting and foraging area for a federally endangered species.

In materials distributed to the public prior to the mid-June 2010 hearings, SDS Lumber writes: "After years of timber harvest, there's no suitable habitat for the bird." It is ironic that the applicant is pointing the finger at its own destructive timber practices to justify further risk to northern spotted owls.

Regardless of whether spotted owls are currently nesting on or near this property, as they did in recent history, this area is designated as prime potential habitat for the species. The fact that Washington's Habitat Conservation Plan for spotted owls is not increasing the numbers of reproductive pairs makes it all the more important to restore this species' habitat—not to damage it even further.

The Environmental Impact Statement commissioned by Klickitat County for its Energy Overlay Zone stated (on page 2-15 of the Final EIS) that "forested areas host higher concentrations of owl and other sensitive species habitats."⁸ The EIS recommended that areas with high concentrations of forested habitats be excluded from the Energy Overlay Zone because of their "higher potential for use by sensitive species and avian species likely to be impacted by wind turbines." This sensitive forested habitat is exactly what is being proposed for development at Whistling Ridge.

Spotted owls are not the only species likely to be significantly impacted by the proposal. Klickitat County's Energy Overlay EIS also found high use of forested habitats by other raptors. The SDS map for the proposed project shows ridge-top locations for turbines, and these are typically the worst possible locations from an avian perspective—i.e., likely to result in the highest number of bird collisions.

6. The DEIS fails to assess compliance with state and federal laws protecting bald eagles, golden eagles, migratory birds, and endangered species.

⁸ Klickitat County Energy Overlay Final Environmental Impact Statement, September 2004.

There are reports of bald eagles and bald eagle nests at the proposed wind site. Yet there is no evidence that the proposed project will be in compliance with the state's Bald Eagle Protection Act, RCW chapter 77.12, and regulations associated with this act.

Nor is there any evidence that the proposed project will be in compliance with the federal Bald and Golden Eagle Protection Act, 16 USC § 668-668(d). This act prohibits any person, association, partnership or corporation from taking a bald or golden eagle at any time or by any manner without a permit. A permit may be issued only if the take would be compatible with the preservation of the species.

There is no evidence in the DEIS that the proposed project will be in compliance with the federal Migratory Bird Treaty Act (MBTA), 16 USC §§ 703-712. The MBTA requires that the U.S. Fish & Wildlife Service take enforcement against "any person, association, partnership or corporation" that "by any means or in any manner" pursues, hunts, takes, captures, kills, or attempts to take, capture or kill a migratory bird or any part, nest or eggs of any migratory bird. Under the MBTA, a corporation may take or kill a migratory bird only if the U.S. Fish & Wildlife Service determines that the take or kill is compatible with migratory bird treaties. This determination must include an evaluation of the bird's species abundance and distribution, as well as its migratory and breeding habits. The killing of a single migratory bird is sufficient to create criminal liability, and does not need to be intentional.

There is no evidence in the DEIS that the proposed project will be in compliance with the federal Endangered Species Act (ESA) of 1973, 16 USC §§ 1531-1544. Under the ESA, "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Section 9 of the ESA prohibits any actions that would "take" an endangered species, as well as actions that would cause an act constituting a "take." The Ninth Circuit has held that "a habitat modification which significantly impairs the breeding and sheltering of a protected species amounts to 'harm' under the ESA.

It seems quite possible that the proposed Whistling Ridge wind project may kill a bald eagle, a migratory bird, or an endangered species. The DEIS must evaluate the likelihood of each of these possibilities, and whether Incidental Take Permits are required from the U.S. Fish & Wildlife Service. A recent court ruling in West Virginia has made it clear that such permits are required under federal law when a wind project is likely to kill any individual animals protected by the Endangered Species Act.

7. The DEIS erred in its analysis of the regional need for new sources of renewable energy.

The DEIS cites the Draft Sixth Northwest Power Plan released in September 2009 by the Northwest Power and Conservation Council. What the DEIS fails to quantify is that this 20-year energy plan for our region concluded that, although population and energy demands will continue to grow in the Pacific Northwest, we can meet 80 percent of expected future energy demands through conservation efforts and improved energy

efficiency. Conservation efforts not only have less environmental impact than building new energy sources, they are also considerably less expensive.

Only about 20 percent of future needs must come from new sources of energy, according to the Council. And shown above, with 40 wind projects already constructed or proposed for this region, there are plenty of new sources to meet these needs. There is no demonstrated need for Whistling Ridge.

The dirty little secret of wind power in the Columbia Plateau Ecoregion is that most of the electricity being generated here by wind turbines is not needed or used in the Pacific Northwest. Instead it is sold to utilities in California. There is *regional* need for new power sources; there is simply a *California* demand for electricity generated in Washington and Oregon.

On page 3-91 of the DEIS, the applicant claims that the Klickitat County Energy Overlay Zone Final EIS “recently evaluated the projected energy demand in Klickitat County, Washington, the county immediately adjacent to Skamania County.” (In fact, this evaluation is already more than six years old). The DEIS then mentions the EIS projection that “four wind power projects with total generating capacity of 1,000 MW” will be developed in Klickitat County by 2024.

In fact, Klickitat County has already approved more than a dozen projects, with a total generating capacity of almost 2,000 megawatts. Rather than suggesting that more energy is needed regionally, this rapid development of wind power in Klickitat County indicates that more than enough wind power is already under development to meet the region’s energy needs.

8. The DEIS fails to estimate the direct and cumulative impacts of this project on the Northwest power grid.

The breaktaking pace of wind development along the Columbia River has created serious challenges for BPA and the regional energy grid. There are limits to the amount of wind power that can be integrated into the grid, and we are already at or near these limits. BPA has expressed concerns about how it can integrate more than 6,000 megawatts of wind power into the grid, yet the DEIS fails to analyze these constraints and how they will be affected by the construction of yet another wind project.

Adding more wind power capacity to the grid requires not only new transmission lines but also new storage capability, because wind is an intermittent power source. Typically wind projects operate at only about 30 percent of their total generating capacity, which means that 70 percent of the time a backup power source must be available.

The DEIS has failed to analyze the environmental impacts of the proposed backup power source for Whistling Ridge. For example, if hydropower will be the backup, the DEIS must consider the indirect impacts of this project on fish, irrigation, navigation and other drawdown impacts.

If backup power will be provided by a natural-gas-fired power plant, the impacts of that power plant should be considered along with the impacts of the wind project. Williams is proposing a new gas line for the Whistling Ridge area, and the substation and transmission inter-tie lines proposed for the Whistling Ridge area could signal the advent of additional power plants in the area. These must be evaluated along with impacts of the infrastructure currently being proposed.

A recent study in Colorado found that wind power's supposed carbon emissions benefits are not being realized, because of the requirement for conventionally-generated backup power.⁹ Because all coal-fired power plants and some natural-gas-fired power plants produce greater emissions when they act as backup systems for wind power, thanks to inefficiencies associated with cycling on and off, the benefits of wind power in reducing carbon emissions are reduced.

Contrary to what the DEIS states, there is no evidence that the Whistling Ridge project will have a beneficial impact on air quality in the Columbia Gorge vicinity. No fossil-fuel-fired projects will be taken offline as a result. In fact, backup power from fossil-fuel-fired projects may be required for those times when the wind is not blowing.

Thank you for the opportunity to comment on this project.

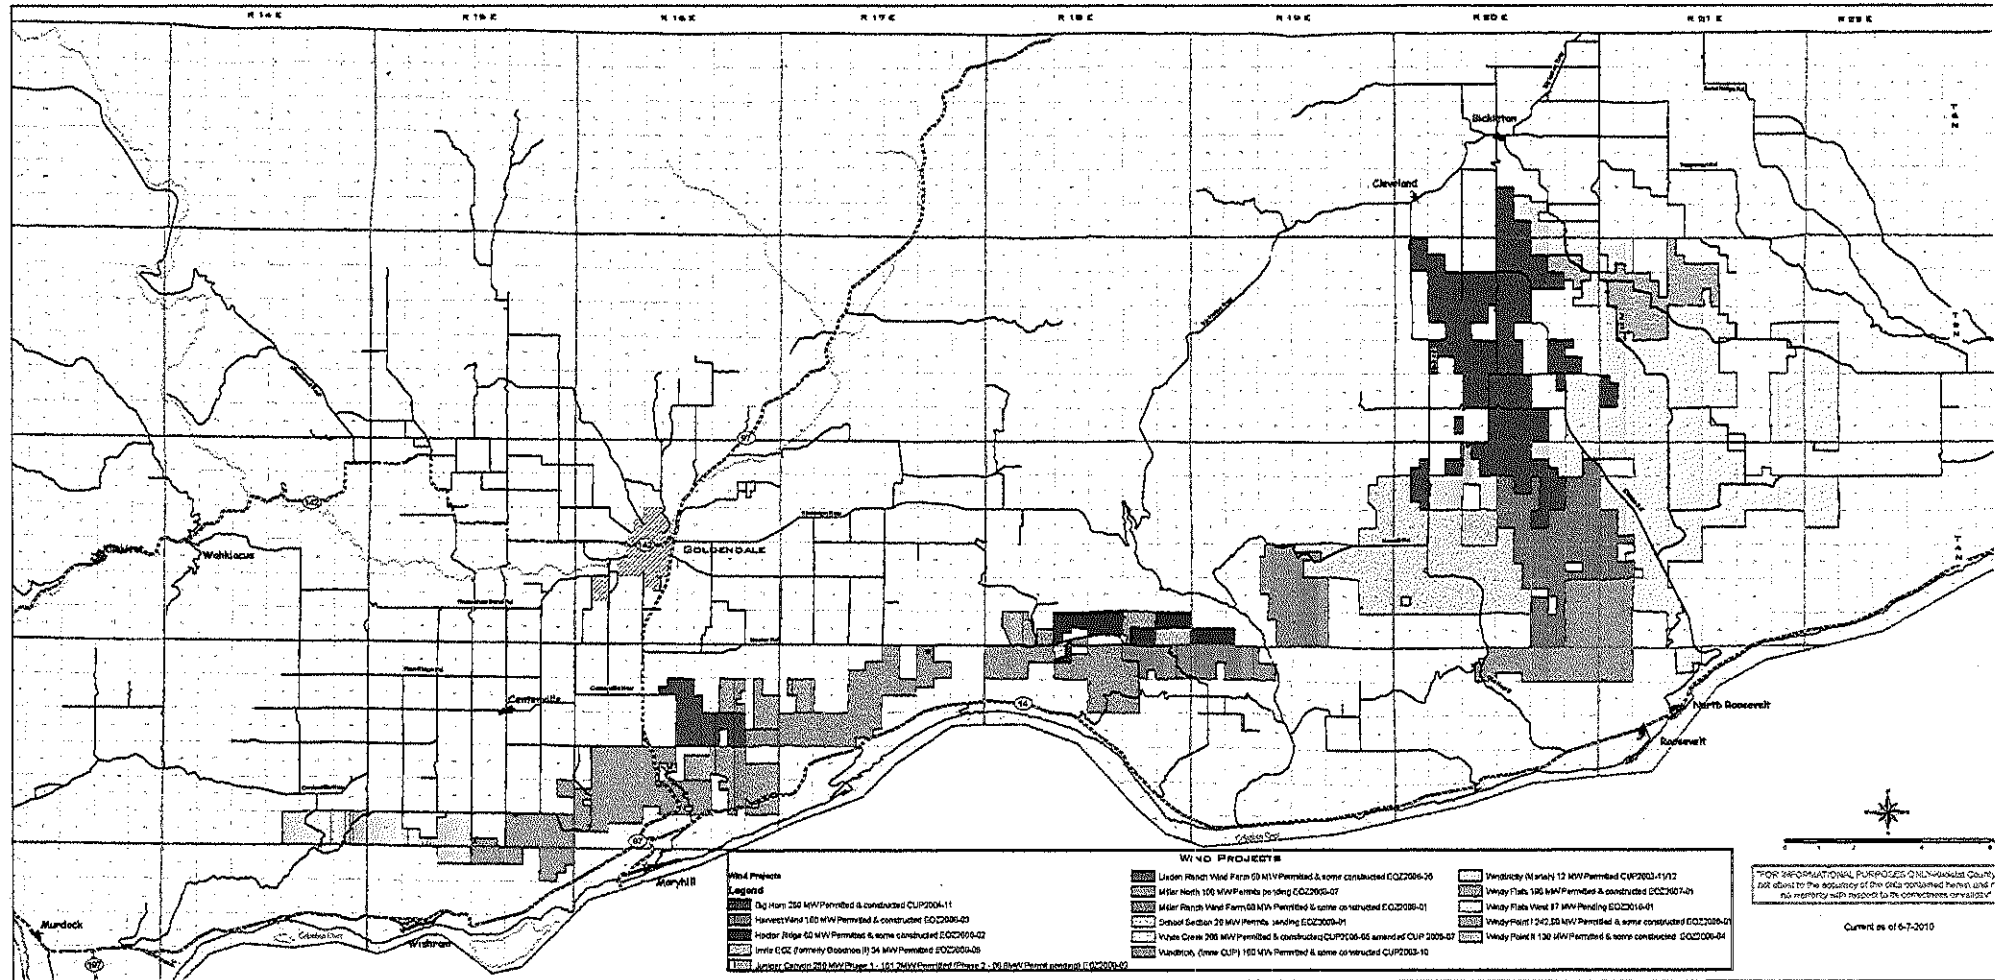

Sincerely,

Dawn Stover

To Whom It May Concern:

I am writing to comment on the Whistling Ridge Energy Project Draft Environmental Impact Statement (DEIS). Please include my comments in the public record, and include my name on the mailing list for all future notices and decisions.

I have lived in the area of this proposed project for 18 years and have followed wind energy developments closely for most of that time, both here in the Columbia Gorge and nationally. I serve as an environmental representative on the technical advisory committees of three wind power projects in the area. I have participated in field visits to wind projects all over the West. I have a degree in biology and have read a great deal of the scientific literature pertaining to wildlife-turbine interactions. As someone who is well informed about both wind power and ecology, I have a number of concerns regarding the DEIS prepared for the Whistling Ridge Energy Project.

1. The evaluation of cumulative impacts is inadequate.

Under SEPA, EFSEC is required to consider whether multiple incremental impacts when considered together may cumulatively result in a significant adverse impact. WAC 197-11-792(2)(c)(iii). Unfortunately, the cumulative impacts analysis done for the Whistling Ridge DEIS only considered the impacts of 10 existing wind projects and three proposed wind projects. In fact, there are at least 15 major wind projects constructed or proposed in Klickitat County alone, and more than 45 major wind projects constructed or proposed along the Columbia River east of Whistling Ridge.

The pace and scale of wind turbine construction in this region has been unprecedented. Only five years ago, an EIS prepared by Klickitat County (which lies immediately to the north and east of the Whistling Ridge site) predicted the construction of four major wind projects, with a total installed capacity of 1,000 megawatts, over a 20-year period. In actuality, 10 major wind projects with a total installed capacity of more than 1,100 megawatts have already been constructed in Klickitat County, and permits are pending for another 500 megawatts. In other words, Klickitat County has seen twice as much wind development in five years as was predicted for 20 years.

Besides the many projects in Klickitat County, the BPA's interconnection queue shows approximately 35 additional projects in other nearby counties that are either permitted or awaiting permits. Other projects are proposed but not yet shown in the BPA queue. From Whistling Ridge to Walla Walla, wind developers are erecting (or proposing to erect) strings of turbines that stretch for more than 100 miles along the ridges on both sides of the Columbia River.¹

In Klickitat County, almost every inch of ridge-top land above the Columbia from Dallesport eastward is already under lease to wind developers.² Additional projects are proposed but not yet shown on this map because permit applications have not been filed.

The environmental impacts analysis for Whistling Ridge must consider the regional impacts of more than 40 major projects within the Columbia Plateau ecoregion. The scale and sprawl of this wind development has significant cumulative impacts on wildlife, habitat, scenic values and other natural resources.

The notion that projects in eastern Klickitat County are "too far away...to result in cumulative impacts" is mistaken. Many birds and bats travel long distances during migration, foraging, and other components of their life cycle. Also, genetic exchanges between individuals of any given species are essential for maintaining population viability.

More important, the notion that projects are too far away to have cumulative impacts is mistaken because significant adverse impacts typically occur at the population level, rather than at the level of individual animals affected by a particular wind project. While different wind projects may affect different individuals, the cumulative effect of combined mortalities at many contiguous sites can be population-level impacts—and perhaps even local extinctions over time.

The DEIS erred in relying on a cumulative impacts analysis published in 2007 for the Mid-Atlantic Highlands. Not only is the Mid-Atlantic region completely different from the Whistling Ridge site in habitat and species composition, but the 2007 study was published before the pace of wind development began to rapidly accelerate. It is inappropriate to base any cumulative impacts analysis for Whistling Ridge on a study done under very different circumstances and in a very different place.

It is also inappropriate to dismiss the cumulative impacts of wind turbines on wildlife because of other man-made effects such as mortalities from buildings and cats. These mortalities don't necessarily affect the same species as wind turbines do: For example, cats do not kill golden eagles, and skyscrapers do not kill species that make their homes

¹ **Current and Proposed Wind Project Interconnections to BPA Transmission Facilities**, Bonneville Power Administration, last updated May 10, 2010, http://www.transmission.bpa.gov/PlanProj/Wind/documents/BPA_wind_map_2010.pdf

² **Klickitat County Wind Projects**, Klickitat County, last updated June 7, 2010, <http://klickitatcounty.org/Planning/default.asp?fCategoryIDSelected=1258566697>

in remote rural areas. More important, these man-made impacts do not justify placing additional pressures on sensitive bird and bat populations from new man-made structures in more remote areas where wind projects may be the leading source of avian and bat fatalities. They merely illustrate the importance of minimizing any additional mortalities caused by wind projects. Two wrongs do not make a right.

The DEIS provides no evidence to substantiate the applicant's assertion that the proposed Whistling Ridge wind project will not cause mortality to birds and bats in sufficient quantities to affect population viability. The analysis does not include any reasonable estimates of current population levels of sensitive species, nor of the threshold population levels required to maintain viability.

2. The DEIS fails to address the potential expansion of the Whistling Ridge project onto Washington Department of Natural Resources public lands in Klickitat County.

The applicant has previously indicated plans to expand the project into Klickitat County, and applied for a lease from DNR to do so. These plans should be evaluated as part of this project, rather than piecemealed for later consideration.

3. The WEST report prepared for the Klickitat County Planning Department is not applicable to the proposed Whistling Ridge Energy Project, and cannot be relied upon to evaluate cumulative impacts.

The report prepared by Western EcoSystems Technology, Inc. (WEST) purports to be a cumulative impacts analysis for Klickitat County.³ Unfortunately, this report sheds little light on the cumulative impacts of wind power development on wildlife in Klickitat County, and it is even less relevant to a project proposed for Skamania County.

As the WEST report's title suggests, the Columbia Plateau Ecoregion is located in eastern Washington and Oregon, which have completely different plant and animal communities than the western Washington site proposed for the Whistling Ridge wind project. All of the projects evaluated in the WEST report are located in arid and un-forested lands, whereas Whistling Ridge is located in a coniferous forest that receives much more precipitation and has a much different plant and animal population. Impacts of wind projects on birds and bats are extremely site-specific, and because of that the WEST study has little applicability to the Whistling Ridge proposal. It is no more applicable than studies from the Altamont Pass Wind Resources Area in California, where significant population-level impacts on birds have been documented; or from the forested

³ **Avian, Bat and Habitat Cumulative Impacts Associated with Wind Energy Development in the Columbia Plateau Ecoregion of Eastern Washington and Oregon**, Prepared for Klickitat County Planning Department by Gregory D. Johnson and Wallace P. Erickson, Western EcoSystems Technology, Inc., February 2010

Mountaineer wind project in Appalachia, where significant population-level impacts on bats have been documented.

The WEST report contains fatality monitoring data from 12 projects around the Columbia Plateau Ecoregion. Only *one* of those projects, Big Horn, is actually located in Klickitat County—and the results from Big Horn show much higher raptor fatality rates than anywhere else in the Pacific Northwest. In other words, the WEST report underestimates the impacts of wind projects in Klickitat County by merging the Big Horn data with results from less lethal projects elsewhere in the region.

The WEST report also looked at 24 projects in the Pacific Northwest for which pre-construction estimates of avian use are available. Here too, the results from Klickitat County show a much higher likelihood of avian impacts than elsewhere in the region. Of the 24 projects evaluated in the report, the seven projects located in Klickitat County had much higher estimated use by both raptors and by birds of all types. For example, the highest raptor use estimated anywhere in our region is at the Linden Ranch in Klickitat County. Raptor use there is estimated to be 2.5 times the average for the Columbia Plateau ecoregion.

In other words, the WEST report does *not* give an accurate picture of cumulative impacts from expanding wind power here in Klickitat County, much less any indications of cumulative impacts to be expected in Skamania County. To the contrary, the WEST report uses data from projects in other parts of Oregon and eastern Washington to underestimate how many birds—especially raptors—are likely to be killed here.

The WEST report has another fundamental flaw. To arrive at a prediction of cumulative fatalities, the report's authors averaged existing fatalities in the region and then compared those averages with estimates of regional population size based on breeding bird surveys provided by the Partners in Flight North American Landbird Conservation Plan. However, the Partners in Flight estimates include relatively large standard errors, and are not accurate enough to serve as reliable population indicators. The estimates used in the WEST report were designed for detecting long-term population trends but not for estimating population size.

As Dr. K. Shawn Smallwood, an ecologist who is one of the nation's leading experts on the interactions between wildlife and wind turbines, points out in a review of the WEST report, the estimates from Partners in Flight are "unsuitable for the use that Johnson and Erickson made of them."⁴ Other researchers have pointed out this flaw but WEST continues to rely on these unsuitable estimates.

Smallwood further writes: "No studies or monitoring programs have been designed or implemented in the US to document wind energy-related population declines of any bird species. Most fatality monitoring programs have been much too brief to document

⁴ **Review of Cumulative Impacts Analysis of Wind Energy Expansion on the Columbia Plateau**, K. Shawn Smallwood, May 18, 2010.

declines, lasting one or two years. All monitoring programs have been too crude to document declines, and the majority of post-construction studies have not been designed to estimate population size of any bird species. Therefore, Johnson and Erickson's statement about wind energy impacts was misleading."

There is no peer-reviewed science in the DEIS submitted by the applicant. Instead the applicant relies on WEST, a wind industry contractor whose work has not been independently reviewed.

4. The DEIS underestimates the impacts of wind projects on long-lived raptor species.

Research on wildlife-turbine interactions in the Pacific Northwest and elsewhere has focused almost exclusively on estimating mortality rates. Although studies dealing with impacts on rare and endangered species are scarce, there is growing evidence that wind projects increase the extinction probability of long-lived species through incremental increases in mortality rates. In other words, while wind turbines may kill a relatively small number of individual birds during any given year, for rare and endangered species this increase can quickly add up to population extinction. A recently published study found that even though wind projects may cause only slight reductions in the survival of birds living in an area associated with wind turbines, those reductions can strongly impact the population viability of long-lived species—and can greatly reduce the time to extinction for those species.⁵

That is the situation we are currently seeing in Klickitat County with species such as ferruginous hawks. Wind projects have already killed at least three ferruginous hawks locally, and there are very few of these animals remaining. There have been no studies in Skamania County, Klickitat County, or anywhere else in the Pacific Northwest to determine the long-term impact of wind projects. Such studies are necessary in order to determine the cumulative impacts of continued industrial wind energy development at the scale now being proposed for Klickitat County.

As mentioned above, wind projects pose a threat to long-lived raptors that are already rare or endangered. There are ways to mitigate this problem, as pointed out in the scientific study cited above: "Unlike other non-natural causes of mortality difficult to eradicate or control, wind-farm fatalities can be lowered by powering down or removing risky turbines and/or farms, and by placing them outside areas critical for endangered birds."

⁵ **Large Scale Risk-Assessment of Wind-Farms on Population Viability of a Globally Endangered Long-Lived Raptor Species.** Martina Carrete, José A. Sánchez-Zapata, José R. Benítez, Manuel Lobón, and José A. Donázar in *Biological Conservation* 142:2954-2961, 2009.

The applicant claims there will be no population-level impacts on any species but has provided insufficient evidence to support this assertion. Currently, the Whistling Ridge proposal includes no provisions for temporary or permanent shutdowns of problem turbines, nor does it place turbines at a reasonable distance from important bird areas such as Spotted Owl Special Emphasis Areas. These provisions must be included to ensure that long-lived raptors and other species of concern are not driven to extinction locally.

In response to unavoidable impacts to wildlife, the applicant proposes “mitigations” including raptor nest surveys, post-construction monitoring studies, and the formation of a Technical Advisory Committee to oversee these activities. None of these actions qualify as mitigation measures. Mitigations are measures that remedy a problem. The applicant is merely proposing to study the problem, not to remedy it.

Mitigation cannot be left to a Technical Advisory Committee that is organized and overseen by the developer. I have served on several Technical Advisory Committees, and while such committees may recommend mitigation measures they are not typically empowered to require implementation of any of these measures.

5. Pre-construction estimates of avian and bat fatalities have not proved reliable.

Although no scientists have done a thorough comparison of pre-construction and post-construction mortality estimates, there is plenty of anecdotal evidence that post-construction mortalities often greatly exceed pre-construction estimates made using the same methodology as has been employed for the Whistling Ridge wind project.

For example, the Environmental Impact Statement (EIS) prepared prior to adoption of the Energy Overlay Zone in Klickitat County grossly underestimated the level of wildlife fatalities likely to result from wind development. At all of the wind projects in Klickitat County where monitoring has been completed or is under way, reports prepared by wildlife consultants show that fatalities of raptors and bats are far in excess of what was anticipated by the EIS. Whistling Ridge is using the same consultants and methodology as Klickitat County for its pre-construction fatality estimates.

At Big Horn, the first large wind project built in Klickitat County, the developer’s wildlife consultants did a full year of monitoring at 100 percent of the turbines, which makes this one of the most comprehensively monitored wind projects anywhere in the United States. The results of that monitoring study show that raptor fatalities are at least eight times higher than what the developer, PPM/Iberdrola, projected.⁶

An independent study of Big Horn’s monitoring results written by Dr. Smallwood concluded that raptor fatalities are up to 16 times higher than predicted prior to

⁶ **Big Horn Wind Power Project Wildlife Fatality Monitoring Study 2006-2007.** Prepared for PPM Energy and Big Horn Wind Project Technical Advisory Committee by Northwest Wildlife Consultants, Inc., 2008.

construction.⁷ Big Horn also kills twice as many bats as anticipated, according to fatality monitoring reports. Monitoring studies at other wind projects in Klickitat County are not yet completed, but the preliminary results from those projects suggest even higher fatality rates.

The above-cited independent scientific analysis based on the results from Big Horn (the first of only two projects in Klickitat County where fatality monitoring has been completed) reported a conservative estimate of 243 raptor fatalities annually in Klickitat County. That estimate of 243 raptor fatalities is for a level of development that does not exceed 1,000 megawatts. At its current rate of wind development, Klickitat County is likely to reach a level of 2,000 megawatts or more within the next year or so. For raptors in Klickitat County, these numbers are rapidly approaching population-level impacts. “There is probably no other human source of mortality that comes close to these levels,” writes Dr. Smallwood.

At the second project in Klickitat County where monitoring has been completed, Goodnoe, the results are similar.⁸ The final monitoring report for Goodnoe calculated fatalities of 0.34 raptors per year per turbine, or 0.17 raptors per megawatt per turbine, or 16 fatalities per year for the project. Only one project reviewed in the WEST report had a higher raptor fatality rate than the one found for Goodnoe. The Goodnoe project is killing far more raptors than predicted by pre-construction surveys.

6. The DEIS underestimates potential impacts on northern spotted owls and other avian species.

The proposed project falls within critical habitat for the northern spotted owl, a species that is not only endangered but has continued to decline since the adoption of the Washington Department of Natural Resources’ Habitat Conservation Plan for the species. This species has continued to decline on federal lands, which makes the state’s HCP more important than ever. There are only an estimated 500 northern spotted owl pairs remaining in all of Washington state.

Even as the state’s Habitat Conservation Plan is failing miserably, the applicant is proposing to undermine that plan by allowing commercial-scale energy development within a Spotted Owl Special Emphasis Area. A commercial wind energy project is *not* appropriate for habitat that is designated as a nesting, roosting and foraging area for a federally endangered species.

In materials distributed to the public prior to the mid-June 2010 hearings, SDS Lumber writes: “After years of timber harvest, there’s no suitable habitat for the bird.” It is ironic that

⁷ **Avian and Bat Mortality at the Big Horn Wind Energy Project, Klickitat County, Washington.** K. Shawn Smallwood, 2008.

⁸ **Goodnoe Hills Wind Project Avian Mortality Monitoring Report,** Prepared for PacifiCorp by URS Corporation, March 16, 2010.

the applicant is pointing the finger at its own destructive timber practices to justify further risk to northern spotted owls.

Regardless of whether spotted owls are currently nesting on or near this property, as they did in recent history, this area is designated as prime potential habitat for the species. The fact that Washington's Habitat Conservation Plan for spotted owls is not increasing the numbers of reproductive pairs makes it all the more important to restore this species' habitat—not to damage it even further.

The Environmental Impact Statement commissioned by Klickitat County for its Energy Overlay Zone stated (on page 2-15 of the Final EIS) that “forested areas host higher concentrations of owl and other sensitive species habitats.”⁹ The EIS recommended that areas with high concentrations of forested habitats be excluded from the Energy Overlay Zone because of their “higher potential for use by sensitive species and avian species likely to be impacted by wind turbines.” This sensitive forested habitat is exactly what is being proposed for development at Whistling Ridge.

Spotted owls are not the only species likely to be significantly impacted by the proposal. Klickitat County's Energy Overlay EIS also found high use of forested habitats by other raptors. The SDS map for the proposed project shows ridge-top locations for turbines, and these are typically the worst possible locations from an avian perspective—i.e., likely to result in the highest number of bird collisions.

7. The DEIS fails to assess compliance with state and federal laws protecting bald eagles, golden eagles, migratory birds, and endangered species.

There are reports of bald eagles and bald eagle nests at the proposed wind site. Yet there is no evidence that the proposed project will be in compliance with the state's Bald Eagle Protection Act, RCW chapter 77.12, and regulations associated with this act.

Nor is there any evidence that the proposed project will be in compliance with the federal Bald and Golden Eagle Protection Act, 16 USC § 668-668(d). This act prohibits any person, association, partnership or corporation from taking a bald or golden eagle at any time or by any manner without a permit. A permit may be issued only if the take would be compatible with the preservation of the species.

There is no evidence in the DEIS that the proposed project will be in compliance with the federal Migratory Bird Treaty Act (MBTA), 16 USC §§ 703-712. The MBTA requires that the U.S. Fish & Wildlife Service take enforcement against “any person, association, partnership or corporation” that “by any means or in any manner” pursues, hunts, takes, captures, kills, or attempts to take, capture or kill a migratory bird or any part, nest or eggs of any migratory bird. Under the MBTA, a corporation may take or kill a migratory bird only if the U.S. Fish & Wildlife Service determines that the take or kill is compatible with migratory

⁹ **Klickitat County Energy Overlay Final Environmental Impact Statement**, September 2004.

bird treaties. This determination must include an evaluation of the bird's species abundance and distribution, as well as its migratory and breeding habits. The killing of a single migratory bird is sufficient to create criminal liability, and does not need to be intentional.

There is no evidence in the DEIS that the proposed project will be in compliance with the federal Endangered Species Act (ESA) of 1973, 16 USC §§ 1531-1544. Under the ESA, "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Section 9 of the ESA prohibits any actions that would "take" an endangered species, as well as actions that would cause an act constituting a "take." The Ninth Circuit has held that "a habitat modification which significantly impairs the breeding and sheltering of a protected species amounts to 'harm' under the ESA.

It seems quite possible that the proposed Whistling Ridge wind project may kill a bald eagle, a migratory bird, or an endangered species. The DEIS must evaluate the likelihood of each of these possibilities, and whether Incidental Take Permits are required from the U.S. Fish & Wildlife Service. A recent court ruling in West Virginia has made it clear that such permits are required under federal law when a wind project is likely to kill any individual animals protected by the Endangered Species Act.

8. The DEIS erred in its analysis of the regional need for new sources of renewable energy.

The DEIS cites the Draft Sixth Northwest Power Plan released in September 2009 by the Northwest Power and Conservation Council. What the DEIS fails to quantify is that this 20-year energy plan for our region concluded that, although population and energy demands will continue to grow in the Pacific Northwest, we can meet more than 80 percent of expected future energy demands through conservation efforts and improved energy efficiency. Conservation efforts not only have less environmental impact than building new energy sources, they are also considerably less expensive.

Less than 20 percent of future needs must come from new sources of energy, according to the Council. And shown above, with 40 wind projects already constructed or proposed for this region, there are plenty of new sources to meet these needs. There is no demonstrated need for Whistling Ridge.

The dirty little secret of wind power in the Columbia Plateau Ecoregion is that most of the electricity being generated here by wind turbines is not needed or used in the Pacific Northwest. Instead it is sold to utilities in California. There is no *regional* need for new power sources; there is simply a *California* demand for electricity generated in Washington and Oregon.

On page 3-91 of the DEIS, the applicant claims that the Klickitat County Energy Overlay Zone Final EIS "recently evaluated the projected energy demand in Klickitat County, Washington, the county immediately adjacent to Skamania County." (In fact, this evaluation is already more than six years old). The DEIS then mentions the EIS

projection that “four wind power projects with total generating capacity of 1,000 MW” will be developed in Klickitat County by 2024.

In fact, Klickitat County has already approved more than a dozen projects, with a total generating capacity of almost 2,000 megawatts. Rather than suggesting that more energy is needed regionally, this rapid development of wind power in Klickitat County indicates that more than enough wind power is already under development to meet the region’s energy needs.

Existing wind projects in this region are already producing so much surplus power that there are times when these projects must be turned off to protect the regional grid. For example, see these recent articles on the surpluses in the Columbia River corridor:
<http://green.blogs.nytimes.com/2010/07/07/sudden-surplus-calls-for-quick-thinking/>
http://www.oregonlive.com/business/index.ssf/2010/06/swollen_columbia_river_churns.html

9. The DEIS fails to estimate the direct and cumulative impacts of this project on the Northwest power grid.

The breaktaking pace of wind development along the Columbia River has created serious challenges for BPA and the regional energy grid. There are limits to the amount of wind power that can be integrated into the grid, and we are already at or near these limits. BPA has expressed concerns about how it can integrate more than 6,000 megawatts of wind power into the grid, yet the DEIS fails to analyze these constraints and how they will be affected by the construction of yet another wind project.

Adding more wind power capacity to the grid requires not only new transmission lines but also new storage capability, because wind is an intermittent power source. Typically wind projects operate at only about 30 percent of their total generating capacity, which means that 70 percent of the time a backup power source must be available.

The DEIS has failed to analyze the environmental impacts of the proposed backup power source for Whistling Ridge. For example, if hydropower will be the backup, the DEIS must consider the indirect impacts of this project on fish, irrigation, navigation and other drawdown impacts.

The applicant has hinted at possible plans to construct a natural-gas-fired power plant, perhaps as a backup power source for when the wind is not blowing at Whistling Ridge. The applicant should be required to disclose those plans now, so that the impacts of a natural-gas-fired power plant can be considered along with the impacts of the wind project.

Also, Williams is proposing a new gas line for the Whistling Ridge area, and the substation and transmission inter-tie lines proposed for the Whistling Ridge area could

signal the advent of additional power plants in the area. These must be evaluated along with impacts of the infrastructure currently being proposed.

A recent study in Colorado found that wind power's supposed carbon emissions benefits are not being realized, because of the requirement for conventionally-generated backup power.¹⁰ Because all coal-fired power plants and some natural-gas-fired power plants produce greater emissions when they act as backup systems for wind power, thanks to inefficiencies associated with cycling on and off, the benefits of wind power in reducing carbon emissions are reduced.

Contrary to what the DEIS states, there is no evidence that the Whistling Ridge project will have a beneficial impact on air quality in the Columbia Gorge vicinity. No fossil-fuel-fired projects will be taken offline as a result. In fact, backup power from fossil-fuel-fired projects may be required for those times when the wind is not blowing.

10. The DEIS failed to evaluate the potential health effects of wind turbines on local residents.

There is ample evidence that low-frequency noises, shadow flicker, and nighttime lighting associated with wind turbines can be injurious to the physical and mental health of people living in the vicinity of turbines.¹¹ While many or even most people might not find noises, lights or flickers annoying or even noticeable, they can be severe—and in some cases life-changing—for a minority of the population. Regardless of whether these impacts affect everyone, they can affect some people, and must be evaluated in that light.

11. The DEIS failed to evaluate alternatives to the proposal.

SEPA and NEPA require consideration of alternatives. The applicant owns tens of thousands of acres of land, including other sites that would be more appropriate for wind power development than Whistling Ridge. The DEIS must evaluate potential alternatives, including alternative sites as well as alternative turbine layout configurations.

12. The DEIS overwhelms the public with quantity but not quality.

I am grateful for the extended comment period. Nevertheless, it is not reasonable to expect members of the general public to be able to digest and respond intelligently within just a few weeks to a record that is thousands of pages long and years in the making.

Despite this huge volume of material, there is very little scientific literature cited in the DEIS, and even less that is peer-reviewed science. The applicant has cherry-picked a few

¹⁰ **How Less Became More...Wind, Power and Unintended Consequences in the Colorado Energy Market**, Prepared by Bentek Energy LLC for the Independent Petroleum Association of Mountain States, April 16, 2010.

statistics and extrapolations from industry-sponsored reports and ignored the independent science and actual mortality studies that suggest major cumulative impacts are likely for wildlife given the pace and scope of wind power development in this region.

Thank you for the opportunity to comment on this project.

Sincerely,

Dawn Stover

To BPA Public Affairs
Office,

June 16, 2010

I, Robert P. Duncan and my wife Jacqueline B. Duncan are in favor of the wind farm in Skamania county. We have traveled the mountains of Italy, Spain, and California and found no ill effects of the view or the esoteric feeling of the mountains. Besides the jobs and revenue that it will generate, the project improves fire access roads in the farm areas making it safer and easier for our firemen in case of a major fire. It also decreases the carbon footprint that a coal fired plant would use to produce 75 MW of power which our growing population state needs.

We are sorry we cannot attend and let our voices be heard.

Thank You
R.P. Duncan and J.B. Duncan

I am a resident of the community of Mill A in Skamania County, Washington - having moved to this community in 1976 and lived here since then (except for 5 years while teaching at Pepperdine University in California -- now retired from teaching). My home is located just west of the proposed Whistling Ridge Energy Project.

I appreciate what Broughton Lumber Company and its parent SDS Lumber Company have done for many of our communities here in Skamania County over many years, and I consider the Whistling Ridge Energy Project to be yet another way that SDS will be of great benefit to the citizens in our area -- furnishing much-needed jobs and boosting our local economy, and also beneficial to our entire country in their effort to help provide more electricity for all of us.

Wind-generators are an excellent method of energy production and will do much to help our country decrease our dependence on foreign oil. They are clean, efficient, and are even better than "renewable" since they do not consume anything (no wood, coal, etc.) I strongly support the Whistling Ridge Energy Project, and I encourage EFSEC and BPA to approve it.

Sincerely,

Lee Rogers

Dear Council Members,

I am a native Oregonian and my father was a native Oregonian logger and logging road builder. I now live in Lyle, WA in the Columbia Gorge. Although I am supportive of alternate energy, I am more supportive of keeping the gorge as pristine as possible. When I saw the before and after photos that SDS had in their brochure I couldn't believe they thought these photos would incline people toward their position. It is obvious to me that the wind towers would be eyesores.

We recently went to Yellowstone Park. As we drove through I thanked the people of vision who created and preserved the park's naturalness.

We must do the same for what's left of the natural beauty of the gorge.

My husband is a consultant in the lumber industry and we understand the difficulties the industry is having at this time. But the economic success of the few cannot be the only impetus to allow this project.

There is only one Columbia Gorge, we cannot allow its beauty to be compromised.

I am unable to attend either of the meetings, but I would like to register my opposition to this project.

Thank you,
Liz Kingslien

Subject: Governor Gregoire must ALLOW Whistling Ridge

Categories: Yellow Category

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause NO significant negative impacts to sensitive wildlife and plant habitat and would not degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire ACCEPT this project.

This proposal NOT is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along an actively forested ridgeline in the foothills of the Cascade Mountains. The project would enhance the use of the land and result in direct and indirect positive impacts to our economy. Collisions with turbine blades are a minor concern compared to the impacts of fossil generation.

Siting Columbia River Gorge would not degrade the scenic value of the Gorge. The turbines and their blinking lights may be slightly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point; however they are not within the scenic area itself. The project is a compliment to the ongoing sustainable foresting operations.

Furthermore, the useful life of turbines is expected to be 20 - 25 years. At which point a decommissioning and dismantling would effectively render their impact entirely unnoticeable.

We have a short time in to impact our dire global situation, and we must REPLACE other HARMFUL POLLUTING means of producing energy.

I support renewable energy, adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure. The rules governing the scenic area should not creep into managing surrounding areas.

John Chaimanis

Gentlemen:

I want to take a few minutes to register my support for the subject project as proposed by SDS Lumber Company.

Although I occasionally drive-by the SDS mill in Bingen, I am not and have never been connected with SDS in any way whatsoever: not as an employee, contractor, supplier, by marriage, friendship or in any other fashion.

Neither do I stand to gain or profit in any way by SDS's development of the proposed wind energy project.

There can be no conceivable, legitimate reason for this project not to be given your support and authorization to move forward as soon as possible. I very much hope that final approval will be forthcoming.

Sincerely,
Kenneth E Shetterly

While I am a supporter of renewable energy, all the environmental choices we make need to be careful ones, considering all impacts. The Whistling Ridge Energy Project, along the Skamania and Klickitat county line is a mix of positive and negative impacts - the negative effects on wildlife and on the environmental well-being of the Gorge outweigh the benefits. I am aware that the potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk. I sincerely hope the decision-makers involved will listen to reason and choose alternatives, preserving what undisturbed areas we have left!

Thank you.

EFSEC:

I am writing to express my support of the Whistling Ridge Energy Project plans. I am a long-time resident of Skamania County and have watched as residents struggled through economic hard times for many, many years, whether related to timber, owls, or tourism. Other Gorge counties are benefiting from the Gorge's abundant wind supply and, as an opponent of nuclear power and also a salmon recovery advocate, I very much favor the clean energy wind farms provide. I have read that agriculture and wind farming are actually quite compatible land uses, and I also think that, with appropriate planning, a fully operational wind farm could serve as an educational tourist attraction as we move toward sustainable alternative energy sources. This particular project does not significantly impact the natural beauty or public enjoyment of this scenic wonderland as many other proposals have and offers Skamania County a long-overdue boost.

Thank you for considering my comments.

I am writing in support of the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project WILL NOT cause negative impacts to sensitive wildlife. As proposed, this project will not degrade the scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire APPROVE this project.

The project would cause minimal or NO disturbance to areas of forested habitat.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would help power the values of the Gorge. The turbines may even be visible from some viewing areas within the National Scenic Area. The project would introduce industrial development into the natural, forested landscape and ENHANCE views in the National Scenic Area.

I support renewable energy and I am in favor of industrial wind energy development within, and adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Don McGuire

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line.

The DEIS is complete, comprehensive and no further analysis is required.

I support the Whistling Ridge Energy project because:

1. This project will create much needed green, renewable energy
2. Because this project is in my backyard. I have been an Underwood, Washington resident for over 15 years.
3. It will create much needed incremental tax revenue for the county and school districts.

I support renewable energy, and the Whistling Ridge Energy Project.

Sincerely,

Richard Potter

Subject: FW: Whistling Ridge Wind Farm - Public Comment

Categories: Yellow Category

Dear WA EFSEC,

I am writing to express opposition to the proposal to site a large-scale wind farm on Saddleback Mountain in a location that is in the heart of the Columbia Gorge, and will be visible from several key viewing areas which are established in the Gorge National Scenic Act. This wind farm, if built, would not only have scenic impact, but also would potentially have adverse long-term impact on bird habitat and wildlife in the region. No other wind farm project to date has been sited in such a densely forested area in proximity to endangered species – including the Northern Spotted Owl and Northern Goshawk.

I have not had an opportunity to carefully review this proposal, but due to the short public comment period, I want to go on record and express that my wife Jodi and I oppose this project and urge you to recommend denial to Governor Gregoire because Whistling Ridge is environmentally irresponsible and would harm the Columbia River Gorge.

Thank you for taking our input into consideration.

Sincerely,

Vince Ready

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. Studies have shown that the proposed project would have no negative impact on wildlife and plant habitat and would not affect the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire approve this project.

I support renewable energy, and reducing our reliance on foreign oil, particularly given the current situation in the Gulf of Mexico. This project is an important step in the right direction for the state of Washington and for the Gorge's energy independence.

I support the Whistling Ridge Energy Project. I believe America needs to move ahead with clean energy solutions which don't depend on oil.

I hope you will also support this project.

Thank you

I have lived in the Gorge for about 10 years and am a big fan of wind power in general. In fact, I LIKE the new array of wind generators out near Maryhill (outside the National Scenic Area). But the reality of the Whistling Ridge project in a residential and nationally protected area will be the following:

No change in electrical costs for average taxpayers*.

A paltry number of construction jobs, most of them temporary and many of those requiring imported specialized labor.

Death to thousands of various wild animals (birds and mammals--especially our best friends, BATS/mosquito mowers, which are abundant in the fecund Cascades).

Audible annoyance/deleterious health effects on humans and their domesticated animals.

A giant scar on the Gorge land/river-scape (this includes the National Scenic Area).

Huge profits (surplus electricity sold back to the electricity brokers for resale to CALIFORNIA/Seattle) for the Stevenson Empire.

The only long-term benefit here is decades of easy money for one entity: Stevenson Empire. Oops, almost forgot the other beneficiaries: electricity brokers who sell to California and Washington's big municipal users.

I am tired of 800# gorillas, such as the Stevensons, throwing their weight around so indiscriminantly around here to the detriment of average and below-average locals. Don't the Stevensons have enough wealth already? How much is enough for them? Somebody please make them stop!

***Talk is cheap. If the Stevensons truly cared about the local community, decades ago they would have spent serious money on a construction solution (such as an overpass for the Bingen lumber mill) to the audibly and psychologically disturbing train horn and noise which plagues Bingen and Hood River residents several times per day and night!

Just say "NO" to:

Death and malaise to thousands of beautiful and beneficial animals.

No economic benefits to the majority of local residents.

Greed of already extremely wealthy land owners and (literal) power brokers.

Sincerely,
Brian Barrett

The choices are limited:

- Proceed with the project and other similar wind farms.
- Increase the energy production from oil, gas, nuclear, and coal and accept the ensuing environmental devastation.
- Do without the energy. One wonders how many of the NIMBY opponents are willing to forego cooling and heating their homes to avoid seeing the windmills in their distant view !

It seems that a mild esthetic impact (although I personally find windmills aesthetically pleasing) and the loss of some bird population is a far lesser evil than pollution of air and water. The loss of life and treasure associated with the various wars we engage in to protect the supplies of fossil fuels is an additional matter of concern.

June 19, 2010

Sirs.

I am writing in opposition to the proposal by Whistling Ridge Energy LLC to construct up to 50 turbines along 2,000 foot-tall ridgeline on the boundary of the Columbia River Gorge National Scenic Area near White Salmon Washington. Approximately 384 acres would be developed for the wind turbine foundations, connecting roadways and overhead and underground transmission lines. Each turbine would be more than 420 feet tall and equipped with blinking lights.

The proposed wind turbines would cover more than 1,000 acres of highly visible ridgelines and would be seen from several designated key viewing areas in the Gorge including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would also be highly visible from communities and cities such as Mill A, Underwood, Hood River, and White Salmon.

All wind developments should be sited east of the eastern boundary of the National Scenic Area (Maryhill and the Deschutes River) or in other areas not visible from the NSA. We need alternative energy sources, but here the cost in loss of other assets is too great!

Sincerely,

Douglas M. Crow

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project will not cause significant negative impacts to sensitive wildlife and plant habitat and will not degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire approve this project.

This proposal is not likely to have any different or greater wildlife impacts than any other wind energy facility proposed in the State of Washington. The project will not permanently disturb any areas of forested habitat and will not result in direct or indirect impacts to the multiple wildlife species. None of the listed or sensitive species including the northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, or elk will suffer detrimental effects from this project.

I support renewable energy, and I support industrial-scale wind energy development wherever it can help us become energy self sufficient.

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would substantially improve the economic conditions in these two counties without causing negative impacts to sensitive wildlife and plant habitat or impacting the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire approve this project.

This proposal is unlikely to have any different and greater wildlife impact than any other wind energy facility proposed in the State of Washington, perhaps even less because this project is proposed along an already cleared for utility access low ridgeline in the foothills of the Cascade Mountains. Locating the turbines on this ridge line where there are already existing electrical towers would cause no additional impact to the scenic value of the Gorge than the already existing utility works, and therefore no significant additional energy development into the forested landscape.

I support renewable energy, and encourage EFSEC to recommend that Governor Gregoire approve this project.

I would like to express my support for the Whistling Ridge Energy Project. Solar, wind, and bio-fuels are our energy future. We NEED to start thinking clean renewable energy instead of the old model of "polluting", "limited resource", "harmful to the environment" types of energy. I know the Gorge is a special place and needs to be preserved but I see wind energy doing just that. Windmills are far less harmful than the polluting coal-fired Boardman plant that spews dangerous pollutants into our air and water that ultimately affects the quality of life here in the Gorge.

Thanks you,
Douglas Miley

Dear Washington State Energy Facility Site Evaluation Council,

Please consider the scenic impact of the proposed turbines and that they would be highly visible from several viewing areas in the Columbia River Gorge. We own a Bed and Breakfast here in Hood River and our view would change from a lovely night time star light sky with low household lighting to hundreds of flashing pulsating lights day and night. One reason so many folks come here from all over the world is to enjoy the mountain, rivers and special views our area has to offer. The National Geographic continually recognizes Hood River and the Gorge as one of the most beautiful and special places to visit. Exert below, but wind turbines over 400 ft tall, blades 230 across and flashing lights 24/7 would completely be in direct contrast to the natural beauty that draws in 640,000 tourists a year to the Gorge.

Mount Hood Oregon

From *National Geographic Traveler*
Written by Aaron Dalton

The European settlers and fortune-seekers who made their way West along the Oregon Trail in the mid-19th century faced a difficult choice when they arrived at the steep valley known today as the Columbia River Gorge—the only sea-level pass through the north-south Cascade mountain range. They could try to float their wagons and possessions down the river on rafts through dangerous rapids. Or they could attempt the overland route through the Cascade mountains on the Barlow Road, a dirt track so steep that it could only be traversed with great difficulty. Some intrepid Barlow Road travelers resorted to cutting down trees and lashing them to the backs of the wagons to slow their descent. The good news: The scenery in the Columbia River Gorge and the Cascade Range are just as spectacular today, but the roads have improved considerably.

Overview

Drivers can get an excellent sense of the history, beauty, and diverse charms of the Columbia River Gorge region by starting in Portland and tracing a roughly triangular route east alongside the Columbia River, south up the slopes of Mount Hood, and then back west following the Sandy River through a picturesque landscape of small villages.

<http://traveler.nationalgeographic.com/print/drives/mount-hood>

From Travel Oregon.....

<http://www.traveloregon.com/Explore-Oregon/Portland-Metro/Trips-We-Love/Hood-River-Valley.aspx>

Hood River Valley – Small town charm and big time flavor- great trip for scenery.

‘Located a scenic sixty miles East of Portland, Hood River and the surrounding valley offer up the bounty of a century of fruit growing and the taste of a dynamic wine-growing region, producing a variety of wines.’

The local economy depends on the tourist dollar and many tourists come to enjoy the view.

The wind turbines are also detrimental to the birds, big horn sheep and wild life and the endangered species in the area.

For these reasons we hope you do not allow, the Whistling Ridge Project as there are plenty of other locations suitable for winds farms in eastern Washington and Oregon.

Ann Frodel

Dear Madam/Sir:

Let me be known that I am strongly opposed to the wind farm being proposed for the Underwood Bluff in Washington. It is directly across the Columbia River from where I reside and I feel it would seriously detract from the natural beauty of our Columbia River Gorge. This is not a suitable site for this project and represents a special interest not the greater good.

Best Regards,

David Peterson

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

The Columbia River Gorge is the only federally designated scenic area in the U.S. While I'm in total support of renewable energy, placing wind turbines where they are visible within the scenic area is in my mind completely contrary to the purpose of designating this as a scenic area.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk. In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: Whistling Ridge Wind Farm

Categories: Yellow Category

Gentlemen:

I am a renewable energy enthusiast yet I feel I need to speak out about this project. In eastern Oregon there are prolific wind generators located in some key areas of strong wind. All that I have seen so far, are located in grassland areas with virtually no trees nearby. This locating factor reduces the possibility of damage to wildlife because most of the wildlife is lower flying, if at all, having little habitat from 100 feet up. However, to locate 50 wind generators in the middle of a forested area really exposes a great deal of habitat to almost 6000 feet of turbulent rotors, which they will not survive. Please do not allow the dollar signs and the green speak to move us one step forward yet 3 steps back. This is a good project but quite simply, the wrong place. Jobs and financial support into the community are always good reasons for these projects to be justified, However as we have learned with the casino issues, not always the primary issues to consider.

Thank you,

John Bryan

Whistling Ridge Energy Project
Public Comment 6/16/2010

Thank you for the opportunity to comment on the DEIS for Whistling Ridge. After reading though this document, I was struck by the generic and generally outdated content. I understand the need to plagiarize other EIS's to lessen preparation efforts; however, it does worry me that this project is not being looked at for the uniqueness of this site, and the natural and scenic resources. Besides that general comment, some specifics are:

- 1) Under "affected environment", "surface water", there is no mention of the unnamed stream west (and down slope) of the A1-A7 turbine group. This stream initiates as a spring and flows year round, and eventually empties into the Columbia River. In addition, it flows through World Stewardship Nature Preserve Land (soon to be purchased by Columbia Land Trust). Please add this consideration to your study.
- 2) Under "groundwater", the same unnamed stream mentioned above has been overlooked since it does originate at groundwater. Please add this to your study.
- 3) There was very little discussion on the flashing red lights. My understanding is that these are fairly bright and regular flashes, which besides being disturbing to local residents could also trigger health issues. Please add this consideration to your study.
- 4) There is no reference to Dr. Pierpont's studies on the health effects of wind turbine sounds, and a response to this new science by the applicant. It is not sufficient to say "not a problem", when current scientific studies indicate the need for larger setbacks to avoid these issues. All of the "noise" documentation is generally positive, educational, and/or based on county defined noise ordinances, all of which do not comprehend continuous operation of noise producing machinery. It is also interesting to me the sheer amount of documentation in the DEIS on noise, causing me to believe that this can be a problem and really needs more than an academic dissertation on sound. The most recent science should be considered in the study.
- 5) The study did not use the noise levels defined by the manufacturer of the proposed towers and the generating station, which are larger and noisier than those discussed. It is unacceptable and reckless to conclude the noise would be within EFSEC limits, if this group does not assess the actual towers and the generator facility to be used. Please update your report for the maximum anticipated noise levels, cumulative effects of multiple towers coupled with power generation/transfer and their impact to the surrounding community.
- 6) Regarding land use and the National Scenic Area. We all understand that regulations, boundaries, etc. do not preclude development of this type of project, however can you honestly say that the lawmakers and NSA visionaries understood (many, many years ago) that 400+ tall manmade, noisy, intrusive, structures would be created and erected. Can you honestly and with good conscience, ignore the basic intent of the National Scenic Act: "Preserve our nation's natural scenic resources", by siting loopholes, ordinance weakness, and the limits of our written language. Remember, this is permanent (30+years) and a resource that can never, never be reclaimed to its current grandeur. Please try to justify this project (as a whole or in parts) given this basic concept of natural scenic area preservation. If you knowingly and willingly ignore preservation of a scenic area, you will spoil our treasure just as oil is spoiling Florida beaches now. Please consider a reconfiguration of the project, at a minimum to eliminate the most visible turbines, specifically the "A1-A7" array.
- 7) More recent studies on bat and raptor deaths caused by wind turbines indicate a significantly higher number than expected. Klickitas County has recently begun a new study because many more deaths were occurring than promised by the boiler plate information in their EIS. Please update your study to consider recent results.

8) There does not seem to be mention or analysis of that land being designated as "Deer and Elk Winter Range"? I was unable to get a map from WDFW in this short time, but I do know that the land immediately south of the project is designated winter range preserve. If this project is or is not in the preserve, what would be the impacts to elk and deer movement, how will they react to the "strings" of turbines, operational noise, construction, etc? If you believe that this wildlife will simply "go around", what is the impact and how will the applicant mitigate the impact to the surrounding communities now in the path of ranging wildlife? What would be the impact to the surrounding communities when the predators (e.g. cougars) follow the new path, and how will we be protected?

9) Regarding impacts to property values: it is inappropriate to merely list/itemize the results of studies, without considering the details. For example, if these studies did not have any homes as close to the projects as this will be, those studies are not applicable. If the studies did not have homes and property of comparable value (i.e. shacks verses million dollar homes), then the studies are not applicable. If these areas did not have property of comparable value, then the studies are not applicable. If the areas understudy do not have comparable "visual" appeal (i.e. in the scenic area), then the studies are not applicable. I expect, due to the locations of the referenced studies, that they are generally not comparable to this situation. Your DEIS needs to be updated with property value studies that represent this project and this neighborhood, for undeveloped land, developed land, and land with homes.

10) Regarding "future developments", the "Middle Mountain Wind Project" should be updated to indicate that the Hood River County Commissioners have determined the project to be not feasible due to local discontent and the results of an independent study concluding the project would be financially unacceptable, contrary to the financial payback reported by their applicant. You might also consider adding the decision regarding the Seven Mile project; impacts to the local community and the scenic area also could not be justified.

I know that you are tired, and a bit numb to the comments so far and yet to come, but I request that you review each as if you lived here. As if you come to the Gorge to enjoy the natural scenery, as if it was in your back yard. Remember, this project is in everyone's back yard, it is a National Scenic Area.

Thank you

Mike Eastwick

June 16, 2010**

Mr. Chairman and Members of the Council. My name is Todd Myers and I serve as the Executive Director of WindWorks! Northwest, a wind power advocacy group with over 300 supporters. Our address is [REDACTED], Washington.

I have two comments on the Draft Environmental Impact Statement. I will first address the discussion of project alternatives under 2.3.2. Second, I will touch on the Draft EIS' discussion of visual impacts in 3.9.3.

The Draft EIS is correct in its assessment of the Whistling Ridge Energy Project as an "integrated whole,' as a single power plant, not pieces of a whole, where some turbines may be eliminated." The project, at 75 megawatts, is the smallest project proposed or operating in Washington State. No exception.

The economic viability of the project hinges on SDS being able to complete the project as designed – at 75 megawatts.

Those who suggest that they can support the project if "only" seven turbines are removed are, in effect, telling you that the project should not proceed. It reminds me of the used car dealer who claims that he's offering you a great deal while acknowledging that the auto lacks a small item: a transmission.

In the interest of fair evaluation, the proposed project before you must be considered as an "integrated whole." Given the economies of scale and utility demand for renewable power, this project, if it is to proceed at all, cannot be downsized.

The Draft EIS offers a thorough and commendable discussion of visual impacts. One area where the document falls short is in assessing the value of the visual amenities that Whistling Ridge *currently* provides to the Gorge area.

The project opponents assert that SDS, by building a windfarm on its property will spoil the value of their property. This concern should can only be fully analyzed if both sides of the coin are examined.

It would be helpful to this discussion if the Draft EIS estimated the financial value of the visual amenity that SDS currently provides – a value, that members of SOSA and the Agri-Tourism Association now enjoy for free. We can only imagine how the authors of the EIS would calculate the value of this free amenity that is so dear to SDS' neighbors.

Would any of them pay to keep things as they are? And, since when does a neighbors' property rights extend to everything he or she can see from their boundaries? Since when was the Scenic Act written to control what can be seen from within the boundaries of the Scenic Area?

Mr. Chairman and Members of the Council, I commend you and BPA for commissioning an excellent environmental document, which provides a rock solid foundation on which to inform your ultimate action on the Whistling Ridge Wind Energy Project.

I oppose the construction of an industrial installation of wind turbines on Underwood Mountain, Whistling Ridge.

As a small business owner I am concerned with the negative impact on our tourism-based business, White Salmon Boatworks. Many people come to our town for the natural beauty. The installation will be harmful to the visual ambiance of our region. This project is too large.

Shelley S Baxter

**Points to Consider
Wind Farm Start-up**

June 16, 2010

I previously worked for a company that did wind farm start-up and have the following information for residents to consider:

TRANSPORTATION: Trucks transporting wind mills and turbines are regulated and permitted by the State DOT. Segments of each turbine is considered an 'oversized load' in both length and width. They can only be transported during certain times of the day, and require a pilot car in the front as well as the back of the transported section. One of the major concerns you will have to consider is the logistical barriers of the actual transport to the generator site. The turning radius of these oversized loads is in excess of standard tractor-trailers. Narrow and/or winding road will prohibit navigation of these over-sized loads.

ROADS: It is my belief that current roads may be inadequate due to actual road bed construction which was designed to accommodate residential vehicular traffic (need fortified road beds, wider surface areas, and gradual road curves to accommodate the over sized loads).

The actual weight of each over sized truck load could be more than double the normal weight of a tractor trailer.

CONSTRUCTION: To construct 50 wind turbines you will have to accommodate several hundred oversized trucks, cranes, transformers and substations, etc.

The actual construction of each wind turbine requires a concrete foundation which would ultimately require hundreds of cement truck deliveries on a 24-hour basis, 7 days per week. Once construction commences you can not stop the pouring process.

EIS: It was mentioned that new or improved roads would not be required to the generating site.

It is my understanding that the initial draft EIS referenced road construction needs while the new EIS eliminated that segment all together - because it was deemed insignificant. To that I would like to suggest the following:

- That you provide the community with an honest assessment of the impact that transportation of machinery and equipment will have on the community such as traffic noise, traffic flow interruption and generation of dirt/dust.
- Staging of trucks and other equipment if there is an interruption in access to the construction site. Is there an alternate route in the project plan or is it just a single access road to the site?

Dave Query

RECEIVED Public Comment #199

JUN 21 2010 16 June 2010

Dear EF SEC ENERGY FACILITY ~~SITE~~ Underwood, Wa,
EVALUATION COUNCIL

My name is Helen Paulus and I live permanently full time in Underwood. I have lived here 28 years. I am writing this letter to you to tell you of my support of the proposed

Whistling Ridge Energy project. I have no business or personal connections to anyone connected to this project. I have no financial loss or gain from this project. But I do use Electricity and I support any alternative energy production. Even our President last night said we must become less dependent on current technology. I believe this project is a benefit to the county. Incidentally I live about 1 1/2 miles distant from the proposed project.

Thank you

Dr Helen Paulus

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a fair and balanced alternative analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS and issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project.

I also request that EFSEC and BPA extend the comment period in order to allow the public sufficient time to review and comment on the 1,578 pages of material contained in the DEIS and appendices. Please extend the comment period by 45 days.

Subject: Whistling Ridge Threatens Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

While the Whistling Ridge Project may follow the letter of the law in regards the restrictions on development in the Gorge Scenic Area, it does not follow the spirit of the regulations. The Gorge was set aside as a national scenic treasure and siting of the energy project within the sight lines from within the Scenic Area violates the intent of the Act. Alternatives must be considered. The National Geographic has ranked the Columbia River Gorge as number 6 among the most scenic areas in the world.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a fair and balanced alternative analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS and issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project.

I also request that EFSEC and BPA extend the comment period in order to allow the public sufficient time to review and comment on the 1,578 pages of material contained in the DEIS and appendices. Please extend the comment period by 45 days.

It is becoming abundantly clear over the many years that wind turbines have been used in large scale farms, that there is a great deal more negative impacts than previously considered. The Columbia River Gorge National Scenic Area is one of a few remaining geographic gems in the world. There are NO good reasons to alter this magnificent area for economic, energy or political purposes.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS and issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project.

I also request that EFSEC and BPA extend the comment period in order to allow the public sufficient time to review and comment on the 1,578 pages of material contained in the DEIS and appendices. Please extend the comment period by 45 days.

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a fair and balanced alternative analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS and issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project.

I also request that EFSEC and BPA extend the comment period in order to allow the public sufficient time to review and comment on the 1,578 pages of material contained in the DEIS and appendices. Please extend the comment period by 45 days.

COMMENT LETTER 68 E-mail: a

Good evening, and thank you for this opportunity to comment. My name is Dan Spatz, and I reside at [REDACTED]. I've lived in the Columbia Gorge since 1967. Although I hold certain official capacities, I'm speaking tonight solely as a private individual. I'm a landowner and taxpayer in The Dalles and also in the Snowden area of Klickitat County, where my property – the place where I grew up -- has a view looking toward the Whistling Ridge project location.

I'm here to speak in favor of this project, for two reasons:

- 1) Global climate change is a reality, and renewable energy is part of the solution. As a society, we want to have our cake and eat it too: we want to reduce our carbon footprint, but we often oppose new sources of energy necessary to achieve that goal. We cannot conserve our way out of the climate change crisis. If we are to maintain our current standard of living, we will need radically different alternatives to fossil fuels on a grand scale, whether this means nuclear power, wind, solar, geothermal, tidal, wave energy, or most likely a combination of all of the above in concert with energy-efficient design. As we build out wind energy in more remote locations, we will inevitably face the need to develop wind power closer to places where people already live. While some may object to the visual appearance of wind turbines, I submit that these are far more attractive than strip-mining coal and tar shales, and drilling for deep-water oil in places like the Gulf of Mexico or Arctic National Wildlife Refuge. Wind energy is clean energy, and for that reason alone we should welcome the project before us.
- 2) I object to the contention that proximity to the Columbia Gorge National Scenic Area should prove a barrier to this project. The project is located outside the national scenic area boundary. The intent of Congress in drafting the scenic area legislation in 1986 was to enhance environmental protection and economic development within the Columbia Gorge. While we still face the need to precisely define certain scenic area boundaries and achieve a necessary mechanism for modifying those boundaries over time, it is very clear that the intent of Congress was not to restrict developments proposed outside the current scenic area boundary. This principle has already been demonstrated in Klickitat and Sherman counties, where wind farms are already visible from within the national scenic area, and the precedent so established should also apply elsewhere in regions adjoining but not included within the national scenic area proper. Yes, there will be some visual impact. But in keeping with my first point, as a society we cannot have our cake and eat it, too. Wind turbines or Gulf Coast oil spills? Not to over-simplify our options, but as a society we will be asked to make precisely this same choice many times, in many places, in the long decades ahead as we confront the global climate change crisis. We might as well face reality now. I vote for wind turbines.

I WAS IN SPAIN IN 2008 AND SAW MANY WINDFARMS--
-I FOUND THEIR MOVEMENT ENCHANTING AND A
THING OF BEAUTY.

AMERICA IS A GREAT COUNTRY--AND A FORTUNATE
ONE, BUT WE ARE AT A CROSSROADS REGARDING
FUTURE ENERGY SOURCES.

I AM GLAD TO SEE SKAMANIA COUNTY TAKING A
LEADERSHIP ROLE IN WIND POWER AND THE GREEN
TECHNOLOGIES OF THE FUTURE.

SOMEDAY, FUTURE SKAMANIAN WILL LOOK BACK IN
PRIDE AND SAY WE WERE AMONG THE FIRST TO
RECOGNIZE THE NEW ENERGY WORLD, PUT ASIDE
OUR PERSONAL DIFFERENCES, AND WENT WITH WHAT
IS BEST FOR THE GREATER GOOD.

THANK YOU

Harold L. Gailey
HAROLD L. GAILEY

I wish to state my support for the Whistling Ridge Energy Project. This project will help reach the goal mandated by the voters of our state to make renewable energy a greater part of the state's energy consumption. It will help Skamania County continue to provide the services that we, the residents, demand and expect. It will also provide some much needed, high-paying stable employment opportunities for residents of the Columbia River Gorge.

I believe that we must, as citizens of this planet, accept our responsibility to find ways to utilize clean, renewable resources to meet our energy demands. As a nation we may have to make some sacrifices that will enable us to exploit the renewable energy resources that are available to us. We can no longer expect the rest of the world to provide us with cheap energy. We can no longer accept the damages to our planet caused by continued use of fossil fuels. We must move forward to develop new technologies that reduce our impact on the environment.

In my view, the potential benefits of this project outweigh any detrimental impact on the region.

I SUPPORT THE WHISTLING RIDGE WIND PROJECT. RENEWABLE ENERGY HAS STRONG FOUNDATION IN AMERICAS FUTURE ENERGY NEEDS. NEVER MORE SO THAN TODAY CONSIDERING OUR FOSSIL FUEL CRISIS IN THE GULF & OVER SEAS. OPPOSITION TO THIS PROJECT FROM VARIOUS GROUPS ON THE GROUNDS OF IMPACT TO THE SCENIC AREA IS REDICULOUS. IT IS LOCATED OUTSIDE COL. G.S.A BOUNDARY LINES AND THEY HAVE NO RIGHT TO DICTATE LAND USE ON PRIVATE PROPERTY. WE NEED THE ECONOMIC BOOST THIS PROJECT WILL PROVIDE FOR SKAMANIA CNTY. - JOBS/SCHOOLS/TOURISM

Frank Backus

- 
1. I am in favor of this wind project.
 2. Environmental Impact Statement found no significant negative Impacts that would preclude the development of this wind project. Not fauna, flora nor scenic impacts.
 3. This project is outside the boundary of the National Scenic Area.
 4. Washington Voter have spoken, utilities are required to provide renewable energy to their customers. Here it is!!!
 5. This project is compatible with the forestry zone of the surrounding property and it is compatible with the neighboring lands that are zoned agriculture.
 6. This project will have a major role in securing the economic stability of Skamania County and of the SDS family of companies.

Wind power is important however every possible location is not the right location for windmills. Every windy ridge is not the right place for a wind farm. It is not necessary to put this wind power development in. There are too many people and livestock and wildlife in this area. The impact to the Scenic Area is too great. We may need more energy from sources other than oil. We may need to do more research on conservation. However THIS wind farm is not crucial to solving the energy crisis. The harm to the scenic area and local residents is too great.

COMMENT LETTER 74

Jeff Teague? WOTW

WR - DEIS
Public Comment #208

1. Whistling Ridge comments, Stevenson, 6-17-10

2.

3. I am opposed to this project as it is written

4. It is hard for me to believe that the parties responsible for drafting this DEIS can be objective and impartial for this proposal. EFSEC is an agency known for siting energy facilities and the BPA is an agency which deals with power generation and distribution of that power. Nothing Personal. ~~It is a business~~ It is your duty to be objective.

2. This DEIS is insufficient in that an appropriate EIS has a list of alternatives. This one only lists one action item and mentions several times throughout the document that it is one of the alternatives. How can the proposed action also be an alternative? The only alternative stated is the No Action Alternative. The applicant says that he cannot go below 70mW and is trying to disguise his unwillingness to minimize this project by saying that public utilities seeking to fulfill their RPS requirements need a minimum of this kind of output "...to be attractive." In one area it states that this project has to be defined as an "integrated whole" to be worthwhile yet in the design/mitigation measure under Biological Resources that "Micrositing of turbines and associated facilities would allow any sensitive resources discovered during construction to be avoided." You can't have it both way.s

3. Pg. 1-7 states that "No other federal agencies have been identified as cooperating agencies for this EIS at this time." Cooperating, hmmm, is that because the NPS and FS have made concerned negative comments about this proposal as it now is written. Also, why have the Yakama Nation not been involved in the DEIS when they, as a sovereign nation, have legitimate cultural resource concerns. Any EIS is required to ensure that there are no impacts to cultural resources. On page 1-8 it states that "Other federal, state or local agencies also may have permitting or other approval authority for the proposed Whistling Ridge Energy Program. Those agencies may use this EIS in order to fulfill NEPA or SEPA responsibilities." Those agencies have an obligation to the public to do their own due diligence and evaluations, not depend on the project proponent's potentially biased data.

4. This DEIS states that the BPA substation would cover "4.25 acres and be sufficient for future installation of equipment if required for future development." What kind of future development----50 more wind turbines? I am concerned with scope creep. With the national and state mandates on "going green" I can see how once they are in, it would be much easier to expand the number of turbines. I don't want to see this project look like the ~~Goldendale~~ Klickitat projects,

5. People come from all over the world to enjoy the majestic natural vistas the CRG has to offer, not man made ones. I don't think very many people would like to see wind turbines at Yosemite, Yellowstone or the Grand Canyon. Neither should they at this National Scenic Area, one of only 2 in the whole United states of America.

6. This EIS is whoefully insufficient in its evaluations of wildlife. It does a poor job of covering bat evaluations, lacks significant bird/bat dispersal data and has no mention of large animal. It is so bold as to state, "For potential impacts to big game species (deer and elk), coordination with WDFW will occur IF APPROPRIATE. It is a known wintering ground for Elk. Also what about cougar, bobcat, coyotes and all the other ~~so-called~~ big game? It states that it will "Convene a Technical Advisory Committee to evaluate mitigation and monitoring programs for ~~the~~ impacts to wildlife and habitat----why is this not already in place?"

This project is proposed at a right time in our local and national energy needs but placed in the wrong place. The Space Needle is around 605ft. tall, these turbines could all be 426 ft. high. There is no way this project could be defined as "visually subordinate." If I want to see the Space needle, which also has a red light on top, I will go to Seattle. I don't want to see 50 space needles from ~~inside the national scenic area.~~

KVAS in the CRG,

Thank you.

Re: Whistling Ridge Energy Project May 2010 Draft Environmental Impact Statement

Members of the Council,

The horrifying, large-scale oil contamination event in the Gulf has increased the pressure to develop viable, alternative sources of energy. Wind-generated power, popularly advertised as being “clean” or “green,” is, however, not without drawbacks. The in-toto, as well as individual problems associated with wind turbines and large turbine arrays may, under certain circumstances and, locations, outweigh their benefits.

Regardless of opinion regarding this proposed project, there must be unbiased, objective documents that permit the public access to information and to guide decision-makers to their tasks as well. The inattention to detail, lack of thoroughness, and to the appearance of fairness is very discouraging to see, especially in print. This EIS was created, with time to spare, compared to the time we have been allotted to review it and to prepare comment.

1. During a brief review of the referenced document, I was startled to note the appearance throughout, of a distinct bias. Right off the bat, in section 1.2.3.3, a discourse of almost a full page of text – five paragraphs worth – is entitled “Business Needs of the Applicant.” No-one’s “business need” is appropriate material for discussion in any EIS document, for what, I hope, are obvious reasons. (Only in a totalitarian regime is the “need” or desire of an individual more important than large-scale human, wildlife and scenic resources.) The only material in this section that is relevant- that dealing with the large number of temporary construction jobs that would result, and the small number of permanent jobs after project completion belongs elsewhere.

2. In view of the fact that no studies have been conducted in the US that determine what effect wind turbines have upon forest-dwelling species of wildlife, it is inappropriate and misleading to repeatedly state that “No impacts are anticipated....” Frequent statements of conclusion appear throughout the document; some are nebulous, speculative, inaccurate or contradict the material provided in the previous text or appendices and add to the appearance of bias.

On page 3-77, it is confidently stated that "Operation of the project would result in no further impacts to habitats on the project site" despite a statement on Page 3-81 that "Because data on impacts to big game as a result of wind project operations is limited, it is difficult to predict the impact of the proposed project on wildlife using priority habitats on the proposed project site." ("Additional coordination with WDFW is ongoing, and would continue to address this resource.")

3. Almost all the mitigation measure introductory statements end with the phrase "...to the extent feasible." It is not always specifically stated who ultimately determines what is "the extent feasible." The appropriate responsible agency, entity or statute should be provided in the text, in the relevant paragraph, so that it can be more easily evaluated. This lack of clarity regarding responsible parties is also seen in Section 3.4.3 "Mitigation Measures"; it also resorts to "the extent feasible" phrase apparently with no one in mind.

4. More research data on human health in connection with wind turbine arrays is available than has ever been in the past, from both Europe and the United States. Unfortunately, it has not been common knowledge and therefore has not been reflected in public policy regulations. There has been testimony dealing with this subject in detail and this body of yet unrecognized information should be a major determinant in wind farm siting decisions. Please acquaint yourselves with the data before moving ahead.

5. The geologic and soils information is troubling even when one has seen the steep hillsides that this project proposes to disturb. Construction will require blasting, which can destabilize fragile habitats, and unpredictable effects may result over large periods of time. The soil types present at or immediately adjacent to the construction sites are not stable and the planned mitigation measures which aim to control erosion and slides may be difficult, if not impossible to achieve, as can be already seen at numerous locations in this portion of the county. *Although downplayed in the EIS, significant erosion events will surely degrade water quality and affect downstream fisheries as well as local aquatic invertebrate populations.*

6. The Scenic Area impacts have been discussed by many already. It would be more than unfortunate to allow all of the effort that has so far been expended to maintain the unoccluded foothill views ^{view} within the designated area to be despoiled by a project of this magnitude, even though it ~~is~~ ^{is} located just outside of the Scenic Area. To many, especially in these times, aesthetic values are worth advocating for.

7. The Columbia River flyway could be considered a cultural resource for the avian species. It has likely existed for a longer time than humans have been here and constitutes a known route for both north-south and east-west migrating birds. It is inconceivable that a project that is known to kill birds could be approved for an area located ^{with} in the flyway.

Larger turbine blades and consequent slower rotation speeds have been reported to minimize bird fatalities, but the fact that Columbia River is the major western flyway in the United States negates this improvement since denser concentrations of birds would be present during migration flights. The rotation speeds mentioned in the document stipulated a wide range and was indicative that the authors were not aware that rotation speed guidelines purporting to offer some protection from bird strikes are available.

8. Although a two-year bird mortality monitoring study after construction is mentioned, no concern for documenting bat mortality is evidenced as no provisions for such are listed on Page 3-82, Section 3.4.82 under Mitigation Measures. This, despite the possibility that two federal bat Species of Concern, Townsend's big-eared bat and Keen's myotis, are reported to "likely occur in the project area." The bat echolocation studies that were conducted at the project site were unable to determine bat species, but stated that "we expect that the potential risk to bats from turbine operations to be somewhat higher than the rates observed at other western facilities placed in non-forested environments. One estimate from Buffalo Ridge, Minnesota data sets predicted a mortality range from 2.2 to 20.8 individuals per year which, over time, certainly could have an impact upon a species of concern's breeding population numbers. The bat echolocation study consultants, Western EchoSystems Technology, Inc., recommended that "The post-construction monitoring program should be designed to accurately estimate the level of bat mortality." Why is it not included?

9. There is no mention of the requirement for providing alternative power sources for specific megawatt-production wind facilities. These are usually natural gas facilities. In what nearby communities would these be built? They should also be considered part of the cost of a wind facility.

10. I have never seen an EIS, especially for a project of this scope that has no other action alternatives. Although they are mentioned in the text, they must be dealt with as real possibilities, regardless of the fact that the proponent does not wish to spend the additional funds it is claimed they would require.

I plan to submit a lengthier statement dealing with additional issues by the July deadline. Thank you for the opportunity to comment, if only in a cursory manner. I realize that it would take a great deal of your time, but it would be wonderful if a more generous amount of time were allotted to speak, especially on an issue with so many facets of concern.

Sincerely,

Sallie Tucker Jones

COMMENT LETTER 77

June 17, 2010

Testimony of the Columbia Gorge Audubon Society, CGAS, before the Bonneville Power Administration and the Washington EFSEC Regarding the Whistling Ridge Wind Energy Project

Whistling Ridge is not so much about renewable energy development. We all support a renewable energy future for our nation, but this simply is the wrong project, at the wrong place, at the wrong time. The Condit Dam on the White Salmon River is going to be removed. Day-after-day, Condit churns out 8-10 megawatts of power, almost half of the firm power Whistling Ridge would produce. Should we rethink the facility's removal? No! Because it's been determined that salmon recovery is a higher priority than renewable energy from the White Salmon River.

So it is with the Columbia Gorge. The Gorge was set aside by Congress as a special place to be preserved and protected for all future generations. No one anticipated the abomination of 500', gleaming white towers with rotating blades being located on ridges just outside the National Scenic Area boundaries, otherwise the lines would have been drawn differently. If this proposal is permitted along with other proposals in the east Gorge, the iconic landscapes that the Scenic Act purports to protect will become subordinate by day to giant towers with whirling blades and by night to flashing red lights. If the Whistling Ridge project is permitted, then it will be time to ask Congress to redraw the boundaries. The incongruity of industrial wind energy projects up-and-down the Gorge on ridge-tops just beyond the Scenic Area boundary flies in the face of the very intent of Scenic Act itself.

A cheer-leading flier sent out by the project proponent asserts that in a "single year" Whistling Ridge will displace X barrels of oil, X tons of CO₂ and X numbers of cars off the road. This is a cruel hoax. Where is the evidence for such an assertion? In fact, for every megawatt of wind energy developed, an off-set of fossil fuel-fired megawatt has to be developed as wind energy's unpredictability destabilizes the electrical grid (Northwest Power Planning Council). With a burgeoning population, naked consumerism and a Wall Street-driven, cowboy economy, we'll need every barrel of oil, every ton of coal and every cubic foot of gas to keep the economy humming. The best evidence we have for this is the Gulf oil "volcano". Even though the Gulf Coast is awash in oil - threatening their very way of life - elected officials have lined up to demand that the moratorium on deep-water oil drilling be lifted so that business as usual can continue. Moreover, the Whistling Ridge developer, SDS and its partners, were paid 20 million dollars in public money by BPA to NOT develop a gas-fired project in Bingen. Where was the concern by SDS for CO₂ emissions then?

The flyer further asserts that there will be no "harm" to wildlife populations. This also is a hoax. The raptor mortality from wind energy projects developed in Klickitat county is ten times what the EIS predicted ("First Golden Eagle killed by Wind Turbines in WA State", Kathy Durbin, The Columbian). What went so terribly wrong? CGAS believes the cozy relationship between project proponents and EIS preparers is what went wrong. Getting a permit opens the spigots to fat state and federal subsidies, without which projects like Whistling Ridge would be unprofitable to develop.

By comparison, the wind energy industry makes much of birds killed by plate glass windows, cats and vehicle grills, but how many eagles, falcons and hawks are killed by these objects? Wind energy is very selective in its bird mortality and raptors are some of our most threatened bird populations. I would not want to be a raptor trying to negotiate the mid-Columbia landscapes these days, would you? And the US Fish & Wildlife Service wants to reintroduce the California Condor to its former range in the Gorge? What a joke!

At an initial hearing before EFSEC on Whistling Ridge, Wallace Stevenson, owner of SDS, said that his company has always tried to do the "right thing". CGAS assumes that this was said to help persuade EFSEC to render a decision favorable to Whistling Ridge. We would like to balance the record with this: Concurrent with establishing the National Scenic Area, Congress designated the lower White Salmon River under the National Wild and Scenic Rivers Act. The management area boundary included some SDS property, including lands along Spring Creek, a critical area for salmon spawning once they are reintroduced. The Forest Service offered SDS a land exchange so these lands would not be logged and the values for which the river was designated could be preserved. Apparently SDS was unable to get above appraised values for their lands, so the company cut the forest down to include Spring Creek and other areas where hiking trails and picnic areas were planned. Now we ask you, was this the right thing to do?

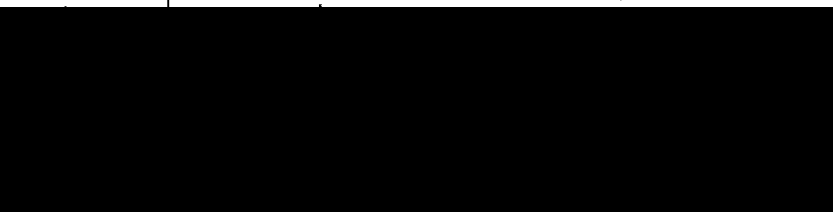

Lastly, the Northwest is not short on renewable energy. It's conveniently overlooked by industrial wind energy proponents, but 10,000 megawatts of high-quality renewable energy is churned out daily by the Columbia River hydro system. And it's come at a high price: Celilo Falls, once the Northwest's cultural and natural history icon, is gone and the world's greatest natural salmon fishery has been driven to near extinction. A sprawling industrial swath of wind turbines now stretches along both sides of the Columbia from Maryhill, WA to Walla Walla. These Columbia River landscapes of "Lewis and Clark" and "Oregon trail" fame have been disfigured and are no longer available to those who aspire to capture the spirit of these storied places. It would seem that we in the Northwest are selling our souls - our incomparable landscapes - to satisfy California's insatiable need for so-called "green" energy.

So, SDS and your sidekick, WindWorks Northwest, don't tell us that now we need to deface the Columbia Gorge to chase a few more "green" megawatts. The region has paid its dues. The wind energy industry, just like the dam builders, will hound out every wind resource to erect their turbines because a pot of money in state and federal subsidies await a secured permit. It is up to thoughtful citizens to insure that some areas are off-limits. Cries of NIMBYism can be heard, but let us not be made to feel guilty by renewable energy wonks, the wind energy industry, and county commissioners who do their bidding, for standing up to protect the last best places.

CGAS will comment further on the deficiencies our Society considers to be in the DEIS in another document within the comment period.

Thank you,

Jill Barker, spokesperson for the Columbia Gorge Audubon

Please accept my comments below in support of the Whistling Ridge Energy Project:

Eminent Domain: the right of the government to take property from a private owner for public use by virtue of the superior dominion of its sovereignty of all lands within its jurisdictions.

Many times, over many years - the government has used the power of eminent domain to take property. Skamania County witnessed this in 1986 when Congress passed Public Law 99-663: The Columbia River Gorge National Scenic Area Act. This action, in and of itself was not a physical taking for which compensation was paid. It was a legislative action that caused, and continues to cause great economic hardships for individuals and communities within its boundaries.

Twenty four years later - a different sort of eminent domain is trying to grasp hold, and take something from Skamania County. Again, it isn't a physical taking - but it is a taking that has the potential to exacerbate economic hardships and impede solid, community friendly developments like the Whistling Ridge Energy Project. This taking is done when special interest groups use financial resources to seed public hearings with naysayers, and in essence - drown out the voice of residents whose communities are most directly affected by the proposed project.

Implementation of the Whistling Ridge Energy Project has many benefits, some not yet known, for Skamania County. The initial economic benefits associated with the project construction, such as local procurements and the 100+ family wage jobs are just the boost that we need. Consider the trickle down effects that will continue at completion of the project - \$731,000 in annual tax revenue, small business growth due to increased local spending, which in turn leads to business success, job growth and more.

At this point, many people would like to believe that a growing tourism base will carry us through these dark economic times. Some would even say that tourism can sustain Skamania County. I argue this concept by noting the lack of developable commercial land available within Skamania County. I would further note that while tourism is important to our communities, we need development that provides jobs and increases tax revenues without relying on the ebb and flow of tourists.

Skamania County needs the Whistling Ridge Energy Project to be a success - and SDS can make it happen. Projects such as this, which are environmentally friendly, economically friendly and community friendly spur similar ideas. They almost force existing and new companies to reconsider how they plan to operate in communities that need growth - but hope to maintain the hometown, rural area environment.

As the council continues with the hearing tonight - I would ask that you consider who is sharing their comments for and against this project. Those for the project - I suspect they live here, and have for a long time. I suspect that they have seen what Skamania County once was, what it could be - and how this project will be of great value to our home.

Ann Lueders

Re: Whistling Ridge Energy Project Draft EIS, May 2010

Council Members:

The Whistling Ridge draft EIS is basically well organized and readable. Nevertheless, it is insufficiently thorough and contains specific inaccuracies and subjective conclusions. Some shortcomings we noted are:

- 1.) An appropriate EIS should list a range of alternatives. However, the draft lists only one action alternative. More alternatives could be developed by such means as relocating or eliminating problematical turbine sites.
- 2.) Applicant SDS owns 70,000 acres of land; within this expanse, the draft claims that Whistling Ridge is best suited for a wind farm. But considering such large ownership, plus numerous valid concerns associated with Whistling Ridge, the draft should address in detail other potential wind power locations on SDS lands.
- 3.) Avoidance of negative visual impacts is a primary objective of the Columbia Gorge Scenic Act, a fact that the draft purposely downplays. For example, no wind turbines are now visible from highways within the Scenic Area, but the draft indicates that they are. The draft achieves this misconception by making no distinction between views of turbines from the east end of the gorge outside of the Scenic Area and views from within the Scenic Area itself. Such intentional deception should be removed.
- 4.) Considering item 3 above, plus information now in the draft (including "Adverse Effects that Cannot be Avoided") and much public testimony about visual concerns, statements like one on page 3-154 are inappropriate and should be excised or restructured; that arbitrary statement claims that: "The project would have only minor to moderate impacts on visual quality as viewed from travel corridors inside the scenic area."
- 5.) The EIS should clearly state that, should this proposal be approved, it would set a precedent by allowing the first wind farm visible from within the Columbia Gorge Scenic Area.

6.) The draft also does not state, as it should, that this project would be the first such project allowed on Pacific Northwest forest lands. Moreover, the draft should recognize that no comprehensive studies have been made concerning effects of wind turbines upon Pacific Northwest forest dwelling wildlife.

7.) Potential impacts on mammals other than draft-mentioned bats and a single squirrel species should be described in the EIS. What animals are present in what relative numbers, and which are most likely to be driven from or avoid the area because of the turbines?

8.) Estimates of expected turbine-caused avian and bat mortalities should be included by utilizing available information from studies at existing wind farm projects. Such estimates would perhaps be difficult for those bird and bat species that prefer forest habitats. But most bird species that frequent Whistling Ridge (87 species, including the bald eagle and five others of "Special Concern", have been recorded there) are also found around wind farms where mortality studies have already been made. To simply state, as the draft now does, that the turbines would "not affect viability" of bird and bat populations "in the region" is quite inadequate. Cumulative impact data, rather than unfounded beliefs, are necessary in making decisions of the magnitude that this proposal encompasses.

9.) Since Class I Underwood Loam soil has "high potential for erosion from water" (pages 3- 5 and 6), why are at least 8 proposed turbines located on or directly adjacent to that soil type? And at least 18 turbines appear to be positioned on or near Class II soils having a "high landslide hazard rating" (pages 3-7 and 8). Consequently, geotech and/or soils scientists should closely examine those sites of questionable stability. Work of that nature has apparently been brief or lacking. Ultimately the EIS should define turbine proximity to both Class I and II soils and provide detailed plans to avoid and correct erosion, especially where those critical soil types might be involved. Another example of unsubstantiated conclusions sprinkled throughout the draft is this statement on page 1-37: "The proposed action would contribute incrementally, though in a minor way, on cumulative impacts to soil erosion as well as vegetation, terrestrial wildlife species and bird and bat species in the region."

10.) The project would require substantial soil relocation. Spoils sites should therefore be approved by a qualified specialist and their locations identified in the EIS draft.

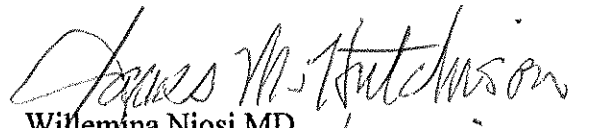

11.) We have examined previously submitted and forthcoming testimony from Keith Brown PhD regarding public health implications of this proposal. Based upon his solid review of pertinent research, we conclude the EIS cannot assure that health of residents living in the Whistling Ridge vicinity would not be adversely affected by turbine noise. Can the developers of the EIS draft provide such assurance? If not, noise concerns should alone exclude approval of this project. And human health concerns from expected turbine noise should be added to the draft's growing list of "Adverse Effects that Cannot be Avoided."

12.) The draft emphasizes anticipated monetary benefits derived from the project. It should also describe expected government expenses associated with the proposal. Too, the draft should include expected short and long term monetary benefits from continued timber harvest (the No Action alternative) at Whistling Ridge.

13.) Amid the draft's generally lucid narrative is the following mysterious sentence on page 1-9: "The site has a long history of commercial logging and associated absence of native habitat, reducing or eliminating the need to clear additional forest land." Could someone decipher that for us?

Thank you for the opportunity to comment on this draft. Please respond to our comments and concerns in the next version of the EIS.

Columbia Gorge residents,

Willemina Niosi MD
and Jim Hutchison 

cc: BPA

TESTIMONY OF JAMES M. HUTCHISON
TO THE WASHINGTON ENERGY SITING COUNCIL
REGARDING SDS WIND POWER APPLICATION

The SDS proposed wind turbine field you are now studying is unique in several respects: It would be the first such project located directly adjacent to the Columbia River Gorge Scenic Area and would introduce turbine towers visible from various locations within the Scenic Area. The Gorge Act, though it did not visualize tall towers that would impact views from the gorge, is very specific about aesthetics. Since the Act's implementation, even single nonconforming houses have generated extensive debate.

Impacts on timber production and wildlife are major concerns related to the proposal. SDS intends to reduce all vegetation to no more than 15 feet high within 150 feet of each turbine. Within the next 350 feet, vegetation would be kept less than 50 feet high. Nearly all timber harvest would thus be permanently eliminated for approximately 18 acres around each turbine. For a 100 turbine field, this would total 1,800 acres, or nearly 3 square miles, of lost timber production. Turbine access roads and appurtenant facilities would multiply this loss several fold.

Numerous wildlife species, not just those threatened or endangered, rely on forest habitats. Bird mortality from wind turbines is fairly well documented, but most such studies have focused on turbines located outside of forest areas. Other wildlife concerns are associated with the SDS proposal; these concerns include seasonal use patterns, travel corridors, habitat alteration or removal, soil loss and associated stream sedimentation, and area abandonment by wildlife due to turbine noise. Many animals, with hearing more acute than ours, can be detrimentally affected by noise. Considering these and related concerns, the Washington Department of Fish and Wildlife's recommendation for a comprehensive cumulative effects analysis should be required for this or any wind turbine application, especially when proposed in a forest setting.

Various kinds of EIS studies are typically prepared and funded by the projects' proponents. However, for this and other wind power projects in Washington, your agency, the Energy Siting Council, prepares the EIS. That approach appears a most questionable use of public funds for this highly contentious proposed gorge project which the Governor may well not approve in the long run.

A Skamania County representative will apparently join the Siting Council to consider the Whistling Ridge turbine proposal. That person should logically be as open-minded and nonbiased as possible. Yet, it should be stressed that Skamania County's Board of Commissioners is already on record as favoring this proposal, plus another controversial proposal by SDS for a large rural resort within the Gorge Scenic Area, plus a big tribe-sponsored gorge gambling casino at Cascade Locks. Perhaps a bit of bias involved there!

This wind power application involves several precedents: No large wind power installations are in or next to the Gorge Scenic Area, and none in the Pacific Northwest

are located on forest lands. Impacts on wildlife and timber harvest in such locations are essentially little studied and unknown. Wind is a legitimate source of power production, but only if it does not conflict overly with other values. In this case, placing multiple wind turbines which would remove hundreds of acres of sustainable tree harvest on forest lands favored by many forms of wildlife immediately adjacent to the Gorge Scenic Area appears substantially unwise.

James M. Hutchison 5-6-09
Retired fish and wildlife biologist

RE: Whistling Ridge Energy Project
Skamania County, Wa

To whom it may concern:

We are residents of Skamania County, Washington and would like to provide our support for the proposed Whistling Ridge wind power site. Alternative sources of energy are a vital part of our future, and fit with National goals of implementing programs to achieve energy sources. We commend SDS for taking the initiative to research and implement this energy source west of the Cascades. The analysis of mitigation methods to achieve a safe and effective energy source such as wind power have already been implemented in other areas of Washington State, as well as throughout the world. We are hoping to see more of these projects implemented in the future.

Sincerely,

James and Cynthia Shank

COMMENT LETTER 81

Dear Washington EFSEC

RE: Governor Gregoire must Support Whistling Ridge

First and foremost, I wanted to be brief and not waste your time. I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would have significant positive economic impacts without effecting wildlife and plant habitat. In my opinion, this project would **NOT** affect any scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire approve this project.

I was born, raised and currently live next to this proposed project site. I have found that many people form an opinion based on untrue facts. I have read and reviewed the draft environmental impact statement, and in doing so have evaluated all the pros and cons of this project. Like any project you have people on both sides and sometimes in the middle. I feel that it is obvious that the pros way outweigh the cons.

This project is a must; and quite frankly a need here in our community! It is good for our economy and for the future need for energy. I am in full support for renewable energy. We need to understand for our future to be successful, this project must go through. SDS Lumber Company has worked hard and has given so much to this community. Most of the people that are opposing this do not live in this area and do not really understand what our needs are right now and what they will be in the future. Thank you for your time.

A handwritten signature in black ink, appearing to read "Ryan Kreps".

Re: Preliminary Comments and Questions on the Whistling Ridge Energy Project Draft Environmental Impact Statement: Cumulative Impacts, Carrying Capacity, Energy Production, *Economic Analysis*

Dear EFSEC and BPA,

These are my preliminary comments and questions. I will be making further comments during the public comment period.

Let me be blunt: in reading the Cumulative Impact Analysis section in the DEIS, 3.14, p. 3-264, I was perturbed to find that there have not been any cumulative impact analyses done. There are statements made about cumulative impacts but no analyses. **The basic refrain appears to be that, in the past, bad environmental things happened in the project area, bad things will happen in the present because of the project, and this will lead to more bad things happening in the future!** This is not cumulative impact analysis.

The NEPA process must use critical analyses for Federal projects and this one qualifies because of BPA's interest. The Council on Environmental Quality's Considering Cumulative Effects: Under the National Environmental Policy Act Handbook gives pretty clear methods on analyzing cumulative effects. Table 5.3, p. 56, Primary and special methods for analyzing cumulative effects, gives seven primary methods and four special methods for analyzing cumulative effects. (I submit the Handbook into the record.) For example, what I did not see in the DEIS was a Trends Analysis, which is #6, in Table 5.3 of the CEQ Handbook—"Trends analysis assesses the status of a resource, ecosystem, and human community over time and usually results in a graphical projection of past or future conditions. **Changes in the occurrence or intensity of stressors over the same period can also be determined. Trends can help the analyst identify cumulative effects problems, establish appropriate**

environmental baselines, or project future cumulative effects. I saw no environmental baselines data in the DEIS. Where is it? With out baseline data, cumulative impacts/effects are very hard to quantify.

Another example, #5, Modeling, under Primary Methods, states “Modeling is a powerful technique for quantifying the cause-and-effect relationships leading to cumulative effects, can take the form of mathematical equations describing cumulative processes such as soil erosion, or may constitute an expert system that computes the effect of various project scenarios base on a program of logical decisions.” The strengths of this method are: it “can give unequivocal results; addresses cause-effect relationships; quantification; can integrate time and space.” Weaknesses are: “need a lot of data, can be expensive, intractable with many interactions.”

Just two examples, and there are many more, from the DEIS, I believe, show its inadequacy, especially in cumulative impacts analysis:

In 3.14.3.4, Vegetation and Wetlands, p. 3-272, the proponent states: “Past and present land development, timber harvest, and agricultural uses have resulted in a **cumulatively significant change** in the composition of vegetation and habitat types in the project vicinity. In general, land development and agricultural uses have resulted in conversion of forested areas to non-forested areas, and timber harvests have resulted in a mosaic of forest ages, with average stand age declining over time from relatively short stand rotations. Changes in stand structure and complexity, patch size, and species distribution also have occurred. Few large, old-growth conifers or late-successional stands exist [my questions: **how many, where are they located, is there a map, etc?**] in the general project vicinity. **Accordingly, past and present uses have resulted in cumulative habitat conversion and an ongoing pattern of habitat fragmentation. [my questions: how much fragmentation, what kind of fragmentation, affecting which species, etc.]** Reasonably foreseeable future actions, such as ongoing land development and timber harvests, **would continue this trend.**” [my emphasis] And, it goes on to say: “Project construction would take place in the context of the existing use of the project vicinity generally for commercial forestry, which includes regular cycles of clearcutting and reforestation. **Nonetheless, by removing trees and other vegetation in the wind project area for the life of the project, development of the Proposed Action would contribute incrementally, though in a relatively minor way, to these cumulative impacts.**” This is not a cumulative impact analysis, wherein all the past, present, and future habitat fragmentation would have to be quantified, and then a cumulative impact analysis done on the project area. And then this project would also have to look at habitat fragmentation in the geographical areas surrounding the project in order to get a total picture of all the habitat fragmentation. Cumulative impacts are not done on a project by project basis with no additive analyses. Regional cumulative impacts matter.

In the same section, p.3-273, Wetlands, the DEIS states: “Incremental losses and degradation of wetlands over time have cumulatively depleted [my questions: **how much, maps, species affected, etc.**] wetland resources in the United States. In the project

vicinity, wetlands likely were previously impacted by construction of a variety of activities, including development of roads and railroads, agricultural activities, and past timber harvests. **[my questions: what are the cumulative impacts on the wetlands from all this past and present activity? How will your project affect these cumulative impacts?]** Reasonably foreseeable future actions **may also affect** wetlands in the project vicinity, but it is expected that these future projects would be required to avoid, minimize, and compensate for any potential impacts to wetlands from filling or other activities as part of project Section 404 permitting requirements. Regardless, because **construction and operation of the proposed wind project would not impact wetlands, implementation of the Proposed Action would not contribute to cumulative impacts to wetlands.**” [my emphasis]

I’m sorry, we’re supposed to take their word for it that their project would not impact wetlands??? Where is the cumulative impact analysis of the wetlands in the area?

This is not cumulative impacts analysis. It is wishful thinking. And wishful thinking doesn’t get the project okayed. I will be submitting further comments on the cumulative impacts at a later date.

We have not even touched upon **Carrying Capacity Analysis**, which should be applied to a wide range of resources to address cumulative effects. From the CEQ Cumulative Effects handbook: “Cumulative effects are a more complex problem for whole ecosystems, because ecosystems are subject to the widest possible range of direct and indirect effects. Analyzing the cumulative effects on ecosystems requires a better understanding of the interworkings of ecological systems and a more holistic perspective. Specifically, ecosystem analysis entails new indicators of ecological conditions including landscape-scale measures. In addition to these two special methods, analyzing cumulative effects on human communities requires specific economic impact analysis and social impact analysis methods.” Where are the special economic impact analyses and social impact analyses for this project? Cumulative economic impacts don’t just mean the impacts to the local area. Cumulative economic impacts are and should be regional in nature and it is prudent to ask what the cumulative impacts of this wind farm will be on our region. Will the impacts be harmful or beneficial? No one can answer that because there is no in-depth analysis in the DEIS.

I also have some questions for BPA:

Questions for BPA:

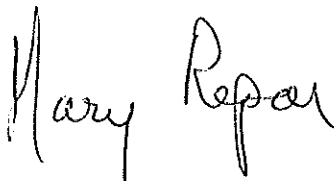

- 1) Even if there are multiple wind farms integrated into your system, do you have to operate the grid as if there were NO wind farms connected to the grid, since wind can be unpredictable and inconsistent?
- 2) If there is no wind and the dams cannot let water through because of other issues (i.e., fish protections), do you have to have backup natural gas plants to produce the added electricity that the wind turbines would be providing? (I am assuming that if the wind farms provide X amount of energy to the grid, BPA will sell X amount of energy to make more money, and the people to whom this X amount of

energy is sold would not be happy if they were not getting their X amount of energy, so if the wind is not blowing and the water is not flowing, the energy would have to come from somewhere, wouldn't it?)

- 3) Does BPA have any plans to build or partner in any natural gas plant projects?
- 4) How big would these natural gas plants have to be?
- 5) How is BPA going to back up the real and potential wind energy production from all of these wind farms?
- 6) Transmission lines:
 - Is BPA going to have to build more transmission lines?
 - Where would these lines have to be built, if they are needed?
 - What kind of lines would have to be built to accommodate all the increased wind energy production?

I would also like to submit the following articles into the record: "Swollen Columbia River churns so much electricity BPA is giving some away," by Ted Sickinger—BPA generating power 144 percent of normal Spring generation—so what to do with all this "extra" power, *The Oregonian*, June 11, 2010; and, "Birds vs. the wind farms," by Hal Bernton, *The Olympian*, June 08, 2010—"Based on that information, the wind power turbines currently operating in Oregon and Washington kill more than 6500 birds and more than 3000 bats annually."; and, "Increased Costs are Blowin' in the Wind," by Todd Wynn and Eric Low, *Cascade Commentary*, from Cascade Policy organization, February 17, 2010—"Wind energy on the Pacific Northwest's electricity grid has increased substantially. Often overlooked are the impacts of increasing wind generation on the reliability and affordability of electricity that very well might outweigh any of the promised environmental benefits."

Thank you for this opportunity to submit my comments. I will be making more comments on the entire DEIS at a future date.

Swollen Columbia River churns so much electricity BPA is giving some away

Published: Friday, June 11, 2010, 7:32 PM Updated: Saturday, June 12, 2010, 8:08 AM

Ted Sickinger, The Oregonian

[View full size](#)

Water shoots back up from the flow deflectors immediately below the spillway at Chief Joseph Dam in Washington. The deflectors help moderate oxygen levels to protect fish when river levels are unusually high.

Winter's snow drought has given way to a temporary flood of late spring runoff, forcing regional managers of the electrical grid to give away power, dial back generation at thermal plants and rapidly fill reservoirs to maintain acceptable conditions for migrating fish.

Robust water flows in the region's rivers are typically a blessing, creating a bounty for electricity generation, irrigation, fish passage and recreation. Indeed, only a month ago, the **Bonneville Power Administration** was issuing dire warnings about summer water shortages.

Those shortages are likely to materialize regardless, as rain now won't substitute for snowmelt in July and August. But early June's onslaught of moisture has temporarily

pushed the Columbia River and its tributaries toward flood stage and taxed the hydro system's flexibility to manage competing interests.

The prevailing pineapple express has pushed precipitation levels to 700 percent of normal in some areas of the Snake River Basin and 170 to 200 percent of normal on the upper Willamette River, said Jim Barton, chief of water management in the Columbia Basin for the **U.S. Army Corps of Engineers**.

Too much rain means too much water over the dams' spillways, and the resulting turbulence leads to excess dissolved oxygen in the water. That's harmful to fish, so the big dam operators in the region -- the Corps and Bureau of Reclamation -- divert as much water as possible into reservoirs or through the dams turbines to generate electricity.

"All the reservoirs are filling or near full, so that makes it challenging," Barton said. "You can only store so much."

Then you generate.

"The more the dams can generate, the less they spill and the less issue with dissolved oxygen," Barton said.

When you create electricity, however, you need to use it, immediately, or risk an imbalance on the grid.

During the last few days, the 31 federally operated hydroelectric dams in the region have been running full tilt, generating an average of 13,000 megawatts of electricity. That's 144 percent of their normal spring generation -- the equivalent of adding four nuclear plants worth of electricity generation to the regional mix.

Complicating the picture is the region's growing fleet of wind turbines, which have been cranking out extra megawatts as the same storm cells dumping rain into the rivers have whipped wind speeds higher.

"You can only run the turbines as fast as you can find a home for the power," said Michael Milstein, a spokesman for the Bonneville Power Administration, which markets the power from the federal dams and one nuclear plant, and integrates the spikey output of the region's wind fleet onto the grid.

To accommodate the surge, the nuclear plant at Hanford has been dialed back to 25 percent of capacity, Milstein said. BPA has also warned wind farm operators that it won't be accepting much, if any, unscheduled power production.

Meanwhile, the agency has been enticing utilities to turn off their own power plants by giving away electricity for free, or near free, at several junctures since Wednesday.

"That's helpful to customers, as it flows through in lower power costs," said Steve

Corson, a spokesman for Portland General Electric.

While the weekend weather is expected to be dry, it takes several days for a slug of moisture to move through the system.

"We expect things to be returning to normal by Monday," Milstein said. "It certainly has been a test of the system."

Birds vs. the wind farms

BY HAL BERNTON

SEATTLE - Biologist Orah Zamora spends her days walking around wind turbines in search of dead birds and bats. Most of her surveys turn up nothing, but every once in a while she finds a carcass that may have been felled by a whirring blade.

“It’s like a crime scene, and you try to figure out what happened. Sometimes, it’s really obvious because you see a slice mark,” Zamora says.

Zamora’s monitoring at the Windy Flats project near Goldendale is part of a larger series of surveys to assess how the wind-power boom is impacting birds that must now share air space with the towering turbines.

The surveys, which are financed by the wind industry, indicate that wind power is a relatively minor hazard to birds. But some scientists say it is still too soon to discount the risks posed by the rush to develop Northwest wind power. They are particularly concerned with the plight of hawks, eagles and other raptors, which are large, long-lived birds at the top of the food chain.

One survey at Big Horn Wind Farm in Klickitat County estimated that more than 30 raptors were killed during an initial year of operations – more than seven times the number forecast in a pre-construction study. The dead raptors included kestrels, red-tailed hawks, shorteared owls and a ferruginous hawk, which Washington state lists as a threatened species.

“It’s just too early to say what this all means,” said K. Shawn Smallwood, a California ecologist who has published numerous scientific articles on wind farms and raptor deaths. “The science is just not there yet.”

There also is uncertainty about how raptors react to wind-power development, which often carves up foraging grounds with miles of new roads. Some say more studies are needed to determine if some species shy away from these areas or eventually abandon nests near the wind farms.

“Some of these projects are going up in undeveloped areas that were kind of havens for these species,” said James Watson, a Washington Department of Fish and Wildlife biologist who has spent 40 years studying raptors. “These turbines are occupying some of the flight space that is their bread and butter.”

Zamora works for West Inc., an ecological field-study company that has become a major contractor for the wind-power industry. The company’s surveys of turbine operations,

which typically last a year or more, do miss some dead birds that get quickly picked apart by ravens, vultures or coyotes. Statisticians try to account for such removals in coming up with the final survey estimates that have been released for about a dozen Northwest wind farms.

Based on that information, the wind-power turbines currently operating in Oregon and Washington kill more than 6,500 birds and more than 3,000 bats annually.

In an era of climate change and a massive oil spill off the coast of Louisiana, windpower advocates say these deaths are an acceptable trade-off for development of a renewable energy source.

They note that house cats and other man-made hazards cause tens of millions of bird deaths each year.

Bird mortality “at wind farms, compared to other human-related causes of bird mortality, is biologically and statistically insignificant,” wrote Mike Sagrillo, a consultant who writes for American Wind Energy Association.

In recent years, some of the biggest Northwest concerns about raptors and windpower development have been in the plateau country of Klickitat County, whose farm fields and grazing lands offer a buffet of chukars, rabbits and other prey to birds that nest in the nearby Columbia River Gorge.

Wind-power developers, after consultations with state biologists, have agreed to relocate some turbines away from canyon edges frequented by raptors, and avoid installing them in some areas used by raptors or near their nests.

“We take the questions and concerns of wildlife impacts very seriously,” said Jan Johnson, a spokeswoman for Iberdrola Renewables.

- [Environment](#)

— Todd Wynn

by Todd Wynn and Eric Lowe

Increased Costs Are Blowin' in the Wind

Summary: Wind energy on the Pacific Northwest's electricity grid has increased substantially. Often overlooked are the impacts of increasing wind generation on the reliability and affordability of electricity that very well might outweigh any of the promised environmental benefits.

Download the [.pdf here](#), or click through the break to read the commentary.

Wind energy on the Pacific Northwest's electricity grid has increased substantially over the years, and this is leading to a number of problems. The Bonneville Power Administration (BPA), the Pacific Northwest's federal power marketing authority, is charged with integrating the large influx of wind power into the electricity grid. In 1998, the BPA's wind generation was roughly 25 megawatts (MW). Today, it totals 2,780 MW; and, with the Oregon Renewable Portfolio Standards passed in 2007, over 6,000 MW of wind power is expected to be on-line by 2013. Often overlooked are the impacts of increasing wind generation on the reliability and affordability of electricity that very well might outweigh any of the promised environmental benefits.

The negative aspects of wind power are quite apparent. Obviously, wind is unpredictable and inconsistent, which creates a significant problem for BPA and electric utilities. To prevent brownouts or overloads on the grid, BPA must schedule energy production in advance.

However, the ability to predict when and how hard the wind will blow is extremely limited (usually a two- or three-day window) and often inaccurate.

Because wind power is so unpredictable, every megawatt must be backed up by an equal amount of reliable energy sources in reserve to replace the energy lost when the wind dies down. This means BPA must have a “balancing” reserve equal to or greater than the wind power capacity utilized at any given time. In the Pacific Northwest the backup source traditionally has been federally owned hydroelectric dams, which are shut on and off to respond to fluctuations in wind energy.

According to BPA, the ability of the federal hydro system to serve as a balancing reserve maxes out between 3,000 and 3,500 MW of installed wind generation. **This means that BPA can only back up roughly half of the projected increase in wind power.** In the near future, BPA will be forced to consider other options to establish a satisfactory reserve for integrating the large influx of unreliable energy.

Some efforts to rectify the integration problem include evaluating the feasibility of dynamic scheduling, which means breaking down the periods of time wind generation is scheduled (e.g. from hour-to-hour to 30-minute increments). Additionally, BPA is analyzing better ways to forecast wind speed and is researching storage technologies (such as compressed air or flywheel technology). Such advances are generally far-off, or would fail to address the problem completely. **Therefore, BPA eventually will be forced either to buy additional dispatchable generation capacity from third-party suppliers or to build additional back up capacity.** This leads to additional costs for BPA, the utilities which purchase power from BPA, and ultimately Oregon ratepayers.

Where this additional backup energy comes from is a critical question. PGE has begun the permitting process for a natural-gas fired plant in North-Central Oregon, and plans for a second natural gas plant in 2015 are underway. These plants will become even more necessary as the ability to use hydroelectric dams as backup is strained and wind generation capacity keeps expanding due to legislative mandates.

Building new natural gas facilities to serve as a backup for additional wind sources has several related problems. **First, natural gas is subject to price volatility, similar to buying gasoline at the pump. Uncertainty in production and delivery lead to significant fluctuations in natural gas costs. Further, natural gas facilities produce greenhouse gas emissions, which at least partly negates the purpose of the renewable energy mandates.** Thus, not only are electricity rates increasing because of additional wind generation, but the subsequent increase of natural gas reliance further exacerbates the problem by introducing volatility.

In 2009, BPA requested the Oregon Public Utility Commission (OPUC) to allow an electricity rate increase to reflect the costs of integrating wind. BPA proposed an increase of \$2.79 per kilowatt-month, and the OPUC set the final rate increase at \$1.29. According to BPA, the associated costs of the \$1.29 rate increase broke down as follows: \$0.05 for regulatory expenses, \$0.26 for load following (e.g. wind forecasting) and \$0.98 to correct imbalances (e.g. balancing reserves such as natural gas or hydro). The previous rate of \$0.68 per kilowatt-month did not reflect the costs associated with imbalances in wind production. The new rate represents a

doubling of wind integration costs, and this rate will continue to increase as more wind energy is added to the grid. These additional costs are eventually passed on to Oregon ratepayers.

It does not seem wise to promote and force Oregonians to purchase an energy source that has so many associated costs. At best, wind power simply replaces a clean, reliable and affordable source of energy: hydroelectricity. At worst, it invites increased price volatility, increased rates, and the prospect of more greenhouse gas-emitting facilities. **Ultimately, increasing wind generation leads to financial burdens on businesses and individuals across the state that ought to be considered further.** Legislators should not attempt to choose “winners” in emerging energy technologies, nor should they force costly energy sources upon ratepayers. Instead, utilities should allow ratepayers to pay the full cost of renewable energy voluntarily and to expand renewable energy according to ratepayer demand.

Todd Wynn is Climate Change and Energy Policy Analyst at Cascade Policy Institute, Oregon's free market public policy research organization. Eric Lowe is a research associate at Cascade Policy Institute.

Congress of the United States
Washington, DC 20515

WR - DEIS
Public Comment #214

November 18, 2009

Mr. Rory Westberg
Deputy Regional Director
National Park Service
Pacific West Region
909 First Avenue, Fifth Floor
Seattle, WA 98104

Dear Mr. Westberg:

We are writing to express our disappointment in the letter submitted by the National Park Service (NPS) to the Bonneville Power Administration (BPA) regarding the Whistling Ridge Energy Project. This letter mentions the project's proximity to the Lewis and Clark National Historic trail and the Oregon Pioneer National Historic Trail as well as it being adjacent to the Columbia River Gorge National Scenic Area as the basis for the Agency's objections.

However, as you know, the National Trails System Act (NTSA) does not give authority to regulate or restrict private land that is not part of the designated trail. In fact the only mention of scenic protection in the Act is in Section 7 (k) authorizing private parties to donate scenic, recreational or conservation easements that enhance the trail and have the donation considered as a public gift for tax purposes.

Although the letter was clearly outside any authority the NPS has under the NTSA, you went on to make specific demands, including "at minimum removing turbine corridor A1-A1 from further project consideration." The letter also asserts that "the visual quality of the region is specifically protected by designation of the Columbia Gorge National Scenic Area (CRGNSA) in 1986." However, the National Scenic Act does not provide any authority to regulate activities outside the National Scenic Area, which the letter acknowledges itself is the case with this project. The relevant section of the Act states:

Per Section 17. Savings provisions (Sec. 554o)

(a) Nothing in sections 544 to 544p of this title shall....

(10) establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas.

As supporters of the development of new sources of renewable energy, including wind power, we are concerned that the Agency would act outside of its jurisdiction to attempt to obstruct this specific project and our nation's broader goals for renewable energy development. We therefore recommend that the May 18, 2009 letter be retracted and in the future that the Agency confine its public comments to those matters that are within its jurisdiction and are consistent with the laws and policies adopted by the Administration and Congress.

Please feel free to contact either of our offices if you have any questions.

Sincerely,

Brian Baird
Member of Congress

Regional Forester Mary Wagner
US Forest, Region 6
333 SW First Avenue
PO Box 3623
Portland, OR 97208

Dear Ms. Wagner,

I write to express my disappointment in both the United States Forest Service's (USFS) letter submitted to the Energy Facility Site Evaluation Council (EFSEC) and testimony provided by USFS staff at the hearing held on May 6, 2009, regarding the Whistling Ridge Energy Project.

As you know, the National Scenic Act does not provide any authority to regulate activities outside the National Scenic Area.

Per Section 17. Savings provisions (Sec. 544o)

(a) Nothing in sections 544 to 544p of this title shall...

(10) establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas.

Despite no authority to do so, the USFS, as stated on the last page of its letter, recommends ... "the applicant eliminate turbine locations found to be visible from Scenic Areas KVAs." In addition, it is my understanding USFS staff testified that the Wind Energy project in Klickitat County should never have been permitted.

My concern is two-fold. Not only is this project outside of your agency's jurisdiction, but your actions could have detrimental impacts on the project with, as I see it, very minimal benefit. Let me be clear, I support wind turbine projects such as this. I believe them to be worthwhile and consistent with our nation's goal of generating clean, renewable energy. I question the value of blocking such a project and I question the agency's role in this issue.

Greetings:

The Congressman has asked I submit to the BPA and EFSEC his November 18th 2009 letter addressed to the NPS (National Park Service) to clearly state his objection to federal agencies asserting their authority in the matter of the Whistling Ridge Wind Energy Project.

If you have questions or need to clarify our request to have the letter included in the public record, please feel free to give me a call. I appreciate the time sensitivity as your deadline for public comments nears.

Thank you. Kelly

Greetings:

The Congressman has asked I submit to the BPA and EFSEC his November 18th 2009 letter addressed to the NPS (National Park Service) to clearly state his objection to federal agencies asserting their authority in the matter of the Whistling Ridge Wind Energy Project.

If you have questions or need to clarify our request to have the letter included in the public record, please feel free to give me a call. I appreciate the time sensitivity as your deadline for public comments nears.

Thank you. Kelly

November 18, 2009

Mr. Rory Westberg
Deputy Regional Director
National Park Service
Pacific West Region
909 First Avenue, Fifth Floor
Seattle, WA 98104

Dear Mr. Westberg:

We are writing to express our disappointment in the letter submitted by the National Park Service (NPS) to the Bonneville Power Administration (BPA) regarding the Whistling Ridge Energy Project. This letter mentions the project's proximity to the Lewis and Clark National Historic trail and the Oregon Pioneer National Historic Trail as well as it being adjacent to the Columbia River Gorge National Scenic Area as the basis for the Agency's objections.

However, as you know, the National Trails System Act (NTSA) does not give authority to regulate or restrict private land that is not part of the designated trail. In fact the only mention of scenic protection in the Act is in Section 7 (k) authorizing private parties to donate scenic, recreational or conservation easements that enhance the trail and have the donation considered as a public gift for tax purposes.

Although the letter was clearly outside any authority the NPS has under the NTSA, you went on to make specific demands, including "at minimum removing turbine corridor A1-A1 from further project consideration." The letter also asserts that "the visual quality of the region is specifically protected by designation of the Columbia Gorge National Scenic Area (CRGNSA) in 1986." However, the National Scenic Act does not provide any authority to regulate activities outside the National Scenic Area, which the letter acknowledges itself is the case with this project. The relevant section of the Act states:

Per Section 17. Savings provisions (Sec. 554o)

(a) Nothing in sections 544 to 544p of this title shall....

(10) establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas.

As supporters of the development of new sources of renewable energy, including wind power, we are concerned that the Agency would act outside of its jurisdiction to attempt to obstruct this specific project and our nation's broader goals for renewable energy development. We therefore recommend that the May 18, 2009 letter be retracted and in the future that the Agency confine its public comments to those matters that are within its jurisdiction and are consistent with the laws and policies adopted by the Administration and Congress.

Please feel free to contact either of our offices if you have any questions.

Sincerely,

Brian Baird
Member of Congress

Attn: Andrew M. Montaña
P.O. Box 14428
Portland, OR 97293-4428
bpa.gov/comment

Dear Mr. Montaña:

The National Park Service (NPS) has reviewed the Notice of Intent to prepare an Environmental Impact Statement (EIS), published in the Federal Register on April 21, 2009. The Bonneville Power Administration (BPA) and Washington Energy Facility Site Evaluation Council (EFSEC) will prepare a joint National Environmental Policy Act (NEPA)/State Environmental Policy Act (SEPA) EIS for a proposed 75 megawatt (MW) wind energy generation project to be located on 1,152 acres in Skamania County, Washington. The NPS has reviewed the Application for Site Certification Agreement (2009-01) (Application) submitted by WRE on March 10, 2009, and offers the following specific comments to the information and analysis provided therein.

The Whistling Ridge Energy (WRE) project is near the Columbia River corridor. While the NPS is supportive of the development of environmentally-sound, alternative energy technologies, we are concerned about the potential direct and cumulative effects of this renewable energy project on recreation and aesthetics in the Columbia River Gorge area.

On page 4.2-76, the Application states that “no national trails are within 5 miles of the proposed facility.” However, this statement is incorrect. Both the Lewis and Clark National Historic Trail and Oregon Pioneer National Historic Trail, administered by the NPS, pass through the Columbia River Gorge and are within 5 miles of the proposed facility. To provide more background on the national significance of these trails, historic travelers on these trails used both the river for downstream transportation and adjacent lands for eastward travel. When Congress designated these trails, it also authorized auto tour routes along Interstate 84 and Washington Route 14. The viewshed from both the river and auto tour routes is a critical part of the visitor experience. In addition to the national historic trails, the visual quality of the region is specifically protected by designation of the Columbia Gorge National Scenic Area (CGNSA) in 1986. These three national resources are independently significant, but the close proximity of all three to each other creates a unique recreational opportunity for visitors to the region. It is important for the NPS to ensure that the scenic and historic values of these areas

TAKE PRIDE®
IN AMERICA 

are preserved from gross alteration of the landscape and viewshed by large-scale industrial development.

Because the WRE project is proposed to be immediately adjacent to the CGNSA boundary, some, if not all, of the proposed 50-turbine project will be visible from within the CGNSA, as described in the visual analysis (Section 4.2) of the Application. About 400 acres of the proposed project (including turbine corridor A1-A7, which will be closest to the CGNSA boundary) are within areas zoned Resource Protection (For/Ag-20) and Residential 10 (R-10) under current Skamania County code. Construction of wind turbines in this area will require a conditional use permit from Skamania County, partially due to the fact that the proposed wind turbines are taller structures than currently allowed in these zones.

We disagree with the level of severity for view impacts suggested in the Application. First, the Application cites dated information regarding viewer perception. In 1987, a survey reported by Thayer and Freeman, reflected both positive and negative attitudes to wind generators, page 4.2-28. This information is inadequate, because at that time, the combined national capacity was less than 2,000 MW. As of 2006, capacity exceeded 12,000 MW, and has likely increased since then, especially given increased emphasis on renewable energy development at both the national and state levels. Moreover, since 1987, the size of turbine infrastructure has increased. Towers are now taller. With taller and more prolific wind turbines, the potential for negative impacts to viewsheds is greater.

Second, the actual size of a feature on the landscape is not the only component in considering viewshed impacts. The Columbia River Gorge area is significant because of the area's scenic and historic qualities. Man-made structures, especially when movement of a structure acts as an additional point of focus, depreciate the scenic and historical qualities that originally warranted national protection. We are concerned with the cumulative impacts to the viewshed resulting from numerous uniform wind turbines extending beyond the horizon line within an open, natural landscape.

We also note that the Application did not adequately cover all of the important viewpoints that should be considered. The Draft EIS should include all of the local Key Viewing Areas identified within the CGNSA, as well as address key viewpoints from the Columbia River that may be potentially impacted. Linear viewpoints from the designated scenic drives and auto tour routes should also be fully considered in the Draft EIS.

The methods used for the visual analysis (Section 4.2) were unclear in some respects. It was not disclosed what heights were used for turbines in generating the simulated scenes, and whether those were placed in the photos by the analytical software or within a photo editing program. Photos used for simulation should not include cloudy or hazy conditions; a clear, blue sky will better illustrate the extremes of contrast between towers and the background.

On page 4.2-66, a footnote in the Application states, "Additionally, for reasons related to commercial viability and engineering feasibility, the project is proposed as an integrated whole, not a series of separate components where parts of the whole may be removed due to subjective, perceived visual effects." The NPS disagrees with this characterization of visual

effects, as the statement appears to suggest that because assessment of visual resources can be a fluid process, it lacks any objectivity or reliability, and is therefore less meritorious when weighed against the concreteness of engineering feasibility and the economics of commercial viability. Impacts to views are not purely subjective and are not merely "perceived," but can be agreed upon and very real. We believe it is clear, even at this early stage, that visual impacts to the CGNSA and the national historic trails will degrade the core scenic and historic landscape values of these resources. We strongly recommend at minimum removing turbine corridor A1-A7 from further project consideration. This would help reduce the impact to visual resources within the CGNSA and along the national historic trails.

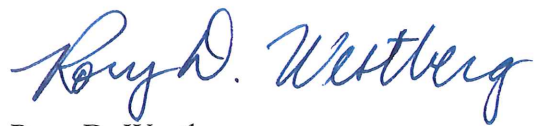

There are certain advantages for developing a wind farm at the proposed location. Natural and cultural resource surveys suggest that few negative impacts are likely to result from the proposed project. Most of the property will remain in commercial forestry operations. Access to BPA transmission lines obviates new line siting and construction. The potential enhancement to local employment and property tax revenues, while small, are still important in this economically depressed county.

Slightly decreasing the total turbines through removing turbine corridor A1-A7 of the proposed project will likely not hinder its viability while alleviating some of the negative visual impacts.

The NPS anticipates having further comments as the NEPA/SEPA process proceeds for the Whistling Ridge Energy project. If you have any questions, please contact:

Subject: Whistling Ridge

Subject: Wind farm siting and permitting officials can help lower the visual impact of wind farms by recommending the deployment of new AVWS technologies on wind turbines.

While large wind farms generate clean energy, their constantly flashing red strobe lights cause great public annoyance and is usually not noticed until after the wind farm is sited and constructed. The wind farm's legacy can include this "light pollution" and have a tremendous negative impact on the community. For example, a 100-turbine wind farm can have approximately 30-50 turbines with two high-intensity flashing lights on at all times of the night. The effects of these flashing lights on the nearby community should be considered during the wind farm permitting and development process.

Recently approved by the FAA, the new generation of "on-demand" lighting systems solves this problem by **keeping all wind turbine obstruction lights OFF at all times** - unless an aircraft is detected flying on an unsafe heading towards the wind farm. Only then does the turbine-based radar system turn the lights on for aircraft safety, and turn the lights off when the aircraft exits the airspace. An Audio Visual Warning System (AVWS) is an on-demand lighting solution. *Wind siting and permitting officials can request wind power developers to implement an AVWS into their wind farms to reduce these adverse visual impacts in your communities.*

An AVWS will benefit your community by:

- Lowering the overall environmental and visual impact of wind farms by reducing "light pollution" and increasing public acceptance in wind energy-producing communities.
- Reducing bird death rates in some areas since migratory birds are less likely to be attracted to wind farm lights and lured toward the operating turbines.
- Fostering more responsible siting practices and therefore overall positive and growth in the wind industry.

Feel free to contact me if you would like further information.

Greg

To: Wright, Al (COM)
Cc: Luce, Jim (COM)
Subject: Response to question from Jim Luce

Al,

Jim Luce called last week and left the following question "How does EFSC work with critical viewing areas in the Columbia Gorge Scenic Area?"

Historically, protected areas are listed as part of our rules (OAR 345-22-0040) and the Columbia River Scenic Area is one those listed, see paragraph (g). By virtue of being listed an energy facility is not allowed. The big however, is that we do not assume that an energy facility outside the scenic is automatically precluded.

For example, when FirstWind proposed the Seven Mile Hill project, just east of the Dalles and bordering the scenic area, the issue of the CGSA came up and the applicant was told that they could not place their facility in the that protected area. Multiple discussion were had that being able to see the facility from the CGSA was not the issue as you can stand within the CGSA and see a myriad of industrial views. However, as FirstWind withdrew the application that regulatory finding was not challenged. Thus, it remains our hypothesis that, for Oregon, only a facility within the CGSA would be prohibited.

Naturally, we assume that if a facility was proposed for construction near the CGSA that our EFSC would likely receive numerous comments about the visual impacts. One of the tools we are hoping to test in the near future on some of our joint State/Federal projects is their visual impact model. I don't know much about it, but it is at least a starting point for determining when an impact is significant. Viewshed degradation is becoming a significant issue associated with both the commercial wind projects and the large transmission projects.

Hope that helps some,

Tom

Subject: Whistling Ridge Energy Project

To Whom It May Concern:

My husband and I are residents of Skamania County and are also employees of the county. For numerous years, our county has relied on Federal tax dollars to subsidize our county's existence in lieu of logging. Although I am a proponent of environmentally responsible logging, I realize those who live outside of our county continue to control our forests and logging will not sustain our economy. The Whistling Ridge Energy Project is, finally, a light at the end of a hopeless tunnel of poverty and welfare. The project is based on environmentally-safe practices and will improve our community as a whole. Many of the opponents of the project DO NOT live in our county. We are tired of those using our county as a "playground" making decisions for our economy and well-being. Friends of the Gorge and other non-profit groups based on "protecting" the Gorge have done nothing more than continue our economical downturn. My husband and I are very active within the county and enjoy fishing, hunting, kiteboarding, and backpacking. We want nothing more than to protect this incredibly beautiful and unique area. We believe the Whistling Ridge Energy Project will do nothing more than improve this beautiful county we call home. Thank you in advance for taking the time to read this email and consider our opinion for this project.

Sincerely,

Summer Scheyer & Russ Hastings

To: COM EFSEC
Subject: Governor Gregoire must deny Whistling Ridge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

I am especially concerned about the impact on spotted owls, as recent studies have shown their numbers continue to decrease steadily, even dramatically in some areas. Any development that might disturb their habitat must be closely, closely scrutinized.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

ENERGY FACILITY SITE
EVALUATION COUNCIL

This is in regards to the slick mailer I received lamenting the wonders of the SDS Lumber Company's plans to install wind turbines on Underwood Mountain. Jason Spadaro says its the right project, right place, and right time.

Well Jason if its the right time, why are they about to dismantle the Condit dam? If we needed this energy wouldn't you think they would first ask us to conserve energy? All this wind power is going to California, none is staying here locally. We have more energy coming out of our ears right here on the Columbia river, Every 40-60 miles on the hydroelectric dams, and most of that energy goes south too.

If its the right place, then why did Hood River County pull their proposed wind turbines on Middle Mountain in the hood River Valley, because its the wrong place. This is the Columbia River Gorge National Scenic Area, you don't put wind turbines in the Grand Canyon, and you don't put them here. I say why don't you put these turbines on your SDS mill site right on the Columbia River in Binger. There is plenty of wind there. These wind turbines belong nowhere near the Columbia River Gorge National Scenic Area, this is not the right place.

As for the ^{right} project, It really saddens me that the SDS Lumber Co. can stroll in and clear cut the entire side of Underwood mountain or spend thousands of dollars mailing ~~CRS~~ ^{Everyone} A slick brochure on how

Much this Area needs this project, we don't need it, you need it. Myself as a Landowner in underwood can't cut a tree down or paint my house a different color without jumping through the gorge Commission hoops. You clearcuts and proposed wind turbines will be visible throughout the Scenic Area for close to 20 miles.

IF this energy were to be used locally I'd be more apt to sign up, but since it's all going to California, I say put the wind turbines up on the California Coast and see how they feel about that, not in the Columbia River Gorge National Scenic Area.

RE: Whistling Ridge Energy Project, EFSEC Application No. 2009-01
Comment on Draft Environmental Impact Statement (Draft EIS)

Dear Sirs and Madams:

Klickitat County appreciates the opportunity to provide this comment on the joint Draft EIS for the Whistling Ridge Energy Project. Whistling Ridge is proposed for location in Skamania County, adjacent to Klickitat County. Klickitat has permitted several wind projects over the past decade, so has acquired experience with evaluating and mitigating project impacts, as well as an appreciation for the socio-economic benefits wind development can bring to a rural community. It is within this context that the County offers these comments and support for Whistling Ridge.

1. Wind Development, Generally: Addressing Both Economic Recovery and Environmental Objectives

Wind development has become increasingly important to both Washington's economy and achieving environmental objectives. Washington voters expressed this when they approved the Energy Independence Act, Ch. 19.285 RCW, in 2006.

[A]ppropriately sited renewable energy facilities ... will promote energy independence in the state and the Pacific Northwest region. Making the most of our plentiful local resources will stabilize electricity prices for Washington residents, provide economic benefits for Washington counties and farmers, create high-quality jobs in Washington, provide opportunities for training apprentice workers in the renewable energy field, protect clean air and water, and position Washington state as a national leader in clean energy technologies¹.

Securing our energy independence is critical not only to economic recovery, but also to our ability to compete in a global economy in which traditional energy supplies are increasingly difficult

¹ RCW 19.285.020; *see also* RCW 70.235.020; RCW 80.80.005.

to obtain. And, it is Washington's rural counties which will play a critical role in generating that energy.

2. Environmental Review for Whistling Ridge

This is EFSEC's fourth wind development project, and the state has been addressing wind project siting now for a decade. BPA has been addressing wind project siting for nearly two decades, if not longer. EFSEC's and BPA's environmental review processes are comprehensive.

Skamania County has reviewed Whistling Ridge for consistency with its land use plans and zoning requirements, as documented through Resolution 2009-54. Klickitat County respects this determination. We also offer the following observation with respect to the Columbia River Gorge Scenic Area.

Whistling Ridge is proposed for location outside the National Scenic Area boundaries. It is outside the purview of the Columbia River Gorge Commission, the Scenic Area Management Plan, and all National Scenic Area Act provisions affecting land use.

Similar to Skamania County, Klickitat could not realize its community and economic development objectives or address its historically high unemployment levels, if Scenic Area proximity were to restrain wind or other types of development in the thirteen exempted urban areas (e.g. the cities of Hood River, Bingen, White Salmon, and The Dalles) or external to the National Scenic Area boundaries. Such an outcome would be inconsistent with the letter and intent of the National Scenic Area Act.

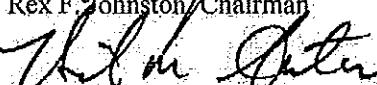

3. Conclusion

Klickitat County appreciates your consideration of these comments. EFSEC and BPA are thoroughly reviewing the Project, which, if constructed, will be an economic and environmental asset to the region and state.

Sincerely,

BOARD OF COUNTY COMMISSIONERS

to obtain. And, it is Washington's rural counties which will play a critical role in generating that energy.

2. Environmental Review for Whistling Ridge

This is EFSEC's fourth wind development project, and the state has been addressing wind project siting now for a decade. BPA has been addressing wind project siting for nearly two decades, if not longer. EFSEC's and BPA's environmental review processes are comprehensive.

Skamania County has reviewed Whistling Ridge for consistency with its land use plans and zoning requirements, as documented through Resolution 2009-54. Klickitat County respects this determination. We also offer the following observation with respect to the Columbia River Gorge Scenic Area.

Whistling Ridge is proposed for location outside the National Scenic Area boundaries. It is outside the purview of the Columbia River Gorge Commission, the Scenic Area Management Plan, and all National Scenic Area Act provisions affecting land use.

Similar to Skamania County, Klickitat could not realize its community and economic development objectives or address its historically high unemployment levels, if Scenic Area proximity were to restrain wind or other types of development in the thirteen exempted urban areas (e.g., the cities of Hood River, Bingen, White Salmon, and The Dalles) or external to the National Scenic Area boundaries. Such an outcome would be inconsistent with the letter and intent of the National Scenic Area Act.

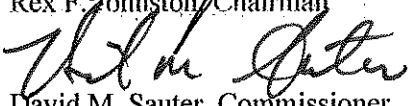

3. Conclusion

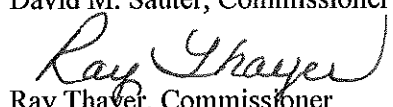

Klickitat County appreciates your consideration of these comments. EFSEC and BPA are thoroughly reviewing the Project, which, if constructed, will be an economic and environmental asset to the region and state.

Sincerely,

BOARD OF COUNTY COMMISSIONERS
Klickitat County, Washington

Rex F. Johnston, Chairman

David M. Sauter, Commissioner

SUBJECT: Preliminary Draft Environmental Impact Statement (DEIS), Whistling Ridge Energy Project

Dear Ms. Chaney:

The Washington Department of Fish and Wildlife (WDFW) has reviewed the above reference document and offers the following comments at this time. Other comments may be offered as the project progresses.

Overall, the Preliminary DEIS is consistent with the 2009 WDFW Wind Power Guidelines, including early and regular consultation, as well as avian and bat studies, habitat characterization, and impact analysis.

WDFW is in agreement with the following excerpt from *Section 3.0 Affected Environment*:

“For permanent impacts to vegetation and habitat, the Section 8.2 of the Wind Power Guidelines (WDFW 2009) recommend mitigation be tailored to specific classifications. The project is located within the classification for “Forestry,” which are those commercial forested areas defined and regulated under the Forest Practices Act. Minimization of conversion of forested areas is suggested, and consultation with WDFW is the only recommended mitigation. No form of acquisition, restoration or conservation of lands is suggested by the guidelines.”

However, we would like to further discuss the proposal as it relates to the table in Section 8.2 of the 2009 WDFW Wind Power Guidelines mitigation for both temporary and permanent impacts.

We support the two-year minimum post-construction avian mortality study, as well as the development of a Technical Advisory Committee (TAC)

WDFW is in general agreement with the proposed commercial forestry operations within the vicinity of each turbine as described in Section 3.0 ("turbine timber buffer") and would like to offer the following interpretation.

According to Section 3.0, "Vegetation surrounding each turbine would be managed according to the following specifications:

- A circular area extending 50 feet from each turbine tower base would be harvested and graveled
- From 50 feet to 150 feet from the base of the turbine towers, tree heights would be limited to 15 feet above the elevation of the base of the turbine
- From 150 feet to 500 feet from the base of the turbine towers, tree height would be limited to 50 feet above the turbine base within an area formed by a 90 degree arc centered on the ordinary downwind direction."

From this, we conclude that within a diameter of 100 to 300 feet surrounding each turbine, tree heights would be limited to 15 feet, and from a diameter of 300 to 500 feet, tree heights would be limited to 50 feet, but only within a 90-degree arc on either side of the turbine aligned with the direction of the prevailing wind. The other 90-degree arc on either side of the turbine perpendicular with the direction of the prevailing wind will essentially be unchanged habitat (i.e. existing commercial forest). We are interested in how this type of habitat and commercial forest management in the immediate vicinity of operating wind turbines will or will not affect the avian and bat mortality. We look forward to working with Whistling Ridge through the TAC to address this issue and cooperatively develop management strategies, if needed, to reduce avian and bat mortality.

Thank you for the opportunity to review the Preliminary DEIS and offer these comments.

Sincerely,

**RE: Renewable Northwest Project's Comments Concerning the
Whistling Ridge Energy Project Draft Environmental
Impact Statement**

Dear Chairman Luce, Director Wright, Mr. Posner, Administrator Wright, Mr. Montano and Council Members:

Renewable Northwest Project (RNP) provides the following comments with respect to the environmental review conducted for the Whistling Ridge Energy Project pending before the Energy Facility Site Evaluation Council (EFSEC) and currently undergoing a comment process for the joint BPA and EFSEC Draft Environmental Impact Statement (DEIS).

RNP does not, as a practice, advocate for particular renewable energy projects. But we have commented, and will continue to comment, on renewable energy projects that we believe have significant policy ramifications for the development of renewable energy in the Northwest.¹ In our view, the Whistling Ridge Energy Project has significant policy ramifications for the development of renewable energy in forested areas of the Northwest, thereby establishing precedent for forestland projects in other regions of the state.

Among the many lessons taught by the recent Gulf Coast oil disaster, one of the clearest is the need for comprehensive clean energy policy. Reliable, renewable energy will play a key role in overall effort to reduce our reliance upon fossil fuel, and pave the way towards a more robust economy. Realizing its potential to drive future economic development, Washington legislatures charged the Clean Energy Leadership Council (CELC) "to create a clean energy leadership initiative that will set the path to leverage Washington's energy infrastructure and make Washington a hub for clean energy technology and a leader in the creation of green jobs and the

¹ For example, RNP was an active participant in the Kittitas Valley Wind Power Project, due to its significant policy ramifications in shaping the direction of Washington's energy policy.

development, deployment, and export of clean energy technologies and services.”²

Reliable, cost-competitive renewable energy benefits from diverse geographic locations of renewable energy projects. Geographic diversity helps integrate variable renewable energy resources into the system at low cost as resources with different daily or seasonal operating characteristics can help support each other. While the State of Washington is endowed by an abundant supply of wind resource potential, to date these resources have been harvested primarily in Washington’s dry, shrub-steppe eco-system that peaks in the spring and summer months. West-side resources may help supply wind during other seasons of the year and blunt the effects rapid wind ramping events.

The Whistling Ridge Energy Project provides Washington with an important opportunity to diversify the supply of wind energy to include resources harvested from forest eco-systems. We are aware of efforts by officials from the Washington Department of Natural Resources to develop procedures for wind power leasing on forestlands.³ However, as the State has yet to adopt procedures or criteria specific to forested land, or to permit a forestland-based project, review of the Whistling Ridge Energy Project must be conducted with the highest standards for science and due process in mind.

We are writing to express our support for acceptance of environmental information contained in the DEIS, and to commend EFSEC, BPA and Whistling Ridge Energy for their compliance with both the spirit and the letter of applicable siting standards and process, including Washington’s Wind Power Guidelines.

RNP was actively involved in the negotiation and development of the 2003 Washington Wind Power Guidelines, as well as the revised 2009 Washington Wind Power Guidelines. We were also active participants in the 2008 Oregon-Columbia Plateau Ecoregion Wind Energy Siting and Permitting Guidelines. As a key participant in these processes, it is our view that the most important element of good wind energy facility siting that minimizes impacts to wildlife and habitat is the early, active and regular consultation with the interested public and with wildlife agencies, including the development of specific protocols to evaluate potential impacts.

As noted in a January 19, 2010 letter from WDFW to the Whistling Ridge Energy Project permitting consultant (enclosed), the wildlife data and information supporting the agency review draft of the DEIS “is consistent with the 2009 WDFW Wind Power Guidelines, including early and regular consultation, as well as avian and bat studies, habitat characterization, and impact analysis.” Under the 2009 Wind Power Guidelines, for commercial forestlands, consultation with WDFW is the principal measure to address habitat and wildlife concerns. Whistling Ridge Energy’s early and regular consultation with WDFW, and its use of study protocols and analyses particularly tailored to commercial forestlands, satisfies the spirit and letter of the Guidelines.

The Whistling Ridge Energy Project has undergone consistent and regular wildlife and habitat studies for multiple seasons and multiple years, beginning as early as 2003. Avian data has been secured over multiple years and in every season of the year. Whistling Ridge has also completed three years of season-specific analysis of bat populations, demonstrating a commitment to wildlife agency review of data concerning impacts to bats. This survey work is beyond what has typically been done in other Northwest wind power

³ See Washington Department of Natural Resources, “Draft Strategies and Procedures for Wind Power Leasing on HCP Trust Lands,” May 27, 2010.

projects, and is consistent with the guideline's theme of siting the project in a manner that will avoid, minimize and mitigate impacts.

We applaud the Project sponsors for the open and transparent manner in which they conducted their research, shared their findings, and engaged the interested public in a series of discussions, field trips, and constructive dialogue. We appreciate the sensitivities associated with a project proposed for location between DNR land historically associated with Northern Spotted Owls and the Columbia Gorge National Scenic Area. In light of these sensitivities, we respectfully suggest that membership in the technical advisory committee (TAC) proposed by the Project sponsors be broadened to include representatives from Washington's environmental community, as well as tribal representatives from the neighboring Yakima Nation. Given its potential as a first project on Washington forestland, we also recommend the Project sponsors work collaboratively with TAC members to develop a comprehensive and robust long-term research agenda.

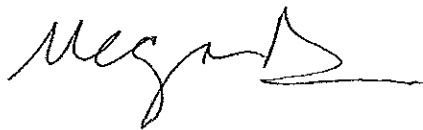

In sum, RNP believes that the Whistling Ridge Energy Project has demonstrated the commitment to meaningful engagement with wildlife agencies, to rigorous environmental review, and to constructive community dialogue that we believe is consistent with the Washington Wind Power Guidelines, and that characterizes responsible wind energy development in the Northwest's commercial forestlands.

We appreciate the opportunity to provide this comment.

Re: Whistling Ridge wind turbine project

Like many people giving open testimony, I am all FOR the project. All persons giving testimony about the Whistling Ridge project seem to agree the time is right for a turbine project. Utilities are being mandated to use larger & larger percentages of wind power. The market is here and now, and the time is perfect.

Progress takes change and change can be good for the world as a whole. There are those who want to stop all progress, just for the sake of having no change. Then there are the Not In My Back Yard people. And, from the world wide environmental perspective, wind power is much friendlier than transporting oil half way around the world in ships.

The location of this turbine project seems to be the primary question. Whistling Ridge is where the wind is abundantly available, locally. The ridge's name is derived from the fact that the wind literally whistles thru the trees when it blows. Trading the whistling noise for the soft slap of turbine blades, and then only when the wind blows, may be better than the whistle.

The power connecting substation can be located optimally close to the project sight and right next to a main Bonneville distribution line. This very rural area will limit impact on a very few humans. The wildlife habitat in the area will change, but the habitat itself will not be "lost." Some animals will move out while others will move into the area. In this case, change might be good, or at least neutral. Since all wind turbines will be located outside of the Columbia Gorge National Scenic area, this should not even be an issue. I hope the lazy turning turbine blades will soon be a sign of progress, and a promise of better things to come.

This privately funded project would mean temporary and permanent local employment. No taxpayer government money will be used to support the construction or maintenance of the project. Economically this project is in a perfect area to help bring desperately needed work dollars into Skamania County. The prime example of this is the money now flowing into neighboring Klickitat County.

The many positive aspects of the project far, far out weigh any temporary negatives. Construction traffic will undoubtedly cause some issues for the local residents. But this too will not last forever, and will soon become a distant memory.

For the reasons stated above, I endorse and SUPPORT this project.

Cam Thomas

Subject: RECOMMEND SUPPORT of the Whistling Ridge Energy Project Draft EIS

Energy Facility Siting & Evaluation Council

As a five year resident of Klickitat County and a near life long Gorge area resident I support the Whistling Ridge Energy Project & urge your support of this project. The project area is outside the Scenic Area thus concerns that relate to it should/do not apply.

Also & more importantly I urge the Council to disregard the Portland Oregon downtown based Friends of the Gorge's (FOG) thoughts/ efforts to miss lead the EFSE Council otherwise. Any large corporation or private organization like FOG worth **7.5 million** can offer/promote a lot of directed comments & miss represent the **true opinions** of the area citizens who reside in the nearby communities & live here within the Gorge.

Subject: whistling ridge enery project draft EIS

Hello,

My name is Mary Twombly. I live at 842 Little Rock Creek Rd. Mill A Washington. I moved here almost 3 years ago. The day we signed the papers on our house we found out about the proposed Industrial Wind Turbine Project. After doing some research on my computer my heart sank as I read all the reports from families living within 2 miles of the Industrial monsters. People like us who had sold their big family homes and wanted to scale down, simplify their lives and live a simple life in the country, gardening, working and enjoying nature. Many of these people now live with insomnia, headaches, irritability, decreased concentration, anxiety, and more. This was very disturbing indeed as I read this information. These are real people, not whiners. They have had to leave their homes to get well. Some have returned only to have the symptoms return. The wind industry disputes these claims dismissing them (without any intelligent responses on why they don't believe it) as whiners, angry etc. Well I would be angry if I had to spend thousands of dollars on medical bills, leave my beloved home and suffer health consequences. People would never do this just to spite the wind industry. These are people just like you and me, and they are sick. It is obvious that there is a problem with placing these large industrial wind turbines too close to residential communities. Why are we continuing to site these projects so close to human habitation? On June 30th 2010 Carl B. Phillips an epidemiologist and health policy researcher with a PHD from Harvard testified at wind siting hearings held at the Wisconsin Public Service Commission in Madison Wisconsin. He stated that there was ample evidence of a problem of some magnitude with siting the Industrial wind turbines near homes. He had studied the subject in depth and submitted a 5 minute verbal testimony and handed in a lengthy written testimony. Dr. Nina Pierpont has done extensive work with persons who live with "wind turbine syndrome" and has written a book called "Wind Turbine Syndrome" A Natural Experiment.

I am a nurse and a massage therapist. I am also a sound healer and work with sound. I am aware of the positive and negative effects of sound. Sound vibrations can harm. Sound vibrations destroyed the Tacoma Narrows Bridge. Low frequency sound vibrations were used as torture in WW2. I am very nervous about the installation of these turbines on the ridges of our beautiful community. There are many people who will be living within 2 miles of the project. How can we risk sacrificing the health of our neighbors? Not everyone is affected by the low frequency vibration.

It would be simple if everyone was, but because of this it makes the ones who are look like liars or crackpots. They are not.

There are many other reasons that I am against the Turbine project. I am opposed to the destruction of the landscape and the wildlife that will be affected.

The migratory birds are at risk, golden eagles, bats etc. In other installations it has been noted that with wildlife nearby disappears or is killed.

The Fish and Wildlife Service recommends not to place these turbines on ridges. I have also heard that one cannot predict what will happen with the sound when turbines are placed on ridges.

I am not opposed to wind turbines, but these ridges so close to the scenic area and long established communities are not a good fit. I told Jason Spadero almost 3 years ago, just because you have this land here and you want to be in the energy industry doesn't mean that it is a good fit.

So my biggest concerns are for the health of the people in this community. It's not fair to put them at risk. Pay attention to the new studies coming out.

Carl Phillips says it would be easy to prove that these turbines are causing health problems, but the money isn't being spent on the studies. The industry doesn't want this type of thing "getting in their way".

If you knowingly OK this project with reliable information about causing humans physical harm, you will be liable for their health problems and could be liable in lawsuits down the road. I beg you to look further into this information. Don't be responsible for harming our community. It just isn't right.

Respectfully,
Mary Twombly

Subject: Whistling Ridge Energy Project

I was unable to attend the recent public hearings regarding the Whistling Ridge Energy Project proposed by SDS Lumber Company. I am in full support of this project and strongly favor its implementation. Sustainable wind energy is an obvious course to pursue in this area of sustainable and abundant energy source.

Having just returned from the eastern Oregon/Washington area, and having seen first-hand the remarkable success being accomplished with harnessing wind power, it only makes good economic sense to take advantage of the site that SDS is proposing.

I have had the pleasure of business relationships with SDS Lumber Company in the past and regard them as a very successful operation. They will install this project in a manner that will certainly benefit this area and the energy needs of the future.

William B. Ward

Public Comment #239

Hello,

We been a resident of Skamania County, for 48 years. I watched the great environmental movement destroy our economy and the economy of our surrounding counties and states.

I understand, now the Boardman, Oregon coal fired plant, is about to become history! What is wrong with these people? They say it creates acid rain in the gorge, Dr. L. I say!

The only air quality problem we have is when the west winds blow, bringing all the airshed problems of Portland and Vancouver with it.

Global warming. Al Gore and all of his fellow believers, need to go somewhere and start their own country, someplace else!

Our weather and climate are changed forever, each time, a volcano erupts somewhere in our world, but they in their environmental movement, never talk of this!

I have no issues over taking care of our environment. We should, it's our duty to do so as stewards of our world we live

ing.

The problem is, extremism!, in anything, is counter productive and really destructive, to our way of life and our country's economy.

So, my feeling on Wind Farms, lets get it done! Time is waisting. Lets take advantage of this great resorce, the wind!

So, you can see them. So what! I dont like green colored cars. Should I start a movement, to prevent folks from having green cars, who like them? Sorry not!

I am 70 yrs, old, disabled and retired. I lived alot in these 70 yrs, Ive seen alot and done alot and learned alot!

All this green madness, thats going on now, is going to destroy us in the end. You've got my vote for the Whistling Ridge project!

Sincerely,
Robert H. Riba

Subject: comments on Whistling Ridge energy project

Please accept the following comments regarding the Whistling Ridge wind energy development project.

I am a strong supporter of alternative energy sources, as long as they are properly sited and designed to minimally impact significant natural resources. Unfortunately, in the case of Whistling Ridge, I cannot support this particular development due to its potential negative impact on the Columbia River Gorge.

The Columbia River Gorge was designated as a National Scenic Area in order to protect and manage its scenic beauty and abundant recreation opportunities. Unfortunately, at the time of the original designation, the legislation did not address "view impacts" of adjoining buffer areas as seen from within the National Scenic Area. I would think that, if industrial wind farms would have been prevalent in the Northwest at the time, the legislation would have addressed siting restrictions for this type of use in those areas where it would negatively impact the National Scenic Area.

The Pacific Northwest does not have a shortage of available sites for wind energy developments. Please deny the application for the Whistling Ridge development, and help preserve the soul of our Columbia River Gorge.

Thank you,

alan wilcox

Subject: comments on Whistling Ridge proposal

Hello my name is Steve Andruss. my address is [REDACTED]

Dear EFSEC committee, Please do not put the wind turbines on Whistling Ridge. White Salmon and Hood River are known for the famed double mt. views. All of our property values will drop when the area becomes known for its multi-turbine views. We need wind power but not in such a beautiful place. The turbine mess out east is bad enough. I am always thankful when I get west of all those blinking lights. It is enough to ruin the eastern gorge with these industrial giants. I don't know how many turbines are out there but adding another 50 turbines to that mess won't make much difference now. To put up 50 turbines on Whistling ridge would blight the whole area. This is a world class scenic area and should be preserved as that. The project west of the Dalles has been canceled and the middle mt. project south of Hood River has been stopped. If we would have known that Whistling Ridge was to become an industrial wind factory we never would have bought property in Mill A. Common sense tells us this is a bad idea and should never be put in. I have been to meetings and listened to the talk about how safe for birds these mills are. The native americans told us that they could not imagine how a bird could fly into these blades. About 2 weeks later, front page of the Oregonian, Golden eagle killed by wind turbines at Goodnoe Hills. How many Golden Eagles are there in the gorge ? At least one is dead. We were told that up to 7000 bats would be killed if the Whistling Ridge project goes in. How many hawks and eagles will die because of this? What are the long term health effects? I have been told that 750 gallons of oil a year will be atomized in each of the turbines. That does not sound like clean energy. Putting these turbines on mountain tops has not been studied thoroughly so we really don't know what the impact will be. Many people are affected by the vibration and sound of the turbines. Again to put them so close to people and towns seems short sighted at best. To conclude I would say don't put the proposed Whistling Ridge tubines in as it is the wrong place to put them. Install them out east where there is less scenic beauty and already lots of turbines and more wind to turn them. Sincerely, Steve Andruss [REDACTED]

Re: Proposed Whistling Ridge Wind Project

Dear Folks,

I steadfastly oppose the Whistling Ridge Project for a number of reasons. Primarily, it is a terrible site as it impacts the Columbia Gorge National Scenic Area in a very big way. Industrial Wind Farms destroy all natural character of the places they are sited. I know. I drive through the eastern Gorge quiet frequently and healthy, wide open feel and wildness of the area is gone now dominated by twirling blades, roads, power lines and thousands of red lights at night. To some this may be an acceptable sacrifice way out in flat farm country, it is completely the opposite, however here on the edge of the Columbia Gorge!!!!

We do need to address increasing energy demands but NOT on the edge of a nationally recognized treasure like the Columbia Gorge.

Thank You,
Daniel Dancer

What is wrong with this project?? EVERYTHING.
° 50 wind turbines 426 feet tall on the very edge of
a National Scenic Area is insane. They are too high,
too many and in the wrong place!! If California,
or Canada, need this power, they can build their own
turbines on their land and ruin their scenery, etc.
Let's not be their FOOLS!
° Right now, wind power seems to make sense only
because of the tax credits. It is only profitable
for the company building the wind farm. The long-
term economic effect here in the Gorge would be
negative because tourism would be hurt: Scenery = \$;

ruined scenery ≠ \$ or tourists,

• The effect of a wind farm on bird and wildlife populations is negative. Turbines Kill!!

In addition, the roads and services necessary to build and service 50 turbines destroy

the very rich, ^{abundant,} and diverse plant and animal life we have here in the Gorge.

A wind Farm is an affront to the land and to living things!

For all of the above reasons please deny this application. The environmental impact is too great.

Subject: I support Whistling Ridge

Hello EFSEC,

I would like to voice my strong support for the Whistling Ridge Energy Project. Washington State utilities must reach the goals set by Initiative 937. Wind is the most feasible and most cost-effective option for bringing 15% new renewable energy on the grid by 2020, which means we need to build more wind farms. Skamania County has the wind, SDS Lumber has the land: it is a match made in heaven. Many studies have shown that the environmental impact of the Whistling Ridge Energy Project would be minimal. For the last century, the site has been used in commercial forest operations. The land has already been cleared, roads built, transmission lines already installed, and wildlife habitats already fragmented. The impacts on a few other species that might be affected are rated low-risk. The environmental benefits are numerous. Wind is clean, renewable, and does not consume water or produce waste. Whistling Ridge will generate 75 megawatts of electricity; enough to power 20,000 homes a year, without contributing to global climate change. The choice is clear: support Whistling Ridge and Skamania County by approving this project.

Sincerely,
john inglis

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. This wind farm will give the Skamania County economy the boost it needs. We are too dependent on timber harvests and federal timber payments. Too many residents are stuck in low-income brackets while unemployment ranks far above the state average. Fortunately, Skamania has another natural resource to develop: wind. Bringing another industry here is exactly what our county needs. It will stimulate local spending, create jobs, and provide new tax revenues. How can that be a bad thing? Skamania County needs to diversify its resources and revenue, and Whistling Ridge can make that happen. I hope the Council approves the SDS application and that the project advances quickly.

Sincerely,
Eric Hess

As a Washington resident who often enjoys the recreational activities available in Skamania County and the Columbia River Gorge (and hence contributes to the local economy), I feel that windmills would enhance rather than detract from the natural beauty of the area. Those who oppose the responsible construction of windfarms are selfish and short-sighted.

The choice is clear: support Whistling Ridge and Skamania County by approving this project.

Thank you for your time.

Hello Energy Facility Site Evaluation Council,

I'm an tired of our country being held hostage to Big Oil with its many foreign sources. I am tired of the ecological disasters that accompany the exploration, refining and consumption of oil. It is imperative that safe, non-poluting forms of energy are encouraged. Wind River is such an alternative. Not to approve this wind farm would be both irresponsible and un-American!!

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. I am a medical student at the University of Washington School of Medicine, and while my professional focus is not on the environment, I am well aware of the human impacts that environmental damage can cause. The recent tragedy in the Gulf Coast highlights the previously existing need for alternative energy, and opponents to its development are contributing to environmental damage while claiming to be fighting against it.

Washington State utilities must reach the goals set by Initiative 937. Wind is the most feasible and most cost-effective option for bringing 15% new renewable energy on the grid by 2020, which means we need to build more wind farms. Hello Energy Facility Site Evaluation Council,

I want to leave my children with clean, reliable, inexpensive electricity to power their future. That means developing alternative sources of energy and having a whole mix of power options to serve our growing population. Wind energy is one of those choices and it makes sense to develop it at Whistling Ridge. Few places exist with the strong winds and transmission lines for such a project. Wind energy is clean, renewable, cost competitive, and is a product we can make right here and use or export to the rest of the country, just like timber. It creates no pollution and can coexist peacefully with the wonderful variety of wildlife we enjoy. Please allow this project to go ahead so that we can leave our children with alternatives for their energy future.

Sincerely,
Fibi Duke

Re: Whistling Ridge Wind Farm

The Whistling Ridge project would technically not be *within* the scenic area, but it would bring an unnatural and terribly imposing negative visual impact to the scenic area. It sets a horrible precedent for industrial-scale and visually imposing and discordant development that will be quite visible from an area prized for its wild areas and scenic beauty.

If find this project disturbing enough, but won't it also set a precedent for even more and possibly even higher windmills? I fear we will have opened pandora's box if we allow this project to move forward.

Are these super tall, stark white, three-winged towers the only or best technology? Do windmills have to be so terribly "in our faces?" Cell towers are sometimes disguised as trees. Can windmills be more of the "eggbeater" design, painted to disappear a bit more and possibly disguised?

Once these windmills are built, they will stand for decades – in use or not. What extra would it cost to locate the windmills (either in construction cost or less efficiency) outside the VIEW of the Gorge Scenic Area? Since this project, like all other windmill projects, is subsidized, shouldn't the tax payer dollars benefit the most people, not just the investors?

Please reconsider this project for the issues above. The country needs alternative energy sources, but we need to be smart about it as well. Once the visual impact is altered by a project like this, it is altered for all decades.

Sincerely,

Debra Garner

Re: Whistling Ridge Energy Project – Application No. 2009-01; Draft EIS Comments.

To EFSEC and BPA:

The Board of Directors of Northwestern Lake Development Homeowners' Association submits the following comments regarding the Draft Environmental Impact Study (DEIS) conducted by EFSEC and BPA with respect to the Whistling Ridge Energy Project (the Project).

I. Introduction.

We represent the owners of 30 residential properties located near the mouth of Little Buck Creek where it empties into Northwestern Lake. There are currently 23 residences built, most of which are full-time residences (as distinct from most recreational cabins located along Northwestern Lake). Our community is approximately two miles east of the Project, and is near the bottom of the Little Buck Creek watershed. The Project would sit at the head of this watershed. Because of our proximity to the Project, we have major concerns about the possible adverse effects it might have on us and our environment.

We submitted Scoping comments, dated 5/15/2009, for this EIS. After reviewing the DEIS, we are of the opinion that, while the DEIS contains massive amounts of information on topics related to the issues we raised, the DEIS fails to directly address and respond to most of our concerns in a meaningful way. We have therefore resubmitted our previous comments in their entirety, and request that EFSEC and BPA revise the DEIS to respond directly and specifically to the concerns that our community has.

Our residents have invested significant amounts of time, energy, money, and especially emotion in building homes and lifestyles focused on our rural, sylvan environment. While we have always known we would be affected by various rural activities such as agriculture and timber operations, we never anticipated that a major industrial activity like a wind farm could be located so near to us. We have grave concerns about several possible adverse effects of the project, and consequent reservations about the location of the Project. We therefore request that EFSEC and BPA carefully study and analyze all possible adverse effects of the Project in its proposed location and evaluate whether other locations would be more appropriate for this type of project.

II. DEIS Issues.

A. Potential Adverse Effects.

1. Noise.

The dominant concern expressed by our Members has been fear that noise from the Project will be a constant nuisance whenever our windows are open, or when we are outside our

homes. Although we are located two miles from the Project, we are concerned that this distance will not protect us due to our geography and wind patterns. The Project will be located at the head of the Little Buck Creek watershed. We are concerned that sound from the Project will echo off valley walls and have an amplified effect on us. In addition, the prevailing winds in the summer (when we are outside most) blow from the Project straight to our homes. So we are also concerned that the wind will carry more noise from the Project to us.

SDS's application has a sound map suggesting that our area will receive 20+ dB of sound from the Project. It is not at all clear to us how this map was produced or whether it is reliable. Perhaps more important, based on reports we have read from residents located near active wind farms, specific decibel measurements might not be the best way to determine whether noise from wind turbines will have an adverse effect. Some of the strongest complaints about wind turbine noise are due to the low-frequency sounds - a constant "whumping" similar to the bass beat that can be heard (and felt) from certain car stereos even from a great distance, and even with the windows rolled up. We have heard that these low frequency sounds can sometimes have much greater impact at a distance than they do at the point of creation. We are therefore very worried about how such sounds might affect us.

It is our understanding that few if any wind projects have been built in terrain with valleys and ridges like ours. So it seems there is very little track record for predicting how noise from the Project might affect us. We therefore request that the EIS make very extensive studies of how sound from the Project will affect us and other residents. In particular, we think tests should be conducted that reproduce, at the Project site, the noise from a project of this size as accurately as technologically possible. Measurements of the noise should be taken not only with instruments, but more importantly, with surveys of the subjective impressions of all affected residents. Unless such surveys are taken, we do not believe an accurate prediction can be made regarding noise effects of the Project.

Lastly, in evaluating whether such noise effects (or any other effects to people) are considered "adverse", we request that EFSEC and BPA rely not on statutory definitions based on decibel levels. Rather, a conclusion that an effect will be "adverse" should be determined by whether the effect will unreasonably diminish the enjoyment of day-to-day life.

3. Lights.

Another complaint we have read about wind turbines regards aviation lights. We request that the EIS investigate what types of light (color, synchronization, quantity, etc.) would have the least impact to people and wildlife. We also request that the EIS evaluate what, if any visual effects aviation lights will have on the night sky in our community (for example, will we see reflections of the lights in the sky on cloudy nights, or even on clear nights?) Likewise, we have read of complaints about "shadow-flicker" from wind turbines. We request that the EIS evaluate whether late afternoon "shadow flicker" will affect our residences, or be visible on the ridges to the east of our community.

3. Environment.

There are many items that should be considered from an environmental and ecosystem perspective regarding a large project like this. All projects like this have an "environmental cost" and although it may not appear to affect our community directly, it does affect the earth; ultimately we are all reliant on the environmental resources of the earth to keep us and all other living creatures alive. In particular, we are concerned that, due to this Project's location in a forest ecosystem, far more wildlife will be negatively affected or harmed than if it were located

in a wheatfield or open plain environment. We are also concerned about whether there will be effects to groundwater and surface water. We request that the EIS carefully evaluate what effects the Project would have on wildlife and the ecosystem.

4. Economics.

While proponents of the Project have correctly emphasized that it could bring some welcome jobs and tax revenues to the area, our Members are quite concerned that if the Project adversely affects our homes, our property values will also be adversely affected. The EIS should evaluate all financial effects of the Project, including specific estimates of diminished property values (region wide) due to reasonably foreseeable adverse effects of the Project.

5. Views.

Our Members have mixed opinions as to whether they would necessarily object to views of the wind turbines, however, most believe that structures of this nature are not in keeping with the spirit or beauty of a National Scenic Area even though such structures are built on land that is just outside of the boundary.

B. Location of the Project.

It would appear that there are much better places to site a project of this magnitude. There are thousands of acres of farmland in Eastern Washington that can (and do) support this type of development. The land to the East is vast, it's close to transmission lines, it is many miles away from homes, has limited recreational value, limited wildlife (as compared to a forest), limited renewable resource (as compared to the timber resources here), there is limited damage to the ecosystem due to installation and it would not detract from views of a National Scenic area. We request that the EIS fully evaluate all of these considerations.

C. Precedent.

We believe it is critical that the EIS address the potential precedent that would be set by approval of this Project. Because it is the first wind farm in Washington to be located in a forest environment (we are told), adjacent to a National Scenic Area, and close to so many residences, a very detailed and thorough analysis of its potential impacts must be provided. Approval of the current application for this project will have precedential effect not only for projects in other regions, but also for expansion of this Project. SDS and DNR have acknowledged that they are investigating a major possible expansion of this Project onto DNR land. We do not know if SDS will seek to expand this Project even further on its own adjacent lands (which would be closer to our community.) However, we are worried that if this Project is approved now based on its smaller size, it will be very difficult to prevent expansions that might initially have been rejected based on an upfront perspective of the total impacts. Consequently, we request that the EIS take the broadest possible view when evaluating the impacts of this Project.

(continued)

III. Conclusion.

We fully support renewable energy and believe it is critical that we embrace it, however, like anything else there are many alternatives to reaching the goals of green power. Some locations are inherently better than others for meeting these goals without imposing undue burdens on the environment or people living near the projects. Given that there are abundant optional locations for this type of project, we cannot support this Project until there is conclusive documentation that it will not have "adverse effects" on our lives and our environment. We respectfully request that EFSEC and BPA rigorously investigate, document, and evaluate our concerns. Thank you.

Sincerely,

Board of Directors: Mike Gundlach, Lynden Hollowell, Mark King, Nanci Sayler, Kit Silver.

Re: Whistling Ridge Energy Project – Application No. 2009-01: Draft EIS Comments.

To EFSEC and BPA:

The Board of Directors of Northwestern Lake Development Homeowners' Association submits the following comments regarding the Draft Environmental Impact Study (DEIS) conducted by EFSEC and BPA with respect to the Whistling Ridge Energy Project (the Project).

I. Introduction.

We represent the owners of 30 residential properties located near the mouth of Little Buck Creek where it empties into Northwestern Lake. There are currently 23 residences built, most of which are full-time residences (as distinct from most recreational cabins located along Northwestern Lake). Our community is approximately two miles east of the Project, and is near the bottom of the Little Buck Creek watershed. The Project would sit at the head of this watershed. Because of our proximity to the Project, we have major concerns about the possible adverse effects it might have on us and our environment.

We submitted Scoping comments, dated 5/15/2009, for this EIS. After reviewing the DEIS, we are of the opinion that, while the DEIS contains massive amounts of information on topics related to the issues we raised, the DEIS fails to directly address and respond to most of our concerns in a meaningful way. We have therefore resubmitted our previous comments in their entirety, and request that EFSEC and BPA revise the DEIS to respond directly and specifically to the concerns that our community has.

Our residents have invested significant amounts of time, energy, money, and especially emotion in building homes and lifestyles focused on our rural, sylvan environment. While we have always known we would be affected by various rural activities such as agriculture and timber operations, we never anticipated that a major industrial activity like a wind farm could be located so near to us. We have grave concerns about several possible adverse effects of the project, and consequent reservations about the location of the Project. We therefore request that EFSEC and BPA carefully study and analyze all possible adverse effects of the Project in its proposed location and evaluate whether other locations would be more appropriate for this type of project.

II. DEIS Issues.

A. Potential Adverse Effects.

1. Noise.

The dominant concern expressed by our Members has been fear that noise from the Project will be a constant nuisance whenever our windows are open, or when we are outside our

homes. Although we are located two miles from the Project, we are concerned that this distance will not protect us due to our geography and wind patterns. The Project will be located at the head of the Little Buck Creek watershed. We are concerned that sound from the Project will echo off valley walls and have an amplified effect on us. In addition, the prevailing winds in the summer (when we are outside most) blow from the Project straight to our homes. So we are also concerned that the wind will carry more noise from the Project to us.

SDS's application has a sound map suggesting that our area will receive 20+ dB of sound from the Project. It is not at all clear to us how this map was produced or whether it is reliable. Perhaps more important, based on reports we have read from residents located near active wind farms, specific decibel measurements might not be the best way to determine whether noise from wind turbines will have an adverse effect. Some of the strongest complaints about wind turbine noise are due to the low-frequency sounds - a constant "whumping" similar to the bass beat that can be heard (and felt) from certain car stereos even from a great distance, and even with the windows rolled up. We have heard that these low frequency sounds can sometimes have much greater impact at a distance than they do at the point of creation. We are therefore very worried about how such sounds might affect us.

It is our understanding that few if any wind projects have been built in terrain with valleys and ridges like ours. So it seems there is very little track record for predicting how noise from the Project might affect us. We therefore request that the EIS make very extensive studies of how sound from the Project will affect us and other residents. In particular, we think tests should be conducted that reproduce, at the Project site, the noise from a project of this size as accurately as technologically possible. Measurements of the noise should be taken not only with instruments, but more importantly, with surveys of the subjective impressions of all affected residents. Unless such surveys are taken, we do not believe an accurate prediction can be made regarding noise effects of the Project.

Lastly, in evaluating whether such noise effects (or any other effects to people) are considered "adverse", we request that EFSEC and BPA rely not on statutory definitions based on decibel levels. Rather, a conclusion that an effect will be "adverse" should be determined by whether the effect will unreasonably diminish the enjoyment of day-to-day life.

3. Lights.

Another complaint we have read about wind turbines regards aviation lights. We request that the EIS investigate what types of light (color, synchronization, quantity, etc.) would have the least impact to people and wildlife. We also request that the EIS evaluate what, if any visual effects aviation lights will have on the night sky in our community (for example, will we see reflections of the lights in the sky on cloudy nights, or even on clear nights?) Likewise, we have read of complaints about "shadow-flicker" from wind turbines. We request that the EIS evaluate whether late afternoon "shadow flicker " will affect our residences, or be visible on the ridges to the east of our community.

3. Environment.

There are many items that should be considered from an environmental and ecosystem perspective regarding a large project like this. All projects like this have an "environmental cost" and although it may not appear to affect our community directly, it does affect the earth; ultimately we are all reliant on the environmental resources of the earth to keep us and all other living creatures alive. In particular, we are concerned that, due to this Project's location in a forest ecosystem, far more wildlife will be negatively affected or harmed than if it were located

in a wheatfield or open plain environment. We are also concerned about whether there will be effects to groundwater and surface water. We request that the EIS carefully evaluate what effects the Project would have on wildlife and the ecosystem.

4. Economics.

While proponents of the Project have correctly emphasized that it could bring some welcome jobs and tax revenues to the area, our Members are quite concerned that if the Project adversely affects our homes, our property values will also be adversely affected. The EIS should evaluate all financial effects of the Project, including specific estimates of diminished property values (region wide) due to reasonably foreseeable adverse effects of the Project.

5. Views.

Our Members have mixed opinions as to whether they would necessarily object to views of the wind turbines, however, most believe that structures of this nature are not in keeping with the spirit or beauty of a National Scenic Area even though such structures are built on land that is just outside of the boundary.

B. Location of the Project.

It would appear that there are much better places to site a project of this magnitude. There are thousands of acres of farmland in Eastern Washington that can (and do) support this type of development. The land to the East is vast, it's close to transmission lines, it is many miles away from homes, has limited recreational value, limited wildlife (as compared to a forest), limited renewable resource (as compared to the timber resources here), there is limited damage to the ecosystem due to installation and it would not detract from views of a National Scenic area. We request that the EIS fully evaluate all of these considerations.

C. Precedent.

We believe it is critical that the EIS address the potential precedent that would be set by approval of this Project. Because it is the first wind farm in Washington to be located in a forest environment (we are told), adjacent to a National Scenic Area, and close to so many residences, a very detailed and thorough analysis of its potential impacts must be provided. Approval of the current application for this project will have precedential effect not only for projects in other regions, but also for expansion of this Project. SDS and DNR have acknowledged that they are investigating a major possible expansion of this Project onto DNR land. We do not know if SDS will seek to expand this Project even further on its own adjacent lands (which would be closer to our community.) However, we are worried that if this Project is approved now based on its smaller size, it will be very difficult to prevent expansions that might initially have been rejected based on an upfront perspective of the total impacts. Consequently, we request that the EIS take the broadest possible view when evaluating the impacts of this Project.

(continued)

III. Conclusion.

We fully support renewable energy and believe it is critical that we embrace it, however, like anything else there are many alternatives to reaching the goals of green power. Some locations are inherently better than others for meeting these goals without imposing undue burdens on the environment or people living near the projects. Given that there are abundant optional locations for this type of project, we cannot support this Project until there is conclusive documentation that it will not have "adverse effects" on our lives and our environment. We respectfully request that EFSEC and BPA rigorously investigate, document, and evaluate our concerns. Thank you.

Subject: Letter of Support For the Whistling Ridge Energy Project

Whistling Ridge,

Wow! It could happen here. Our little community can be a part of a new clean energy economy. I salute Whistling Ridge Energy/SDS efforts to really make this happen. Power has to come from somewhere and what a better place than a locally produced renewable source right in our backyard. We have the wind resource, the transmission lines, and a local company and willing workforce that can make this happen. Let's do this one right.

Ultimately, the arguments against wind turbines boil down to detractors "don't like the way they look." They are entitled to this opinion. If educated about the dirty alternatives or presented with the very real possibility of their sons and daughters being involved in future conflicts to secure our nation's energy security I'm certain their opinions would change.

The new energy economy is not about a silver bullet that renders everything else obsolete. Wind energy is going to be just one part of an increasingly interlinked and interdependent network of distributed renewable energy generation facilities. Solar, hydro, biomass, waves, geothermal, and wind are the silver buckshot that will move our country towards energy independence. I would be proud to say that I'm from a forward community that is contributing towards this effort.

Oh, and, for the record ... I think wind turbines look amazingly cool.

Sincerely,
Jim Pytel

Subject: Governor Gregoire must deny Whistling Ridge

I would like to urge you to deny permission for the wind energy project proposed by Whistling Ridge. Although wind energy may be appropriate in some areas, it is simply short-sighted and destructive to allow for-profit corporations to plant wind farms in sensitive areas, with major financial incentives, without the state and country first making a careful study of what locations are appropriate. This kind of marring of the landscape is virtually impossible to undo, and the benefits of the excess energy production are far-off and limited. The project could easily end up being a complete boondoggle, with citizens and the environment paying the price, not just financially, but in loss of our beloved natural areas.

So much more energy could be saved by some modest efforts at energy conservation, and the environment of our region would benefit too. I urge you to take on the vested interests and push for real conservation measures, calling on the people of Washington to each do their part, instead of opting for the easy political gains of hyping alternate energy while selling out the state to self-interested corporations.

Beyond all this, I fully support the following message from Friends of the Columbia Gorge:

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county line. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area. EFSEC should recommend that Governor Gregoire deny this project.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because this project is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The project would permanently disturb large areas of forested habitat and result in direct and indirect impacts to multiple wildlife species through habitat loss and displacement, direct collisions with turbine blades, and other factors. The potentially affected listed and sensitive species include northern spotted owl, western gray squirrel, northern goshawk, several species of bats, multiple migratory bird species, mule deer, black-tailed deer, and elk.

In addition, locating 426-foot-tall turbines on the ridge line of the Columbia River Gorge would degrade the scenic value of the Gorge. The turbines and their blinking lights would be highly visible from several designated key viewing areas within the National Scenic Area, including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would introduce industrial development into the natural, forested landscape and indefinitely alter views in the National Scenic Area.

I support renewable energy, but I am opposed to industrial-scale wind energy development within or adjacent to the Columbia River Gorge National Scenic Area, a designated national scenic treasure.

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. This wind farm will give the Skamania County economy a necessary boost. Our county has struggled for too many years with high unemployment, which is far above the state average. Now Skamania County has an opportunity to take advantage of a natural resource, which is clean and economically viable. This industry is exactly what our county needs. It will stimulate local spending, create jobs, and provide new tax revenues. How can that be a bad thing? Skamania County needs to diversify its resources and revenue, and Whistling Ridge can make that happen. I urge the Council to approve the SDS application and advance this important project quickly.

Sincerely,
Theresa Lusty

COMMENT LETTER 123

Michelle, Kayce (COM)

From: Rusty Neff [REDACTED]
Sent: Tuesday, July 13, 2010 8:27 PM
To: COM EFSEC
Subject: Whistling Ridge Energy Project Draft EIS

RE: Whistling Ridge Energy Project Draft EIS

To Whom It May Concern;

I'm writing to express my opposition to the Whistling Ridge Energy Project . As a third generation local of the greater White Salmon area, I am appalled at what SDS Lumber is proposing for this project.

We as a community and region have developed green energy here for nearly 100 years in the form of hydroelectric power on the Columbia and its tributaries. In doing so we have sacrificed Celilo Falls, the Cascade Rapids and much of the salmon and steelhead fisheries, as well as many amazing historical Native American sites. Nearby in Klickitat County, we have numerous wind energy projects already developed and more on the way.

How much is enough for one area? The Whistling Ridge project is proposed to be sited on timberland owned by SDS Lumber Company. While the company claims it is not productive, we have watched them harvest and utilize timber from this site. But timber prices are down a bit and the company thinks it can make more money by cutting the trees and placing wind turbines where the trees once stood. In what way is this green? The trees are necessary for cleaning our air and water, pulling CO2 out of the air, providing wildlife habitat and stabilizing the soils on relatively steep slopes. And by planning for wind turbines with blades that will reach as low as 100 feet off the ground, we know they won't be re-growing timber on the site.

What's more, while the proposed site is just outside the Columbia River Gorge National Scenic Area, it is highly visible from many locations within the scenic area. The original legislation for the NSA called for extremely limited development within view from Interstate 84 and Highway 14. This project will be extremely visible from those locations. SDS has been running ads in the local paper showing how visible these towers will be from within the NSA. At some point we need to look to the congressional intent to protect the views of this area. I highly doubt the framers of the scenic area act ever envisioned allowing 400 foot towers (with bright red lights on each of them at night) where they are so visible.

The Columbia River Gorge is an area I consider to be sacred to me and my family. . This is the wrong project for the wrong area. Please say no to the Whistling Ridge Energy Project.

Sonja Neff

Subject: Whistling Ridge DEIS comment

Thank you for the opportunity to comment on the DEIS for Whistling Ridge. After reading though this document, I realized that there is a workable solution that could satisfy common ground that could satisfy many of the residents of Skamania County, and people Columbia Gorge National Scenic Area. The workable solution I recommend is to approve of the Whistling project with the exception of the A1-A7 turbine group.

1) Under "affected environment", "surface water", there is no mention of the unnamed stream east (and down slope) of the A1-A7 turbine group. This stream initiates as a spring and flows year round, and eventually empties into the Columbia River. In addition, it flows through World Stewardship Nature Preserve Land (soon to be purchased by Columbia Land Trust). Please add this consideration to your study. Under "groundwater", the same unnamed stream mentioned above has been overlooked since it does originate at groundwater. Eliminating the A1-A7 turbine would eliminate any effects on the following factors would eliminate the impact to these important water resources.

3) There was no discussion on the impact to the military flight route VR-1355. The A1-A7 turbines cut across the introduction of the route as the aircraft fly over the Hood River Bridge and make their turn onto this route. Also, helicopters transiting from Fort Lewis to the Yakima proving ground transit the Columbia Gorge, and this would eliminate any impact to their routing.

4) The noise would be tolerable as the turbines are now more than 1 mile away from the nearest home. Eliminating the A1-A7 turbines would bring the Whistling Ridge project in line compliance with current scientific studies indicate the need for larger setbacks to avoid these issues. It is interesting to note the sheer amount of documentation in the DEIS on noise, causing me to believe that this can be a problem and really needs to be addressed.

5) The study did not use the noise levels defined by the manufacturer of the proposed towers and the generating station, which are larger and noisier than those discussed. Eliminating the A1-A7 turbines puts the noise levels within EFSEC limits even when using the actual towers and the generator facility that will be used in the Whistling Ridge project are used for noise calculations. It also would make the noise within EFSEC limits when computing the maximum anticipated noise levels, cumulative effects of multiple towers coupled with power generation/transfer and their impact to the surrounding community.

6) Eliminating the A1-A7 turbines keeps the Whistling Ridge project in compliance with the basic intent of the National Scenic Act: to "Preserve our nation's natural scenic resources". This allows EFSEC to support the preservation of a scenic area while also supporting wind energy.

7) More recent studies on bat and raptor deaths caused by wind turbines indicate a significantly higher number than expected. Klickitat County has recently begun a new study because many more deaths were occurring than promised by the boiler plate information in their EIS. Please update your study to consider recent results. Eliminating the A1-A7 turbines would significantly reduce the risk of bat and raptor deaths as the turbines closest to the flyway are eliminated

8) The land immediately south of the A1-A7 turbines project is designated winter range preserve. Eliminating the A1-A7 turbines eliminates a major impact to elk and deer movement in their designated winter range.

9) Eliminating the A1-A7 turbines will virtually eliminate impacts to property values since no turbines are close to residences.

10) Regarding "future developments", the "Middle Mountain Wind Project" should be updated to indicate that the Hood River County Commissioners have determined the project to be not feasible due to local discontent. Please also consider adding the decision regarding the Seven Mile project; impacts to the local community and the scenic area also could not be justified. Eliminating the A1-A7 turbines would make this project much more acceptable to the local population because the impact to the National Scenic area would be much less.

I request that you review these comments each as if you lived here, please remember, this project is in everyone's back yard, it is a National Scenic Area and one of the most traveled tourist destinations in the Northwest..

Thank you

Joyce Eastwick

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. This wind farm will give the Skamania County economy the boost it needs. We are too dependent on timber harvests and federal timber payments. Too many residents are stuck in low-income brackets while unemployment ranks far above the state average. Fortunately, Skamania has another natural resource to develop: wind. Bringing another industry here is exactly what our county needs. It will stimulate local spending, create jobs, and provide new tax revenues. How can that be a bad thing? Skamania County needs to diversify its resources and revenue, and Whistling Ridge can make that happen. I hope the Council approves the SDS application and that the project advances quickly.

Sincerely,
Doug Holliston

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a fair and balanced alternative analysis.

This proposal is likely to cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

I request that EFSEC and BPA extend the comment period by 45 days, in order to allow the public sufficient time to review and comment on the 1,578 pages of material contained in the DEIS and appendices.

Subject: Whistling Ridge Threatens Gorge

I am concerned about the impacts of major industrial construction on the ridgeline boundary of the Columbia River Gorge National Scenic Area near White Salmon.

I live in the City of Mosier, where our businesses depend on the tourism created by the natural scenic beauty of the Columbia Gorge. In a recent survey (Mosier Community Survey, 2008) 99% of the Mosier Valley residents who responded rated "scenery and natural beauty" as Very Important to them.

For a wider view, read the final report of the Columbia Gorge Future Forum, in which many Gorge residents responded negatively to the industrialization of the Gorge by the wind turbine industry and in which one of the most commonly shared Gorge values was our scenic beauty.

And who hasn't read the National Geographic review of the Gorge as the 6th most highly rated destination in the world because of the "... incredible job of protecting the views..."

It greatly concerns me that we can so easily despoil forever what is so rare and so highly valued by the rest of the world. And for what? The sacrifice of long term vision for immediate profit? Profit for a very few at the expense of the other Gorge communities and counties whose economic development depends on the protection of the scenic Columbia Gorge?

I hope that greed does not lead us into making decisions that will negatively impact most of our current population and that our future generations will forever regret.

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. Washington State utilities must reach the goals set by Initiative 937. Wind is the most feasible and most cost-effective option for bringing 15% new renewable energy on the grid by 2020, which means we need to build more wind farms. Skamania County has the wind, SDS Lumber has the land: it is a match made in heaven. Many studies have shown that the environmental impact of the Whistling Ridge Energy Project would be minimal. For the last century, the site has been used in commercial forest operations. The land has already been cleared, roads built, transmission lines already installed, and wildlife habitats already fragmented. The impacts on a few other species that might be affected are rated low-risk. The environmental benefits are numerous. Wind is clean, renewable, and does not consume water or produce waste. Whistling Ridge will generate 75 megawatts of electricity; enough to power 20,000 homes a year, without contributing to global climate change. The choice is clear: support Whistling Ridge and Skamania County by approving this project.

Sincerely,
Benjames Derrick

Subject: Whistling Ridge Benefits outweigh costs

I am concerned about the opinions of others, but I don't share the Not in my Back Yard, elitist perspective of my friends who are opposing this project. As we build bigger and bigger houses (and second houses) in the Gorge, we should take on our fair share of the burden of powering them with electricity that is sustainable.

Gorge Friends are in the same class as those in Massachusetts who opposed a wind farm off Martha's Vineyard for twenty years.

I hope that all towers can be sited in a way that truly minimizes the visual impact on Gorge residents and visitors, but I support the project as a whole.

Subject: Whistling Ridge Energy Project

Is there perhaps a site better suited for this development than in the heart of the Columbia River Gorge National Scenic Area?

I think it's vital that we protect the scenic beauty of this particular place. I already wince at every clear cut visible in the NSA. The last thing we need is to add industrial development to an area that has already been compromised by commercial interests.

Subject : FW: Whistling Ridge Energy Project Draft EIS

While the Whistling Ridge Wind Project proponents deserve credit for responding thoughtfully to some of the previous objections to their earlier proposals, the revised proposal remains of great concern. If allowed the proposed wind mills will still seriously impact the beauty of the Gorge Scenic Area. As presently proposed viewers from numerous locations including parts of the cities of White Salmon, Underwood, and Hood River, as well as the Columbia River itself will have their views of the Gorge defaced by 425 foot towers of steel, rotating blades and flashing strobe lights.

There are few areas in the world with as much natural beauty as we now have in this part of the Gorge. We could not sell it away. Granted our Nation needs alternative sources of energy and Skamania County needs new sources of revenue. But there are many less scenic areas of Washington, Oregon and the entire country which could also contain our windmills. Some things should not be traded for money.

Related Concerns:

1. A first Gorge Windmill project will set a precedent. Other proposals and very likely other windmill farms will follow. New companies (for example a conglomerate such as General Electric) will be much less concerned about the welfare of this area than our neighbors at SDS.
2. Wind farm derived tax revenues will not be the only economic consequence of a local wind farm. Probable negative consequences include decreased property values, reduced appeal to future tourists and prospective new residents because of diminished attractiveness of the area and likely increased infrastructure costs associated with building and maintaining a windfarm (including road maintenance and additional fire protection).
3. Huge steel towers with massive concrete bases would be with us a very long time. The costs of removing an obsolete windmill would be substantial. But how long would a wind tower be useful?

When I consider the dramatic and initially unforeseeable changes in energy demand and modes of production over the past 150 years (particularly the last 50 or so) I am astounded. Who can predict whether 100, 50 or even 30 years from now massive 425 ft steel windmills will make any contribution to our energy needs?

Subject: Whistling Ridge Threatens Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

Please keep the Gorge looking as it did in the days of Lewis & Clark. We have so few areas in the U.S. where a historical landscape is unmarred.

Subject: Whistling Ridge Energy Project EFSEC Application 2009-001 and Draft EIS

The City of Bingen, located in Klickitat County adjacent to the proposed Whistling Ridge Energy Project, is supportive of alternative renewable energy including wind energy facilities. Wind energy projects are one way the State of Washington and the United States can help reduce the reliance on traditional, non-renewable energy sources.

The City of Bingen notes that the Whistling Ridge project is located outside of the Columbia River Gorge National Scenic Area and is therefore not subject to the National Scenic Area Act. The City of Bingen is also in an area that is not subject to the National Scenic Area Act. We would not be able to realize our community and economic development objectives if proximity to the Scenic Area begins to restrain that development. The city believes that restrictions on properties located outside of the Scenic Area or that are exempt from the Scenic Area Act are inconsistent with the letter and intent of the National Scenic Area Act.

Thank you for considering our comments. If you have any questions, please do not hesitate to contact me.

Sincerely,

Betty J. Barnes
Mayor

COMMENT LETTER 138

BRIAN BAIRD
CONGRESS OF THE UNITED STATES
3RD DISTRICT, WASHINGTON

June 16, 2010

WR - DEIS
Public Comment #316

Allen Fiksdal
EFSEC Manager
Energy Site Evaluation Council
PO Box 43172
Olympia, WA 98504

Dear Mr. Fiksdal:

I write to offer my strong support to the proposed Whistling Ridge Energy Project in Skamania County. This is a viable project on privately held commercial timberland outside of the National Scenic Area. It will benefit the residents of Skamania County through increased property tax revenue. It will also benefit the region in creating renewable energy that is clean and self sustaining. This is an excellent example of how we can balance environmental protection and economic development.

It has come to my attention that there may be some opposition to the project because several of the turbines may be visible from within the National Scenic Area. I find the argument disingenuous and political in nature. I don't consider a few turbines to be an eyesore, rather they are a powerful symbol of our changing economy in the gorge and our national commitment to renewable energy.

I find the complaints hollow because those who complain of having to see a few turbines from inside the NSA have not complained of similar visual impairments from nearby communities. Stand inside the NSA and you can see signs of commerce, industry and development from nearby communities that are outside the boundaries of the NSA. It is as Congress intended: a balance of environmental protection and economic vitality.

As a member of Congress, I have been a strong supporter of the NSA. The legislation specifically states in the Saving Clause of the Act, that no protective measures or buffer zones should be established around the NSA. This project is outside the NSA. It is not subject to the rules of the NSA. It is an environmentally sound project that should be embraced and encouraged. I support it. It is the right project at the right time in the right place.

EXECUTIVE OFFICE

JUL 23 2010

In reply refer to: DKR-7

The Honorable Brian Baird
United States House of Representatives
2350 Rayburn House Office Building
Washington, D.C. 20515

Dear Representative Baird:

Thank you for your letter supporting the proposed Whistling Ridge wind project. The Bonneville Power Administration (BPA) is considering the interconnection request from the project's sponsor and conducting an environmental review under the National Environmental Policy Act (NEPA). Washington State's Energy Facility Site Evaluation Council (EFSEC) is responsible for environmental review of the proposed facility under the Washington State Environmental Policy Act (SEPA).

BPA and EFSEC are coordinating their respective review processes and recently completed a joint draft environmental impact statement (DEIS). The record for public comment on the DEIS is open through August 27. In June, the two agencies held public open houses on the draft EIS in both Underwood, and Stevenson, Washington.

I appreciate knowing of your interest in and support for the proposed project. I will keep you and your staff informed of BPA's progress as it continues to work with EFSEC for review of the interconnection request. If you have additional questions, please contact me or Liz Klumpp, BPA's Constituent Account Executive for Washington, at (360) 943-0157.

Sincerely,

A handwritten signature in blue ink, reading "Stephen J. Wright".

JUL 16 2010

ENERGY FACILITY SITE
EVALUATION COUNCIL

July 15, 2010

Dear Council Members/BPA Representatives:

In our testimony of May 6, 2009 we specifically requested that three issues be directly addressed within the scope of the proposed Whistling Ridge Energy Project EIS. **The current draft EIS does not adequately address the three issues.**

First,

The draft EIS utterly ignores the strongly recommended and extremely useful "The 'How To' Guide To Siting Wind Turbines To Prevent Health Risks From Sound" (authors: George W. Kamperman and Richard R. James, October 28 2008... *we have attached this once again for your convenience*) a version of which was prepared and provided by the authors specifically for EFSEC's consideration. It provides an ecological and scientifically sound approach, which will minimize the likelihood of detrimental impact when industrial wind turbines are to be sited near people's homes.

The draft EIS offers no assurance that Whistling Ridge wind turbine siting will preserve a resident's right to enjoy the current peace and tranquility of his/her homesite. More importantly, the potential negative impacts to a resident's health and well-being are **not** adequately mitigated.

Mr. Richard James, an acoustical engineer, provided **credible testimony** (source provided you in May 2009 material) **that wind turbines generate a type of noise that is not adequately measured by the dBA scale used in the Washington state noise standards.** The dBA scale is designed to detect noises audible to humans. Wind turbines generate low-frequency noise (20Hz or lower) that might cause the body to resonate even if it is not audible. **Such effects are measurable on the C-weighted scale (dBC).**

Your draft EIS dismisses the C-rated scale as insignificant and we quote: "The turbine sound power level manufacturing ratings show C-weighted levels are within 2dB of A-weighted levels. Therefore, low-frequency noise is not anticipated to be an issue for this project"(page 3-130 draft EIS). If this is factual (which cannot be verified given that the data below 31.5 Hz was not provided in the draft EIS) it would only measure 2 decibels difference at the source (wind turbine). **The problem with this rationale has been scientifically proven.** The difference at the affected homesites would be substantial, as the lower-frequency vibrations (dBC) travel greater distances than the higher dBA frequencies, attenuating at approximately half

the rate of the higher frequencies. **Thus, when you reach the homesites, the dBC values will be roughly 20 dB higher than the dBA values** (see page 7, Kamperman and James). Further, the lower-frequency noise easily penetrates home structure, while the higher frequencies are somewhat attenuated by home structure, thus inside the home the difference between the dBA and dBC scales will be even greater (see page 11-12, Kamperman and James). **This is why it is necessary to use the C-weighted scale in addition to the A-weighted scale.**

Even your cited expert G. Leventhal questions current measurement techniques in Low Frequency Noise. What we know, what we do not know and what we would like to know, *Journal of Low Frequency Noise, Vibration and Active Control, Vol. 28, Number 2, 2009*:

“Does the way in which we measure low frequency noise hide some of its disturbing characteristics?” (p. 98)

“Unfortunately, conventional methods of dealing with environmental noise stressors are A-weighted, which means that the presence of disturbing low frequency noise may not be detected...chronic psychophysiological damage may result from long-term exposure to an audible low-level low frequency noise, which is left uncontrolled, despite complaints.” (p. 95)

Earlier in the draft EIS, before dismissing the need to use the C-rated scale you state, “C-weighting is often used to assess potential annoyance due to low-frequency noise that may excite vibration in structures” (p. 3-115). This is exactly what happens!

Quoting yet another of your cited experts G.P. van den Berg from Do wind turbines produce significant low frequency sound levels?, presentation at 11th International Meeting on Low Frequency Noise and Vibration and its Control, Maastricht, The Netherlands, 30 August to 1 September 2004:

“Although infrasound levels from large turbines at frequencies below 20 Hz are too low to be audible, they may cause structural elements of buildings to vibrate... Perceptible vibrations of windows may occur at frequencies from 1 to 10 Hz... sound pressure levels above 60 dB at frequencies below 10 Hz occur close to a turbine as well as at 750 m distance and further.” (p. 7)

This has been validated by the research of S.S. Jung, W. Cheung, C. Cheong and S. Shin, Experimental Identification of Acoustic Emission Characteristics of Large Wind Turbines with Emphasis on Infrasound and Low-Frequency Noise, *Journal of the Korean Physical Society, Vol. 53, No. 4, October 2008*.

“...we found that the low-frequency noise of the 1.5 MW... wind turbines in the frequency range over 30 Hz would very likely lead to psychological complaints from ordinary adults and that the infrasound in the frequency range from 5 Hz to 8 Hz would very likely lead to complaints about rattling house fittings, such as doors and windows.”

We strongly feel the .38-mile set back from the nearest residence is woefully insufficient. This is especially true in this area of canyons, bowls, and mountains, as

the terrain will contain, reflect and transmit the sound from the wind turbines greater distances than in typically used flatter terrain. The simplistic sound modeling and the limited collected data used in this draft EIS result in an **inaccurate** depiction of likely impact. (Decibel levels exceeding predictions has been documented by M.A. Nissenbaum at Mars Hill, 2010 and G.B. van den Berg 2006 in his work at the Rhede Wind Farm).

Again, we request that potential noise (dBA) and low-frequency (dBC) impacts be thoroughly investigated through valid baseline measurements and cutting edge computer simulations that will accurately depict for this mountainous area the sound emissions produced in worst case conditions, such as recommended by Kamperman and James, 2008. This would include ambient sound monitoring on all residential properties within and up to 2 miles of the project property boundary.

Prospathopoulos, J. M. and Voutsinas, S. G.'s work (*Application of a ray theory model to the prediction of noise emissions from isolated wind turbines and wind parks... in Wind Energy, Volume 10 Issue 2, Pages 103 – 119, published online: 6 Dec 2006, John Wiley & Sons, Ltd.*) **proves** that the simple computer model employed in this draft EIS prediction is inadequate. **“In cases of complex terrain... simple projection models are no longer valid.”**

The need for using more complex computational models than the ones employed for this draft EIS is well-documented by the U.S. Department of Energy Workshop Report: Research Needs for Wind Resource Characterization, Technical Report NREL/TP-500-43521, June 2008 (*Jointly sponsored by DOE Office of Science, Office of Biological and Environmental Research and DOE Office of Energy Efficiency and Renewable Energy, Wind & Hydropower Technologies Program*).

“Models routinely under-predict power performance likely due to; a misrepresentation of the vertical wind speed and turbulence profile, a lack of understanding of the impact of complex terrain on flow, fundamental errors in modeling of ray effects/wind turbine wakes and/or a combination of these effects” (page 38).

“The utility in models... that are based upon linear formation... falls off rapidly when applied in relatively steep terrain or if the weather fluctuates much. Several non-linear formations have been developed... that allow for turbulence prediction in steeper terrain” (page 47).

In studying your draft EIS, we determined it does not demonstrate that any additional sound measurements were even conducted. It appears the limited data originally gathered by the SDS consultant was the only information utilized. **An Independent Qualified Acoustical Consultant (unbiased third party**

with no financial or other connection to SDS or related companies) should have performed (not just reviewed what was provided) all sound monitoring, simulations and projections.

It appears that no actual sound monitoring was conducted at any of the three closest residences. It is not depicted in the draft EIS and we must necessarily assume it was not done. “Measurement Location 2” sound monitoring appears to have been measured almost 2 miles distant from the affected residence. “Measurement Location 1” sound monitoring appears to have been measured approximately a ½ mile distant beyond both the planned and the current residence closest to the wind turbines. No dBC scale measurements were conducted at all.

Applying Kamperman and James methodology to even the current SDS application noise data for receiver ID3 (the closest residential property), shows that the noise level would increase from **26 dBA** (using Kamperman and James recommended L_{90} , rather than the L_{eq} depicted in draft EIS *Table 3.7-4*) to **42-plus dBA** during nighttime operation (*draft EIS Table 3.7-9*) ...**an increase in excess of 16 dBA. This considerably exceeds (by more than 3 times) the 5 dBA recommended by Kamperman and James, as well as the Government of South Australia EPA Protection Authority Environmental Noise Guidelines (see attached), in preventing health risks!** Further, it exceeds the 10 decibel EPA guidelines and is thereby considered “serious and warranting close attention”. A 10 dB increase almost always causes adverse community response (*page 14 of the “How To” guide*). **This is a more accurate depiction of what people will be subjected to at 2 a.m. (when attempting to sleep) than what is presented in this draft EIS.**

The need for the draft EIS to more accurately represent nighttime ambient background noise level is further supported by the U.S. Department of Transportation “Transit Noise and Vibration Impact Assessment”, May 2006 (Chapter 5: General Noise Assessment, pages 5-14 & 15)...

“In areas away from major roadways, noise from local streets or in neighborhoods is estimated using a relationship determined during a research program by the U.S. EPA.(2) EPA determined that ambient noise can be related to population density in locations away from transportation corridors, such as airports, major roads and railroad tracks, according to the following relation: $L_{dn} = 22 + 10 \log(p)$ (indBA) where p = population density in people per square mile.”

In the USDOT document **Table 5-7, Estimating Existing Noise Exposure for General Assessment**, it shows that the estimated *Leq* for nighttime is **25 decibels** for a population density of 1–100 per square mile. The closest homesites certainly fall within this category. Given that the draft EIS did not include measurements at the closest residences, **a figure of 25 dB as estimated by EPA must be used, rather than the convoluted and inaccurate estimate of 34-35 dB depicted in the draft EIS (Table 3.7-9, page 3-128).**

The draft EIS computer prediction model (Cadna/A) depicts on Table 3-7.7 that wind turbines were treated as “point” source with no information provided to suggest that the computer simulation treats each array as a “line” source – even though they are arrayed in a line. “Point” sources attenuate (drop) at a rate of 6 dB per doubling of distance. “Line” sources attenuate (drop) at a rate of 3 dB per doubling of distance. **There is ample scientifically proven evidence both from:**

NASA studies (*Prediction of the Far Field Noise from Wind Energy Farms, Shepherd, K. P. and Hubbard, H.H 1986, NASA-CR-177956*)

“At intermediate distances the array acts like a line source for which the theoretical decay rate is 3 dB per doubling of distance or 10 dB per decade. Only at the extreme distances, greater than one row length or 900 m, does the decay rate approach the single source value of 6 dB per doubling of distance or 20 dB per decade”; (page 4)

and van den Berg’s 2006 thesis (*The sound of high winds: the effect of atmospheric stability on wind turbine sound and microphone noise, Rijksuniversiteit Groningen*), cited in your draft EIS, that demonstrates wind turbines arrayed in a line, as they are projected to be at the Whistling Ridge site, may operate as a “line” source.

This phenomenon is a well-documented fact by the US Department of Transportation (*May 2006 – Transit Noise and Vibration Impact Assessment*) that individual cars traveling on a highway can be treated as a “point” source, while multiple cars traveling in a line have to be treated as a “line” source. The same is true of railcar transportation. (That is why sound barriers are erected on heavily traveled highways – to protect nearby residents.)

We want to state this clearly. The draft EIS leads people to believe that the sound from the line of wind turbines will drop at a rate of 6 dB. “As a general rule, at distances greater than 50 feet from a noise generator such as a wind turbine, SPL drops at a rate of 6dB with each doubling of distance.”(Page 3-114). This, in our opinion, is **inaccurate for wind turbines arrayed in a line on a ridge in mountainous, bowled and irregular terrain.** We feel the negative sound impact to be experienced by this community’s residents is **grossly underestimated.**

The only way to mitigate this impact is to set the wind turbines back further from the closest non-participating properties.

The “How To” Guide referenced above clearly articulates how to go about setting such standards. Simple reliance on the Washington State Environmental Noise Levels, Chapter 173-60 WAC (enacted 35 years ago, before large industrial wind turbines were even developed), is not enough. The acoustical experts’ “How To” Guide approach is to locate a wind turbine so as **to not increase preconstruction/operation background sound levels by more than 5 dBA along the property lines of the receiving non-participating property. And, such that it would not exceed a total of 35 dBA within 100 feet of any occupied structure.** (Page 15) Additionally, we refer you to the low-frequency sound limits also depicted on page 15. *NOTE: In previously provided expert testimony, Mr. James recommended a **minimum distance of 1.2 miles** between turbines and residences.*

Again, we reiterate that if industrial wind turbines are as “quiet” as represented, setting enhanced noise standards or requiring the meeting of standards used just across the river in Oregon should provide no difficulty for developers to meet. You now have an opportunity to make a strong statement illustrating BPA’s and EFSEC’s commitment to safeguarding the health of Washington’s residents.

We formerly provided as part of our May 6, 2009 testimony, documentation of potential health risks from sound:

“Deputation (by Dr. Robert McMurtry M.D., F.R.C.S (C), F.A.C.S) to the Standing Committee on General Government Regarding Bill C-150 April 22, 2009 www.wind-watch.org/documents/wp-content/uploads/mcmurtry-deputation-to-standing-committee.pdf); a news release (March 4, 2009 www.windaction.org/documents/20306) from the Medical Staff of Northern Maine Medical Center regarding “Health Concerns and the Need for Careful Siting of Wind Turbines”; “Wind Turbine Syndrome A Report on a Natural Experiment” published by K-Selected Books; and work of New York physician Nina Pierpont M.D., Ph.D. at www.windturbinesyndrome.com..

In late February 2009 the Office of Energy Security (OES), *[the equivalent to Washington’s EFSEC]*, requested that the Minnesota Department of Health (MDH) **evaluate the possible health effects associated with low frequency vibrations and sound arising from large wind energy conversion systems to assist them in guiding decision-making for future wind energy projects.** MDH produced a 26–page white paper **“Public Health Impacts of Wind Turbines”** on May 22, 2009 (*attached*).

The following quotes are a summary (of the 26-page white paper) with excerpts of salient points especially applicable to the draft EIS. We feel you must give serious consideration and take appropriate action in adequately addressing the environmental and health issues of the proposed Whistling Ridge Energy Project. NOTE: Underlining that follows is our emphasis.

Health Issues

“Noise originates from mechanical equipment inside the nacelles of the turbines (gears, generators, etc.) and from interaction of turbine blades with wind. ... The most problematic wind turbine noise is a broadband “whooshing” sound produced by interaction of turbine blades with the wind.” (Page 6)

“The NRC (National Research Council of the National Academies) also notes that effects of low frequency (infrasound) vibration (less than 20 Hz) ... have been asserted to disturb some people.” (Page 6)

Sound

“... low frequencies are not effectively attenuated by walls and windows of most homes or vehicles. (For example, one can typically hear the bass, low frequency music from a neighboring car at a stoplight, but not the higher frequencies.)” (Page 9)

“Rhythmic, low frequency pulsing of higher frequency noise (like the sound of an amplified heart beat) is one type of sound that can be caused by wind turbine blades under some conditions.” (Page 9)

“The World Health Organization (WHO, 1999) suggests that A-weighting noise that has a large low frequency component is not reliable assessment of loudness.” (Page 11)

Noise From Wind Turbines

“Aerodynamic noise from a wind turbine may be underestimated during planning. One source of error is that most meteorological wind speed measurements noted in wind farm literature are taken at 10 meters above the ground. Wind speed above this elevation, in the area of the wind turbine rotor, is then calculated using established modeling relationships. In one study... it was determined that the wind speeds at the hub at night were up to 2.6 times higher than modeled. Subsequently, it was found that noise levels were 15 dB higher than anticipated.” (Pages 11-12)

“Rhythmic modulation of noise, especially low frequency noise, has been found to be more annoying than steady noise.” (Page 12)

“Horizontal layers with different wind speeds or directions can form in the atmosphere. ... called shear. If the winds at the top and bottom of the blade rotation are different, blade noise will vary between the top and bottom of blade rotation, causing modulation of aerodynamic noise. (Page 12)

“... additional noise, or thumping, may occur as each blade passes through the transition between different wind speed (or wind direction) areas.” (Page 13)

“... in the nighttime the atmosphere can stabilize (vertically), and layers form. ... Consequently, blade noise would be greater at night.” (Page 14)

“A number of reports ... suggest that aerodynamic modulation is typically underestimated ... that detailed modeling of wind, terrain, land use and structures may be used to predict whether modulation of aerodynamic noise will be a problem at a proposed wind turbine site.” (Page 14)

“... noise from a wind turbine farm may be greater than noise from the nearest turbine due to synchrony between noise from more than one turbine...” (Page 14)

Impacts of Wind Turbine Noise

“Some people are more sensitive to low frequency noise. The difference, in dB, between soft (acceptable) and loud (annoying) noise is much less at low frequency...” (Page 16)

“Two studies in Sweden... showed... when noise measurements were greater than 40 dB(A), about 50% of the people surveyed (22 of 45 people) reported annoyance. When noise measurements were between 35 and 40 dB(A) about 24% reported annoyance (67 of 276 people). Noise annoyance was more likely in areas that were rated as quiet and in areas where turbines were visible. In one of the studies, 64% respondents who reported noise annoyance also reported sleep disturbance; 15% of respondents reported sleep disturbance without annoyance.” (Page 17)

“... reports have catalogued complaints of annoyance and some more severe health impacts ... The most common complaint is decreased quality of life, followed by sleep loss and headache. Complaints seem to be either from individuals with homes quite close to turbines, or individuals who live in areas subject to aerodynamic modulation and, possibly, enhanced sound propagation which can occur in hilly or mountainous terrain.” (Page 18)

Noise Assessment and Regulation

“... lower noise levels (dB(A)) from wind turbines engenders annoyance similar to much higher levels of noise exposure from aircraft, road traffic and railroads.” (Page 20)

“The World Health Organization (WHO) recommends that if dB(C) is greater than 10 dB more than dB(A), the low frequency components of the noise may be important and should be evaluated separately. In addition, WHO says “[i]t should be noted that a large proportion of low-frequency components in noise may increase considerably the adverse effects on health.” (Page 20)

“... sound tends to propagate as if by spherical dispersion. This creates amplitude decay at a rate of about -6 dB per doubling of distance. However, low frequency noise from a wind turbine has been shown to follow more of a cylindrical decay at long distances, about -3 dB per doubling of distance in the downwind direction...” (Page 23)

“As one moves away from the noise source, loudness at higher frequencies decreases more rapidly (and extinguishes faster) than at lower frequencies. Measurement of A-weighted decibels... obscures this finding.” (Page 23)

Conclusions

“Wind turbines generate a broad spectrum of low-intensity noise. At typical setback distances higher frequencies are attenuated. In addition, walls and windows of homes attenuate high frequencies, but their effect on low frequencies is limited. Low frequency noise is primarily a problem that may affect some people in their homes, especially at night.” (Page 25)

“The most common complaint in various studies of wind turbine effects on people is annoyance or an impact on quality of life. Sleeplessness and headache are the most common health complaints and are highly correlated (but not perfectly correlated) with annoyance complaints. Complaints are more likely when turbines are visible or when shadow flicker occurs. Most available evidence suggests that reported health effects are related to audible low frequency noise. Complaints appear to rise with increasing outside noise levels above 35 dB(A).” (Page 25)

“The Minnesota nighttime standard of 50 dB(A) not to be exceeded more than 50% of the time in a given hour, appears to underweight penetration of low frequency noise into dwellings.” (Page 25)

NOTE: Washington State noise standards, which rely on dB(A), do not adequately take into account the low frequency noise generated by wind turbines.

“For some projects, wind velocity for a wind turbine project is measured at 10 m and then modeled to the height of the rotor. These models may under-predict wind speed that will be encountered when the turbine is erected. Higher wind speed will result in noise exceeding model predictions.” (Page 25)

“... if a turbine is subject to aerodynamic modulation because of shear caused by terrain (mountains, trees, buildings) or different wind conditions through the rotor plane, turbine noise may be heard at greater distances.” (Page 25)

NOTE: the mountainous terrain and bowl topography of the Whistling Ridge Energy Project area will likely amplify the low frequency noise, more acutely impacting nearby residents than is suggested by the project's dB(A) modeling projections.

OUR THOUGHTS/COMMENTS

We feel this white paper is particularly relevant as it was produced by two Ph.D. Toxicologists for a public health state agency as requested by that state's agency equivalent to Washington's EFSEC.

It depicts how low frequency noise generated by wind turbine farms may indeed, be more pronounced at night, exacerbating sleep problems and related health issues.

It points out that the current methodology of most meteorological wind speed measurements and modeled projections can significantly underestimate the actual noise levels experienced.

In our opinion, this paper and its findings, reinforces the need for quality independent sound measurement and modeling, as well as the wisdom of using the Kamperman and James “How To” Guide to Siting Wind Turbines to Prevent Health Risks from Sound.

Our **second** area of concern relates to protecting the incredible scenic beauty of the Columbia River Gorge. This area is a local, national and even global treasure, recently rated in National Geographic as tied for number 6 in the world for its natural and sustainable beauty. We see no evidence that the proposed mere “painting of the wind turbines a gray color” will adequately mitigate the profoundly detrimental effect on the truly unique and exceptional scenic and recreational resources wisely preserved and protected for the enjoyment of all through the Columbia Gorge National Scenic Area Act. “436” foot-tall wind turbines lining the scenic area would surely denigrate the scenic experience and we feel certain, was not remotely foreseen when determining the scenic area boundaries and thus, would undermine the intent of the Act.

The draft EIS constructed visual representations of the turbines depicted against backgrounds of haze and clouds obscures the significant adverse impact that will be experienced by viewers. This draft EIS and its simulated pictorial representations shamefully understates the actual impact.

We feel it is imperative that the final EIS include alternatives such as adjusted placement or outright removal of the proposed A-array or however many wind turbines might be necessary to prevent any negative aesthetic impact to the nationally and globally recognized scenic area and its view points in the Columbia River Gorge. **People come here to heal their souls and to escape from, not be impressed by, industrial complexes.**

The Third issue we raised was partially resolved, not due to your actions, but as a result of a decision rendered by DNR, which prevented, at least temporarily, the leasing of adjacent DNR land to SDS for placement of additional wind turbines.

We are still greatly concerned that this proposed project is reportedly the first of its kind in forested habitats in Washington. This begs the need for intelligent planning, caution and due consideration given the potentially profound impact on watersheds, wildfire risk, bats, avian species, mammals and humans.

We feel greatly disappointed that the current draft EIS appears to hide behind outdated and inadequate state regulations, and pray that EFSEC and BPA will yet demonstrate desperately needed leadership in adopting a quality and accurate model for wind turbine siting that is in harmony with the environment while providing ample protection for the health and quality of life of all Washington residents.

In summary, we specifically request:

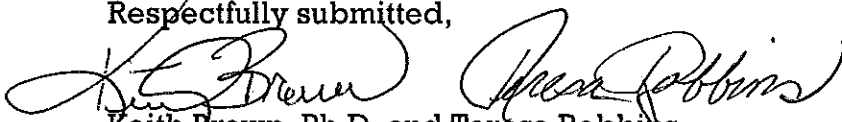

- New sound impact determinations/predictions be conducted (not simply review the current estimates) by an Independent Qualified Acoustical Consultant, preferably by Kamperman and James;
- That a proven complex, 3-dimensional computerized sound propagation model, using both dBA and dBC scales and based on the most current and best available science, be used to more accurately predict sound impacts in this mountainous terrain in an effort to protect people's sleep, health and quality of life;
- and that the "How to" Guide to Siting Wind Turbines to Prevent Health Risks (or **minimally**, the EPA guidelines) be used in determining projected impact and that any predicted decibel increases over 10 be mitigated up front by effective set-backs or the outright elimination of selected wind turbines.

EFSEC... the very name indicates that you must evaluate appropriate siting for proposed energy facilities, but does it demand that you must site? Have you ever recommended against siting a wind energy facility?

This siting, if it occurs, will set a precedent with troubling and long-standing consequences for not only forested lands in Washington, but will also put at risk all other national and state treasures, parks, and scenic areas. History is replete with

disastrous consequences from forging ahead to achieve short-term financial windfalls without adequate regulatory oversight and caution. Big money interests and unfortunately, sometimes government, suppresses and ignores mounting scientific evidence that is contrary to its financial and political goals (as in the effects of tobacco, deforestation and most recently, deep-water drilling). Must we blindly go forward and ruin all that has been set aside? Once it is gone, it is gone. Employing wisdom and forethought, if there is ever a time for EFSEC and BPA to determine **“NO, the cost is too great!”** this is it.

Respectfully submitted,

Keith Brown, Ph.D. and Teresa Robbins

KEITH BROWN, Ph.D.

Look, I'm not an expert on wind turbines, but I've taught program evaluation, advanced statistics and measurement techniques at Indiana and Boise State Universities. I was the assistant director of one of the top research and development centers in my field. My job was to find the truth. During the last two years I've spent hundreds and hundreds of hours researching probable impact of wind turbine noise.

The primary purpose of the noise portion of this draft EIS **should be to predict as accurately as possible and to fully describe potential adverse impacts of the probable and worst case noise scenarios** that would be inflicted upon the people who live, work, recreate and sleep in the Cook-Underwood, Mill A and surrounding communities.

This EFSEC/BPA draft EIS, in our opinion, **fails to do this**. Instead:

- 1) it **hides** behind outdated noise regulations never intended for industrial wind turbine complexes,
- 2) it **distorts** the comparison of the EPA to Washington noise guidelines,
- 3) it **ignores** guidelines specifically designed to reduce adverse wind turbine noise impacts,
- 4) it **collects inadequate data** on current noise levels at homes closest to the proposed industrial wind turbines and finally,
- 5) it **uses a computer model too simple to accurately predict** noise levels at affected home locations in complex mountainous terrain and varied weather conditions.

1) What do we mean by "outdated" regulations? The Washington Noise Regulations were written in 1975 (that's **35 years ago**). This is well before the current large-scale industrial wind turbines were even developed!

This draft EIS **ignores** the substantial work that has been done since 1996 in developing regulations and guidelines specific to appropriate and ecological siting of industrial wind turbines. Simply using the outdated Washington Noise regulations will result in this community being subjected to significantly higher noise levels than to which Oregon communities, just across the river, are currently subjected.

(Typical 26 decibel "Background") NIGHTTIME MAX		
OREGON	EPA	DRAFT EIS
36	45	50
10	10 serious, warrants close attention	24

Just across the river, an industrial wind turbine complex is permitted to create noise levels only up to 10 decibels over existing ambient background noise (typically 26 decibels). So, total ambient background noise plus the wind energy facility operating at **maximum** capacity **is not to exceed a total of 36 decibels.**

How can BPA, which operates in Oregon as well, in good conscience, apply a more destructive standard to Washington? This draft EIS will allow the Whistling Ridge wind complex to increase total noise levels up to and exceeding 60 decibels during the day and 50 decibels during the night. **That's a difference of an additional 14 decibels during the night over the Oregon standard...** when people are attempting to sleep.

Even according to the inadequate sound measurements done for this draft EIS, measured nighttime ambient background noise **would be allowed to rise by 24 decibels!**

You might think 'That's not a lot'. The EPA Region X guidelines stated that an increase of **10-plus decibels** over existing background noise **will result in significant negative community reaction** and would be considered **serious, warranting close attention**. Further, the New York State Energy Research and Development Authority states "...A 10 dB increase is subjectively heard as an approximate doubling in loudness and almost always causes an adverse community response."

24 decibels? Really... That's okay?

2) 1974 EPA guidelines (for general noise, not wind turbine noise) specify a 10 decibel penalty for nighttime hours, which would effectively **limit noise levels to 45 decibels** during the night. In our opinion, this draft EIS skews even this distinction by averaging allowable daytime and nighttime levels, thereby boosting the suggested nighttime limit to **49 decibels**, then portraying it to be "generally consistent" with the 50 decibel outdated Washington standard. What should be compared is the EPA nighttime limit of 45 to the Washington nighttime 50, **which is not generally consistent** (*p.3-118, draft EIS*). Further, it makes no mention of the EPA guidelines just cited above regarding the impact of decibel increases of 10 or more over background noise.

3) It is astounding that this draft EIS makes no mention of the plethora of guidelines designed specifically to reduce the impact of industrial wind turbine complexes. You wouldn't have had to go very far to get this information.

We've already mentioned the Oregon standards (*copy attached*). Similar guidelines exist in country after country around the world, including Australia (*copy attached*), Denmark, France, Germany, Holland, even the World Health Organization. We actually provided you in May of 2009, the extremely useful, recent research **and relevant** Kamperman and James "How to" Guide to Siting Wind Turbines to Prevent Health Risks from Sound. (*copy attached*)

What do all these guidelines have in common? They are based on research of what would be effective in limiting the impact of wind turbine complex noise on nearby residents. **They limit maximum noise levels to between 35 and 40 decibels.** Why do they do this? Based upon decades of extensive experience with wind turbines, they have determined the type and level of noise produced by industrial wind turbine complexes impacts people differently than other industrial noises.

The following chart taken from the **Public Health Impacts of Wind Turbines** prepared by the Minnesota Department of Health Environmental Health Division in response to a request from the Minnesota Department of Commerce Office of Energy Security (equivalent to Washington State EFSEC) demonstrates that the modulating sound wave noise wind turbines produce, results in significantly more annoyance than noises of traffic, railways, and aircraft.

Verbal Testimony of Keith Brown, Ph.D. and Teresa Robbins on the EFSEC/BPA draft EIS for Whistling Ridge Energy Project Noise Impact Section – June 16 2010

Figure 6: Annoyance associated with exposure to different environmental noises

Reprinted with permission from Pedersen, E. and K.P. Waye (2004). Perception and annoyance due to wind turbine noise—a dose-response relationship. The Journal of the Acoustical Society of America 116: 3460. Copyright 2004, Acoustical Society of America.

What specifically does this show? **35+%** of people in rural areas **experience wind turbine noise at about 40 decibels as “highly annoying”**. Conversely, at 40 decibels of aircraft, traffic or railway noise, **0%** of people report “high annoyance”. It would take 70 decibels of aircraft noise, and far in excess of 70 decibels for road traffic and railway noise to create the same level of annoyance that wind turbines create at 40 decibels.

Noise standards used for aircraft, railway, and traffic noise **are inadequate** when applied to wind turbine noise impact. **Wind turbines are clearly in a different class of sound impact and require a different standard!**

4) We see no additional measurements other than the short-term and limited measurements originally provided by the consultant hired by SDS (three 10-minute readings at a site approximately a ½ mile beyond the home site closest to proposed wind turbine placement and three 10-minute readings from a site nearly 2 miles beyond the 3rd closest home site ... and one 24-hour measurement from the site a ½ mile beyond the closest home site... all taken in January 2009). **Reported measurements were not even taken at the closest property lines or residences.**

Readings of such short duration prevented measurement of actual ambient noise levels at the home sites when the proposed wind turbines site was experiencing wind at the 6 and 9 meters per second level recommended for accurate projections (*see attached Wind Farms Environmental Noise Guidelines produced by Environmental Protection Authority – South Australia*). For your convenience, 6 and 9 are the cut-in speed and rated power speed, respectively.

By the way, it is critical to take measurements at the right time – summer... and the right place – affected residences. The greatest potential adverse impact is during the summer when people are sleeping with windows open during an inversion when the ambient background noise is very low at the homesite and the wind turbines are operating at maximum speed. Measuring far away from the homes in winter utterly misrepresents what these residents will experience.

Further, the consultant reported that the SDS meteorological data was **potentially compromised due to ice-y conditions**, indicating we don't even know what the actual wind levels were at the wind turbine site during the limited readings provided!

5)

a. The home site closest to the proposed wind turbines is in an area where the wind turbine noise may reflect off of the amphitheater-like bowl terrain, thus the sound will not attenuate as it would in flatter terrain and will be louder. We see no evidence that this was built-in to the computer model. Research in complex mountainous terrain by Prospathopoulos, J. M. and Voutsinas, S. G. (*Application of a ray theory model to the prediction of noise emissions from isolated wind turbines and wind parks... in Wind Energy, Volume 10 Issue 2, Pages 103 – 119, published online: 6 Dec 2006, John Wiley & Sons,*

Ltd.) **proves** that the simple computer model employed in this draft EIS prediction is inadequate. **“In cases of complex terrain... simple projection models are no longer valid.”**

b. The computer projection model utilized is based upon wind speeds measured at 10 meters height, which extensive research shows **will underestimate the wind speeds at the hub by a factor of as much as 2.6! This results in underestimating the wind turbine noise by as much as 15 decibels** during inversions when wind shears develop due to layering of air and the separation of wind currents. *(The sound of high winds: the effect of atmospheric stability on wind turbine sound and microphone noise, van den Berg, G. P. 2006, Rijksuniversiteit Groningen)*

While the draft EIS notes this phenomenon, it is once again, not built into the computer projection model used. This is important because, it is during these inversions (mostly at night) that people experience even greater sleep disturbance and what is described by van den Berg 2006 as “thumping”, “pile driving”, “a train coming and never arriving”... and that the most annoyance is reported.

c. The computer projection model appears to use each wind turbine as a “point source”, with no information provided to suggest that the computer simulation treats each array as a “line” source.

There is ample scientifically proven evidence both from: NASA studies *(Prediction of the Far Field Noise from Wind Energy Farms, Shepherd, K. P. and Hubbard, H.H 1986, NASA-CR-177956)*

“At intermediate distances the array acts like a line source for which the theoretical decay rate is 3 dB per doubling of distance or 10 dB per decade. Only at the extreme distances, greater than one row length or 900 m, does the decay rate approach the single source value of 6 dB per doubling of distance or 20 dB per decade”(page 4);

and van den Berg's 2006 thesis, which you even cited in your EIS, that demonstrates wind turbines arrayed in a line, as they are projected to be at the Whistling Ridge site, may operate as a "line source". This results in sound attenuation at 3 decibels per doubling of distance vs. the 6 decibels projected from a "point source". (We recommend you actually read the whole thesis, as we did.)

The same thing happens with cars traveling in a line and it is why USDOT (May 2006 – *Transit Noise and Vibration Impact Assessment*) requires that the **3 decibel attenuation** be used in all assessment and designed mitigation of potentially heavy traffic impact.

We've thoroughly examined this draft EIS on noise impact and find it to be totally inadequate. It needs to be redone.

TERESA ROBBINS

SO...WHAT DOES ALL THIS MEAN TO THE PEOPLE OF THIS COMMUNITY?

We offer this recent study (with appropriate "control" group protocols) conducted by Medical Doctor Michael A. Nissenbaum (whole slew of qualifications) to provide some important insight and "sound" the alarm (*see attached: Wind Turbines, Health, Ridgelines, and Valleys, 2010*).

"If industrial wind turbines installed in close proximity to human habitation result in sleep disturbance and stress, then it follows ... that wind turbines will, over the long term, result in... serious health effects (cardiovascular disease, chronic feelings of depression, anger, helplessness) and reduced quality of life."

He compared a group of “exposed” individuals, meaning living within 3500 feet of a ridgeline arrangement of 28 1.5 MW wind turbines... *(Note: the proposed Whistling Ridge will have more and larger turbines)*

And a group of similar age and occupation “not exposed” individuals, meaning living approximately 3 miles away from the industrial complex...

Here’s what he found:

“EXPOSED”

NOT “EXPOSED”

Anti-migraines	

“There is absolutely no doubt that people living within 3500 feet of a ridgeline arrangement of turbines 1.5 MW or larger ... in a rural environment will suffer negative effects.”

Ridgeline industrial wind turbine complex “noise travels farther and hits homes and people at greater amplitude than it would from a lower elevation. Even though this is not rocket science, it was conclusively proven in a NASA funded study in 1990.”

“The WHO says that 30dbA is ideal, and noise levels of above 40 dbA have definite health consequences. At Mars Hill, where affected homes are present at 3500 feet, sound levels have been measured at over 52.5 dbA.... The people who live within 3500 feet ...are truly suffering.”

And you are proposing to allow up to 60 decibels here? We fear this will lead to similar suffering as residents of Mars Hill.

The cutting edge equipment we have previously proposed you use for more accurate measurement, and according to Nissenbaum,

...“revealed drastic short duration excesses over allowed sound levels, levels that set homes vibrating and rendering them unlivable, but also levels of lower frequency transient noise at the audible level, that demonstrates not only failure of preconstruction sound modeling as currently practiced, but also the

inadequacy of the measuring tools in the toolkit of the everyday practicing acoustician-consultant who generates reports for industry and local government.”

In addition to this study, we are providing you with a copy of the 26-page white paper Public Health Impacts of Wind Turbines prepared by the Minnesota Department of Health Environmental Health Division in response to a request from the Minnesota Department of Commerce Office of Energy Security (equivalent to Washington State EFSEC).

It is a recent review, **performed by two unbiased Ph.D. Toxicologists**, of all the relevant published studies. While we strongly insist you read the entire study, due to limited time to testify, we offer one quote from the white paper conclusions.

“The most common complaint in various studies of wind turbine effects on people is annoyance or an impact on quality of life. Sleeplessness and headaches are the most common health complaints and are highly correlated (but not perfectly correlated) with annoyance complaints. Complaints are more likely when turbines are visible or when shadow flicker occurs. Most available evidence suggests that reported health effects are related to audible low frequency noise. Complaints appear to rise with increasing outside noise levels above 35 dbA.”

And if that is not enough, here are quotes from one of the experts you cited in the draft EIS (**van den Berg, 2006**). He has conducted one of the most comprehensive studies of what is causing the increased noise levels experienced above model predictions.

“Recently Pedersen... found that annoyance was relatively high at calculated maximum sound immission levels below 40 dB(A) where one would not expect strong annoyance.”

“As wind turbines become taller, the discrepancy between real and expected levels grows and as more tall wind turbines are constructed complaints may become more widespread. ... It may be that earlier discrepancies between real and projected sound immission were not sufficient to evoke strong community reactions, and **that only recently turbines have become so tall that the discrepancy now is intolerable.**”(our emphasis)

“... in quiet nights the wind farm can be heard at distances up to several kilometers when the turbines rotate at high speed. In these nights, certainly at distances from 500 to a 1000 meters from the wind farm, one can hear a low-pitched thumping sound with a repetition rate of once a second... not unlike distant pile driving. A resident living a distance of 2.3 kilometers from the wind farm describes the sound as ‘an endless train’.”

And finally, this is your cited expert we quote

“... proponents must accept that wind turbine noise is not (always) benign, that the noise may affect people, and that people who are complaining are not always just a nuisance.”

Read his excellent 210-page dissertation. We have. Hence, we continue to be upset and very concerned.

Respectfully Submitted,

Keith Brown, Ph.D.

Teresa Robbins

THE “HOW TO” GUIDE TO SITING WIND TURBINES TO PREVENT HEALTH RISKS FROM SOUND

"A subset of society should not be forced to bear the cost of a benefit for the larger society."¹

I. Introduction

A new source of community noise is spreading rapidly across the rural U.S. countryside. Industrial-scale wind turbines (WT), a common sight in many European countries, are now actively promoted by federal and state governments in the U.S. as a way to reduce coal-powered electrical generation and global warming. The presence of industrial wind projects is expected to increase dramatically over the next few years, given the tax incentives and other economic and political support currently available for renewable energy projects in the U.S.

As a part of the widespread enthusiasm for renewable energy, state and local governments are promoting “Model Ordinances” for siting industrial wind farms which establish limits for noise and other potential hazards. These are used to determine where wind projects can be located in communities, which are predominantly rural and often extremely quiet during the evening and night. Yet, complaints about noise from residents near existing industrial wind turbine installations are common. This raises serious questions about whether current state and local government siting guidelines for noise are sufficiently protective for people living close to the wind turbine developments. Research is emerging that suggests significant health effects are associated with living too close to modern industrial wind turbines. Research into the computer modeling and other methods used to determine the layout of wind turbine developments, including the distance from nearby residences, is at the same time showing that the output of the models may not accurately predict sound propagation. The models are used to make decisions about how close a turbine can be to a home or other sensitive property. The errors in the predicted sound levels can easily result in inadequate setback distances thus exposing the property owner to noise pollution and potential health risks. Current information suggests the models should not be used for siting decisions unless known errors and tolerances are applied to the results.

Our formal presentation and paper on this topic (*Simple guidelines for siting wind turbines to prevent health risks*) is an abbreviated version of this essay. The formal paper was presented to the Institute of Noise Control Engineers (INCE) at its July Noise-Con 2008 conference in Detroit, MI. A copy of

¹ George S. Hawkins, Esq., “*One Page Takings Summary: U.S. Constitution and Local Land Use*,” Stony Brook-Millstone Watershed Association; “...nor shall private property be taken for public use, without just compensation.” Fifth Amendment, US Constitution.

the paper is included at the end of this document. The formal paper covered the community noise studies performed in response to complaints, research on health issues related to wind turbine noise, critiques of noise studies performed by consultants working for the wind developer, and research/technical papers on wind turbine sound immissions and related topics. The formal paper also reviewed sound studies conducted by consultants for governments, the wind turbine owner, or the local residents for a number of sites with known health or annoyance problems. The purpose was to determine if a set of simple guidelines using dBA and dBC sound levels can serve as the 'safe' siting guidelines for noise and its effects on communities and people. The papers considered in our review included, but were not limited to, those listed in Tables 1-4 on pages 2 through 4 of the Noise-Con document.

This essay expands upon the Noise-Con paper and includes information to support the findings and recommended criteria. We are proposing very specific, yet reasonably simple to implement and assess criteria for audible and non-audible sound on adjacent properties and also present a sample noise ordinance and the procedures needed for pre-construction sound test, computer model requirements and follow-up tests (including those for assessing compliance).

The purpose of this expanded paper is to outline a rational, evidence-based set of criteria for industrial wind turbine siting in rural communities, using:

- 1) A review of the European and other wind turbine siting criteria and existing studies of the prevalence of noise problems after construction;
- 2) Primary review of sound studies done in a variety of locations in response to wind turbine noise complaints (Table 1);
- 3) Review of publications on health issues for those living in close proximity to wind turbines (Table 2);
- 4) Review of critiques of pre-construction developer noise impact statements (Table 3); and
- 5) Review of technical papers on noise propagation and qualities from wind turbines (Table 4).

The Tables are on pages 2-4 of the formal paper. We also cite standard international criteria for community noise levels and allowances for low-frequency noise.

The specific sections are:

1. Introduction (This section)
2. Results of Literature Review and Sound Studies
3. Development of Siting Criteria
4. Proposed Sound Limits
5. How to Include the Recommended Criteria in Local or State Noise Ordinances
6. Elements of a Wind Energy System Licensing Ordinance
7. Measurement Procedures (Appendix to Ordinance)
8. The Noise-Con 2008 paper "Simple guidelines for siting wind turbines to prevent health risks" with revisions not in the paper included in the conference's Proceedings.

The construction of large WT (industrial wind turbines) projects in the U.S. is a relatively recent phenomenon, with most projects built after 2000. Other countries, especially in Europe, have been using wind energy systems (WES) since the early 1990's or earlier. These earlier installations generally used turbines of less than 1 MW capacity with hub heights under 61 m (200 feet). Now, many of these earlier turbines reaching the end of their useful life, are being replaced with the

larger 1.5 to 3 MW units. Thus, the concepts and recommendations in this article, developed for the 1.5 MW and larger turbines being build in the U.S, may also be applicable abroad.

II. Results of Literature Review and Sound Studies

In the U.K. there are currently about 133 operating WT developments. Many of these have been in operation for over 10 years. The Acoustic Ecology Institute² (AEI) reported that a Special Report for the British government titled "Wind Energy Noise Impacts,"³ found that about 20% of the wind farms in the U.K. generated most of the noise complaints. Another study commissioned by British government, from the consulting firm Hayes, McKensie, reported that only five of 126 wind farms in the U.K. reported problems with the noise phenomenon known as aerodynamic modulation.⁴ Thus, experience in the U. K. shows that not all WT projects lead to community complaints. AEI posed an important question: "What are the factors in *those* wind farms that may be problematic, and how can we avoid replicating these situations elsewhere?"

As experienced industrial noise consultants ourselves, we would have expected the wind industry, given the U.K. experience, to have attempted to answer this question, conducting extensive research -- using credible independent research institutions -- before embarking on wind power development in the U.S. The wind industry was aware, or should have been aware, that 20% of British wind energy projects provoked complaints about noise and/or vibration, even in a country with more stringent noise limits than in the U.S.

The wind industry complies with stricter noise limits in the U.K. and other countries than it does in the U.S., for example⁵:

- Australia: higher of 35 dBA or $L_{90} + 5$ dBA
- Denmark: 40 dBA
- France: $L_{90} + 3$ dBA (night) and $L_{90} + 5$ dBA (day)
- Germany: 40 dBA
- Holland: 40 dBA
- United Kingdom: 40 dBA (day) and 43 dBA or $L_{90} + 5$ dBA (night)
- Illinois: Octave frequency band limits of about 50 dBA (day) and about 46 dBA (night)
- Wisconsin: 50 dBA
- Michigan: 55 dBA

Industry representatives on state governmental committees have worked to establish sound limits and setbacks that are lenient and favor the industry. In Michigan, for example, the State Task Force (working under the Department of Labor and Economic Growth) recommended in its "Siting Guidelines for Wind Energy Systems" that the limits be set at 55 dBA or $L_{90} + 5$ dBA, whichever is higher. In Wisconsin, the State Task Force has recommended 50 dBA.

When Wisconsin's Town of Union wind turbine committee made an open records request to find out the scientific basis for the sound levels and setbacks in the state's draft model ordinance, it found that no scientific or medical data was used at all. Review of the meeting minutes provided

² (<http://www.acousticecology.org/srwind.html>)

³ AEI is a 501(c)3 non-profit organization based in Santa Fe, New Mexico, USA. The article is available at <http://www.acousticecology.org/srwind.html>

⁴ Study review available at: <http://www.berr.gov.uk/files/file35592.pdf>

⁵ Ramakrishnan, Ph. D., P. Eng., Ramani, "Wind Turbine Facilities Noise Issues" Dec. 2007 Prepared for the Ontario Ministry of Environment.

under the request showed that the limits had been set by Task Force members representing the wind industry.⁶ This may explain why state level committees or task forces have drafted ordinances with upper limits of 50 dBA or higher instead of the much lower limits applied to similar projects in other countries. There is no independent, scientific or medical support for claims that locating 400+ foot tall wind turbines as close as 1000 feet (or less) to non-participating properties will not create noise disturbances, economic losses or other risks.⁷ But, there is considerable independent research supporting that this will result in public health risks and other negative impacts on people and property.

To illustrate the way a typical WT developer responds to a question raised by a community committee about noise and health the following example is presented and discussed:

Q: 19. What sound standards will EcoEnergy ensure that the turbines will be within, based on the setbacks EcoEnergy plans to implement, and what scientific and peer reviewed data do you have to ensure and support there will be no health and safety issues to persons within your setbacks?

Answer: As mentioned, turbines are sited to have maximum sound level of 45dBA. These sound levels are well below levels causing physical harm. Medical books on sound indicate sound levels above 80-90dBA cause physical (health) effects. The possible effects to a person's health due to "annoyance" are impossible to study in a scientific way, as these are often mostly psychosomatic, and are not caused by wind turbines as much as the individuals' obsession with a new item in their environment.

From EcoEnergy's "Response to the Town of Union Health & Safety Research Questionnaire"

By Curt Bjurlin, M.S., Wes Slaymaker, P.E., Rick Gungel, P.E., EcoEnergy, L.L.C., submitted to Town of Union, Wisconsin and Mr. Kendall Schneider, on behalf of the Town of Union

A serious question was asked and it deserves a responsible answer. The committee, charged with fact-finding, sought answers they presumed would be based on independent, peer-reviewed studies. Instead, the industry response was spurious and misleading, and did not address the question. It stated that the turbines will be located so as to produce maximum sound levels of 45 dBA, the tone and context implying that 45 dBA is fully compatible with the quiet rural community setting. No acknowledgement is made of the dramatic change this will be for the noise environment of nearby families. No mention is made of how the WT, once in operation, will raise evening and nighttime background sound levels from the existing background levels of 20 to 30 dBA to 45 dBA. There is no disclosure of the considerable low frequency content of the WT sound; in fact, there are often claims to the contrary. They fail to warn that the home construction techniques used for modern wood frame homes result in walls and roofs that cannot block out WT low frequencies.

There is no mention of the nighttime sound level recommendations set by the World Health Organization (WHO) in its reports, *Guidelines for Community Noise*⁸ and "Report on the third

⁶ Lawton, Catharine M., Letter to Wisconsin's "Guidelines and Model Ordinances Ad Hoc Subcommittee of the Wisconsin Wind Power Siting Collaborative" in Response to Paul Helgeson's 9/20/00 "Wisconsin Wind Ordinance Egroups E-Mail Message," Sept. 20, 2000, a Public Record obtained through Open Meetings Act request by the Town of Union, Wisconsin, Large Wind Turbine Citizens Committee.

⁷ It is worth noting that the 2007-06-29 version of the Vestas Mechanical Operating and Maintenance Manual for the model V90 - 3.0 MW VCRS 60 Hz turbine includes this warning for technicians and operators:

"2. Stay and Traffic by the Turbine

Do not stay within a radius of 400m (1300ft) from the turbine unless it is necessary. If you have to inspect an operating turbine from the ground, do not stay under the rotor plane but observe the rotor from the front.
Make sure that children do not stay by or play nearby the turbine."

⁸ Available at <http://www.who.int/docstore/peh/noise/guidelines2.html>.

meeting on night noise guidelines.⁹ In these documents WHO recommends that sound levels during nighttime and late evening hours should be less than 30 dBA during sleeping periods to protect children's health. They noted that a child's autonomic nervous system is 10 to 15 dB more sensitive to noise than is an adult. Even for adults, health effects are first noted in some studies when the sound levels exceed 32 dBA L_{max}. These sounds are 10-20 dBA lower than the sound levels needed to cause awakening.

For sounds that contain a strong low frequency component, which is typical of wind turbines, WHO says that the limits may need to be even lower than 30 dBA to avoid health risks. Further, they recommend that the criteria use dBC frequency weighting instead of dBA for sources with low frequency content. When WT sound levels are 45 dBA outside a home, we may find that the interior sound levels will drop to the 30 dBA level recommended for sleeping areas but low frequency noise only decreased 6-7 dBC from outside to inside. That could create a sleep problem because the low frequency content of the noise can penetrate the home's walls and roof with little reduction. An example demonstrating how WT sound is affected by walls and windows is provided later in this document.

The wind turbine developers in the excerpt above do not disclose that the International Standards Organization (ISO) in ISO 1996-1971 recommends 25 dBA as the maximum night-time limit for rural communities. As can be seen in the table below, sound levels of 40 dBA and above are only appropriate in suburban communities during the day and urban communities during day and night. There are no communities where 45 dBA is considered acceptable at night.

ISO 1996-1971 Recommendations for Community Noise Limits (dBA)			
District Type	Daytime Limit	Evening Limit 7-11pm	Night Limit 11pm-7am
Rural	35dB	30dB	25dB
Suburban	40dB	35dB	30dB
Urban residential	45dB	40dB	35dB
Urban mixed	50dB	45db	40dB

Further, the wind industry claims, "These sound levels are well below levels causing physical harm. Medical books on sound indicate sound levels above 80-90dBA cause physical (health) effects." Concern about sound levels in the 80-90 dBA range is for hearing health (your ears) and not the health-related issues of sleep disturbance and other symptoms associated with prolonged exposure to low levels of noise with low frequency and amplitude modulation such as the sound emitted by modern wind turbines. This type of response is a non-answer. It is an overt attempt to mislead while giving the appearance of providing a legitimate response.

Furthermore, the statement, "The possible effects to a person's health due to 'annoyance' are impossible to study in a scientific way, as these are often mostly psychosomatic, and are not caused by wind turbines as much as the individuals' obsession with a new item in their environment," is both inaccurate and misleading. It ignores the work of researchers such as Pedersen, Harry, Phipps, and Pierpont on wind turbine effects specifically, and the numerous medical research studies reviewed by Frey and Hadden. The studies belie the claims of the wind industry. This "failure to locate" published

⁹ Available at: <http://www.euro.who.int/Noise/activities/20040721> 1 References found in Report on third meeting at pages 13 and others

studies that are readily available on the internet as to make some interpret the claim of “no medical research” as a conscious decision to not look for it. Those companies that do acknowledge the existence of medical research take the position that it is not credible for one or another reason and thus can be ignored.

Making statements outside their area of competence, wind industry advocates, without medical qualifications, label complaints of health effects as “psychosomatic” in a pejorative manner that implies the complaints can be discounted because they are not “really medical” conditions. Such a response cannot be considered to be based in fact. It is, at best, an opinion. It ignores the work of many researchers, including the World Health Organizations, on the effect of sounds during nighttime hours that result in sleep disturbance and other disorders with physical, not just psychological, pathologies.^{10,11} Many people find it difficult to articulate what has changed. They know something is different from before the wind turbines were operating and they may express it as feeling uncomfortable, uneasy, sleepless, or some other symptom, without being able to explain why it is happening.

Our review of the studies listed in Tables 1-4 of our Noise-Con paper show that some residents living as far as 3 km (1.86 mi) from a wind farm complain of sleep disturbance from the noise. Many residents living 1/10 of this distance (300 m or 984 ft) from wind farms experience major sleep disruption and other serious medical problems from nighttime wind turbine noise. The peculiar acoustic characteristics of wind turbine noise immissions¹² cause the sounds at the receiving properties to be more annoying and troublesome than the more familiar noise from traffic and industrial factories. Limits used for these other community noise sources are not appropriate for siting modern industrial wind turbines. The residents who are annoyed by wind turbine noise complain of the repetitive, approximately once-per-second (1 Hz) “swoosh-boom-swoosh-boom” sound of the turbine blades and of “low frequency” noise. It is not clear to us whether the complaints about “low frequency” noise are about the audible low frequency part of the “swoosh-boom” sound, the once-per-second amplitude modulation (amplitude modulation means that the sound varies in loudness and other characteristics in a rhythmic pattern) of the “swoosh-boom” sound, or some combination of the two.

Figure 1 of our Noise Con paper, reproduced as Figure 1, below, shows the data from one of the complaint sites plotted against the sound immission spectra for a modern 2.5 MWatt wind turbine; A home in the United States at 2km distance, Young’s threshold of perception for the 10% most sensitive population (ISO 0266); and a spectrum obtained for a rural community during a three hour, 20 minute test from 11:45 pm until 3:05 am on a windless June evening near Ubyly, Michigan. This is a quiet rural community located in central Huron County (also called Michigan’s Thumb). It is worth noting that this sound measurement sample demonstrates how quiet a rural community can be when located at a distance from industry, highways, and airport related noise emitters.

The line representing the threshold of perception is the focus of this graph. The remaining graphs show sound pressure levels (dB) at each of the frequency ranges from the lowest inaudible sounds at the left, to sounds that “rumble” (20Hz to about 200 Hz) and then those in the range of communication (200Hz through about 4000Hz) through high pitched sounds (up to 10,000 Hz). At

¹⁰ WHO European Centre for Environment and Health, Bonn Office, “Report on the third meeting on night noise guidelines,” April 2005.

¹¹ According to Online Etymology Dictionary, *psychosomatic* means “pertaining to the relation between mind and body, ... applied from 1938 to physical disorders with psychological causes.”

¹² *Emissions* refer to acoustic energy from the viewpoint of the sound emitter, while *immissions* refer to acoustic energy from the viewpoint of the receiver.

each frequency where the graphs of sound pressures are above (exceed) the graph showing perception the wind turbine sounds would be perceptible or audible. The more the wind turbine sound exceeds the perception curve the more pronounced it will be. When it exceeds the quiet rural background sound level (LA90) it will not be masked or obscured by the rural soundscape.

The over-all sounds from each of the frequency bands are summed and presented on the right hand side of the graph. These are presented with corrections for A-weighting (dBA) and C-weighting (dBC). These show that if only dBA criteria are used to assess and limit wind turbine sound the low frequency content of the wind turbines emissions are not revealed. Note that in many cases the values for dBC are almost 20 dB higher than the dBA values. This is the basis for the WHO warning that when low frequency sound content is present outside a home dBA is not an appropriate method of describing predicted noise impacts, sound limits, or criteria.

Figure 1-Graph Of Wind Turbine Sounds Vs. Rural Background And Threshold Of Perception

(Note: The lowest LAeq and LCEq shown at right are measured background LA90 and LCE0. The Leq values could be 0-5 dB higher)

Our review of the studies listed in Tables 1-4 in the Noise-Con paper at the end of this document, provided answers to a number of significant questions we had, as acoustical engineers, regarding the development of siting guidelines for industrial-scale wind turbines. They are provided below for easy of reading and continuity:

Do international, national, or local community noise standards for siting wind turbines near dwellings address the low frequency portion of the wind turbines' sound immissions? No. State and local governments are in the process of establishing wind farm noise limits and/or wind turbine setbacks from nearby residents, but the standards incorrectly assume that limits based on dBA levels are sufficient to protect the residents.

Do wind farm developers have noise limit criteria and/or wind turbine setback criteria that apply to nearby dwellings? Yes. But the industry-recommended wind turbine noise levels (typically 50-55 dBA) are too high for the quiet nature of the rural communities and may be unsafe for the nearest residents. An additional concern is that some of the methods for pre-construction computer modeling may predict sound levels that are too low. These two factors combined can lead to post-construction complaints and health risks.

An example of a condition that complies with

Are all residents living near wind farms equally likely to be affected by wind turbine noise? No. Children, people with certain pre-existing medical conditions, and the elderly are likely to be the most susceptible. Some people are unaffected while nearby neighbors develop serious health problems caused by exposure to the same wind turbine noise.

How does wind turbine noise impact nearby residents? Wind turbine-associated symptoms include sleep disturbance, headache, ringing in the ears, dizziness, nausea, irritability, and problems with memory, concentration, and problem solving, as described in the first paper in this volume.

What are the technical options for reducing wind turbine noise immission at residences? There are only two options: 1) increase the distance between the source and receiver, or 2) reduce the source sound power emission. Either solution is incompatible with the objective of the wind farm developer, which is to maximize the wind power electrical generation within the land available.

Is wind turbine noise at a residence much more annoying than traffic noise? Yes. Researchers have found that, "Wind turbine noise was ... found to cause annoyance at sound pressure levels lower than those known to be annoying for other community noise sources, such as road traffic. ... Living in a clearly rural area in comparison with a suburban area increases the risk of annoyance with wind turbine noise.¹³" In other papers by Pedersen wind turbine noise was perceived by about 85% of respondents to the study at sound levels as low as 35.0-37.5 dBA.¹⁴ Currently, this increased sensitivity is believed to be due to the presence of amplitude modulation in the wind turbine's sound emissions which limits the masking effect of other ambient sounds and the low frequency content which is associated with the sounds inside homes and other buildings.

Amplitude modulation is a continuing change in the sound level in synchronization with the turning of the wind turbine's blades. An example of amplitude modulation is shown in the figure 2 below. This figure shows the constantly varying dBA sound level in the graph at the top. The sound level varies from a low of 40 dBA to a high of 45 dBA repeating every 1.3 seconds continuously when the turbine is operating. The turbine is located approximately 1200 feet from the farmhouse. The photo shows the turbine that was dominant during this test.

¹³ Pedersen E, Bouma J, Bakker R and Van den Berg F, "Wind Farm perception- A study on acoustic and visual impact of wind turbines on residents in the Netherlands;" 2nd International Meeting on Wind Turbine Noise, Lyon France; Sept. 20-21, 2007 (Pages 2 and 3)

¹⁴ Pedersen E and Persson Waye K. 2004. Perceptions and annoyance due to wind turbine noise -- a dose-response relationship. J Acoust Soc Am 116(6): 3460-3470

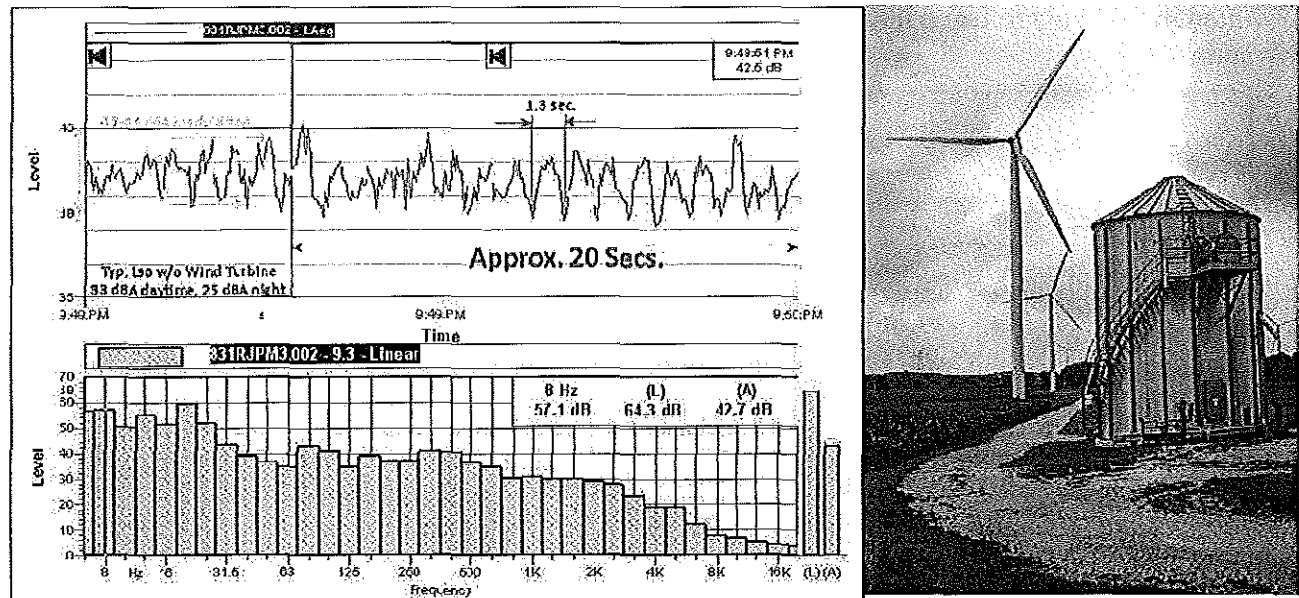

Figure 2 Amplitude Modulation at a farmhouse (Study sponsored by CCCRE, Calumet, Wisconsin)

It is worth noting that this measurement averages about 43 dBA (L_{eq}) which is very close to the sound level predicted for a single turbine at 1000 feet in Figure 1 (solid red line with solid triangle markers). The lower graph shows the frequency spectrum at approximately 9:49 PM at a low point in the amplitude modulation. (The frequency chart's cursor is the vertical line at the upper graph's midpoint.) Note the dominance of sound energy in the lower frequency range. This was also present in the model's predictions in Figure 1.

It is not hard to understand why many people in this community feel that they have been forced to accept noise pollution as a side effect of the wind project. Even though the 40 to 45 dBA sound levels in this example may comply with the 50 dBA limits adopted by the host county from the Wisconsin Model Ordinance the impact on the people near the wind project are subjected to noise pollution. This example demonstrates why criteria set at 50 dBA or higher do not protect the health and economic welfare of people living in the host communities. Adopting criteria such as those recommended later in this essay can prevent these situations from occurring.

Low frequency noise is a problem inside buildings

When low frequency sound is present outside homes and other occupied structures, it is often more an indoor problem than an outdoor one. This is very true for wind turbine sounds.

Why do wind turbine noise immissions of only 35 dBA disturb sleep at night? Affected residents complain of the middle- to high-frequency, repetitive swooshing sounds of the rotating turbine blades at a constant rate of about 1 Hz, plus low frequency noise. The amplitude modulation of the "swooshing" sound changes continuously. Residents also describe a thump or low frequency banging sound that varies in amplitude up to 10 dBA in the short interval between the swooshing sounds. This may be a result of sounds from multiple wind turbines with similar spectral content combining to increase and decrease the sound over and above the effects of modulation. [Note: These effects (e.g. phasing and coherence effects) are not normally considered in predictive models.] It may also be a result of turbulence of the air and wind on wind turbine operations when the blades are not at an optimum angle for noise emissions and/or power generation. It is also a result of sounds penetrating homes and other buildings at night and at other times where quiet is needed. When low frequency sound is present outside homes and other occupied structures, it is

often more likely to be an indoor problem than an outdoor one. This is very true for wind turbine sounds.

Figure 3-A Single Wind Turbine Sound Inside Home @ 1000 Feet

The usual assumption about wall and window attenuation being 15 dBA or more, which is valid for most sources of community noise, may not be sufficiently protective given the relatively high amplitude of the wind turbines' low frequency immission spectra. Figures 2 and 3 demonstrate the basis for this concern.

To demonstrate the effects of outdoor low frequency content from wind turbines we prepared Figure 1 showing the effect of a single turbine (propagation model based on sound power level test data) at 1000 feet and then in Figure 4 projected the impact of ten (10) similar turbines at one (1) mile. We applied the façade sound isolation data from the Canada Research Council to the wind turbine example used in our Noise-Con 2008 paper and shown in Figure 1 above. The graphs each show the outdoor sound pressure levels predicted for the distance of 1000 feet and one mile as the upper graph line respectively. The curve showing the threshold of human perception for sounds at each 1/3 octave band center is also plotted. When the graphs representing wind turbine sound have data points above this threshold curve the sounds will be perceptible to at least 10% of the population (which includes most children).

In addition to the top graph line representing the sounds outside the home there are two other graph lines for the sounds inside the home¹⁵. One curve represents the condition of no open windows and the other represents one open window.

With just one turbine at 1,000 feet there is a significant amount of low frequency noise above hearing threshold within rooms having exterior walls without windows or very well sealed windows. Even with the windows closed the sound pressure levels in the 63 Hz to 200 Hz one-octave bands still exceed the perception curve, in many cases by more than 10 dB. Note the perceptible sound between 50 and 200 Hz with a wall resonance frequency at 125 Hz (2 X 4 studs on 16 inch centers) for the "windows closed" condition. This would be perceived as a constant low rumble, which would be present inside homes whenever the turbines are operating.

Figure 4-Sound from Ten (10) Wind Turbines inside home at One Mile

When comparing the dBC values the difference between inside sounds and outside is much less. The maximum difference in this example is only 7 dBC and that is for the situation with windows closed. With windows open the sound inside the home would be 56 dBC while it is 61 dBC outside; a difference of only 5 dBC^{16,17,18}. If we looked only at dBA it would appear that the home's

¹⁵ The typical wood stud exterior used in modern home construction is vinyl siding over 1/2 inch OSB or rigid fiberglass board applied to 2 X 4 studs with the stud space filled with thermal and 1/2 inch gypsum board applied on the exposed interior side. This has a mass of about 3-4 lbs/sq ft and low 26 STC.

¹⁶ The basis for these predictions includes reports on aircraft sound insulation for dwellings and façade sound isolation data from the Canada Research Council.

¹⁷ "On the sound insulation of wood stud exterior walls" by J. S. Bradley and J. S. Birta, institute for Research in Construction, National Research Council, Montreal Road, Ottawa K1A 0R6, Canada, published: J. Acoust. Soc. Am. 110 (6), December 2001

walls and roof provide a reduction of 15 dBA or more. But, that that would be misleading because it ignores the effects of low frequency sound.

We next increased the number of 2.5 Mw turbines from one to ten and moved the receiver one mile from the closest turbine. We assumed the acoustic center for the ten turbines to be 2km (1-1/4 miles) from the receiver. These results are presented in Figure 4. We were surprised to find that the one mile low frequency results are only 6.3 dB below the 1,000 foot one turbine example.

There is one other characteristic of wind turbine sound that increases the sleep disturbance potential above that of other long-term noise sources. The amplitude modulation of the sound emissions from the wind turbines create a repetitive rise and fall in sound levels synchronized to the blade rotation speed. Many common weather conditions increase the magnitude of amplitude modulation. Most of these occur at night. The graph in Figure 5 shows this effect in the first floor bedroom of a farm home in the U.K. The home is located 930 meters (3,050 feet) from the nearest turbine. The conditions documented by an independent acoustical consultant show the sound level varying over 9 dBA range from 28 to 37 dBA. The pattern repeats approximately every second often for hours at a time. For many people, especially seniors, children and those with pre-existing medical conditions, this represents a major challenge to restful sleep.

Figure 5- Amplitude modulation in a home 930 meters (3000 feet) from the nearest turbine.¹⁹

This may explain why some residents as far as two (2) miles from a wind farm find the wind turbines sounds highly annoying. It also demonstrates the primary reason why relying on dBA

¹⁹ This chart used with permission of Mike Stigwood, MIOA, FRSH, MAS Environmental, U.K. and the Davis family.

alone will not work for community noise criteria. It is the low frequency phenomena associated with wind turbine emissions that makes the dBC test criteria an important part of the proposed criteria²⁰.

III. Development of Siting Criteria

Basis For Using L_{A90} To Determine Pre-Construction Long-Term Background Sound

We began our research into guidelines for proper siting by reviewing guidelines used in other countries to limit WT sound emissions. A recent compendium of these standards was presented in the report "Wind Turbine Facilities Noise Issues."²¹ We found common ground in many of them. Some set explicit not-to-exceed sound level limits, for example, in Germany, 40 dBA nighttime in residential areas and 35 dBA nighttime in rural and other noise-sensitive areas. Other countries use the existing background sound levels for each community as the basis for establishing the sound level limits for the WES project. This second method has the advantage of adjusting the allowable limits for various background soundscapes. It makes use of a standard method for assessing background sound levels by measuring over a specified period of observation to determine the sound level exceeded 90% of the time (L_{90}) during the night. The night is important because it is the most likely time for sleep disturbance. Then, using the background sound level as the base, the WES project is allowed to increase it by 5 dBA. It is this second method ($L_{90} + 5$ dBA) that was adopted for the criteria in this document. It has the advantage of adjusting the criteria for each community without the need for tables of allowable limits for different community types. The focus is only on the nighttime criteria. This is because the WES will operate 24 hours a day and the nighttime limits will be the controlling limits whether or not there are other limits for daytime.

Wind turbine noise is more annoying than other noises and needs lower limits

Since many rural communities are very quiet, it is possible that some will have L_{90} values of 25 dBA or lower. This may seem extreme when compared to limits usually imposed on other sources of community noise. However, wind turbine sounds are not comparable to the more common noise sources of vehicles, aircraft, rail, and industry. Several studies have shown that annoyance to wind turbine sounds begins at levels as low as 30 dBA.²² This is especially true in quiet rural communities that have not had previous experience with industrial noise sources. This increased sensitivity may be due to the periodic 'swoosh' from the blades in the quiet rural soundscape, or it may be more complex. In either case, it is a legitimate response to wind turbine sound documented in peer-reviewed research.

Noise criteria need to take into account low frequency noise

In the table to the right are a series of observations and recommendations by the World Health Organization (WHO) supporting the need for stricter limits when there is substantial low frequency content in outdoor sound. Our review of other studies, and our own measurements, has demonstrated that wind turbine sound includes considerable low frequency content. We include a dBC limit in our guidelines to address the WHO

recommendation that when low

frequency sound may be present, criteria based on measurements using a C-weighting filter on the sound level meter (dBC) are needed in addition to dBA criteria.

The World Health Organization recognizes the special place of low frequency noise as an environmental problem. Its publication "Community Noise" (Berglund et al., 2000) makes a number of references to low frequency noise, some of which are as follows:

- "It should be noted that low frequency noise... can disturb rest and sleep even at low sound levels.
- For noise with a large proportion of low frequency sounds a still lower guideline (than 30dBA) is recommended.
- When prominent low frequency components are present, noise measures based on A-weighting are inappropriate.
- Since A-weighting underestimates the sound pressure level of noise with low frequency components, a better assessment of health effects would be to use C-weighting.
- It should be noted that a large proportion of low frequency components in a noise may increase considerably the adverse effects on health."

WHO also states: "The evidence on low frequency noise is sufficiently strong to warrant immediate concern."

IV. Proposed Sound Limits

The simple fact that so many residents complain of low frequency noise from wind turbines is clear evidence that the single A-weighted (dBA) noise descriptor used in most jurisdictions for siting turbines is not adequate. The only other simple audio frequency weighting that is standardized and available on sound level meters is C-weighting or dBC. A standard sound level meter set to measure dBA is increasingly less sensitive to low frequency below 500 Hz (one octave above middle-C). The same sound level meter set to measure dBC is equally sensitive to all frequencies above 32 Hz (lowest note on grand piano). It is generally accepted that dBC readings are more predictive of perceptual loudness than dBA readings if low frequency sounds are significant.

We are proposing to use the commonly accepted dBA criteria that is based on the pre-existing background sound levels allowing the wind turbine development to increase this by 5 dB (e.g. $L_{90A} + 5$) by the audible sounds from wind turbines. According to the New York State Energy Research & Development Authority:

- "... A change in sound level of 5 dB will typically result in a noticeable community response; and
- "... A 10 dB increase is subjectively heard as an approximate doubling in loudness, and almost always causes an adverse community response."²³

To address the lower frequencies that are not considered in A-weighted measurements we are proposing to add limits based on dBC that follow the same scheme as used for dBA limits. The Proposed Sound Limits are presented in the text box at the end of this section.

For the current industrial grade wind turbines in the 1.5 to 3 MWatt (or over) range, the addition of the dBC requirement may result in an increased distance between wind turbines and the nearby

²³ (*Wind Energy Development: A Guide for Local Authorities in New York*; page 30; New York State Energy Research & Development Authority, Albany, NY October 2002)

residents. For the conditions shown in Figure 1, the distances would need to be increased significantly. This would result in setbacks in the range of 1 km or greater for the current generation of wind turbines if they are to be located in rural areas with little or no low frequency sound from man-made noise sources and where the L_{A90} background sound levels are 30 dBA or lower. In areas with higher background sound levels, turbines could be located somewhat closer, but still at a distance greater than the 305 m (1000 ft.) or smaller setbacks commonly seen in U.S. based wind turbine standards set by many states and used for wind turbine developments.

Following are some additional Questions and Answers that summarize the major points of this discussion relevant to criteria.

What are the typical wind farm noise immission criteria or standards? Limits are not consistent and may vary even within a particular country. Examples are listed above in the section on Results of Literature and Sound Studies.

What is a reasonable wind farm sound immission limit to protect the health of residences? We are proposing a not-to-exceed immission limit of 35 L_{Aeq} and a site-specific limit of $L_{A90} + 5$ dBA at the closest property line, whichever is exceeded first. We also propose the use of C-weighted criteria to address complaints of wind turbine low frequency noise. For the C-weighted criteria, we propose a site-specific limit of $L_{C90} + 5$ dBC. We also require that the site-specific L_{Ceq} (dBC) sound level at a receiving property line not exceed the pre-existing L_{A90} dB background sound level + 5dB by more than 20 dB. In other words, the dBC operating immission limit (as L_{Ceq}) at the receiving property line should not be more than 20 dB above the measured dBA (as L_{A90}) pre-construction long-term background sound level + 5dB.²⁴ This criterion prevents an Immission Spectra Imbalance that often leads to complaints about rumble or other low frequency problems. We also include a not-to-exceed immission limit of 55 and 60 L_{Ceq} at the receiving property line.²⁵ Use of the multiple metrics and weightings will address the audible and inaudible low frequency portions of wind turbine sound emissions. Exceedances of any of the limits establish non-compliance.

Why should the dBC immission limit not be permitted to be more than 20 dB above the background measured $L_{A90}+5$ dB? The World Health Organization and others²⁶ have determined that if a noise has a measured difference between dBC and dBA more than 20 dB, the noise is highly likely to create an annoyance because of the low frequency component.

Isn't L_{A90} the minimum background noise level? Not exactly. This is the sound level that represents the quietest 10% of the time. It is often considered to be the sound level that represents the sounds one hears late in the evening or at night when there are no near-by or short term sounds present. It is very important to establish this "long term background" noise environment at the property line for a potentially impacted residence (L_{A90}) during the quietest sleeping hours of the night, between 10 p.m. and 4 a.m.. Why? Because nighttime sleep disturbance has generated the majority of wind farm noise complaints throughout the world those conditions should guide the design of wind projects. ANSI standards define the "long term background sound" as excluding all short term sounds from the test sample using carefully selected sampling times and conditions using ten (10) minute long samples. This means that nature sounds not present during all seasons and wind noise are not to be included in the measurement. Following the procedures in ANSI S12.9, Part 3 for long term background sound the L_{A90} and L_{C90} can be measured with one or more 10-minute

²⁴ Hessler Jr., George F., Proposed criteria in residential communities for low-frequency noise emissions from industrial sources, *Noise Control Engineering Journal*; 52(4), pg. 180 in "2. Purpose of Proposed Criteria," (July-Aug 2004)

²⁵ Ibid, pg. 180 in "3. Proposed Criteria."

²⁶ Ibid

measurements during any night when the atmosphere is classified as stable with a light wind from the area of the proposed wind farm. The basis for the immission limits for the proposed wind farm would then be the Nighttime Immission Limits, which we propose to be the minimum ten (10) minute nighttime L_{A90} and L_{C90} plus 5 dB, a test for Spectra Imbalance, and not-to-exceed limits for the period of 10 p.m. to 7 a.m. Daytime Limits (7 a.m. to 10 p.m.) could be set using daytime measurements, but unless the wind utility only operates during the day, the nighttime limit will always be the limiting sound level. Thus, daytime limits are not normally needed.

A nearby industrial scale wind utility meeting these noise immission criteria would occasionally be audible to the residents during nighttime and daytime. However, it would be unlikely for it to be an indoor problem.

The method used for establishing the background sound level at a proposed wind farm in many of the studies in Table 1, does not meet the requirements set by ANSI S12.9 Part 3 for outdoor measurements and determination of long-term background sound levels. Instead, they use unattended noise monitors to record hundreds of 10-minute or one-hour un-observed measurements that include the short term sounds from varying community and wind conditions over a period of days or weeks. The results for daytime and nighttime are usually combined to determine the average wind noise at the microphone as a function of wind velocity measured at a height of ten (10) meters. This provides an enormous amount of data, but the results have little relationship to wind turbine sound immissions or to potential for turbine noise impacts on nearby residents. They also do not comply with ANSI standards for methodology or quality and as such are not suitable for use in measurements that will be used to assess compliance with other standards and guidelines. This exhaustive exercise often only demonstrates how much 'pseudo-noise' is generated by instruments located in a windy environment that exceeds the capability of the instrument's wind screen to protect the microphone. In many cases, this unqualified data is used to support a claim that the wind noise masks the turbines' sound immissions.

The major complaints of residents living near wind farms is sleep disruption at night when there is little or no wind near ground level and the wind turbines located at a much higher elevation are turning and generating near or at maximum power and maximum noise emission. There is usually more surface wind and turbulence during daytime caused by solar radiation. Thus, the use of averaged data involving one or more 24-hour periods is of little value in predicting conditions that will result in people who cannot sleep in their homes during the night because of loud intrusive wind turbine noise.

The methodology used to predict the sound propagation from the turbines into the community also fails to represent the conditions of maximum turbine noise impact on nearby residents. This should be expected given the limitations of models based on ISO 9613-2²⁷. They also do not consider the effects of a frequent nighttime condition when winds at the ground are calm and the winds at the hub are at or above nominal operating speed. This condition is often referred to as a "stable" atmosphere. During this condition, the wind turbines can be producing the maximum or near maximum power while the wind at ground level is calm and the background noise level is low. The Michigan rural night test data in the earlier figure shows how quiet a night can be in the absence of wind at the ground. This common condition is known to directly cause chronic sleep

²⁷ The ISO 9613-2 sound propagation model formulas have known errors of 3 dB even when the conditions being modeled are a perfect match to the limiting conditions specified in the standard. Wind turbines operate far outside the limits for wind speed, height of the noise source above the ground, and other factors identified in the standard thus increasing the likelihood for error above the specified 3 dB. In addition, there are known measurement errors in the IEC61400-11 test that add another 2 dB of uncertainty to the model's predictions.

disruption. Further, the studies report average sound levels and do not disclose the effects of amplitude modulation or low frequency sound which makes the turbine's sound more objectionable and likely to cause sleep problems.

Are there additional noise data to be recorded for a pre-wind turbine noise survey near selected dwellings? Yes. The precision measuring sound level meter(s) need to be programmed to include measurement of L_{Aeq} , L_{A10} , L_{A90} , L_{Ceq} , L_{C10} , and L_{C90} , with starting time and date for each 10-minute sample. The L_{10} results will be used to validate the L_{90} data. For example, on a quiet night one might expect L_{10} and L_{90} to show similar results within 5 to 10 dB between L_{10} and L_{90} for each weighting scale. On a windy night or one with nearby short term noise sources the difference between L_{10} and L_{90} may be more than 20 dB. There is also often a need to obtain a time-averaged, one-third octave band analysis over the frequency range from 6.3 Hz to 10 kHz during the same ten minute sample. The frequency analysis is very helpful for identifying and correcting for extraneous sounds such as interfering insect noise. An integrating averaging sound level meter meeting ANSI or IEC Type 1 standards has the capability to perform all of the above acoustic measurements simultaneously and store the results internally. There is also a requirement for measurement of the wind velocity near the sound measurement microphone continuously throughout each 10-minute recorded noise sample. The 10-minute maximum wind speed near the microphone must be less than 2 m/s (4.5 mph) during measurements of background noise (L_{90}), and the maximum wind speed for noise measurements during turbine operation must be less than 4 m/s (9 mph). Measurements should be observed (without contaminating the data) and notes identifying short-term noises should be taken for these tests.

Is there a need to record weather data during the background noise recording survey? One weather monitor is required at the proposed wind farm on the side nearest the residents. The weather station sensors are at the standard 10 meter height above ground. It is critical that the weather be recorded every 10 minutes, synchronized with the clocks in the sound level recorders without ambiguity, at the start and end time of each 10 minute period. The weather station should record wind speed and direction, temperature, humidity and rain.

Why do Canada and some other countries base the permitted wind turbine noise immission limits on the operational wind velocity at the 10m height wind speed instead of a maximum dBA or $L_{90} + 5$ dBA immission level? First, it appears that the wind turbine industry will take advantage of every opportunity to elevate the maximum permitted noise immission level to reduce the setback distance from the nearby dwellings. Including wind as a masking source in the criteria is one method for elevating the permissible limits. The background noise level does indeed increase with surface wind speed. When this happens, it can be argued that the increased wind noise provides some masking of wind turbine noise. However, this is not true if the surface winds are calm. After sunset, when the ground cools (e.g. in the middle of the night), the lower level atmosphere can separate from the higher-level atmosphere. Then, the winds at the ground will be calm while wind at the turbine hub is very strong. Under this condition, the wind velocity at a 10-meter high wind monitoring station (such as those often used for weather reporting) may be $\frac{1}{4}$ to $\frac{1}{2}$ the speed of the wind at the hub, yet drop to calm at ground level. The result is that no ground level wind noise is present to mask the sound of the wind turbines, which can be operating at or close to full capacity.

This condition is one of the major causes of wind turbine related noise complaints for residents within 3 km (1.86 miles) of a wind farm. When the turbines are producing high sound levels, it is quiet outside the surrounding homes. The PhD thesis of G.P. van den Berg, *The Sounds of High*

Winds, is very enlightening on this issue (Table 3). See also the letter by John Harrison in Ontario "On Wind Turbine Guidelines."²⁸

What sound monitor measurements would be needed for enforcement of the wind turbine sound ordinance? A similar set of sound tests using the ten (10) minute series of measurements would be repeated, with and without the operation of the wind turbines, at the location where noise was measured before construction, which is closest to the resident registering the wind turbine noise complaint. If the nighttime background (L_{90}) noise level (turbines off) was found to be slightly higher than the measured background prior to the wind farm installation, then the results with the turbines operating must be corrected using standard acoustical engineering methods to determine compliance with the pre-turbine established sound limits.

Who should conduct the sound measurements? An independent acoustics expert should be retained who reports to the County Board or other responsible governing body. This independent acoustics expert should be responsible for all the acoustic measurements including setup and calibration of instruments and interpretation of recorded results. He or she should perform all pre-turbine background noise measurements and interpretation of results to establish the nighttime (and daytime, if applicable) industrial wind turbine sound immission limits, and to monitor compliance.

At present, the acoustical consultants are retained by, and work directly for, the wind farm developers. This presents a serious problem with conflict of interest on the part of the consultants. The wind farm developer would like to show that a significant amount of wind noise is present to mask the sounds of the wind turbine immissions. The community is looking for authentic results showing that the wind turbine noise will be only barely perceptible, and then only occasionally, during the night or daytime.

Is frequency analysis required either during the pre-construction background noise survey or for compliance measurements? Normally one-third octave or narrower band analysis would only be required if there is a complaint of tones immission from the wind farm. Although only standardized dBA and dBC measurements are required to meet the proposed criteria, the addition of one-third octave band analysis is often useful to validate the dBA and dBC results.

The following summarizes the criteria necessary when siting wind turbines to minimize the risk of adverse impacts from noise on the adjacent community²⁹. For those not familiar with acoustical annotation the table and its formulas may seem overly complex, but the criteria are defined in this manner to be as unambiguous as possible. They will be clear for those who are familiar with acoustical terminology. Definitions are provided in a later section of this essay.

²⁸ Harrison, J., *Wind Turbine Guidelines*, available at <http://amherstislandwindinfo.com/>

²⁹ The authors have based these criteria, procedures, and language on their current understanding of wind turbine sound emissions, land-use compatibility, and the effects of sound on health. However, use of the following, in part or total, by any party is strictly voluntary and the user assumes all risks. Please seek professional assistance in applying the recommendations of this document to any specific community or WES development.

NOISE CRITERIA FOR SITING WIND TURBINES TO PREVENT HEALTH RISKS²⁹

1. Establishing Long-Term Background Noise Level

- a. Instrumentation: ANSI or IEC Type 1 Precision Integrating Sound Level Meter plus meteorological instruments to measure wind velocity, temperature and humidity near the sound measuring microphone. Measurement procedures must meet ANSI S12.9, Part 3 except as noted in Section 4. below.
- b. Measurement location(s): Nearest property line(s) from proposed wind turbines representative of all non-participating residential property within 2.0 miles.
- c. Time of measurements and prevailing weather: The atmosphere must be classified as stable with no vertical heat flow to cause air mixing. Stable conditions occur in the evening and middle of the night with a clear sky and very little wind near the surface. Sound measurements are only valid when the measured wind speed at the microphone is less than 2 m/s (4.5 mph).
- d. Long-Term Background sound measurements: All data recording shall be a series of contiguous ten (10) minute measurements. The measurement objective is to determine the quietest ten minute period at each location of interest. Nighttime test periods are preferred unless daytime conditions are quieter. The following data shall be recorded simultaneously for each ten (10) minute measurement period: dBA data includes L_{A90} , L_{A10} , L_{Aeq} and dBC data includes L_{C90} , L_{C10} , and L_{Ceq} . Record the maximum wind speed at the microphone during the ten minutes, a single measurement of temperature and humidity at the microphone for each new location or each hour whichever is oftener shall also be recorded. A ten (10) minute measurement contains valid data provided: Both L_{A10} minus L_{A90} and L_{C10} minus L_{C90} are not greater than 10 dB and the maximum wind speed at the microphone is less than 2 m/s during the same ten (10) minute period as the acoustic data.

2. Wind Turbine Sound Immission Limits

No wind turbine or group of turbines shall be located so as to cause wind turbine sound immission at any location on non-participating property containing a residence in excess of the limits in the following table:

Table of Not-To-Exceed Property Line Sound Immission Limits ¹			
Criteria	Condition	dBA	dBC
A	Immission above pre-construction background:	$L_{Aeq} = L_{A90} + 5$	$L_{Ceq} = L_{C90} + 5$
B	Maximum immission:	35 L_{Aeq}	55 L_{Ceq} for quiet ² rural environment 60 L_{Ceq} for rural-suburban environment
C	Immission spectra imbalance	L_{Ceq} (immission) minus (L_{A90} (background) +5) \leq 20 dB	
D	Prominent tone penalty:	5 dB	5 dB
Notes			
1	Each Test is independent and exceedances of any test establishes non-compliance. Sound "immission" is the wind turbine noise emission as received at a property.		
2	A "Quiet rural environment" is a location >2 miles from a major transportation artery without high traffic volume during otherwise quiet periods of the day or night.		
3	Prominent tone as defined in IEC 61400-11. This Standard is not to be used for any other purpose.		
¹ Procedures provided in Section 7. Measurement Procedures (ANSI 12.9 Part 3 with Amendments) of the most recent version of "The How To Guide To Siting Wind Turbines To Prevent Health Risks From Sound" by Kamperman and James and the apply to this table.			

3. Wind Farm Noise Compliance Testing

All of the measurements outlined above in 1. Establishing Nighttime Background Noise Level must be repeated to determine compliance with 2. Wind Turbine Sound Immission Limits. The compliance test location is to be the pre-turbine background noise measurement location nearest to the home of the complainant in line with the wind farm and nearer to the wind farm. The time of day for the testing and the wind farm operating conditions plus wind speed and direction must replicate the conditions that generated the complaint. Procedures of ANSI S12.9- Part 3 apply except as noted in Section 4. The effect of instrumentation limits for wind and other factors must be recognized and followed.

4. ANSI S12.9 Part 3 Selected Options and Requirement Amendments

For measurements taken to assess the preceding criteria specific options provided for in ANSI S12.9-Part 3 (2008) shall be followed along with any additional requirements included below:

- 5.2 Background Sound: Use definition (1): 'long-term'
- 5.2 long-term background sound: The L_{90} excludes short term background sounds
- 5.3 basic measurement period: Ten (10) minutes $L_{90(10 \text{ min})}$
- 5.6 Sound Measuring Instrument: Type 1 Precision meeting ANSI S1.43 or IEC 61672-1. The sound level meter shall cover the frequency range from 6.3 Hz to 20k Hz and simultaneously measure dBA L_N and dBC L_N . The instrument must also be capable of accurately measuring low-level background sounds down to 20 dBA.
- 6.5 Windscreen: Required
- 6.6(a) An anemometer accurate to $\pm 10\%$ at 2m/s to full-scale accuracy. The anemometer shall be located 1.5 to 2 meters above the ground and orientated to record maximum wind velocity. The maximum wind velocity, wind direction, temperature and humidity shall be recorded for each ten (10) minute sound measurement period observed within 5 m. of the measuring microphone.
- 7.1 Long-term background sound
- 7.2 Data collection Methods: Second method with observed samples to avoid contamination by short term sounds (purpose: to avoid loss of statistical data)
- 8. Source(s) Data Collection: All requirements in ANSI S12.18 Method #2, Precision to the extent possible while still permitting testing of the conditions that lead to complaints. The meteorological requirements in ANSI S12.18 may not be applicable for some complaint tests. For sound measurements in response to a complaint, the compliance sound measurements should be made under conditions that replicate the conditions that caused the complaint without exceeding instrument and windscreen limits and tolerances.
- 8.1(b) Measuring microphone with windscreen shall be located 1.2m to 1.8m (1.5 preferred) above the ground and greater than 8 m. from large sound reflecting surface.
- 8.3(a) All meteorological observations required at both (not either) microphone and nearest 10 m. weather reporting station.
- 8.3(b) For a ten (10) minute background sound measurement to be valid the wind velocity shall be less than 2m/s (4.5 mph) measured less than 5 m. from the microphone. Compliance sound measurements shall be taken when winds are less than 4m/s at the microphone.
- 8.3(c) In addition to the required acoustic calibration checks, the sound measuring instrument internal noise floor, including microphone, must also be checked at the end of each series of ten minute measurements and no less frequently than once per day. Insert the microphone into the acoustic calibrator with the calibrator signal off. Record the observed dBA and dBC reading on the sound level meter to determine an approximation of the instrument self noise. Perform this test before leaving the background measurement location. The calibrator-covered microphone must demonstrate the results of this test are at least 5 dB below the immediately previous ten (10) minute acoustic test results, for the acoustic background data to be valid. This test is necessary to detect undesired increase in the microphone and sound level meter internal self-noise. As a precaution sound measuring instrumentation should be removed from any air conditioned space at least an hour before use. Nighttime measurements are often performed very near the meteorological dew point. Minor moisture condensation inside a microphone or sound level meter can increase the instrument self noise and void the measured background data.
- 8.4 The remaining sections, starting at 8.4 in ANSI S12.9 Part 3 Standard do not apply.

V. How to Include the Recommended Criteria in Ordinances and/or Community Noise Limits

The following two sections present the definitions, technical requirements, and complaint resolution processes that support the recommended criteria. Following the formal elements is a section discussing the measurement procedures and requirements for enforcement of these criteria. For the purpose of the following sections the government authority will be referred to as the Local Government Authority (LGA) as a place marker for State, County, Township or other authorized authority. The abbreviation 'WES' is used for industrial scale wind energy system.

The authors have based these criteria, procedures, and language on their current understanding of wind turbine sound emissions, land-use compatibility, and the effects of sound on health. However, use of the following, in part or total, by any party is strictly voluntary and the user assumes all risks. Please seek professional assistance in applying the recommendations of this document to any specific community or WES development.

VI. ELEMENTS OF A WIND ENERGY SYSTEMS LICENSING ORDINANCE FOR SOUND

I. Purpose and Intent.

Based upon the findings stated above, it is the intended purpose of the LGA to regulate Wind Energy Systems to promote the health, safety, and general welfare of the citizens of the Town and to establish reasonable and uniform regulations for the operation thereof so as to control potentially dangerous effects of these Systems on the community.

II. Definitions.

The following terms have the meanings indicated:

"Aerodynamic Sound" means a noise that is caused by the flow of air over and past the blades of a WES.

"Ambient Sound" Ambient sound encompasses all sound present in a given environment, being usually a composite of sounds from many sources near and far. It includes intermittent noise events, such as, from aircraft flying over, dogs barking, wind gusts, mobile farm or construction machinery, and the occasional vehicle traveling along a nearby road. The ambient also includes insect and other nearby sounds from birds and animals or people. The near-by and transient events are part of the ambient sound environment but are not to be considered part of the long-term background sound.

"American National Standards Institute (ANSI)" Standardized acoustical instrumentation and sound measurement protocol shall meet all the requirements of the following ANSI Standards:

ANSI S1.43 Integrating Averaging Sound Level Meters: Type-1 (or IEC 61672-1)

ANSI S1.11 Specification for Octave and One-third Octave-Band Filters (or IEC 61260)

ANSI S1.40 Verification Procedures for Sound Calibrators

ANSI S12.9 Part 3 Procedures for Measurement of Environmental Sound

ANSI S12.18 Measurement of Outdoor Sound Pressure Level

IEC 61400-11 Wind turbine generator systems -Part 11: Acoustic noise measurements

"Anemometer" means a device for measuring the speed and direction of the wind.

"Applicant" means the individual or business entity that seeks to secure a license under this section of the Town municipal code.

"A-Weighted Sound Level (dBA)" A measure of over-all sound pressure level designed to reflect the response of the human ear, which does not respond equally to all frequencies. It is used to describe sound in a manner representative of the human ear's response. It reduces the effects of the low with respect to the frequencies centered around 1000 Hz. The resultant sound level is said to be "A-weighted" and the units are "dBA." Sound level meters have an A-weighting network for measuring A-weighted sound levels (dBA) meeting the characteristics and weighting specified in ANSI Specifications for Integrating Averaging Sound Level Meters, S1.43-1997 for Type 1 instruments and be capable of accurate readings (corrections for internal noise and microphone response permitted) at 20 dBA or lower. In this document dBA means L_{Aeq} unless specified otherwise.

"Background Sound (L_{90})" refers to the sound level present at least 90% of the time. Background sounds are those heard during lulls in the ambient sound environment. That is, when transient sounds from flora, fauna, and wind are not present. Background sound levels vary during different times of the day and night. Because WES operates 24/7 the background sound levels of interest are those during the quieter periods which are often the evening and night. Sounds from the WES of interest, near-by birds and animals or people must be excluded from the background sound test data. Nearby electrical noise from streetlights, transformers and cycling AC units and pumps etc must also be excluded from the background sound test data.

Background sound level (dBA and dBC (as L_{90})) is the sound level present 90% of the time during a period of observation that is representative of the quiet time for the soundscape under evaluation and with duration of ten (10) continuous minutes. Several contiguous ten (10) minute tests may be performed in one hour to determine the statistical stability of the sound environment. Measurement periods such as at dusk when bird and insect activity is high or the early morning hours when the 'dawn chorus' is present are not acceptable measurement times. Longer term sound level averaging tests, such as 24 hours or multiple days are not at all appropriate since the purpose is to define the quiet time background sound level. It is defined by the L_{A90} and L_{C90} descriptors. It may be considered as the quietest one (1) minute during a ten (10) minute test. L_{A90} results are valid only when L_{A10} results are no more than 10 dB above L_{A90} for the same period. L_{C10} less L_{C90} are not to exceed 10 dB to be valid.

The background noise environment consists of a multitude of distant sources of sound. When a new nearby source is introduced the new background noise level would be increased. The addition of a new source with a noise level 10 below the existing background would increase the new background 0.4 dB. If the new source has the same noise level as the existing background then the new background is increased 3.0 dB. Lastly, if the new source is 3.3 dB above the existing background then the new background would have increased 5 dB. For example, to meet the requirement of $L_{90A} + 5 \text{ dB} = 31 \text{ dBA}$ if the existing quiet nighttime background sound level is 26 dBA, the maximum wind turbine noise immission contribution independent of the background cannot exceed 29.3 dBA L_{eq} at a dwelling. When adding decibels, a 26 dBA background combined with 29.3 dBA from the turbines (without background) results in 31 dBA.

Further, background L_{90} sound levels documenting the pre-construction baseline conditions should be determined when the ten (10) minute maximum wind speed is less than 2 m/s (4.5 mph) near ground level/microphone location 1.5 m height.

"Blade Passage Frequency" (BPF) means the frequency at which the blades of a turbine pass a particular point during each revolution (e.g. lowest point or highest point in rotation) in terms of

events per second. A three bladed turbine rotating at 28 rpm would have a BPF of 1.4 Hz. [E.g. ((3 blades times 28rpm)/60 seconds per minute = 1.4 Hz BPF)]

“C-Weighted Sound Level (dBC)” Similar in concept to the A-Weighted sound Level (dBA) but C-weighting does not de-emphasize the frequencies below 1k Hz as A-weighting does. It is used for measurements that must include the contribution of low frequencies in a single number representing the entire frequency spectrum. Sound level meters have a C-weighting network for measuring C-weighted sound levels (dBC) meeting the characteristics and weighting specified in ANSI S1.43-1997 Specifications for Integrating Averaging Sound Level Meters for Type 1 instruments. In this document dBC means L_{Ceq} unless specified otherwise.

“Decibel (dB)” A dimensionless unit which denotes the ratio between two quantities that are proportional to power, energy or intensity. One of these quantities is a designated reference by which all other quantities of identical units are divided. The sound pressure level (L_p) in decibels is equal to 10 times the logarithm (to the base 10) of the ratio between the pressure squared divided by the reference pressure squared. The reference pressure used in acoustics is 20 MicroPascals.

“Emission” Sound energy that is emitted by a noise source (wind farm) is transmitted to a receiver (dwelling) where it is immitted (see “immission).

“Frequency” The number of oscillations or cycles per unit of time. Acoustical frequency is usually expressed in units of Hertz (Hz) where one Hz is equal to one cycle per second.

“Height” means the total distance measured from the grade of the property as existed prior to the construction of the wind energy system, facility, tower, turbine, or related facility at the base to its highest point.

“Hertz (Hz)” Frequency of sound expressed by cycles per second.

“Immission” Noise immitted at a receiver (dwelling) is transmitted from noise source (wind turbine) that emitted sound energy (see “emission”).

“Immission spectra imbalance” The spectra are not in balance when the C-weighted sound level is more than 20 dB greater than the A-weighted sound level. For the purposes of this requirement, the A-weighted sound level is defined as the long-term background sound level (L_{A90}) +5 dBA. The C-weighted sound level is defined as the L_{Ceq} measured during the operation of the wind turbine operated so as to result in its highest sound output. A Complaint test provided later in this document is based on the immission spectra imbalance criteria.

“Infra-Sound” sound with energy in the frequency range of 0-20 Hz is considered to be infra-sound. It is normally considered to not be audible for most people unless in relatively high amplitude. However, there is a wide range between the most sensitive and least sensitive people to perception of sound and perception is not limited to stimulus of the auditory senses. The most significant exterior noise induced dwelling vibration occurs in the frequency range between 5 Hz and 50 Hz. Moreover, levels below the threshold of audibility can still cause measurable resonances inside dwelling interiors. Conditions that support or magnify resonance may also exist in human body cavities and organs under certain conditions. Although no specific test for infrasound is provided in this document, the test for immission spectra imbalance will limit low frequency sound and thus, indirectly limit infrasound. See low-frequency noise (LFN) for more information.

“Low Frequency Noise (LFN)” refers to sounds with energy in the lower frequency range of 20 to 200 Hz. LFN is deemed to be excessive when the difference between a C-weighted sound level and an A-weighted sound level is greater than 20 decibels at any measurement point outside a residence or

other occupied structure. The criteria for this condition is the "Immission Spectra Imbalance" entry in the **Table of Not-To-Exceed Property Line Sound Immission Limits.**"

"Measurement Point (MP)" means location where sound measurements are taken such that no significant obstruction blocks sound from the site. The Measurement Point should be located so as to not be near large objects such as buildings and in the line-of-sight to the nearest turbines. Proximity to large buildings or other structures should be twice the largest dimension of the structure, if possible. Measurement Points should be at quiet locations remote from street lights, transformers, street traffic, flowing water and other local noise sources.

"Measurement Wind Speed" For measurements conducted to establish the background noise levels ($L_{A90\ 10\ min}$, $L_{C90\ 10\ min}$, and etc.) the maximum wind speed, sampled within 5m of the microphone and at its height, shall be less than 2 m/s (4.5 mph) for valid background measurements. For valid wind farm noises measurements conducted to establish the post-construction sound level the maximum wind speed, sampled within 5m of the microphone and at its height, shall be less than 4m/s (9 mph). The wind speed at the WES blade height shall be at or above the nominal rated wind speed and operating in its highest sound output mode. For purposes of enforcement, the wind speed and direction at the WES blade height shall be selected to reproduce the conditions leading to the enforcement action while also restricting maximum wind speeds at the microphone to less than 4 m/s (9 mph).

For purposes of models used to predict the sound levels and sound pressure levels of the WES to be submitted with the Application, the wind speed shall be the speed that will result in the worst-case L_{Aeq} and L_{Ceq} sound levels at the nearest non-participating properties to the WES. If there may be more than one set of nearby sensitive receptors, models for each such condition shall be evaluated and the results shall be included in the Application.

"Mechanical Noise" means sound produced as a byproduct of the operation of the mechanical components of a WES(s) such as the gearbox, generator and transformers.

"Noise" means any unwanted sound. Not all noise needs to be excessively loud to represent an annoyance or interference.

"Project Boundary" means the external property boundaries of parcels owned by or leased by the WES developers. It is represented on a plot plan view by a continuous line encompassing all WES(s) and related equipment associated with the WES project.

"Property Line" means the recognized and mapped property parcel boundary line.

"Qualified Independent Acoustical Consultant" Qualifications for persons conducting baseline and other measurements and reviews related to the application for a WES or for enforcement actions against an operating WES include, at a minimum, demonstration of competence in the specialty of community noise testing. An example is a person with Full Membership in the Institute of Noise Control Engineers (INCE). There are scientists and engineers in other professional fields that have been called upon by their local community for help in the development of a WES Noise Ordinance. Many of these scientists and engineers have recently spent hundreds of hours learning many important aspects of noise related to the introduction of WES into their communities. Then with field measurement experience with background data and wind turbine noise emission, they have become qualified independent acoustical consultants for WES siting. Certifications such as Professional Engineer (P.E.) do not test for competence in acoustical principles and measurement and are thus not, without further qualification, appropriate for work under this document. The Independent Qualified Acoustical Consultant can have no financial or other connection to a WES developer or related company.

“Sensitive Receptor” means places or structures intended for human habitation, whether inhabited or not, public parks, state and federal wildlife areas, the manicured areas of recreational establishments designed for public use, including but not limited to golf courses, camp grounds and other nonagricultural state or federal licensed businesses. These areas are more likely to be sensitive to the exposure of the noise, shadow or flicker, etc. generated by a WES or WESF. These areas include, but are not limited to: schools, daycare centers, elder care facilities, hospitals, places of seated assemblage, non-agricultural businesses and residences.

“Sound” A fluctuation of air pressure which is propagated as a wave through air

“Sound Power” The total sound energy radiated by a source per unit time. The unit of measurement is the watt. Abbreviated as L_w . This information is determined for the WES manufacturer under laboratory conditions specified by IEC 61400-11 and provided to the local developer for use in computer model construction. There is known measurement error in this test procedure that must be disclosed and accounted for in the computer models. Even with the measurement error correction it cannot be assumed that the reported L_w values represent the highest sound output for all operating conditions. They reflect the operating conditions required to meet the IEC 61400-11 requirements. The lowest frequency is 50 Hz for acoustic power (L_w) requirement (at present) in IEC 61400-11. This Ordinance requires wind turbine certified acoustic power (L_w) levels at rated load for the total frequency range from 6.3 Hz to 10k Hz in one-third octave frequency bands tabulated to the nearest 1 dB. The frequency range of 6.3 Hz to 10k Hz shall be used throughout this Ordinance for all sound level modeling, measuring and reporting.

“Sound Pressure” The instantaneous difference between the actual pressure produced by a sound wave and the average or barometric pressure at a given point in space.

“Sound Pressure Level (SPL)” 20 times the logarithm, to the base 10, of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micronewtons per square meter. In equation form, sound pressure level in units of decibels is expressed as $SPL (dB) = 20 \log p/p_r$.

“Spectrum” The description of a sound wave's resolution into its components of frequency and amplitude. The WES manufacturer is required to supply a one-third octave band frequency spectrum of the wind turbine sound emission at 90% of rated power. The published sound spectrum is often presented as A-weighted values but C-weighted values are preferred. This information is used to construct a model of the wind farm's sound immission levels at locations of interest in and around the WES. The frequency range of interest for wind turbine noise is approximately 6 Hz to 10k Hz.

“Statistical Noise Levels” Sounds that vary in level over time, such as road traffic noise and most community noise, are commonly described in terms of the statistical exceedance levels L_{NA} , where L_{NA} is the A-weighted sound level exceeded for N% of a given measurement period. For example, L_{10} is the noise level exceeded for 10% of the time. Of particular relevance, are: L_{A10} and L_{C10} the noise level exceed for 10% of the ten (10) minute interval. This is commonly referred to as the average maximum noise level. L_{A90} and L_{C90} are the A-weighted and C-weighted sound levels exceeded for 90% of the ten (10) minute sample period. The L_{90} noise level is defined by ANSI as the long-term background sound level (i.e. the sounds one hears in the absence of the noise source under consideration and without short term or near-by sounds from other sources), or simply the “background level.” L_{eq} is the A or C-weighted equivalent noise level (the “average” noise level). It is defined as the steady sound level that contains the same amount of acoustical energy as the corresponding time-varying sound.

"Tonal sound or tonality" Tonal audibility. A sound for which the sound pressure is a simple sinusoidal function of the time, and characterized by its singleness of pitch. Tonal sound can be simple or complex.

"Wind Energy Systems (WES)" means equipment that converts and then transfers energy from the wind into usable forms of electrical energy.

"Wind Turbine" or "Turbine" (WT) means an industrial scale mechanical device which captures the kinetic energy of the wind and converts it into electricity. The primary components of a wind turbine are the blade assembly, electrical generator and tower.

III. APPLICATION PROCEDURE FOR WIND ENERGY SYSTEMS AND TECHNICAL REQUIREMENTS FOR LICENSING

This ordinance is intended to promote the safety and health of the community through criteria limiting sound emissions during operation of Wind Energy Systems. It is recognized that the requirements herein are neither exclusive, nor exhaustive. In instances where a health or safety concern is known to the wind project developer or identified by other means with regard to any application for a Wind Energy System, additional and/or more restrictive conditions may be included in the license to address such concerns. All rights are reserved to impose additional restrictions as circumstances warrant. Such additional or more restrictive conditions may include, without limitation (a) greater setbacks, (b) more restrictive noise limitations, or (c) limits restricting operation during night time periods or for any other conditions deemed reasonable to protect the community.

A. Application

Any Person desiring to secure a Wind Energy Systems license shall file an application form provided by the LGA Clerk, together with two additional copies of the application with the LGA Clerk.

B. Information to be submitted with Application

1. Information regarding the:

- Make and model of all turbines potentially used in this project,
- Sound Power Levels (L_w) for each 1/3 octave band from 6.3 Hz to 10,000 Hz, and
- A sound propagation model predicting the sound levels immitted into the community computed using at minimum 1/1 octave band sound power levels to compute the L_{Ceq} and L_{Aeq} levels to generate L_{Aeq} and L_{Ceq} contours in 5 dB increments overlaying an aerial view and property survey map from the WES property out to a distance to include all residential property within two (2) miles of the WES Property. Appropriate corrections for model algorithm error, IEC61400-11 test measurement accuracy, and directivity patterns of for each model of WT shall be disclosed and accounted for in the model(s). Predictions shall be made at all property lines within and outward for two (2) miles from the project boundary for the wind speed, direction and operating mode that would result in the worst case WT nighttime sound emissions.

The prediction model shall assume that the winds at hub height are sufficient for the highest sound emission operating mode. The projection shall include a description of all assumptions made in the model's construction and algorithms. If the model does not consider the effects of wind direction, geography of the terrain, and/or the effects of reinforcement from coherent sounds or tones from

the turbines all these items should be identified and all other means used to adjust the model's output to account for these factors. The results shall be displayed as a contour map of the predicted levels as over-all L_{Aeq} and L_{Ceq} contours out to 2 miles from the WES property, and shall also include a table showing the 1/3 or 1/1 octave band sound pressure as L_{Ceq} levels for the nearest property line(s) for sensitive receptor sites (including residences) within the model's boundaries. The predicted values must include the over-all sound levels and 1/1 or 1/3 octave band sound pressure levels from 6 Hz to 10k Hz in data tables that include the location of each receiving point by GPS location or other repeatable means.

C. Preconstruction Background Noise Survey

1. The Town reserves the right to require the preparation of (a) a preconstruction noise survey for each proposed Wind Turbine location conducted per procedures provided in the section on Measurement Procedures showing long-term background L_{A90} and L_{C90} sound levels. This must be completed and accepted prior to approval of the final layout and issuance of project permits.
 - a. If any proposed wind farm project locates a WES within two miles of a sensitive receptor these studies are mandatory. The preconstruction baseline studies shall be conducted by an Independent Qualified Acoustical Consultant selected and hired by the LGA.
 - b. The applicant shall be responsible for paying the consultant's fees and costs associated with conducting the study. These fees and cost shall be negotiated with the consultant and determined prior to any work being done on the study. The applicant shall be required to set aside 100% of these fees in an escrow account managed by the LGA, before the study is commenced by the consultant. Payment for this study does not require the WES developer's acceptance of the study's results.
 - c. If the review shows that the predicted L_{Aeq} and L_{Ceq} sound levels exceed any of the criteria specified in the **Table of Not-To-Exceed Property Line Sound Immission Limits** then the application cannot be approved.
2. The LGA will refer the application to the LGA engineer (if qualified in acoustics) or an independent qualified acoustical consultant for further review and comparison of the long-term background sound levels against the predicted L_{Aeq} and L_{Ceq} sound levels reported for the model using the criteria in the **Table of Not-To-Exceed Property Line Sound Immission Limits**. The reasonably necessary costs associated with such a review shall be the responsibility of the applicant, in accord with the terms of this ordinance.

D. Post Construction Noise Measurement Requirements

1. **Sound Regulations Compliance:** A WES shall be considered in violation of the conditional use permit unless the applicant demonstrates that the project complies with all sound level limits using the procedures specified in this ordinance. Sound levels in excess of the limits established in this ordinance shall be grounds for the LGA to order immediate shut down of all non-compliant WT units.
2. **Post-Construction Sound Measurements:** Within twelve months of the date when the project is fully operational, and within four weeks of the anniversary date of the pre-construction background noise measurements, repeat the existing sound environment measurements taken before the project approval. Post-construction sound level measurements shall be taken both with all WES's running and with all WES's off. At the discretion of the Town, the Pre-construction background sound levels (L_{A90} and L_{C90}) can be substituted for the "all WES off" tests if a random sampling of 10% of the pre-construction study sites shows that background L_{90A} and L_{90C} conditions have increased less than 3 dB from those measured under the pre-

construction nighttime conditions. The post-construction measurements will be reported to the LGA (available for public review) using the same format as used for the preconstruction sound studies. Post-construction noise studies shall be conducted by a firm chosen and hired by the LGA. Costs of these studies are to be reimbursed by the Licensee in a similar manner to that described above. The wind farm developer's may ask to have its own consultant observe the publicly retained consultant at the convenience of the latter. The WES Licensee shall provide all technical information and wind farm data required by the qualified independent acoustical consultant before, during, and/or after any acoustical studies required by this document and for acoustical measurements.

3. Sound Limits

1. Establishing Long-Term Background Sound Level

- a. Instrumentation: ANSI or IEC Type 1 Precision Integrating Sound Level Meter plus meteorological instruments to measure wind velocity, temperature and humidity near the sound measuring microphone. Measurement procedures must meet ANSI S12.9, Part 3 and Measurement Procedures Appendix to Ordinance following next Section.
- b. Measurement location(s): Nearest property line(s) from proposed wind turbines representative of all non-participating residential property within 2.0 miles.
- c. Time of measurements and prevailing weather: The atmosphere must be classified as stable with no vertical heat flow to cause air mixing. Stable conditions occur in the evening and middle of the night with a clear sky and very little wind near the surface. Sound measurements are only valid when the measured maximum wind speed at the microphone must be less than 2 m/s (4.5 mph).
- d. Long-Term Background sound measurements: All data recording shall be a series of contiguous ten (10) minute measurements. The measurement objective is to determine the quietest ten minute period at each location of interest. Nighttime test periods are preferred unless daytime conditions are quieter. The following data shall be recorded simultaneously for each ten (10) minute measurement period: dBA data includes L_{A90} , L_{A10} , L_{Aeq} and dBC data includes L_{C90} , L_{C10} , and L_{Ceq} . The maximum wind speed at the microphone during the ten minutes, a single measurement of temperature and humidity at the microphone for each new location or each hour whichever is oftener shall also be recorded. A ten (10) minute measurement contains valid data provided: Both L_{A10} minus L_{A90} and L_{C10} minus L_{C90} are not greater than 10 dB and the maximum wind speed at the microphone is less than 2 m/s during the same ten (10) minute period as the acoustic data.

2. Wind Turbine Sound Immission Limits

No wind turbine or group of turbines shall be located so as to cause wind turbine sound immission at any location on non-participating property containing a residence in excess of the limits in the following table:

Table of Not-To-Exceed Property Line Sound Immission Limits ¹			
Criteria	Condition	dBA	dBC
A	Immission above pre-construction background:	$L_{Aeq} = L_{A90} + 5$	$L_{Ceq} = L_{C90} + 5$
B	Maximum immission:	$35 L_{Aeq}$	55 L_{Ceq} for quiet ² rural environment 60 L_{Ceq} for rural-suburban environment
C	Immission spectra imbalance (C - A \leq 20dB)	L_{Ceq} (immission) minus (L_{A90} (background) + 5 dB) \leq 20 dB	
D	Prominent tone penalty:	5 dB	5 dB
Notes			
1	Each Test is independent and exceedances of any test establishes non-compliance Sound "immission" is the wind turbine sound emission as received at a property.		
2	A "quiet rural environment" is a location 2 miles from a major transportation artery without high traffic volume during otherwise quiet periods of the day or night.		
3	Prominent tone as defined in IEC 61400-11. This Standard is not to be used for any other purpose.		
¹ Required Procedures provided in VIII Reference Standards including ANSI 12.9 Part 3 as Amended			

3. Wind Farm Noise Compliance Testing

All of the measurements outlined above in 1. Establishing Long Term Background Noise Level must be repeated to determine compliance with 2. Wind Turbine Sound Immission Limits. The compliance test location is to be the pre-turbine background noise measurement location nearest to the home of the complainant in line with the wind farm and nearer to the wind farm. The time of day for the testing and the wind farm operating conditions plus wind speed and direction must replicate the conditions that generated the complaint. Procedures of ANSI S12.9- Part 3 apply as amended in the Appendix to Ordinance. The effect of instrumentation limits for wind and other factors must be recognized and followed.

3. Operations

The WES/WT is non-compliant and must be shut down immediately if it exceeds any of the limits in the **Table of Not-To-Exceed Property Line Sound Immission Limits**.

4. Complaint Resolution

1. The owner/operator of the WES shall respond within five (5) business days after notified of a noise complaint by any property owner within the project boundary and a one-mile radius beyond the project boundary.
2. The tests shall be performed by a qualified independent acoustical consultant acceptable to the complainant and the local agency charged with enforcement of this ordinance.
3. Testing shall commence within ten (10) working days of the request. If testing cannot be initiated within ten (10) days, the WES(s) in question shall be shut down until the testing can be started.
4. A copy of the test results shall be sent to the property owner, and the LGA's Planning or Zoning department within thirty (30) days of test completion.
5. If a Complaint is made, the presumption shall be that it is reasonable. The LGA shall undertake an investigation of the alleged operational violation by a qualified individual mutually acceptable to the LGA.

- a) The reasonable cost and fees incurred by the LGA in retaining said qualified individual shall be reimbursed by the owner of the WESF.
 - b) Funds for this assessment shall be paid or put into an escrow account prior to the study and payment shall be independent of the study findings.
6. After the investigation, if the LGA reasonably concludes that operational violations are shown to be caused by the WESF, the licensee/operator/owner shall use reasonable efforts to mitigate such problems on a case-by-case basis including such measures as not operating during the nighttime or other noise sensitive period if such operation was the cause of the complaints.

5. Reimbursement of Fees and Costs.

Licensee/operator/owner agrees to reimburse the LGA 's reasonable fees and costs incurred in the preparation, negotiation, administration and enforcement of this Ordinance, including, without limitation, the LGA 's attorneys' fees, engineering and/or consultant fees, LGA meeting and hearing fees and the costs of public notices. If requested by the LGA the funds shall be placed in an escrow account under the management of the LGA. The preceding fees are payable within thirty (30) days of invoice. Unpaid invoices shall bear interest at the rate of 1% per month until paid. The LGA may recover all reasonable costs of collection, including attorneys' fees.

VII. MEASUREMENT PROCEDURES

SUPPLEMENT TO WIND ENERGY SYSTEMS LICENSING ORDINANCE FOR SOUND

I. Introduction

The potential impact of sound and sound induced building vibration associated with the operation of wind powered electric generators is often a primary concern for citizens living near proposed wind energy systems (WES(s)). This is especially true of projects located near homes, residential neighborhoods, businesses, schools, and hospitals in quiet residential and rural communities. Determining the likely sound and vibration impacts is a highly technical undertaking and requires a serious effort in order to collect reliable and meaningful data for both the public and decision makers.

This protocol is based in part on criteria published in American National Standards S12.9 -Part 3 Quantities and Procedures for Description and Measurement of Environmental Sound, and S12.18 and for the measurement of sound pressure level outdoors.

The purpose is to first, establish a consistent and scientifically sound procedure for evaluating existing background levels of audible and low frequency sound in a WES project area, and second to use the information provided by the Applicant in its Application showing the predicted over-all sound levels in terms of L_{Aeq} and L_{Ceq} and 1/3 or 1/1 octave bands as part of the required information submitted with the application.

The over-all values shall be presented as overlays to the applicant's iso-level plot plan graphics and, for 1/1 or 1/3 octave data, in tabular form with location information sufficient to permit comparison of the baseline results to the predicted levels. This comparison will use the level limits of the ordinance to determine the likely impact operation of a new wind energy system project will have on the existing community soundscape. If the comparison demonstrates that the WES project will not exceed any of the level limits the project will be considered to be within allowable limits for safety and health. If the Applicant submits only partial information required for this comparison

the application cannot be approved. In all cases the burden to establish the operation as meeting safety and health limits will be on the Applicant.

Next, it covers requirements for the sound propagation model to be supplied with the application.

Finally, if the project is approved, this section covers the study needed to compare the post-build sound levels to the predictions and the baseline study. The level limits in the ordinance apply to the post-build study. In addition, if there have been any complaints about WES sound or low frequency noise emissions or wind turbine noise induced dwelling vibration by any resident of an occupied dwelling that property will be included in the post-build study for evaluation against the rules for sound level limits and compliance.

The characteristics of the proposed WES project and the features of the surrounding environment will influence the design of the sound and vibration study. Site layout, types of WES(s) selected and the existence of other significant local audible and low frequency sound sources and sensitive receptors should be taken into consideration when designing a sound study. The work will be performed by a qualified independent acoustical consultant for both the pre-construction background and post-construction sound studies as described in the body of the ordinance.

II. Instrumentation

All instruments and other tools used to measure audible, inaudible and low frequency sound shall meet the requirements for ANSI or IEC Type 1 Integrating Averaging Sound Level Meter Standards. The principle standard reference for this document is ANSI 12.9/Part 3 with important additional specific requirements for the measuring instrumentation and measurement protocol.

III. Measurement of Pre-Construction Sound Environment (Base-line)

An assessment of the proposed WES project areas existing sound environment is necessary in order to predict the likely impact resulting from a proposed project. The following guidelines must be used in developing a reasonable estimate of an area's existing background sound environment. All testing is to be performed by an independent qualified acoustical consultant approved by the LGA as provided in the body of the ordinance. The WES applicant may file objections detailing any concerns it may have with the LGA's selection. These concerns will be addressed in the study. Objections must be filed prior to the start of the noise study. All measurements are to be conducted with ANSI or IEC Type 1 certified and calibrated test equipment per reference specification at the end of this section. Test results will be reported to the LGA or its appointed representative.

Sites with No Existing Wind Energy Systems (Base-line Sound Study)

Sound level measurements shall be taken as follows:

The results of the model showing the predicted worst case L_{Aeq} and L_{Ceq} sound emissions of the proposed WES project will be overlaid on a map (or separate L_{Aeq} and L_{Ceq} maps) of the project area. An example (right) shows an approximately two (2) mile square section with iso-level contour lines prepared by the

applicant, sensitive receptors (homes) and locations selected for the baseline sound tests whichever are the controlling metric. The test points shall be located at the property line bounding the property of the turbine's host closest to the wind turbine. Additional sites may be added if appropriate. A grid comprised of one (1) mile boundaries (each grid cell is one (1) square mile) should be used to assist in identifying between two (2) to ten (10) measurement points per cell. The grid shall extend to a minimum of two (2) miles beyond the perimeter of the project boundary. This may be extended to more than two (2) miles at the discretion of the LGA. The measurement points shall be selected to represent the noise sensitive receptor sites based on the anticipated sound propagation from the combined WT in the project. Usually, this will be the closest WT. If there is more than one WT near-by then more than one test site may be required.

The intent is to anticipate the locations along the bounding property line that will receive the highest sound immissions. The site that will most likely be negatively affected by the WES project's sound emissions should be given first priority in testing. These sites may include sites adjacent to occupied dwellings or other noise sensitive receptor sites. Sites shall be selected to represent the locations where the background soundscapes reflect the quietest locations of the sensitive receptor sites. Background sound levels (and 1/3 octave band sound pressure levels if required) shall be obtained according to the definitions and procedures provided in the ordinance and recognized acoustical testing practice and standards.

All properties within the proposed WES project boundaries will be considered for this study.

One test shall be conducted during the period defined by the months of April through November with the preferred time being the months of June through August. These months are normally associated with more contact with the outdoors and when homes may have open windows during the evening and night. Unless directed otherwise by the LGA the season chosen for testing will represent the background soundscape for other seasons. At the discretion of the LGA, tests may be scheduled for other seasons.

All measurement points (MPs) shall be located with assistance from the LGA staff and property owner(s) and positioned such that no significant obstruction (building, trees, etc.) blocks sound and vibration from the nearest proposed WES site.

Duration of measurements shall be a minimum of ten (10) continuous minutes for all criteria at each location. The duration must include at least six (6) minutes that are not affected by transient sounds from near-by and non-nature sources. Multiple ten (10) minute samples over longer periods such as 30 minutes or one (1) hour may be used to improve the reliability of the L_{A90} and L_{C90} values. The ten (10) minute sample with the lowest valid L_{90} values will be used to define the background sound.

The tests at each site selected for this study shall be taken during the expected 'quietest period of the day or night' as appropriate for the site. For the purpose of determining background sound characteristics the preferred testing time is from 10pm until 4 am. If circumstances indicated that a different time of the day should be sampled the test may be conducted at the alternate time if approved by the Town.

Sound level measurements shall be made on a weekday of a non-holiday week. Weekend measurements may also be taken at selected sites where there are weekend activities that may be affected by WT sound.

Measurements must be taken with the microphone at 1.2 to 1.5 meters above the ground and at least 15 feet from any reflective surface following ANSI 12.9 Part 3 protocol including selected options and other requirements outlined later in this Section.

Reporting

1. For each Measurement Point and for each qualified measurement period, provide each of the following measurements:
 - a. L_{Aeq} , L_{A10} , and L_{A90} , and
 - b. L_{Ceq} , L_{C10} , and L_{C90}
2. A narrative description of any intermittent sounds registered during each measurement. This may be augmented with video and audio recordings.
3. A narrative description of the steady sounds that form the background soundscape. This may be augmented with video and audio recordings.
4. Wind speed and direction at the microphone (Measurement Point), humidity and temperature at time of measurement will be included in the documentation. Corresponding information from the nearest 10 meter weather reporting station shall also be obtained.

Measurements taken only when wind speeds are less than 2m/s (4.5 mph) at the microphone location will be considered valid for this study. A windscreen of the type recommended by the monitoring instrument's manufacturer must be used for all data collection.

5. Provide a map and/or diagram clearly showing (Using plot plan provided by LGA or Applicant):
 - The layout of the project area, including topography, the project boundary lines, and property lines.
 - The locations of the Measurement Points.
 - The distance between any Measurement Points and the nearest WT(s).
 - The location of significant local non-WES sound and vibration sources.
 - The distance between all MPs and significant local sound sources. And,
 - The location of all sensitive receptors including but not limited to: schools, day-care centers, hospitals, residences, residential neighborhoods, places of worship, and elderly care facilities.

Sites with Existing Wind Energy Systems

Two complete sets of sound level measurements must be taken as defined below:

1. One set of measurements with the wind generator(s) off unless the LGA elects to substitute the sound data collected for the background sound study. Wind speeds must be suitable for background sound tests as specified elsewhere in this ordinance.
2. One set of measurements with the wind generator(s) running with wind speed at hub height sufficient to meet nominal rated power output or higher and less than 2 m/s below at the microphone location. Conditions should reflect the worst case sound emissions from the WES project. This will normally involve tests taken during the evening or night when winds are calm (less than 2m/sec) at the ground surface yet, at hub height, sufficient to power the turbines.

Sound level measurements and meteorological conditions at the microphone shall be taken and documented as discussed above.

Sound level Estimate for Proposed Wind Energy Systems (when adding more WT to existing project)

In order to estimate the sound impact of the proposed WES project on the existing environment an estimate of the sound produced by the proposed WES(s) under worst-case conditions for

producing sound emissions must be provided. This study may be conducted by a firm chosen by the WES operator with oversight provided by the LGA.

The qualifications of the firm should be presented along with details of the procedure that will be used, software applications, and any limitations to the software or prediction methods as required elsewhere in this ordinance for models.

Provide the manufacturer's sound power level (L_{Aw}) and (L_{Cw}) characteristics for the proposed WES(s) operating at full load utilizing the methodology in IEC 61400-11 Wind Turbine Noise Standard. Provide one-third octave band sound power level information from 6.3 Hz to 10k Hz. Furnish the data using no frequency weighting. A-weighted data is optional. Provide sound pressure levels predicted for the WES(s) in combination and at full operation and at maximum sound power output for all areas where the predictions indicate L_{Aeq} levels of 30 dBA and above. The same area shall be used for reporting the predicted L_{Ceq} levels. Contour lines shall be in increments of 5 dB.

Present tables with the predicted sound levels for the proposed WES(s) as L_{Aeq} and L_{Ceq} and at all octave band centers (8 Hz to 10k Hz) for distances of 500, 1000, 1500, 2000, 2500 and 5000 feet from the center of the area with the highest density of WES(s). For projects with multiple WES(s), the combined sound level impact for all WES(s) operating at full load must be estimated.

The above tables must include the impact (increased dBA and dBC (L_{eq}) above baseline L_{90} background sound levels) of the WES operations on all residential and other noise sensitive receiving locations within the project boundary. To the extent possible, the tables should include the sites tested (or likely to be tested) in the background study.

Provide a contour map of the expected sound level from the new WES(s), using 5dB L_{Aeq} and L_{Ceq} increments created by the proposed WES(s) extending out to a distance of two (2) miles from the project boundary, or other distance necessary, to show the 25 L_{Aeq} and 50 L_{Ceq} boundaries.

Provide a description of the impact of the proposed sound from the WES project on the existing environment. The results should anticipate the receptor sites that will be most negatively impacted by the WES project and to the extent possible provide data for each MP that are likely to be selected in the background sound study (note the sensitive receptor MPs):

1. Report expected changes to existing sound levels for L_{Aeq} and L_{A90}
2. Report expected changes to existing sound levels for L_{Ceq} and L_{C90}
3. Report the expected changes to existing sound pressure levels for each of the 1/1 or 1/3 octave bands in tabular form from 8 Hz to 10k Hz.
4. Report all assumptions made in arriving at the estimate of impact, any limitations that might cause the sound levels to exceed the values of the estimate, and any conclusions reached regarding the potential effects on people living near the project area. If the effects of coherence, worst case weather, or operating conditions are not reflected in the model a discussion of how these factors could increase the predicted values is required.
5. Include an estimate of the number of hours of operation expected from the proposed WES(s) and under what conditions the WES(s) would be expected to run. Any differences from the information filed with the Application should be addressed.

IV. Post-Construction Measurements

Post Construction Measurements should be conducted by a qualified noise consultant selected by and under the direction of the LGA. The requirements of this Appendix for Sites with Existing Wind Energy Systems shall apply

1. Within twelve months of the date when the project is fully operational, preferably within two weeks of the anniversary date of the pre-construction background sound measurements, repeat the measurements. Post-construction sound level measurements shall be taken both with all WES(s) running and with all WES(s) off except as provided in this ordinance.
2. Report post-construction measurements to the LGA using the same format as used for the background sound study.

VIII. REFERENCE Standards and ANSI S12.9 Part 3 with Required Amendments

ANSI/ASA S12.9-1993/Part 3 (R2008) - American National Standard Quantities and Procedures for Description and Measurement of Environmental Sound, Part 3: Short-Term Measurements with an Observer Present.

This standard is the second in a series of parts concerning description and measurement of outdoor environmental sound. The standard describes recommended procedures for measurement of short-term, time-average environmental sound outdoors at one or more locations in a community for environmental assessment or planning for compatible land uses and for other purposes such as demonstrating compliance with a regulation. These measurements are distinguished by the requirement to have an observer present. Sound may be produced by one or more separate, distributed sources of sound such as a highway, factory, or airport. Methods are given to correct the measured levels for the influence of background sound.

Wind Turbine Siting Acoustical Measurements

ANSI S12.9 Part 3 Selected Options and Requirement Amendments

For the purposes of this ordinance specific options provided in ANSI S12.9-Part 3 (2008) shall apply with the additional following requirements to Sections in ANSI S12.9/Part 3:

- 5.2 background sound: Use definition (1) 'long-term'
- 5.2 long-term background sound: The L_{90} excludes short term background sounds
- 5.3 basic measurement period: Ten (10) minutes $L_{90(10\text{ min})}$
- 5.6 Sound Measuring Instrument: Type 1 Integrating Meter meeting ANSI S1.43 or IEC 61672-1. The sound level meter shall cover the frequency range from 6.3 Hz to 20k Hz and simultaneously measure dBA L_N and dBC L_N . The instrument must also be capable of accurately measuring low-level background sounds down to 20 dBA.
- 6.5 Windscreen: Required
- 6.6(a) An anemometer accurate to $\pm 10\%$ at 2m/s. to full scale accuracy. The anemometer shall be located 1.5 to 2m above the ground and orientated to record maximum wind velocity. The maximum wind velocity, wind direction, temperature and humidity shall be recorded for each ten (10) minute sound measurement period observed within 5 m. of the measuring microphone..
- 7.1 Long-term background sound
- 7.2 Data collection Methods: Second method with observed samples to avoid contamination by short term sounds (purpose: to avoid loss of statistical data)
- 8 Source(s) Data Collection: All requirements in ANSI S12.18 Method #2 precision to the extent possible while still permitting testing of the conditions that lead to complaints. The

meteorological requirements in ANSI S12.18 may not be applicable for some complaints. For sound measurements in response to a complaint, the compliance sound measurements should be made under conditions that replicate the conditions that caused the complaint without exceeding instrument and windscreen limits and tolerances.

- 8.1(b) Measuring microphone with windscreen shall be located 1.2m to 1.8m (1.5m preferred) above the ground and greater than 8m from large sound reflecting surface.
- 8.3(a) All meteorological observations required at both (not either) microphone and nearest 10m weather reporting station.
- 8.3(b) For a 10 minute background sound measurement to be valid the wind velocity shall be less than 2m/s (4.5 mph) measured less than 5m from the microphone. Compliance sound measurements shall be taken when winds shall be less than 4m/s at the microphone.
- 8.3(c) In addition to the required acoustic calibration checks, the sound measuring instrument internal noise floor, including microphone, must also be checked at the end of each series of ten minute measurements and no less frequently than once per day. Insert the microphone into the acoustic calibrator with the calibrator signal off. Record the observed dBA and dBC reading on the sound level meter to determine an approximation of the instrument self noise. Perform this test before leaving the background measurement location. This calibrator-covered microphone must demonstrate the results of this test are at least 5 dB below the immediately previous ten-minute acoustic test results, for the acoustic background data to be valid. This test is necessary to detect undesired increase in the microphone and sound level meter internal self-noise. As a precaution sound measuring instrumentation should be removed from any air-conditioned space at least an hour before use. Nighttime measurements are often performed very near the meteorological dew point. Minor moisture condensation inside a microphone or sound level meter can increase the instrument self noise and void the measured background data.
- 8.4 The remaining sections starting at 8.4 in ANSI S12.9 Part 3 Standard do not apply.

ANSI S12.18-1994 (R2004) American National Standard Procedures for Outdoor Measurement of Sound Pressure Level

This American National Standard describes procedures for the measurement of sound pressure levels in the outdoor environment, considering the effects of the ground, the effects of refraction due to wind and temperature gradients, and the effects due to turbulence. This standard is focused on measurement of sound pressure levels produced by specific sources outdoors. The measured sound pressure levels can be used to calculate sound pressure levels at other distances from the source or to extrapolate to other environmental conditions or to assess compliance with regulation. This standard describes two methods to measure sound pressure levels outdoors. METHOD No. 1: general method; outlines conditions for routine measurements. METHOD No. 2: precision method; describes strict conditions for more accurate measurements. This standard assumes the measurement of A-weighted sound pressure level or time-averaged sound pressure level or octave, 1/3-octave or narrow-band sound pressure level, but does not preclude determination of other sound descriptors.

ANSI S1.43-1997(R2007) American National Standard Specifications for Integrating Averaging Sound Level Meters

This Standard describes instruments for the measurement of frequency-weighted and time-average sound pressure levels. Optionally, sound exposure levels may be measured. This standard is consistent with the relevant requirements of ANSI S1.4-1983(R 1997) American National Standard Specification for Sound Level Meters, but specifies additional characteristics that are necessary to

measure the time-average sound pressure level of steady, intermittent, fluctuating, and impulsive sounds.

ANSI S1.11-2004 American National Standard 'Specification for Octave-Band and Fractional-Octave-Band Analog and Digital Filters'

This standard provides performance requirements for analog, sampled-data, and digital implementations of band-pass filters that comprise a filter set or spectrum analyzer for acoustical measurements. It supersedes ANSI S1.11-1986 (R1998) American National Standard Specification for Octave-Band and Fractional-Octave-Band Analog and Digital Filters, and is a counterpart to International Standard IEC 61260:1995 Electroacoustics - Octave-Band and Fractional-Octave-Band Filters. Significant changes from ANSI S1.11-1986 have been adopted in order to conform to most of the specifications of IEC 61260:1995. This standard differs from IEC 61260:1995 in three ways: (1) the test methods of IEC 61260 clauses 5 is moved to an informative annex, (2) the term 'band number,' not present in IEC 61260, is used as in ANSI S1.11-1986, (3) references to American National Standards are incorporated, and (4) minor editorial and style differences are incorporated.

ANSI S1.40-2006 American National Standard Specifications and Verification Procedures for Sound Calibrators

IEC 61400-11

Second edition 2002-12, Amendment 1 2006-05

IEC 61400-11

Second edition 2002-12, Amendment 1 2006-0

Wind turbine generator systems –Part 11: Acoustic noise measurement techniques

The purpose of this part of IEC 61400 is to provide a uniform methodology that will ensure consistency and accuracy in the measurement and analysis of acoustical emissions by wind turbine generator systems. The standard has been prepared with the anticipation that it would be applied by:

- the wind turbine manufacturer striving to meet well defined acoustic emission performance requirements and/or a possible declaration system;
- the wind turbine purchaser in specifying such performance requirements;
- the wind turbine operator who may be required to verify that stated, or required, acoustic performance specifications are met for new or refurbished units;
- the wind turbine planner or regulator who must be able to accurately and fairly define acoustical emission characteristics of a wind turbine in response to environmental regulations or permit requirements for new or modified installations.

This standard provides guidance in the measurement, analysis and reporting of complex acoustic emissions from wind turbine generator systems. The standard will benefit those parties involved in the manufacture, installation, planning and permitting, operation, utilization, and regulation of wind turbines. The measurement and analysis techniques recommended in this document should be applied by all parties to insure that continuing development and operation of wind turbines is carried out in an atmosphere of consistent and accurate communication relative to environmental concerns. This standard presents measurement and reporting procedures expected to provide accurate results that can be replicated by others.

Revision: 2.1³¹

Industrial scale wind turbines are a familiar part of the landscape in Europe, U.K. and other parts of the world. In the U.S., however, similar industrial scale wind energy developments are just beginning operation. The presence of industrial wind projects will increase dramatically over the next few years given the push by the Federal and state governments to promote renewable energy sources through tax incentives and other forms of economic and political support. States and local governments in the U.S. are promoting what appear to be lenient rules for how industrial wind farms can be located in communities, which are predominantly rural and often very quiet. Studies already completed and currently in progress describe significant health effects associated with living in the vicinity of industrial grade wind turbines. This paper reviews sound studies conducted by consultants for governments, the wind turbine owner, or the local residents for a number of sites with known health or annoyance problems. The purpose is to determine if a set of simple guidelines using dBA and dBC sound levels can serve as the 'safe' siting guidelines. Findings of the review and recommendations for sound limits will be presented. A discussion of how the proposed limits would have affected the existing sites where people have demonstrated pathologies apparently related to wind turbine sound will also be presented.

Background

A relatively new source of community noise is spreading rapidly across the rural U.S. countryside. Industrial grade wind turbines, a common sight in many European countries, are now being promoted by Federal and state governments as the way to minimize coal powered electrical energy and its effects on global warming. But, the initial developments using the newer 1.5 to 3 MWatt wind turbines here in the U.S. has also led to numerous complaints from

³¹ The criteria table at the end of this paper and portions of the narrative have been revised to reflect our current understanding of how to specify the sound limits with less ambiguity and to use the new format for presenting them.

residents who find themselves no longer in the quiet rural communities they were living in before the wind turbine developments went on-line. Questions have been raised about whether the current siting guidelines being used in the U.S. are sufficiently protective for the people living closest to the developments. Research being conducted into the health issues using data from established wind turbine developments is beginning to appear that supports the possibility there is a basis for the health concerns. Other research into the computer modeling and other methods used for determining the layout of the industrial wind turbine developments and the distances from residents in the adjacent communities are showing that the output of the models should not be considered accurate enough to be used as the sole basis for making the siting decisions.

The authors have reviewed a number of noise studies conducted in response to community complaints for wind energy systems sited in Europe, Canada, and the U.S. to determine if additional criteria are needed for establishing safe limits for industrial wind turbine sound immissions in rural communities. In several cases, the residents who filed the complaints have been included in studies by medical researchers who are investigating the potential health risks associated with living near industrial grade wind turbines 365 days a year. These studies were also reviewed by the authors to help in identifying what factors need to be considered in setting criteria for 'safe' sound limits at receiving properties. Due to concerns about medical privacy, details of these studies are not discussed in this paper. Current standards used in the U.S. and in most other parts of the world rely on not-to-exceed dBA sound levels, such as 50 dBA, or on not-to-exceed limits based on the pre-construction background sound level plus an adder (e.g. $L_{90A} + 5$ dBA).

Our review covered the community noise studies performed in response to complaints, research on health issues related to wind turbine noise, critiques of noise studies performed by consultants working for the wind developer, and research/technical papers on wind turbine sound immissions and related topics. The papers are listed in Tables 1-4.

Discussion

After reviewing the materials in the tables; we have arrived at our current understanding of wind turbine noise and its impact on the host community and its residents. The review showed that some residents living as far as 3 km (two (2) miles) from a wind farm complain of sleep disturbance from the noise. Many residents living one-tenth this distance (300 m. or 1000 feet) from a wind farm are experiencing major sleep disruption and other serious medical problems from nighttime wind turbine noise. The peculiar acoustic characteristics of wind turbine noise immissions cause the sounds heard at the receiving properties to be more annoying and troublesome than the more familiar noise from traffic and industrial factories. Limits used for these other community noise sources do not appear to be appropriate for siting industrial wind turbines. The residents who are annoyed by wind turbine noise complain of the approximately one (1) second repetitive swoosh-boom-swoosh-boom sound of the turbine blades and "low frequency" noise. It is not apparent to these authors whether the complaints that refer to "low frequency" noise are about the audible low frequency part of the swoosh-boom sound, the one hertz amplitude modulation of the swoosh-boom sound, or some combination of both acoustic phenomena.

To assist in understanding the issues at hand, the authors developed the 'conceptual' graph for industrial wind turbine sound shown in Figure 1. This graph shows the data from one of the complaint sites plotted against the sound immission spectra for a modern 2.5 MWatt wind turbine; Young's threshold of perception for the 10% most sensitive population (ISO 0266); and a spectrum obtained for a rural community during a three hour, 20 minute test from 11:45 pm until 3:05 am on a windless June evening in near Ubly, Michigan a quiet rural community located in central Huron County. (Also called: Michigan's "Thumb.") It is worth noting that this rural community demonstrates how quiet a rural community can be when located at a distance from industry, highways, and airport related noise emitters.

During our review we posed a number of questions to ourselves related to what we were learning. The questions (*italics*) and our answers are:

*Do National or International or local community Noise Standards for siting wind turbines near dwellings address the low frequency portion of the wind turbine's sound immissions?*³² No! State and Local governments are in the process of establishing wind farm noise limits and/or wind turbine

³² Emissions refer to acoustic energy from the 'viewpoint' of the sound emitter, while immissions refer to acoustic energy from the viewpoint of the receiver.

setbacks from nearby residents, but the standards incorrectly presume that limits based on dBA levels are sufficient to protect the residents.

Do wind farm developers have noise limit criteria and/or wind turbine setback criteria that apply to nearby residents? Yes! But the Wind Industry recommended residential wind turbine noise levels (typically 50-55 dBA) are too high for the quiet nature of the rural communities and may be unsafe for the nearest residents. An additional concern is that some of the methods for implementing pre-construction computer models may predict sound levels that are too low. These two factors combined can lead to post-construction complaints and health risks.

Are all residents living near wind farms equally affected by wind turbine noise? No, children, people with pre-existing medical conditions, especially sleep disorders, and the elderly are generally the most susceptible. Some people are unaffected while some nearby neighbors develop serious health effects caused by exposure to the same wind turbine noise.

How does wind turbine noise impact nearby residents? Initially, the most common problem is chronic sleep deprivation during nighttime. According to the medical research documents, this may develop into far more serious physical and psychological problems

What are the technical options for reducing wind turbine noise immission at residences? There are only two options: 1) increase the distance between source and receiver, and/or 2) reduce the source sound power immission. Either solution is incompatible with the objective of the wind farm developer to maximize the wind power electrical generation within the land available.

Figure 1-Generalized Sound Spectra vs. perception and rural community L_{90A} background 1/3 octave SPL

Is wind turbine noise at a residence much more annoying than traffic noise? Yes, researchers have found that "Wind turbine noise was perceived by about 85% of the respondents even when the calculated A-weighted SPL were as low as 35.0-37.5 dB. This could be due to the presence of

amplitude modulation in the noise, making it easy to detect and difficult to mask by ambient noise." [JASA 116(6), December 2004, pgs 3460-3470, "Perception and annoyance due to wind turbine noise-a dose-relationship" Eja Pedersen and Kerstin Persson Waye, Dept of Environmental Medicine, Goteborg University, Sweden]

Why do wind turbine noise immissions of only 35 dBA disturb sleep at night? This issue is now being studied by the medical profession. The affected residents complain of the middle to high frequency swooshing sounds of the rotating turbine blades at a constant repetitive rate of about 1 hertz plus low frequency noise. The amplitude modulation of the swooshing sound changes continuously. The short time interval between the blade's swooshing sounds described by residents as sometimes having a thump or low frequency banging sound that varies in amplitude up to 10 dBA. This may be a result of phase changes between turbine emissions, turbulence, or an operational mode.. The assumptions about wall and window attenuation being 15 dBA or more may not be sufficiently protective considering the relatively high amplitude of the wind turbine's low frequency immission spectra.

What are the typical wind farm noise immission criteria or standards? Limits are not consistent and may vary even within a particular country. Example criteria include: Australia-the lower of 35 dBA or $L_{90} + 5$ dBA, Denmark-40 dBA, France $L_{90} + 3$ (night) and $L_{90} + 5$ (day), Germany-40 dBA, Holland-40 dBA, United Kingdom-40 dBA (day) and 43 dBA (night) or $L_{90} + 5$ dBA, Illinois-55 dBA (day) and 51 dBA (night), Wisconsin-50 dBA and Michigan-55 dBA. Note: Illinois statewide limits are expressed only in nine contiguous octave frequency bands and no mention of A-weighting for the hourly l_{eq} limits. Typically, wind turbine noise just meeting the octave band limits would read 5 dB below the energy sum of the nine octave bands after applying A-weighting. So the Illinois limits are approximately 50 dBA (daytime 7 AM to 10 PM) and 46 dBA at night, assuming a wind farm is a Class C Property Line Noise Source.

What is a reasonable wind farm sound immission limit to protect the health of residences? We are proposing an immission limit of 35 dBA or $L_{90A} + 5$ dBA whichever is lower and also a C-weighted criteria to address the impacted resident's complaints of wind turbine low frequency noise: For the proposed criteria the dBC sound level at a receiving property shall not exceed $L_{90A} + 20$ dB. In other words, the dBC operating immission limit shall not be more than 20 dB above the measured dBA (L_{90A}) pre-construction nighttime background sound level. A maximum not-to-exceed limit of 50 dBC is also proposed.

Why should the dBC immission limit not be permitted to be more than 20 dB above the background measured L_{90A} ? The World Health Organization and others have determined a sound emitter's noise that results in a difference between the dBC and dBA value greater than 20 dB will be an annoying low frequency issue.

Is not L_{90A} the minimum dBA background noise level? This is not exactly correct. The L_{90} is the statistical descriptor representing the quietest 10% of the time. It may be understood as the sounds one hears when there are no nearby or short-term sounds from man-made or natural sources. It excludes sounds that are not part of the soundscape during all seasons. It is very important to establish the statistical average background noise environment outside a potentially impacted residence during the quietest (10 pm to 4 am) sleeping hours of the night. This nighttime sleep disturbance has generated the majority of the wind farm noise complaints throughout the world. The basis for a community's wind turbine sound immission limits would be the minimum 10 minute nighttime L_{90A} plus 5 dB for the time period of 10 pm to 7 am. This would become the Nighttime Immission Limits for the proposed wind farm. This can be accomplished with one or several ten (10) minute measurements during any night when the

atmosphere is classified stable with a light wind from the area of the proposed wind farm. The Daytime Limits (7 am to 7 pm) could be set 10 dB above the minimum nighttime L_{90A} measured noise, but the nighttime criteria will always be the limiting sound levels.

A nearby wind farm meeting these noise immission criteria will be clearly audible to the residents occasionally during nighttime and daytime. Compliance with this noise standard would be determined by repeating the initial nighttime minimum nighttime L_{90A} tests and adding the dBC (L_{eqC}) noise measurement with the turbines on and off. If the nighttime background noise level (turbines off) was found to be slightly higher than the measured background prior to the wind farm installation, then the results with the turbines on must be corrected to determine compliance with the pre-turbine established sound limits.

The common method used for establishing the background sound level at a proposed wind farm used in many of the studies in Table 1 was to use unattended noise monitors to record hundreds of ten (10) minute measurements to obtain a statistically significant sample over varying wind conditions or a period of weeks. The measured results for daytime and nighttime are combined to determine the statically average wind noise as a function of wind velocity measured at a height of ten (10) meters. This provides an enormous amount of data but the results have little relationship to the wind turbine sound immission or turbine noise impact in nearby residents. The purpose of this exhaustive exercise often only demonstrates how much noise is generated by the wind. In some cases it appears that the data is used to 'prove' that the wind noise masks the turbine's sound immissions.

The most glaring failure of this argument occurs during the frequent nighttime condition of a stable atmosphere. Then, the wind turbines operate at full or near full power and noise output while the wind at ground level is calm and the background noise level is low. This is the condition of maximum turbine noise impact on nearby residents. It is the condition which most directly causes chronic sleep disruption. Furthermore, the measurement methodology is usually faulty, as much of the wind noise measured by unattended sound monitors is the pseudo-wind noise generated by failure of the microphone's windscreen. This results in totally erroneous background sound levels being used for permitting and siting decisions. (See studies in Table 3, esp. Van den Berg)

Are there additional noise data to be recorded for a pre-wind turbine noise survey near selected dwellings? Yes, The measuring sound level meter(s) need document the L_{Aeq} , L_{A10} , L_{A90} and L_{Ceq} , L_{C10} , L_{C90} sound levels plus start time & date for each 10 minute sample. The L_{10} results will be utilized to help validate that conditions were appropriate for measuring the L_{90} long term background sound levels. For example, on a quiet night one would expect L_{A10} to be less than 10 dB higher than the L_{A90} long-term background sound level. On a windy night or day the difference may be more than 20 dB. There is a requirement for measurement of the wind velocity near the sound measurement microphone continuously throughout each ten (10) minute recorded noise sample. The ten (10) minute average of the wind speed near the microphone shall not exceed 2 m/s (4.5 mph) and the maximum wind speed for operational tests shall not exceed 4 m/s (9 mph). It is strongly recommended that observed samples be used for these tests.

Is there a need to record weather data during the background noise recording survey? One weather monitor is required at the proposed wind farm on the side nearest the residents. The weather station sensors are at standard ten (10) meter height above ground. It is critical the weather be recorded every ten (10) minutes synchronized with the clocks in the sound level recorders without ambiguity in the start and end time of each ten (10) minute period. The weather station should record wind speed and direction, temperature, humidity and rain.

Why do Canada and some other countries base the permitted wind turbine noise immission limits on the operational wind velocity at the 10m height wind speed instead of a maximum dBA or $L_{A90} + 5$ dBA immission level? First, it appears that the wind turbine industry will take advantage of every opportunity to elevate the maximum permitted noise immission level to reduce the setback distance from the nearby dwellings. Including wind as a masking source in the criteria is one method for elevating the permissible limits. Indeed the background noise level does increase with surface wind speed. When it does occur, it can be argued that the increased wind noise provides some masking of the wind farm turbine noise emission. However, in the middle of the night when the atmosphere is defined as stable (no vertical flow from surface heat radiation) the layers of the lower atmosphere can separate and permit wind velocities at the turbine hubs to be 2 to 4 times the wind velocity at the 10m high wind monitor but remain near calm at ground level. The result is the wind turbines can be operating at or close to full capacity while it is very quiet outside the nearby dwellings.

This is the heart of the wind turbine noise “problem” for residents within 3 km (approx. two miles) of a wind farm. When the turbines are producing the sound from operation it is quietest outside the surrounding homes. The PhD thesis of P.G. van den Berg “The Sounds of High Winds” is very enlightening on this issue. See also the letter by John Harrison in Ontario “On Wind Turbine Guidelines.”

What sound monitor measurements would be needed for enforcement of the wind turbine sound ordinance? A similar sound and wind 10 minute series of measurements would be repeated at the pre-wind farm location nearest the resident registering the wind turbine noise complaint, with and without the operation of the wind turbines. An independent acoustics expert should be retained who reports to the County Board or other responsible governing body. This independent acoustics expert shall be responsible for all the acoustic measurements including instrumentation setup, calibration and interpretation of recorded results. An independent acoustical consultant shall also perform all pre-turbine background noise measurements and interpretation of results to establish the Nighttime (and Daytime if applicable) industrial wind turbine sound immission limits. At present the acoustical consultants are retained by, and work directly for, the wind farm developer.

This presents a serious problem with conflict of interest on the part of the consultant. The wind farm developer would like to show the significant amount of wind noise that is present to mask the sounds of the wind turbine immissions. The wind farm impacted community would like to know that wind turbine noise will be only barely perceptible and then only occasionally during the night or daytime.

Is frequency analysis required either during pre-wind farm background survey or for compliance measurements? Normally one-third octave or narrower band analysis would only be required if there is a complaint of tones immission from the wind farm.

Proposed Sound Limits

The simple fact that so many residents complain of low frequency noise from wind turbines is clear evidence that the single A-weighted (dBA) noise descriptor used in most jurisdictions for siting turbines is not adequate. The only other simple audio frequency weighting that is standardized and available on all sound level meters is C-weighting or dBC. A standard sound level meter set to measure dBA is increasingly less sensitive to low frequency below 500 Hz (one octave above middle-C). The same sound level meter set to measure dBC is equally sensitive to all frequencies above 32 Hz (lowest note on grand piano). It is well accepted that dBC readings

are more predictive of perceptual loudness than dBA readings if low frequency sounds are significant.

We are proposing to use the commonly accepted dBA criteria that is based on the pre-existing background sound levels plus a 5 dB allowance for the wind turbine's immissions (e.g. $L_{90A} + 5$) for the audible sounds from wind turbines. In addition, to address the lower frequencies that are not considered in A-weighted measurements we are proposing to add limits based on dBC. The Proposed Sound Limits are presented in the text box at the end of this paper.

For the current industrial grade wind turbines in the 1.5 to 3 MWatt range, the addition of the dBC requirement will result in an increased distance between wind turbines and the nearby residents. For the generalized graphs shown in Figure 1, the distances would need to be approximately double the current distance. This will result in setbacks in the range of 1 km or greater for the current generation of wind turbines if they are to be located in rural areas where the L_{90A} background sound levels are 30 dBA or lower. When no man-made sounds are audible they can even be under 20 dBA. In areas with higher background sound levels, turbines could be located somewhat closer, but still at a distance greater than the 305 m (1000 ft.) or less setbacks commonly seen in U.S. based wind turbine standards set by many states and used for wind turbine developments.

1. Establishing Long-Term Background Noise Level

- a. Instrumentation: ANSI or IEC Type 1 Precision Integrating Sound Level Meter plus meteorological instruments to measure wind velocity, temperature and humidity near the sound measuring microphone. Measurement procedures must meet ANSI S12.9, Part 3.
- b. Measurement location(s): Nearest property line(s) from proposed wind turbines representative of all non-participating residential property within 2.0 miles.
- c. Time of measurements and prevailing weather: The atmosphere must be classified as stable with no vertical heat flow to cause air mixing. Stable conditions occur in the evening and middle of the night with a clear sky and very little wind near the surface. Sound measurements are only valid when the measured wind speed at the microphone does not exceed 2 m/s (4.5 mph).
- d. Long-Term Background sound measurements: All data recording shall be a series of contiguous ten (10) minute measurements. The measurement objective is to determine the quietest ten minute period at each location of interest. Nighttime test periods are preferred unless daytime conditions are quieter. The following data shall be recorded simultaneously for each ten (10) minute measurement period: dBA data includes L_{A90} , L_{A10} , L_{Aeq} and dBC data includes L_{C90} , L_{C10} , and L_{Ceq} . The maximum wind speed at the microphone during the ten minutes, a single measurement of temperature and humidity at the microphone for each new location or each hour whichever is oftener shall also be recorded. A ten (10) minute measurement contains valid data provided: Both L_{A10} minus L_{A90} and L_{C10} minus L_{C90} are not greater than 10 dB and the maximum wind speed at the microphone did not exceed 2 m/s during the same ten (10) minute period as the acoustic data.

2. Wind Turbine Sound Immission Limits

No wind turbine or group of turbines shall be located so as to cause wind turbine sound immission at any location on non-participating property containing a residence in excess of the limits in the following table:

Table of Not-To-Exceed Property Line Sound Immission Limits¹

Criteria	Condition	dBA	dBC
A	Immission above pre-construction background:	$L_{Aeq} = L_{A90} + 5$	$L_{Ceq} = L_{C90} + 5$
B	Maximum immission:	$35 L_{Aeq}$	55 L_{Ceq} for quiet ² rural environment 60 L_{Ceq} for rural-suburban environment
C	Immission spectra imbalance	L_{Ceq} (immission) minus (L_{A90} (background)+5) ≤ 20 dB	
D	Prominent tone penalty:	5 dB	5 dB

Notes

- 1 Each Test is independent and exceedances of any test establishes non-compliance
Sound "immission" is the wind turbine noise emission as received at a property
- 2 A "Quiet rural environment" is a location 2 miles from a state road or other major transportation artery without high traffic volume during otherwise quiet periods of the day or night.
- 3 Prominent tone as defined in IEC 61400-11. This Standard is not to be used for any other purpose.

¹ Procedures provided in Section 7. Measurement Procedures (Appendix to Ordinance) of the most recent version of "The How To Guide To Siting Wind Turbines To Prevent Health Risks From Sound" by Kamperman and James apply to this table.

3. Wind Farm Noise Compliance Testing

All of the measurements outlined above in 1. Establishing the Long-Term Background Noise Level must be repeated to determine compliance with 2. Wind Turbine Sound Immission Limits. The compliance test location is to be the pre-turbine background noise measurement location nearest to the home of the complainant in line with the wind farm and nearer to the wind farm. The time of day for the testing and the wind farm operating conditions plus wind speed and direction must replicate the conditions that generated the complaint. Procedures of ANSI S12.9-Part 3 apply as amended. Instrumentation limits for wind and other factors must be recognized and followed.

The authors have based these criteria, procedures, and language on their current understanding of wind turbine sound emissions, land-use compatibility, and the effects of sound on health. However, use of the following, in part or total, by any party is strictly voluntary and the user assumes all risks. Please seek professional assistance in applying the recommendations of this document to any specific community or WES development.

1 INTRODUCTION

This document aims to help developers, planning and enforcement authorities, other government agencies and the broader community assess environmental noise impacts from wind farms.

The core objective of these guidelines is to balance the advantage of developing wind energy projects in this State with protecting the amenity of the surrounding community from adverse noise impacts.

Wind farms need specific guidelines because wind turbines have unique noise generating characteristics and the environments surrounding wind farm sites usually have low ambient noise.

A workshop with approximately 40 participants was held to help develop these guidelines. A technical subgroup, formed from the workshop group, provided specific technical consultation during development. An earlier draft of these guidelines was distributed to the original workshop participants and their submissions were used to prepare this final document.

In addition, the Environment Protection Authority (EPA) has taken into consideration the documents listed in the Bibliography (Section 11).

Shaded boxes throughout this draft document contain explanatory comments.

Guidelines

The *Environment Protection Act 1993* requires a duty of care for the environment. This is specified under Section 25 of the Act and states:

A person must not undertake an activity that pollutes, or might pollute, the environment unless the person takes all reasonable and practicable measures to prevent or minimise any resulting environmental harm.

Guidelines published by the EPA indicate the standard of care that is likely to be required to secure compliance with the general environmental duty as outlined in s. 25 of the Act.

They have the advantage of flexibility and can be adapted to a range of circumstances.

2 NOISE CRITERIA

The general approach in setting noise criteria for new developments is to require compliance with a base noise level.

This base noise level is typically 5 dB(A) lower than the level considered to reflect the amenity of the receiving environment. Designing new developments at a lower level accounts for the cumulative effect of noise from other similar development and for the increased sensitivity of receivers to a new noise source.

The impact of a given noise is also closely linked to the amount it exceeds the background noise. For example, the same noise in a quiet rural area will generally have a greater adverse impact than in a busy urban area because of the masking effect of high ambient noise environments.

If the noise generated does not exceed the background noise by more than 5 dB(A) the impact will be marginal and acceptable.

A unique characteristic of wind farms is that the noise level from each wind turbine generator (WTG) increases as the wind speed at the site increases. As an offset, the background noise also generally increases under these conditions and can mask the WTG noise.

Comparison with a base noise level alone will therefore not be sufficient to indicate the potential impact of a wind farm: a farm could comply with this base level at lower wind speeds but exceed it when the wind speed rises.

Most international and interstate jurisdictions (see examples below) set a base noise level for low wind speeds and also ensure that the wind farm noise does not exceed the background noise by more than 5 dB(A) as the wind speed increases.

This general approach recognises the unique noise generating characteristics of wind turbines and the particular ambient noise environments of most sites and is the one used by these guidelines.

The New Zealand Standard NZS 6808 sets the predicted base level (L_{Aeq}) at 40 dB(A). This is higher than the approach of these guidelines, but the specified propagation model to be used in accordance with that standard does not account for factors such as ground absorption and topography effects that can substantially reduce the noise level in practice. In addition, the New Zealand Standard requires the criteria to be met at all receivers, regardless of their relative amenity or relationship with the wind farm development.

A comprehensive publication developed by the wind farm industry for the UK Department of Trade and Industry (1996) sets the base level (L_{A90}) at 35–40 dB(A). The actual value chosen within this range depends on the number of dwellings affected, the effect on the capacity of the wind farm of meeting the standard, and the duration and level of exposure.

Wind turbines and wind farms have been being developed in Denmark for over 20 years. Denmark has set a base noise level only (and does not consider the influence of background noise). The base noise level (L_{Aeq}) is set at 40 dB(A) for a wind speed of $V_{10m} = 8$ m/s. These guidelines will provide a similar result given the expected influence of background noise.

The NSW EPA has not published specific guidelines for wind farms but has assessed a number of development applications using the same base noise level and background noise approach as these guidelines.

Most wind farm sites are within or next to areas where low ambient noise levels are a significant component of that area's amenity. These might include rural living zones or zones that are not intended to be subject to any other significant ambient noise sources from adjacent premises.

The criteria in these guidelines have been established for just such a scenario and have been developed in accordance with the objects of the *Environment Protection Act 1993* (the Act).

Where the wind farm sites are within or next to areas where more intensive activity is expected, the base noise level may also be increased commensurate with the amenity of that area. It is recommended that the developer discuss such a situation with the EPA and the relevant planning authority.

2.1 Determining wind farm operating criteria

The *Environment Protection (Industrial Noise) Policy 1994* limits the noise level from non-domestic noise sources including wind farms to 40 dB(A) or the lowest typical background noise level plus 5 dB(A) (whichever is the greater) in rural areas from 2200 hrs until 0700 hrs the following day.

This limit applies to existing noise sources and does not necessarily reflect the preferred noise criterion for new (planning) development. The general approach for new development applies a night time level of 35 dB(A) to significant development in a rural location.

To prevent adverse impacts from the increased noise of WTGs under high wind conditions, the increasing noise level must also be compared to the corresponding background noise at the relevant receiver.

2.2 Noise criteria—new wind farm development

The predicted equivalent noise level ($L_{Aeq,10}$), adjusted for tonality in accordance with these guidelines, should not exceed:

- 35 dB(A), or
- the background noise ($L_{A90,10}$) by more than 5 dB(A)

whichever is the greater, at all relevant receivers for each integer wind speed from cut-in to rated power of the WTG.

The background noise should be as determined by the data collection and regression analysis procedure recommended under these guidelines (Section 3). It should be read from the resultant graph at the relevant integer wind speed.

2.3 Agreements with wind farm developers

Wind farm developers commonly enter into agreements with the owners of private land suitable for a wind farm site. The agreement provides the wind farm developers with the appropriate siting and generally provides the landowner with a level of compensation and diversity in their income stream.

The criteria have been developed to minimise the impact on the amenity of premises that do not have an agreement with wind farm developers.

Notwithstanding this, the EPA cannot ignore noise impacts on the basis that an agreement has been made between the developer and the landowner. Developers cannot absolve themselves of their obligations under the Act by entering into an agreement with a landowner.

If it is shown that a development is having an 'adverse effect on an amenity value of an area that ... unreasonably interferes with ... the enjoyment of the area' then appropriate action can be taken under the Act.

However, the existence of an agreement will affect the consideration of whether the interference is unreasonable in a given situation. It is unlikely that there will be *unreasonable* interference if:

- a formal agreement is documented between the parties
- the agreement clearly outlines to the landowner the expected impact of the noise from the wind farm and its effect upon the landowner's amenity
- the likely impact of exposure will not result in adverse health impacts (e.g. the level does not result in sleep disturbance).

A risk associated with relying on such agreements still remains where the criteria in these guidelines are exceeded. This is because an interpretation of 'unreasonable' is required in any future assessment of the impact of wind farm noise initiated by a complaint from the landowner (or future landowners).

2.4 Staged development

The procedure and criteria presented in these guidelines are for greenfield sites but a wind farm may be developed over a number of separate stages.

A previous stage of the wind farm that is installed and operating may raise the background noise level at the relevant receivers by up to 5 dB(A).

Any subsequent stage in the development of the wind farm site should meet the criteria using the background noise levels as they existed prior to the wind farm. Therefore, the noise generated by existing WTGs from a previous stage should not be considered as part of the background noise in determining criteria for subsequent stages.

2.5 Cumulative development

Separate wind farm developments in close proximity to each other may impact on the same relevant receiver.

Therefore, as for staged development, any additional wind farm that may impact on the same relevant receiver as an existing wind farm should meet the criteria using the background noise levels as they existed before the original wind farm site development. The noise generated by existing WTGs from another wind farm should not be considered as part of the background noise in determining criteria for subsequent development.

On occasion it will not be possible to determine the background noise levels as they existed before the original wind farm development.

This may result in subsequent developers of new wind farm sites needing to provide sufficient distance from a relevant receiver (who is common to an existing site) such that the base noise level is met at that receiver for all operating wind speeds of the WTGs (V_{10m})¹ up to 10 m/s.

¹ Refer to 3.1 -- Background noise

3 MEETING THE CRITERIA

This section describes the steps to be taken to assess whether the wind farm noise reaching receivers at relevant locations will comply with the criteria of these guidelines.

Background noise is measured at relevant receiver locations over continuous 10-minute intervals and particularly over the range of wind speeds at which the WTGs operate. The data must adequately represent conditions at the site and cover approximately 2000 intervals.

Wind speed is measured at 10 m above the ground and in intervals that correlate with the background noise measurements. The wind speed data, together with the manufacturer's noise data for the WTG and using a suitable model, is then used to predict noise levels at each integer wind speed from cut-in to rated power, at relevant receiver locations.

The correlated wind speed and background noise data are plotted against each other to give a standard graph for background noise at each relevant receiver. This graph is then used in conjunction with the predicted noise levels to assess whether the wind farm will meet the criteria of these guidelines.

3.1 Background noise

What is background noise?

Background noise is the 'lull' in the ambient noise environment.

Intermittent noise events such as from aircraft flying over, dogs barking, mobile farm machinery and the occasional vehicle travelling along a nearby road are all part of the ambient noise environment but would not be considered part of the background noise unless they were present for at least 90% of the time.

Why is background noise important?

Background noise can mask the noise effects of new development such as a wind farm and the level of masking is a critical factor in assessing the impact of a wind farm.

Wind generated noise can provide a good masking effect, particularly as it has similar characteristics to wind farm generated noise.

Background noise measurement locations

Background noise measurements should be carried out at locations that are relevant for assessing the impact of WTG noise on nearby premises (relevant receivers).

Relevant receiver locations are premises:

- on which someone resides or has development approval to build a residential dwelling
- at which the predicted noise level exceeds the relevant base noise level for wind speeds (V_{10m}) of 10 m/s or less
- that are representative of the worst case situation when considering the range of premises, e.g. a house located among a group of nearby houses within a residential zone.

1. A proposed wind farm site with a zone in its vicinity that is primarily for residential land use and is yet to be fully developed should be discussed with the relevant planning authority and the EPA.

These locations will probably also be considered relevant receivers and background noise levels will be required at the zone boundary.

The relevant planning authority can then be informed about the potential impacts on any future residential development.

Nearby areas for which the zoning intent is not clear should also be discussed with the relevant planning authority and the EPA.

2. Background noise generally increases at a greater rate than noise from WTGs at high wind speeds. If the wind farm is predicted to achieve the base noise level at the very high wind speed of 10 m/s, 10 m above the ground (V_{10m} ; see Section 3.4) the wind farm noise at even higher wind speeds is expected to be masked by the increasing background noise. Therefore the impact will not be adverse and further investigation is not required.

The only exception is a receiver within 1500 m of the wind farm site that is in an area unlikely to be exposed to a windy environment. This specific circumstance should be discussed with the EPA.

3. The worst case situation may not always be the closest receiver to the wind farm site. The closest receiver should always be a measurement position but other locations where the background noise environment may differ due to prevailing weather patterns and/or local topography should also be included as relevant receivers.

Background noise environments likely to differ at receivers around a wind farm site should also be discussed with the EPA.

Background noise measurement position

All measurements should be made outdoors. The microphone should be positioned 1200-1500 mm above the ground and at least 5 m from any reflecting surface (other than the ground).

The property boundary of the receiving premises is not necessarily a valid measuring position (particularly for large rural properties) unless it is likely that someone would regularly be there or the Development Plan clearly envisages noise sensitive development at such a location.

In general, any area within 20 m of a house and in the direction of the wind farm would be a valid measuring position.

Background noise levels can be significantly affected by local conditions, such as the presence of trees nearby. Where this is expected then it is recommended that photographs be taken showing the noise measurement position and associated surroundings, such as buildings, trees and topography.

This will ensure that no significant physical changes have been made to the locations between the time of the initial background noise measurements and of compliance checking.

Data collection

Equipment

Background noise levels should be collected for continuous 10-minute time intervals using sound level meters or loggers of at least Type 2 certification in accordance with Australian Standard AS 1259-1990 or IEC-61672 (International Electrotechnical Commission 2002).

The meters or loggers must be calibrated on site immediately before and after any measurement period using a calibrator complying with IEC 942 and approved by the meter manufacturer.

Type 2 certified monitoring equipment provides a sufficient level of accuracy for assessing the impact of wind farms under these guidelines.

Type 1 certified monitoring equipment will probably become commercially available in South Australia in the future, possibly sooner if an Australian Standard is prepared dealing with measurement procedures for wind farm sites. The EPA intends to modify this guideline to suit technical advancements and relevant standards/policy development.

Wind

Microphones should be protected with windshields in accordance with the microphone manufacturer's instructions, and the protection should be sufficient to ensure the noise level threshold of the monitoring equipment does not adversely affect the data used in the analysis. If microphones cannot be appropriately protected then affected data should not be collected.

As part of the development application, developers may need to confirm that the reported noise levels aren't influenced by high wind speed across the microphone, particularly where average wind speeds at the noise measurement position are expected to exceed 5 m/s (a high wind speed for the purposes of noise level measurement conditions).

Affected data can be identified by monitoring the wind speed at the noise measurement position (1200-1500 mm above ground level at the relevant receiver) over 10-minute intervals that correspond with the noise level measurement intervals. This information would then be compared with both the collected data for that interval and the manufacturer's specifications for microphone performance under those conditions.

The EPA is currently sponsoring a 12-month field trial, started in January 2003, to determine typical wind speeds at a background noise level measurement site and how these speeds relate to background noise level data. When the trials are complete the data collection procedure will be reviewed.

Rain

Rain periods during monitoring may also adversely affect the collected data. If rain was recorded in the vicinity during the collection period the developer must supply evidence that the affected data has not been used in the analysis.

The nearest weather station might not provide a sufficient indication of localised conditions in remote areas. A simple method might record rain using a local gauge or collection method that is regularly checked, and discard all data in periods where rain was detected. High sensitivity tipping rain gauges have been used overseas but they are not readily available.

Data

Data not adversely affected by the effects of wind or rain should be collected for a sufficient period to cover the range of wind speeds and directions generally expected at the wind farm site.

Particular emphasis should be placed on collecting background noise data corresponding to the operating wind speed range of the WTGs.

Sufficient data is considered to be approximately 2000 measurement intervals (or the equivalent of two weeks worth of data).

The EPA field trials will also evaluate the quantity of data required to provide reliable regression analysis and to adequately represent the expected range of conditions at the site. When the trials are complete the data collection procedure will be reviewed.

Compliance checking will require the background noise level data collection process to be repeated when the wind farm is operational (see Section 4).

Background noise varies naturally throughout the year, with different prevailing wind directions, foliage on trees, atmospheric conditions and the like.

A community concern is that the developer may measure during a limited (minimum 2 week) period that is not representative of the rest of the year.

This guideline recommends that compliance checking be repeated at different periods of the year where valid concerns exist.

The developer must collect representative background noise data. Non-compliance may result in one or a number of WTGs being stopped under certain conditions.

3.2 Wind speed measurements

Manufacturers of wind turbines publish noise level data for their machines derived through a comprehensive international measurement standard.

The noise level generated by a wind turbine increases as the wind speed driving it increases. Generally data is provided for at least each integer wind speed from cut-in speed up to rated power.

Wind speeds for the purposes of the WTG noise level data are measured at 10 m above ground level.

The noise level data for each WTG is used as the basis for predicting the total noise level from a wind farm.

Wind speed 10 m above the ground at the wind farm site and background noise at the relevant receiver must be correlated so that background noise and wind farm noise can be compared. Therefore, wind speed measurements must be made in 10-minute intervals that correlate/synchronise with the background noise data collection.

Measurement height

The wind speed should be measured at 10 m above ground level.

A developer will often measure wind speed at different heights to determine whether wind conditions at the site are suitable for an economic wind farm development. It may be acceptable to

convert the results from a different measurement height to 10 m provided the wind shear model used to do this is clearly stated and is accepted by the EPA.

All wind speeds referred to in these guidelines and within any development application referred to a planning authority should be expressed at 10 m above ground level unless otherwise stated.

All predicted noise levels should be based on noise level data derived from wind speed measurements taken at 10 m above ground level.

Measurement location

The same location should be used for measuring wind speed and direction for all of the following procedures:

- background noise measurements
- compliance checking
- noise predictions.

Therefore the wind speed measurement location at the wind farm site should not:

- be significantly affected by the operation of the WTGs in their final location
- provide lower wind speed results than other locations on the wind farm site, where those locations will house WTGs that affect the noise level at a relevant receiver.

For large or topographically diverse wind farm sites, the suitability of the wind speed measurement location may need to be confirmed as part of the development assessment process.

3.3 Noise level prediction

Prediction locations

The noise level associated with the wind farm should be predicted at all locations identified as relevant receivers under these guidelines for each integer wind speed from cut-in speed to the speed of rated power.

WTG manufacturers generally do not test or extrapolate tested results above wind speeds of rated power.

The measurement of noise levels under high wind speeds (used to determine the sound power level of a turbine model) is difficult.

Where wind farms comply with the noise level criteria in these guidelines up to rated power it is unlikely that adverse impacts will occur at higher wind speeds.

Propagation model

A suitable model must be selected (or developed) to predict the worst case noise level at all relevant receivers.

The following information should be provided as part of the development application:

- the propagation model, and any variation of the model, used for the prediction
- an estimate of the model accuracy in dB(A)

- the assumptions used as input to the model, including allowances for noise absorption due to air, ground, topographical and wind effects.

The noise level at the relevant receiver locations should be predicted allowing for the propagating effect of wind (the noise sounds louder downwind than upwind) in the direction from the wind farm to that receiver at each integer wind speed. This represents a worst case situation. (In most situations there will be different wind directions and wind speeds between each WTG on a wind farm site and the relevant receiver. These effects will reduce the actual noise level when compared to that predicted under worst case conditions.)

Noise levels should be predicted by an acoustic engineer defined for the purposes of these guidelines as an engineer who is eligible for membership of both the Australian Acoustical Society and the Institution of Engineers Australia.

The New Zealand Standard NZS 6808:1998 uses a simple propagation model that does not account for wind, ground or topographical effects, and uses a simplified approach to account for atmospheric effects.

The model is expected to predict higher than actual noise levels where topography (land rise or structure between receiver and wind farm) or ground effects (heavy foliage) are important. However, on other sites it may predict with similar accuracy to more complex propagation models because it does not account for the propagating effect of the wind.

This model can be used with limited background in acoustic engineering. If it, or a similar simple propagation model, is intended to be used, this should be discussed with the EPA. Use of such a model and input by someone other than an acoustic engineer may be acceptable where the predicted levels easily meet the criteria.

Sound power data

The sound power level can be thought of as the noise signature for the WTG model proposed for the wind farm.

The sound power level data at each integer wind speed from cut-in speed to the speed of rated power should be specified in the development application as determined in accordance with International Electrotechnical Standard IEC 61400-11.

Tonality is a characteristic that can increase the adverse impact of a given noise source and it can be determined by breaking the noise signature down into discrete frequency bands.

If tonality is a characteristic of the WTG noise, 5 dB(A) should be added to the predicted or measured noise level from the wind farm.

To help determine whether there is tonality, the method and results of testing (such as in accordance with IEC 61400-11) carried out on the proposed WTG model to determine the presence of tonality should also be specified in the development application.

At the time of development application, the contractual arrangements for which particular WTG model may not have been finalised between the developer and WTG supplier. If the WTG model to be installed differs from that assumed at the time of development application, the developer should assess and discuss the effect on the propagation model with the EPA.

The wind farm developer must also discuss changes to the type, location or operation of the WTGs with the relevant planning authority.

3.4 Data analysis

Background noise and wind speed data

At the completion of the data collection period there should be a minimum of 2000 pairs of synchronised background noise and wind speed measurements at wind speeds between the cut-in speed and the speed of rated power.

The background noise should be plotted against the corresponding wind speed measurement for each relevant receiver. It is common to plot the wind speed along the x axis and the background noise along the y axis.

A best fit regression analysis should be carried out on the data. The polynomial order (from linear up to third order) providing the best correlation co-efficient should be used to provide the fitted regression line.

The correlation co-efficient should be specified for each polynomial order.

Data that has been collected at the extreme ends of the range of wind speeds (below and above the operating wind speeds of the WTG) can influence the slope of the fitted regression line and should not be included in the regression analysis.

The graph for each relevant receiver showing the plotted points, the fitted regression line, the polynomial describing that line and the correlation co-efficient should be included in the development application.

A typical graph is shown below for information. (In this example graph the operating speeds of the WTG are not known and thus, unlike real situations, data above and below the operating have not been removed.)

Background noise at the receiver vs Wind speed at windfarm

The predicted noise level should be overlaid on such a graph to determine compliance with the criteria.

4 COMPLIANCE CHECKING

It is unlikely that the worst case noise propagation conditions of the prediction procedure of these guidelines will often be repeated during operation of the wind farm. The actual impacts are therefore likely to be less than the predicted impacts.

Notwithstanding this, the prediction process relies on assumptions about a range of inputs, and the procedure given in this section for measuring the actual noise impacts is a means of confirming compliance or otherwise with the predicted impacts.

The measurement of wind farm noise is expected to be difficult due to the masking effect of the ambient noise and its influence on the base noise level descriptor (L_{Aeq}). The background noise descriptor (L_{A90}) is used to remove this effect.

In setting the compliance checking criteria, the cumulative pre-existing effect of the background noise and the wind farm noise, and the level of accuracy of the measurement procedure have been considered.

4.1 Procedure

Compliance checking follows a similar procedure to compliance prediction (Section 3).

Ambient noise levels with the wind farm operating are measured at relevant receiver locations, over continuous 10-minute intervals and over at least the range of wind speeds at which the WTGs operate. The data must cover approximately 2000 intervals.

Wind speed is measured at 10 m above the ground and in intervals that correlate with the ambient noise measurements.

Compliance checking should collect data associated with the worst case wind direction from the wind farm to the relevant receiver. A wind direction spread of 45 degrees either side of the direct line between the nearest WTG and the relevant receiver is considered acceptable (International Electrotechnical Commission 1998, 1(j) p9). This will not always be practical, given prevailing wind conditions.

Cases in which it appears to be impractical to collect 2000 data points under worst case wind direction conditions or in which all WTGs are not operating, should be discussed with the EPA.

4.2 Data analysis

Regression analysis should be repeated on the ambient noise and wind speed measurement data using the same polynomial order regression formula as for Section 3.5. The correlation co-efficient should be specified in the compliance checking report.

Data below the cut-in speed and above the speed for rated power should not be included (see Section 3.5).

A graph should be prepared for each relevant receiver showing the plotted points, the fitted regression line, the polynomial describing that line and the correlation co-efficient in the compliance checking report.

In addition, the graph should have the criteria determined in accordance with these guidelines superimposed.

4.3 Criteria

The ambient noise level ($L_{A90,10}$) measured in accordance with the compliance checking procedure and determined by the regression analysis procedure should be read from the resultant graph at

the relevant integer wind speed. It should then be adjusted for tonality in accordance with these guidelines and should not exceed:

- 35 dB(A), or
- the pre-existing background noise by more than 5 dB(A)

whichever is the greater, at all relevant receivers for each integer wind speed from cut-in to rated power.

4.4 Tonality

Where, in the opinion of an officer authorised under the Environment Protection Act, the wind farm exhibits tonality as a characteristic, the developer should conduct a tonality test in accordance with a procedure acceptable to the EPA.

An addition of 5 dB(A) should be made to the measured background noise level from a wind farm where tonality is shown to be a characteristic.

4.5 Annoying characteristics

These guidelines have been developed with the fundamental characteristics of noise from a wind farm taken into account. These include the aerodynamic noise from the passing blades (commonly termed 'swish') and the infrequent and short-term braking noise.

However, annoying characteristics that are not fundamental to a typical wind farm should be rectified. Such characteristics may include infrasound (low frequency noise below the audible frequency range that manifests as a rattle in lightweight materials such as glass) or adverse mechanical noise (perhaps generated as a failure of a component).

Infrasound was a characteristic of some early wind turbine models that has been attributed to early designs in which turbine blades were downwind of the main tower – the turbulence generated around the tower was cut through by the blades, generating this effect.

Modern designs generally have the blades upwind of the tower. Wind conditions onto the blades and improved blade design minimise the generation of the effect. The EPA has consulted the working group and completed an extensive literature search but is not aware of infrasound being present at any modern wind farm site.

4.6 Excessive noise

The operation of the wind farm should comply with the criteria at all relevant receivers². The extent of relevant receivers should not be confined to those identified during the development assessment stage.

The EPA can require the developer to repeat the compliance checking procedure if it receives any complaint that may be valid about an unreasonable interference on those premises from noise impacts.

An Environment Protection Order as provided under s. 93 of the Environment Protection Act may be issued by the EPA to secure compliance with the criteria in these guidelines.

This may mean that the operation of certain WTGs would be restricted under certain wind speed conditions.

² See shaded panel

The EPA recognises that measurements in a windy environment are technically difficult and subject to variation. Exceeding the compliance checking criteria may be the result of varying background noise, rather than of excessive wind farm noise.

It is expected that there will be natural variations in background noise throughout the year³, with different prevailing wind directions, foliage on trees, atmospheric conditions and possibly with changes to local conditions such as buildings, trees or topography that may affect compliance with the criteria. Where this may be the case, the onus of responsibility for proof resides with the developer.

A range of alternative compliance checking procedures, such as those detailed in the Clause 6 of the International Energy Agency recommended practices (1997), can remove the influence of background noise to accurately determine the wind farm noise in isolation.

³ The EPA field trials are expected to provide information on the extent of variation of the background noise. When the trials are complete the compliance checking procedure will be reviewed.

5 DOCUMENTATION

Development applications for wind farms are often referred to the EPA by the relevant planning authority for assessment of the environmental noise impact.

The draft Planning SA Bulletin at the time of drafting these guidelines indicates that the referral may become formal by adding wind farm developments as a scheduled item in the *Development Act 1993*.

If it appears likely that the criteria under these guidelines will be approached, developers should discuss the development with the EPA before submitting the application to ensure they provide all relevant information.

All relevant information on the noise impacts must be included with the application. Possible information requirements are summarised below.

5.1 Predicted noise from the wind farm

- (a) make and model of WTGs to be used, including hub height
- (b) one third octave band sound power levels and associated wind speed of WTGs to be used
- (c) positions of all WTGs
- (d) positions of all affected premises within 1.5 km of any WTG, noting which premises are part of the development and which are not
- (e) distance of all affected premises in d above from nearest WTG
- (f) description of the zone category for all receivers in (d), as outlined in the relevant Development Plan under the *Development Act 1993*
- (g) predicted noise levels for those premises in (d) for worst case wind direction and over the operating wind speed range of the WTGs
- (h) the model used and the method for deriving the noise levels in (g)
- (i) amount of noise reduction, if any, allowed for acoustic screening to estimate the levels in (g)
- (j) topographical map of wind farm and affected premises showing contour lines
- (k) location of wind measuring position(s) used for noise assessment and compliance purposes.

5.2 Measurement and assessment

- (a) description of noise measuring equipment used, including make, model and type and including type and model of windscreen used for the microphone
- (b) noise measurement position including height above ground, wind speed (at the noise measurement position) and distance to nearest building structure
- (c) description and photograph of measurement position showing nearby trees and building structures
- (d) atmospheric conditions at the wind farm including wind speed and direction
- (e) time and duration of monitoring
- (f) sampling time for wind and noise measurements
- (g) number of data pairs measured (wind farm speed and background noise level)
- (h) description of regression analysis method

- (i) graphical plot of data in Section 5.1 (g) above and regression curve
- (j) correlation co-efficient for regression curve
- (k) graphical plot and corresponding tabulated data analysing predicted noise levels and criteria against integer wind speeds.

5.3 Compliance checking

- (a) description of all noise monitoring equipment, including type of microphone wind protection used
- (b) noise monitoring position(s)
- (c) photographs of noise monitoring position taken before the wind farm was installed (at the noise modelling stage) and at the time of compliance checking, showing the noise measurement position and associated surroundings, such as buildings, trees and topography
- (d) description of wind speed and direction measuring equipment used and the location on the wind farm, including height above ground level
- (e) description of wind speed measuring equipment used for the purposes in Section 5.2
- (f) details of which WTGs were operating during compliance check
- (g) atmospheric conditions
- (h) time and duration of monitoring period
- (i) list of all monitored data showing wind speed, wind direction and noise level
- (j) graphical plot and tabulated data overlaying line of best fit and criteria against integer wind speeds
- (k) noise level at target and WTG cut-in speeds
- (l) assessment of any audible annoying noise characteristics

6 GLOSSARY

A-weighted: frequency weighted as specified in Australian Standard AS 1259–1990 noise level meters or its replacement.

Authorised officer: a person appointed to be an authorised officer under Division 1 of Part 10 of the *Environment Protection Act 1993*.

Ambient noise: the total noise in a given environment.

Background noise: ambient noise, in the absence of the noise under investigation, measured using time weighting 'F', that is equalled or exceeded for 90% of the measurement time interval. Expressed as $L_{A90,T}$, where T refers to the measurement time interval in minutes.

Base noise level: means an $L_{Aeq,10}$ of 35 dB(A) unless otherwise stated.

dB(A): the noise level in decibels, obtained using the 'A' weighted network of a noise level meter as specified in Australian Standard AS 1259–1990 Noise Level Meters or its replacement.

EPA: Environment Protection Authority.

Equivalent noise level: the equivalent continuous A-weighted sound pressure level obtained using time weighting 'F', over the measurement time interval. Expressed as $L_{Aeq,T}$, where T refers to the measurement time interval in minutes.

Extraneous noise: noise from animals, excessive wind effects, insects, birds, aircraft or unusual traffic conditions or any other infrequently occurring component of the ambient noise.

Impulsive noise: noise containing impulse components as part of its characteristics, comprising a single pressure peak, or sequence of such peaks, or a single burst with multiple pressure peaks, whose amplitude decays with time, or a sequence of such bursts.

Low frequency noise: a noise with perceptible and definite content in the audible frequency range below 250 Hz.

Measurement place: a place at the receiver where the noise level is to be measured.

Noise source: premises at which an activity or process is undertaken that results in the emission of noise.

Predicted noise level: the $L_{Aeq,10}$ wind farm noise level at a receiver predicted in accordance with these guidelines.

Premises: any land, or the whole or part of a building or structure.

Prevailing background noise level: the background noise level derived from regression analysis of the background noise data.

Receiver: premises that may be affected by the noise source, other than premises on the same land as the noise source.

T: measurement time interval; taken to be 10 minutes unless stated otherwise.

Tonal noise: noise with perceptible and definite pitch or tone.

V_{10m} : wind speed measured in metres per second (m/s) at the wind farm site at 10 m above the ground.

WTG: wind turbine generator.

Wind farm: a group of WTGs installed in the same region and all operated by the same operator. It is not necessary that all WTGs are located on the same premises.

Zone: an area of land delineated as a zone, precinct or otherwise in the relevant Development Plan under the *Development Act 1993*, that is subject to a set of land use rules under that Plan.

I. Introduction

In late February 2009 the Minnesota Department of Health (MDH) received a request from the Office of Energy Security (OES) in the Minnesota Department of Commerce, for a “white paper” evaluating possible health effects associated with low frequency vibrations and sound arising from large wind energy conversion systems (LWECS). The OES noted that there was a request for a Contested Case Hearing before the Minnesota Public Utilities Commission (PUC) on the proposed Bent Tree Wind Project in Freeborn County Minnesota; further, the OES had received a long comment letter from a citizen regarding a second project proposal, the Lakeswind Wind Power Plant in Clay, Becker and Ottertail Counties, Minnesota. This same commenter also wrote to the Commissioner of MDH to ask for an evaluation of health issues related to exposure to low frequency sound energy generated by wind turbines. The OES informed MDH that a white paper would have more general application and usefulness in guiding decision-making for future wind projects than a Contested Case Hearing on a particular project. (Note: A Contested Case Hearing is an evidentiary hearing before an Administrative Law Judge, and may be ordered by regulatory authorities, in this case the PUC, in order to make a determination on disputed issues of material fact. The OES advises the PUC on need and permitting issues related to large energy facilities.)

In early March 2009, MDH agreed to evaluate health impacts from wind turbine noise and low frequency vibrations. In discussion with OES, MDH also proposed to examine experiences and policies of other states and countries. MDH staff appeared at a hearing before the PUC on March 19, 2009, and explained the purpose and use of the health evaluation. The Commissioner replied to the citizen letter, affirming that MDH would perform the requested review.

A brief description of the two proposed wind power projects, and a brief discussion of health issues to be addressed in this report appear below.

A. Site Proposals

Wind turbines are huge and expensive machines requiring large capitol investment. Figure 1 shows some existing wind turbines in Minnesota. Large projects require control of extensive land area in order to optimize spacing of turbines to minimize turbulence at downwind turbines. Towers range up to 80 to 100 meters (260 to 325 feet), and blades can be up to 50 meters long (160 feet) (see Tetra Tech, 2008; WPL, 2008). Turbines are expected to be in place for 25-30 years.

Figure 1: Wind turbines

1. Bent Tree Wind Project in Freeborn County

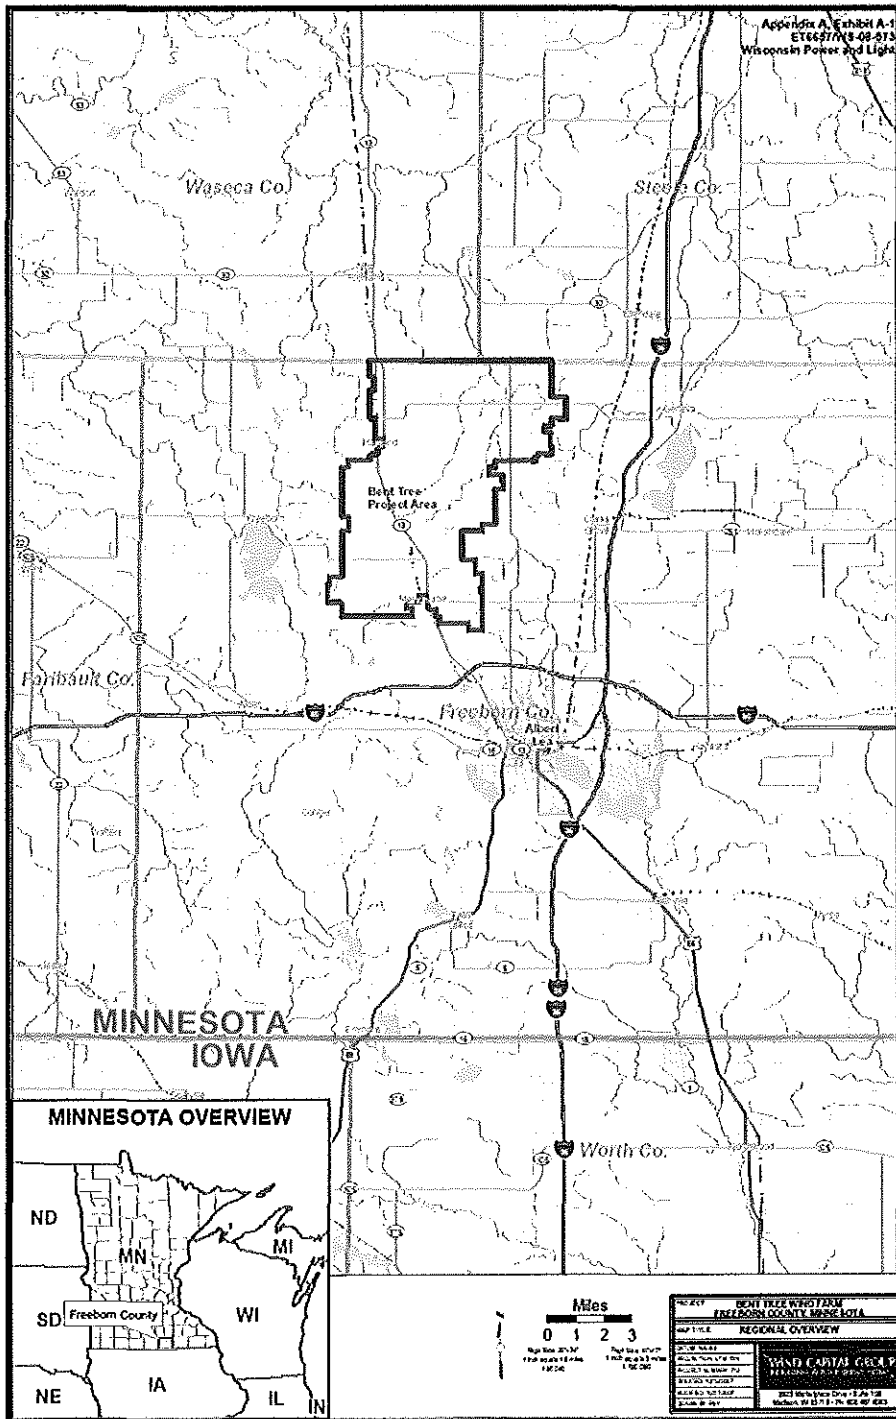

This is a proposal by the Wisconsin Power and Light Company (WPL) for a 400 megawatt (MW) project in two phases of 200 MW each (requiring between 80 and 130 wind turbines). The cost of the first phase is estimated at \$497 million. The project site area would occupy approximately 40 square miles located 4 miles north and west of the city of Albert Lea, approximately 95 miles south of Minneapolis (Figure 2) (WPL, 2008). The Project is a LWECS and a Certificate of Need (CON) from the PUC is required (*Minnesota Statutes 216B.243*). The PUC uses the CON process to determine the basic type of facility (if any) to be constructed, the size of the facility, and when the project will be in service. The CON process involves a public hearing and preparation of an Environmental Report by the OES. The CON process generally takes a year, and is required before a facility can be permitted.

WPL is required to develop a site layout that optimizes wind resources. Accordingly, project developers are required to control areas at least 5 rotor diameters in the prevailing (north-south) wind directions (between about 1300 and 1700 feet for the 1.5 to 2.5 MW turbines under consideration for the project) and 3 rotor diameters in the crosswind (east-west) directions (between about 800 and 1000 feet). Thus, these are minimum setback distances from properties in the area for which easements have not been obtained. Further, noise rules promulgated by the Minnesota Pollution Control Agency (MPCA; *Minnesota Rules* Section 7030), specify a maximum nighttime noise in residential areas of 50 A-weighted decibels (dB(A)). WPL has proposed a minimum setback of 1,000 feet from occupied structures in order to comply with the noise rule.

2. Noble Flat Hill Wind Park in Clay, Becker and Ottertail Counties

This is a LWECS proposed by Noble Flat Hill Windpark I (Noble), a subsidiary of Noble Environmental Power, based in Connecticut. The proposal is for a 201 MW project located 12 miles east of the City of Moorhead, about 230 miles northwest of Minneapolis (Figure 3) (Tetra Tech, 2008). The cost of the project is estimated to be between \$382 million and \$442 million. One hundred thirty-four GE 1.5 MW wind turbines are planned for an area of 11,000 acres (about 17 square miles); the site boundary encompasses approximately 20,000 acres. Setback distances of a minimum of 700 feet are planned to comply with the 50 dB(A) noise limit. However, rotor diameters will be 77 meters (250 feet). Therefore, setback distances in the prevailing wind direction of 1,300 feet are planned for properties where owners have not granted easements. Setbacks of 800 feet are planned in the crosswind direction.

Figure 2: Bent Tree Wind Project, Freeborn County

B. Health Issues

The National Research Council of the National Academies (NRC, 2007) has reviewed impacts of wind energy projects on human health and well-being. The NRC begins by observing that wind projects, just as other projects, create benefits and burdens, and that concern about impacts is natural when the source is near one's home. Further, the NRC notes that different people have different values and levels of sensitivity. Impacts noted by the NRC that may have the most effect on health include noise and low frequency vibration, and shadow flicker. While noise and vibration are the main focus of this paper, shadow flicker (casting of moving shadows on the ground as wind turbine blades rotate) will also be briefly discussed.

Noise originates from mechanical equipment inside the nacelles of the turbines (gears, generators, etc.) and from interaction of turbine blades with wind. Newer wind turbines generate minimal noise from mechanical equipment. The most problematic wind turbine noise is a broadband "whooshing" sound produced by interaction of turbine blades with the wind. Newer turbines have upwind rotor blades, minimizing low frequency "infrasound" (i.e., air pressure changes at frequencies below 20-100 Hz that are inaudible). However, the NRC notes that during quiet conditions at night, low frequency modulation of higher frequency sounds, such as are produced by turbine blades, is possible. The NRC also notes that effects of low frequency (infrasound) vibration (less than 20 Hz) on humans are not well understood, but have been asserted to disturb some people.

Finally, the NRC concludes that noise produced by wind turbines is generally not a major concern beyond a half mile. Issues raised by the NRC report and factors that may affect distances within which wind turbine noise may be problematic are discussed more extensively below.

II. Elementary Characteristics of Sensory Systems and Sound

A. Sensory Systems

1. Hearing

Sensory systems respond to a huge dynamic range of physical stimuli within a relatively narrow dynamic range of mechanical, chemical and/or neuronal (electrophysiological) output. Compression of the dynamic range is accomplished by systems that respond to logarithmic increases in intensity of physical stimuli with arithmetically increasing sensory responses. This general property is true for hearing, and has been recognized since at least the mid-19th century (see e.g., Woodworth and Schlosberg, 1964). "Loudness" is the sensory/perceptual correlate of the physical intensity of air pressure changes to which the electro-mechanical transducers in the ear and associated neuronal pathways are sensitive. Loudness increases as the logarithm of air pressure, and it is convenient to relate loudness to a reference air pressure (in dyne/cm² or pascals) in tenths of logarithmic units (decibels; dB). Further, the ear is sensitive to only a relatively narrow frequency range of air pressure changes: those between approximately 20 and 20,000 cycles per second or Herz (Hz). In fact, sensitivity varies within this range, so that the sound pressure level relative to a reference value that is audible in the middle of the range

(near 1,000 Hz) is about 4 orders of magnitude smaller than it is at 20 Hz and about 2 orders of magnitude smaller than at 20,000 Hz (Fig. 3). Accordingly, measurements of loudness in dB generally employ filters to equalize the loudness of sounds at different frequencies or “pitch.” To approximate the sensitivity of the ear, A-weighted filters weigh sound pressure changes at frequencies in the mid-range more than those at higher or lower frequencies. When an A-weighted filter is used, loudness is measured in dB(A). This is explained in greater detail in Section B below.

The ear accomplishes transduction of sound through a series of complex mechanisms (Guyton, 1991). Briefly, sound waves move the eardrum (tympanic membrane), which is in turn connected to 2 small bones (ossicles) in the middle ear (the malleus and incus). A muscle connected to the malleus keeps the tympanic membrane tensed, allowing efficient transmission to the malleus of vibrations on the membrane. Ossicle muscles can also relax tension and attenuate transmission. Relaxation of muscle tension on the tympanic membrane protects the ear from very loud sounds and also masks low frequency sounds, or much background noise. The malleus and incus move a third bone (stapes). The stapes in turn applies pressure to the fluid of the cochlea, a snail-shaped structure imbedded in temporal bone. The cochlea is a complex structure, but for present purposes it is sufficient to note that pressure changes or waves of different frequencies in cochlear fluid result in bending of specialized hair cells in regions of the cochlea most sensitive to different frequencies or pitch. Hair cells are directly connected to nerve fibers in the vestibulocochlear nerve (VIII cranial nerve).

Transmission of sound can also occur directly through bone to the cochlea. This is a very inefficient means of sound transmission, unless a device (e.g. a tuning fork or hearing aid) is directly applied to bone (Guyton, 1991).

2. Vestibular System

The vestibular system reacts to changes in head and body orientation in space, and is necessary for maintenance of equilibrium and postural reflexes, for performance of rapid and intricate body movements, and for stabilizing visual images (via the vestibulo-ocular reflex) as the direction of movement changes (Guyton, 1991).

The vestibular apparatus, like the cochlea, is imbedded in temporal bone, and also like the cochlea, hair cells, bathed in vestibular gels, react to pressure changes and transmit signals to nerve fibers in the vestibulocochlear nerve. Two organs, the utricle and saccule, called otolith organs, integrate information about the orientation of the head with respect to gravity. Otoliths are tiny stone-like crystals, embedded in the gels of the utricle and saccule, that float as the head changes position within the gravitational field. This movement is translated to hair cells. Three semi-circular canals, oriented at right angles to each other, detect head rotation. Stimulation of the vestibular apparatus is not directly detected, but results in activation of motor reflexes as noted above (Guyton, 1991).

Like the cochlea, the vestibular apparatus reacts to pressure changes at a range of frequencies; optimal frequencies are lower than for hearing. These pressure changes can be caused by body movements, or by direct bone conduction (as for hearing, above) when vibration is applied directly to the temporal bone (Todd et al., 2008). These investigators

found maximal sensitivity at 100 Hz, with some sensitivity down to 12.5 Hz. The saccule, located in temporal bone just under the footplate of the stapes, is the most sound-sensitive of the vestibular organs (Halmagyi et al., 2004). It is known that brief loud clicks (90-95 dB) are detected by the vestibular system, even in deaf people. However, we do not know what the sensitivity of this system is through the entire range of sound stimuli.

While vestibular system activation is not directly felt, activation may give rise to a variety of sensations: vertigo, as the eye muscles make compensatory adjustments to rapid angular motion, and a variety of unpleasant sensations related to internal organs. In fact, the vestibular system interacts extensively with the “autonomic” nervous system, which regulates internal body organs (Balaban and Yates, 2004). Sensations and effects correlated with intense vestibular activation include nausea and vomiting and cardiac arrhythmia, blood pressure changes and breathing changes.

While these effects are induced by relatively intense stimulation, it is also true that A-weighted sound measurements attuned to auditory sensitivity, will underweight low frequencies for which the vestibular system is much more sensitive (Todd et al., 2008). Nevertheless, activation of the vestibular system *per se* obviously need not give rise to unpleasant sensations. It is not known what stimulus intensities are generally required for for autonomic activation at relatively low frequencies, and it is likely that there is considerable human variability and capacity to adapt to vestibular challenges.

B. Sound

1. Introduction

Sound is carried through air in compression waves of measurable frequency and amplitude. Sound can be tonal, predominating at a few frequencies, or it can contain a random mix of a broad range of frequencies and lack any tonal quality (white noise). Sound that is unwanted is called noise.

Audible Frequency Sound

Besides frequency sensitivity (between 20 and 20,000 Hz), humans are also sensitive to changes in the amplitude of the signal (compression waves) within this audible range of frequencies. Increasing amplitude, or increasing sound pressure, is perceived as increasing volume or loudness. The sound pressure level in air (SPL) is measured in micro Pascals (μPa). SPLs are typically converted in measuring instruments and reported as decibels (dB) which is a log scale, relative unit (see above). When used as the unit for sound, dBs are reported relative to a SPL of 20 μPa . Twenty μPa is used because it is the approximate threshold of human hearing sensitivity at about 1000 Hz. Decibels relative to 20 μPa are calculated from the following equation:

$$\text{Loudness (dB)} = \text{Log} \left(\left(\text{SPL} / 20 \mu\text{Pa} \right)^2 \right) * 10$$

Figure 4 shows the audible range of normal human hearing. Note that while the threshold sensitivity varies over the frequency range, at high SPLs sensitivity is relatively consistent over audible frequencies.

Figure 4: Audible Range of Human Hearing

Equivalence curves for different frequencies, when sound meter readings in dB are taken with A or C-weighting filters. (Adapted from EPD Hong Kong SAR, 2009)

Sub-Audible Frequency Sound

Sub-audible frequency sound is often called infrasound. It may be sensed by people, similar to audible sound, in the cochlear apparatus in the ear; it may be sensed by the vestibular system which is responsible for balance and physical equilibrium; or it may be sensed as vibration.

Resonance and modulation

Sound can be attenuated as it passes through a physical structure. However, because the wavelength of low frequency sound is very long (the wavelength of 40 Hz in air at sea level and room temperature is 8.6 meters or 28 ft), low frequencies are not effectively attenuated by walls and windows of most homes or vehicles. (For example, one can typically hear the bass, low frequency music from a neighboring car at a stoplight, but not the higher frequencies.) In fact, it is possible that there are rooms within buildings exposed to low frequency sound or noise where some frequencies may be amplified by resonance (e.g. $\frac{1}{2}$ wavelength, $\frac{1}{4}$ wavelength) within the structure. In addition, low frequency sound can cause vibrations within a building at higher, more audible frequencies as well as throbbing or rumbling.

Sounds that we hear generally are a mixture of different frequencies. In most instances these frequencies are added together. However, if the source of the sound is not constant, but changes over time, the effect can be re-occurring pulses of sound or low frequency modulation of sound. This is the type of sound that occurs from a steam engine, a jack hammer, music and motor vehicle traffic. Rhythmic, low frequency pulsing of higher frequency noise (like the sound of an amplified heart beat) is one type of sound that can be caused by wind turbine blades under some conditions.

2. Human Response to Low Frequency Stimulation

There is no consensus whether sensitivity below 20 Hz is by a similar or different mechanism than sensitivity and hearing above 20 Hz (Reviewed by Møller and Pedersen, 2004). Possible mechanisms of sensation caused by low frequencies include bone conduction at the applied frequencies, as well as amplification of the base frequency and/or harmonics by the auditory apparatus (eardrum and ossicles) in the ear. Sensory thresholds are relatively continuous, suggesting (but not proving) a similar mechanism above and below 20 Hz. However, it is clear that cochlear sensitivity to infrasound (< 20 Hz) is considerably less than cochlear sensitivity to audible frequencies.

Møller and Pedersen (2004) reviewed human sensitivity at low and infrasonic frequencies. The following findings are of interest:

- When whole-body pressure-field sensitivity is compared with ear-only (earphone) sensitivity, the results are very similar. These data suggest that the threshold sensitivity for low frequency is through the ear and not vestibular.
- Some individuals have extraordinary sensitivity at low frequencies, up to 25 dB more sensitive than the presumed thresholds at some low frequencies.
- While population average sensitivity over the low frequency range is smooth, sound pressure thresholds of response for individuals do not vary smoothly but are inconsistent, with peaks and valleys or “microstructures”. Therefore the sensitivity response of individuals to different low frequency stimulation may be difficult to predict.
- Studies of equal-loudness-levels demonstrate that as stimulus frequency decreases through the low frequencies, equal-loudness lines compress in the dB scale. (See Figure 4 as an example of the relatively small difference in auditory SPL range between soft and loud sound at low frequencies).
- The hearing threshold for pure tones is different than the hearing threshold for white noise at the same total sound pressure.

3. Sound Measurements

Sound measurements are taken by instruments that record sound pressure or the pressure of the compression wave in the air. Because the loudness of a sound to people is usually the primary interest in measuring sound, normalization schemes or filters have been applied to absolute measurements. dB(A) scaling of sound pressure measurements was intended to normalize readings to equal loudness over the audible range of frequencies at low loudness. For example, a 5,000 Hz (5 kHz) and 20 dB(A) tone is expected to have the same intensity or loudness as a 100 Hz, 20 dB(A) tone. However, note that the absolute sound pressures would be about 20,000 μ Pa and 40,000 μ Pa, respectively, or about a difference of 20 dB (relative to 20 μ Pa), or as it is sometimes written 20 dB(linear).

Most sound is not a single tone, but is a mixture of frequencies within the audible range. A sound meter can add the total SPLs for all frequencies; in other words, the dB readings over the entire spectrum of audible sound can be added to give a single loudness metric. If sound is reported as A-weighted, or dB(A), it is a summation of the dB(A) scaled sound pressure from 20 Hz to 20 kHz.

In conjunction with the dB(A) scale, the dB(B) scale was developed to approximate equal loudness to people across audible frequencies at medium loudness, and dB(C) was developed to approximate equal-loudness for loud environments. Figure 4 shows isopleths for 20 dB(A) and 105 dB(C). While dB(A), dB(B), dB(C) were developed from empirical data at the middle frequencies, at the ends of the curves these scales were extrapolated, or sketched in, and are not based on experimental or observational data (Berglund et al., 1996). As a result, data in the low frequency range (and probably the highest audible frequencies as well) cannot be reliably interpreted using these scales. The World Health Organization (WHO, 1999) suggests that A-weighting noise that has a large low frequency component is not reliable assessment of loudness.

The source of the noise, or the noise signature, may be important in developing equal-loudness schemes at low frequencies. C-weighting has been recommended for artillery noise, but a linear, unweighted scale may be even better at predicting a reaction (Berglund et al., 1996). A linear or equal energy rating also appears to be the most effective predictor of reaction to low frequency noise in other situations, including blast noise from mining. The implication of the analysis presented by Berglund et al. (1996) is that annoyance from non-tonal noise should not be estimated from a dB(A) scale, but may be better evaluated using dB(C), or a linear non-transformed scale.

However, as will be discussed below, a number of schemes use a modified dB(A) scale to evaluate low frequency noise. These schemes differ from a typical use of the dB(A) scale by addressing a limited frequency range below 250 Hz, where auditory sensitivity is rapidly changing as a function of frequency (see Figure 4).

III. Exposures of Interest

A. Noise From Wind Turbines

1. Mechanical noise

Mechanical noise from a wind turbine is sound that originates in the generator, gearbox, yaw motors (that intermittently turn the nacelle and blades to face the wind), tower ventilation system and transformer. Generally, these sounds are controlled in newer wind turbines so that they are a fraction of the aerodynamic noise. Mechanical noise from the turbine or gearbox should only be heard above aerodynamic noise when they are not functioning properly.

2. Aerodynamic noise

Aerodynamic noise is caused by wind passing over the blade of the wind turbine. The tip of a 40-50 meter blade travels at speeds of over 140 miles per hour under normal operating conditions. As the wind passes over the moving blade, the blade interrupts the laminar flow of air, causing turbulence and noise. Current blade designs minimize the amount of turbulence and noise caused by wind, but it is not possible to eliminate turbulence or noise.

Aerodynamic noise from a wind turbine may be underestimated during planning. One source of error is that most meteorological wind speed measurements noted in wind farm literature are taken at 10 meters above the ground. Wind speed above this elevation, in

much less than the difference at night (1.85 m/s (4.1 mph) and 4.5 m/s (10 mph), respectively). As a result one would expect that the blade angle can be better tuned to the wind speed during the daytime. Consequently, blade noise would be greater at night.

A number of reports have included discussion of aerodynamic modulation (van den Berg, 2005; UK Department of Transport and Industry, 2006; UK Department for Business Enterprise and Regulatory Reform, 2007; van den Berg, 2008). They suggest that aerodynamic modulation is typically underestimated when noise estimates are calculated. In addition, they suggest that detailed modeling of wind, terrain, land use and structures may be used to predict whether modulation of aerodynamic noise will be a problem at a proposed wind turbine site.

4. Wind farm noise

The noise from multiple turbines similarly distant from a residence can be noticeably louder than a lone turbine simply through the addition of multiple noise sources. Under steady wind conditions noise from a wind turbine farm may be greater than noise from the nearest turbine due to synchrony between noise from more than one turbine (van den Berg, 2005). Furthermore, if the dominant frequencies (including aerodynamic modulation) of different turbines vary by small amounts, an audible beat or dissonance may be heard when wind conditions are stable.

B. Shadow Flicker

Rhythmic light flicker from the blades of a wind turbine casting intermittent shadows has been reported to be annoying in many locations (NRC, 2007; Large Wind Turbine Citizens Committee, 2008). (Note: Flashing light at frequencies around 1 Hz is too slow to trigger an epileptic response.)

Modeling conducted by the Minnesota Department of Health suggests that a receptor 300 meters perpendicular to, and in the shadow of the blades of a wind turbine, can be in the flicker shadow of the rotating blade for almost 1½ hour a day. At this distance a blade may completely obscure the sun each time it passes between the receptor and the sun. With current wind turbine designs, flicker should not be an issue at distances over 10 rotational diameters (~1000 meters or 1 km (0.6 mi) for most current wind turbines). This distance has been recommended by the Wind Energy Handbook (Burton et al., 2001) as a minimum setback distance in directions that flicker may occur, and has been noted in the Bent Tree Permit Application (WPL, 2008).

Shadow flicker is a potential issue in the mornings and evenings, when turbine noise may be masked by ambient sounds. While low frequency noise is typically an issue indoors, shadow flicker can be an issue both indoors and outdoors when the sun is low in the sky. Therefore, shadow flicker may be an issue in locations other than the home.

Ireland recommends wind turbines setbacks of at least 300 meters from a road to decrease driver distraction (Michigan State University, 2004). The NRC (2007) recommends that shadow flicker is addressed during the preliminary planning stages of a wind turbine project.

IV. Impacts of Wind Turbine Noise

A. Potential Adverse Reaction to Sound

Human sensitivity to sound, especially to low frequency sound, is variable. Individuals have different ranges of frequency sensitivity to audible sound; different thresholds for each frequency of audible sound; different vestibular sensitivities and reactions to vestibular activation; and different sensitivity to vibration.

Further, sounds, such as repetitive but low intensity noise, can evoke different responses from individuals. People will exhibit variable levels of annoyance and tolerance for different frequencies. Some people can dismiss and ignore the signal, while for others, the signal will grow and become more apparent and unpleasant over time (Moreira and Bryan, 1972; Bryan and Tempest, 1973). These reactions may have little relationship to will or intent, and more to do with previous exposure history and personality.

Stress and annoyance from noise often do not correlate with loudness. This may suggest, in some circumstances, other factors impact an individual's reaction to noise. A number of reports, cited in Staples (1997), suggest that individuals with an interest in a project and individuals who have some control over an environmental noise are less likely to find a noise annoying or stressful.

Berglund et al. (1996) reviewed reported health effects from low frequency noise. Loud noise from any source can interfere with verbal communication and possibly with the development of language skills. Noise may also impact mental health. However, there are no studies that have looked specifically at the impact of low frequency noise on communication, development of language skills and mental health. Cardiovascular and endocrine effects have been demonstrated in studies that have looked at exposures to airplane and highway noise. In addition, possible effects of noise on performance and cognition have also been investigated, but these health studies have not generally looked at impacts specifically from low frequency noise. Noise has also been shown to impact sleep and sleep patterns, and one study demonstrated impacts from low frequency noise in the range of 72 to 85 dB(A) on chronic insomnia (Nagai et al., 1989 as reported in Berglund et al., 1996).

Case studies have suggested that health can be impacted by relatively low levels of low frequency noise. But it is difficult to draw general conclusions from case studies. Feldmann and Pitten (2004) describe a family exposed during the winter to low frequency noise from a nearby heating plant. Reported health impacts were: "indisposition, decrease in performance, sleep disturbance, headache, ear pressure, crawl parästhesy [crawling, tingling or numbness sensation on the skin] or shortness of breath."

Annoyance, unpleasant sounds, and complaints

Reported health effects from low frequency stimulation are closely associated with annoyance from audible noise. "There is no reliable evidence that infrasounds below the hearing threshold produce physiological or psychological effects" (WHO, 1999). It has not been shown whether annoyance is a symptom or an accessory in the causation of

health impacts from low frequency noise. Studies have been conducted on some aspects of low frequency noise that can cause annoyance.

Noise complaints are usually a reasonable measure of annoyance with low frequency environmental noise. Leventhall (2004) has reviewed noise complaints and offers the following conclusions:

- “ The problems arose in quiet rural or suburban environments
 - The noise was often close to inaudibility and heard by a minority of people
 - The noise was typically audible indoors and not outdoors
 - The noise was more audible at night than day
 - The noise had a throb or rumble characteristic
 - The main complaints came from the 55-70 years age group
 - The complainants had normal hearing.
 - Medical examination excluded tinnitus.
- “ These are now recognised as classic descriptors of low frequency noise problems.”

These observations are consistent with what we know about the propagation of low intensity, low frequency noise. Some people are more sensitive to low frequency noise. The difference, in dB, between soft (acceptable) and loud (annoying) noise is much less at low frequency (see Figure 4 audible range compression). Furthermore, during the daytime, and especially outdoors, annoying low frequency noise can be masked by high frequency noise.

The observation that “the noise was typically audible indoors and not outdoors” is not particularly intuitive. However, as noted in a previous section, low frequencies are not well attenuated when they pass through walls and windows. Higher frequencies (especially above 1000 Hz) can be efficiently attenuated by walls and windows. In addition, low frequency sounds may be amplified by resonance within rooms and halls of a building. Resonance is often characterized by a throbbing or a rumbling, which has also been associated with many low frequency noise complaints.

Low frequency noise, unlike higher frequency noise, can also be accompanied by shaking, vibration and rattling. In addition, throbbing and rumbling may be apparent in some low frequency noise. While these noise features may not be easily characterized, numerous studies have shown that their presence dramatically lowers tolerance for low frequency noise (Berglund et al., 1996).

As reviewed in Leventhall (2003), a study of industrial exposure to low frequency noise found that fluctuations in total noise averaged over 0.5, 1.0 and 2.0 seconds correlated with annoyance (Holmberg et al., 1997). This association was noted elsewhere and led (Broner and Leventhall, 1983) to propose a 3dB “penalty” be added to evaluations of annoyance in cases where low frequency noise fluctuated.

In another laboratory study with test subjects controlling loudness, 0.5 – 4 Hz modulation of low frequency noise was found to be more annoying than non-modulated low

frequency noise. On average test subjects found modulated noise to be similarly annoying as a constant tone 12.9 dB louder (Bradley, 1994).

B. Studies of Wind Turbine Noise Impacts on People

1. Swedish Studies

Two studies in Sweden collected information by questionnaires from 341 and 754 individuals (representing response rates of 68% and 58%, respectively), and correlated responses to calculated exposure to noise from wind farms (Pedersen and Waye, 2004; Pedersen, 2007; Pedersen and Persson, 2007). Both studies showed that the number of respondents perceiving the noise from the wind turbines increased as the calculated noise levels at their homes increased from less than 32.5 dB(A) to greater than 40 dB(A). Annoyance appeared to correlate or trend with calculated noise levels. Combining the data from the two studies, when noise measurements were greater than 40 dB(A), about 50% of the people surveyed (22 of 45 people) reported annoyance. When noise measurements were between 35 and 40 dB(A) about 24% reported annoyance (67 of 276 people). Noise annoyance was more likely in areas that were rated as quiet and in areas where turbines were visible. In one of the studies, 64% respondents who reported noise annoyance also reported sleep disturbance; 15% of respondents reported sleep disturbance without annoyance.

2. United Kingdom Study

Moorhouse et al. (UK Department for Business Enterprise and Regulatory Reform, 2007) evaluated complaints about wind farms. They found that 27 of 133 operating wind farms in the UK received formal complaints between 1991 and 2007. There were a total of 53 complainants for 16 of the sites for which good records were available. The authors of the report considered that many complaints in the early years were for generator and gearbox noise. However, subjective analyses of reports about noise (“like a train that never gets there”, “distant helicopter”, “thumping”, “thudding”, “pulsating”, “thumping”, “rhythmical beating”, and “beating”) suggested that aerodynamic modulation was the likely cause of complaints at 4 wind farms. The complaints from 8 other wind farms may have had “marginal” association with aerodynamic modulation noise.

Four wind farms that generated complaints possibly associated with aerodynamic modulation were evaluated further. These wind farms were commissioned between 1999 and 2002. Wind direction, speed and times of complaints were associated for 2 of the sites and suggested that aerodynamic modulation noise may be a problem between 7% and 25% of the time. Complaints at 2 of the farms have stopped and at one farm steps to mitigate aerodynamic modulation (operational shutdown under certain meteorological conditions) have been instituted.

3. Netherlands Study

F. van den Berg et al. (2008) conducted a postal survey of a group selected from all residents in the Netherlands within 2.5 kilometers (km) of a wind turbine. In all, 725 residents responded (37%). Respondents were exposed to sound between 24 and 54 dB(A). The percentage of respondents annoyed by sound increased from 2% at levels of 30 dB(A) or less, up to 25% at between 40 and 45 dB. Annoyance decreased above 45 dB. Most residents exposed above 45 dB(A) reported economic benefits from the

turbines. However, at greater than 45 dB(A) more respondents reported sleep interruption. Respondents tended to report more annoyance when they also noted a negative effect on landscape, and ability to see the turbines was strongly related to the probability of annoyance.

4. Case Reports

A number of un-reviewed reports have catalogued complaints of annoyance and some more severe health impacts associated with wind farms. These reports do not contain measurements of noise levels, and do not represent random samples of people living near wind turbines, so they cannot assess prevalence of complaints. They do generally show that in the people surveyed, complaints are more likely the closer people are to the turbines. The most common complaint is decreased quality of life, followed by sleep loss and headache. Complaints seem to be either from individuals with homes quite close to turbines, or individuals who live in areas subject to aerodynamic modulation and, possibly, enhanced sound propagation which can occur in hilly or mountainous terrain. In some of the cases described, people with noise complaints also mention aesthetic issues, concern for ecological effects, and shadow flicker concerns. Not all complaints are primarily about health.

Harry (2007) describes a meeting with a couple in Cornwall, U.K. who live 400 meters from a wind turbine, and complained of poor sleep, headaches, stress and anxiety. Harry subsequently investigated 42 people in various locations in the U.K. living between 300 meters and 2 kilometers (1000 feet to 1.2 miles) from the nearest wind turbine. The most frequent complaint (39 of 42 people) was that their quality of life was affected. Headaches were reported by 27 people and sleep disturbance by 28 people. Some people complained of palpitations, migraines, tinnitus, anxiety and depression. She also mentions correspondence and complaints from people in New Zealand, Australia, France, Germany, Netherlands and the U.S.

Phipps (2007) discusses a survey of 619 households living up to 10 kilometers (km; 6 miles) from wind farms in mountainous areas of New Zealand. Most respondents lived between 2 and 2.5 km from the turbines (over 350 households). Most respondents (519) said they could see the turbines from their homes, and 80% of these considered the turbines intrusive, and 73% considered them unattractive. Nine percent said they were affected by flicker. Over 50% of households located between 2 and 2.5 km and between 5 and 9.5 km reported being able to hear the turbines. In contrast, fewer people living between 3 and 4.5 km away could hear the turbines. Ninety-two households said that their quality of life was affected by turbine noise. Sixty-eight households reported sleep disturbances: 42 of the households reported occasional sleep disturbances, 21 reported frequent sleep disturbances and 5 reported sleep disturbances most of the time.

The Large Wind Turbine Citizens Committee for the Town of Union (2008) documents complaints from people living near wind turbines in Wisconsin communities and other places in the U.S. and U.K. Contained in this report is an older report prepared by the Wisconsin Public Service Corporation in 2001 in response to complaints in Lincoln County, Wisconsin. The report found essentially no exceedances of the 50 dB(A) requirement in the conditional use permit. The report did measure spectral data

accumulated over very short intervals (1 minute) in 1/3 octave bands at several sites while the wind turbines were functioning, and it is of interest that at these sites the sound pressure level at the lower frequencies (below 125 Hz) were at or near 50 dB(A).

Pierpont (2009) postulates wind turbine syndrome, consisting of a constellation of symptoms including headache, tinnitus, ear pressure, vertigo, nausea, visual blurring, tachycardia, irritability, cognitive problems and panic episodes associated with sensations of internal pulsation. She studied 38 people in 10 families living between 1000 feet and slightly under 1 mile from newer wind turbines. She proposes that the mechanism for these effects is disturbance of balance due to “discordant” stimulation of the vestibular system, along with visceral sensations, sensations of vibration in the chest and other locations in the body, and stimulation of the visual system by moving shadows. Pierpont does report that her study subjects maintain that their problems are caused by noise and vibration, and the most common symptoms reported are sleep disturbances and headache. However, 16 of the people she studied report symptoms consistent with (but not necessarily caused by) disturbance of equilibrium.

V. Noise Assessment and Regulation

1. Minnesota noise regulation

The Minnesota Noise Pollution Control Rule is accessible online at: <https://www.revisor.leg.state.mn.us/rules/?id=7030> . A summary of the Minnesota Pollution Control Agency (MPCA) noise guidance can be found online at: <http://www.pca.state.mn.us/programs/noise.html> . The MPCA standards require A-weighting measurements of noise; background noise must be at least 10 dB lower than the noise source being measured. Different standards are specified for day and night, as well as standards that may not be exceeded for more than 10 percent of the time during any hour (L10) and 50 percent of the time during any hour (L50). Household units, including farm houses, are Classification 1 land use. The following are the Class 1 noise limits:

Table 1: Minnesota Class 1 Land Use Noise Limits

Daytime		Nighttime	
L50	L10	L50	L10
60 dB(A)	65 dB(A)	50 dB(A)	55 dB(A)

These noise limits are single number limits that rely on the measuring instrument to apply an A-weighting filter over the entire presumed audible spectrum of frequencies (20 Hz to 20 KHz) and then integrating that signal. The result is a single number that characterizes the audible spectrum noise intensity.

2. Low frequency noise assessment and regulation

Pedersen and Wayne (2004) looked at the relationship between total dB(A) sound pressure and the annoyance of those who are environmentally exposed to noise from different sources. Figure 6 demonstrates the difficulty in using total dB(A) to evaluate annoyance. Note how lower noise levels (dB(A)) from wind turbines engenders annoyance similar to

much higher levels of noise exposure from aircraft, road traffic and railroads. Sound impulsiveness, low frequency noise and persistence of the noise, as well as demographic characteristics may explain some of the difference.

Figure 6: Annoyance associated with exposure to different environmental noises

Reprinted with permission from Pedersen, E. and K.P. Waye (2004). Perception and annoyance due to wind turbine noise—a dose-response relationship. *The Journal of the Acoustical Society of America* 116: 3460. Copyright 2004, Acoustical Society of America.

Kjellberg et al. (1997) looked at the ability of different full spectrum weighting schemes to predict annoyance caused by low frequency audio noise. They found that dB(A) is the worst predictor of annoyance of available scales. However, if 6 dB (“penalty”) is added to dB(A) when dB(C) – dB(A) is greater than 15 dB, about 71% of the predictions of annoyance are correct. It is important to remember that integrated, transformed measurements of SPL (e.g. dB(A), dB(C)) do not measure frequencies below 20 Hz. While people detect stimuli below 20 Hz, as discussed in above sections, these frequencies are not measured using an A-weighted or C-weighted meter.

The World Health Organization (WHO) recommends that if dB(C) is greater than 10 dB more than dB(A), the low frequency components of the noise may be important and should be evaluated separately. In addition, WHO says “[i]t should be noted that a large proportion of low-frequency components in noise may increase considerably the adverse effects on health.” (WHO, 1999)

Many governments that regulate low frequency noise look at noise within bands of frequencies instead of summing the entire spectrum. A study by Poulsen and Mortensen (Danish Environmental Protection Agency, 2002) included a summary of low frequency noise guidelines. German, Swedish, Polish, and Dutch low frequency evaluation curves were compared (see Figure 7). While there are distinctions in how the evaluation curves are described, generally, these curves are sound pressure criterion levels for 1/3 octaves from about 8 Hz to 250 Hz. Exceedance in any 1/3 octave measurement suggests that the noise may be annoying. However, note that regulations associated with low frequency

noise can be quite complex and the regulatory evaluations associated with individual curves can be somewhat different.

Figure 7: 1/3 Octave Sound Pressure Level Low frequency Noise Evaluation Curves

(Danish Environmental Protection Agency, 2002)

The Danish low frequency evaluation requires measuring noise indoors with windows closed; SPL measurements are obtained in 1/3 octave bands and transformed using the A-weighting algorithm for all frequencies between 10 and 160 Hz. These values are then summed into a single metric called $L_{pA,LF}$. A 5 dB “penalty” is added to any noise that is “impulsive”. Danish regulations require that 20 dB $L_{pA,LF}$ is not exceeded during the evening and night, and that 25 dB $L_{pA,LF}$ is not exceeded during the day.

Swedish guidance recommends analyzing 1/3 octave bands between 31.5 and 200 Hz inside a home, and comparing the values to a Swedish assessment curve. The Swedish curve is equal to the United Kingdom (UK) Department of Environment, Food and Rural Affairs (DEFRA) low frequency noise criterion curve for overlapping frequencies (31.5 – 160 Hz).

The German “A-level” method sums the A-weighted equivalent levels of 1/3 octave bands that exceed the hearing threshold from 10 – 80 Hz. If the noise is not tonal, the measurements are added. The total cannot exceed 25 dB at night and 35 dB during the day. A frequency-dependent adjustment is applied if the noise is tonal.

In the Poulsen and Mortensen, Danish EPA study (2002), 18 individuals reported annoyance levels when they were exposed through earphones in a controlled environment to a wide range of low frequency environmental noises, all attenuated down to 35 dB, as depicted in Table 2. Noise was simulated as if being heard indoors, filtering out noise at

higher frequencies and effectively eliminating all frequencies above 1600 Hz. Noise levels in 1/3 octave SPLs from 8 Hz to 1600 Hz were measured and low frequencies (below 250 Hz) were used to predict annoyance using 7 different methods (Danish, German A-level, German tonal, Swedish, Polish, Sloven, and C-level). Predictions of annoyance were compared with the subjective annoyance evaluations. Correlation coefficients for these analyses ranged from 0.64 to 0.94, with the best correlation in comparison with the Danish low frequency noise evaluation methods.

As would be expected, at 35 dB nominal (full spectrum) loudness, every low frequency noise source tested exceeded all of the regulatory standards noted in the Danish EPA report. Table 2 shows the Danish and Swedish regulatory exceedances of the different 35 dB nominal (full spectrum) noise.

Table 2: 35 dB(A) (nominal, 8 Hz-20KHz) Indoor Noise from Various Outdoor Environmental Sources

	Traffic Noise	Drop Forge	Gas Turbine	Fast Ferry	Steel Factory	Generator	Cooling Compressor	Discotheque
Noise	67.6 dB(lin)	71.1 dB(lin)	78.4 dB(lin)	64.5 dB(lin)	72.7 dB(lin)	60.2 dB(lin)	60.3 dB(lin)	67.0 dB(lin)
Noise ≥ 20 Hz	35.2 dB(A)	36.6 dB(A)	35.0 dB(A)	35.1 dB(A)	33.6 dB(A)	36.2 dB(A)	36.6 dB(A)	33.6 dB(A)
	62.9 dB(C)	67.3 dB(C)	73.7 dB(C)	61.7 dB(C)	66.0 dB(C)	58.6 dB(C)	59.0 dB(C)	57.8 dB(C)
Danish Environmental Protection Agency	14.5 dB	21.5 dB *	14.8 dB	15.0 dB	13.1 dB	16.1 dB	14.0 dB	18.0 dB *
Swedish National Board of Health and Welfare	14.1 dB	19.7 dB	15.9 dB	16.8 dB	15.5 dB	18.3 dB	16.0 dB	10.0 dB

* includes 5 dB "penalty"

Noise adjusted to dB(lin), dB(A), dB(C) scales. Calculated exceedances of Danish and Swedish indoor criteria. (data from Danish Environmental Protection Agency, 2002)

In their noise guidance, the WHO (1999) recommends 30 dB(A) as a limit for "a good night's sleep". However, they also suggest that guidance for noise with predominating low frequencies be less than 30 dB(A).

3. Wind turbine sound measurements

Figure 8 shows examples of the SPLs at different frequencies from a representative wind turbine in the United Kingdom. Sound pressure level measurements are reported for a Nordex N-80 turbine at 200 meters (UK Department of Transport and Industry, 2006) when parked, at low wind speeds, and at high wind speeds. Figure 8 also includes, for reference, 3 sound threshold curves (ISO 226, Watanabe & Moller, 85 dB(G)) and the DEFRA Low Frequency Noise Criterion Curve (nighttime).

Figure 8: Low Frequency Noise from Wind Farm: Parked, Low Wind Speed, and High Wind Speed

(UK Department of Transport and Industry, 2006)

In general, sound tends to propagate as if by spherical dispersion. This creates amplitude decay at a rate of about -6 dB per doubling of distance. However, low frequency noise from a wind turbine has been shown to follow more of a cylindrical decay at long distances, about -3 dB per doubling of distance in the downwind direction (Shepherd and Hubbard, 1991). This is thought to be the result of the lack of attenuation of low frequency sound waves by air and the atmospheric refraction of the low frequency sound waves over medium to long distances (Hawkins, 1987).

Figure 9 shows the calculated change in spectrum for a wind farm from 278 meters to 22,808 meters distant. As one moves away from the noise source, loudness at higher frequencies decreases more rapidly (and extinguishes faster) than at lower frequencies. Measurement of A-weighted decibels, shown at the right of the figure, obscures this finding.

Figure 9: Change in Noise Spectrum as Distance from Wind Farm Changes

(UK Department of Transport and Industry, 2006)

Thus, although noise from an upwind blade wind turbine is generally broad spectrum, without a tonal quality, high frequencies are efficiently attenuated by both the atmosphere, and by walls and windows of structures, as noted above. As a result, as one moves away from a wind turbine, the low frequency component of the noise becomes more pronounced.

Kamperman and James (2008) modeled indoor noise from outdoor wind turbine noise measurements, assuming a typical vinyl siding covered 2X4 wood frame construction. The wind turbine noise inside was calculated to be 5 dB less than the noise outside. Model data suggested that the sound of a single 2.5 MW wind turbine at 1000 feet will likely be heard in a house with the windows sealed. They note that models used for siting turbines often incorporate structure attenuation of 15dB. In addition, Kamperman and James demonstrate that sound from 10 2.5 MW turbines (acoustically) centered 2 km (1¼ mile) away and with the nearest turbine 1 mile away will only be 6.3 dB below the sound of a single turbine at 1000 feet (0.19 mile).

4. Wind turbine regulatory noise limits

Ramakrishnan (2007) has reported different noise criteria developed for wind farm planning. These criteria include common practices (if available) within each jurisdiction for estimating background SPLs, turbine SPLs, minimum setbacks and methods used to

assess impacts. Reported US wind turbine noise criteria range from: ambient + 10 dB(A) where ambient is assumed to be 26 dB(A) (Oregon); to 55 dB(A) or “background” + 5 dB(A) (Michigan). European criteria range from 35 dB(A) to 45 dB(A), at the property. US setbacks range from 1.1 times the full height of the turbine (consenting) and 5 times the hub height (non-consenting; Pennsylvania); to 350 m (consenting) and 1000 m (non-consenting; Oregon). European minimum setbacks are not noted.

VI. Conclusions

Wind turbines generate a broad spectrum of low-intensity noise. At typical setback distances higher frequencies are attenuated. In addition, walls and windows of homes attenuate high frequencies, but their effect on low frequencies is limited. Low frequency noise is primarily a problem that may affect some people in their homes, especially at night. It is not generally a problem for businesses, public buildings, or for people outdoors.

The most common complaint in various studies of wind turbine effects on people is annoyance or an impact on quality of life. Sleeplessness and headache are the most common health complaints and are highly correlated (but not perfectly correlated) with annoyance complaints. Complaints are more likely when turbines are visible or when shadow flicker occurs. Most available evidence suggests that reported health effects are related to audible low frequency noise. Complaints appear to rise with increasing outside noise levels above 35 dB(A). It has been hypothesized that direct activation of the vestibular and autonomic nervous system may be responsible for less common complaints, but evidence is scant.

The Minnesota nighttime standard of 50 dB(A) not to be exceeded more than 50% of the time in a given hour, appears to underweight penetration of low frequency noise into dwellings. Different schemes for evaluating low frequency noise, and/or lower noise standards, have been developed in a number of countries.

For some projects, wind velocity for a wind turbine project is measured at 10 m and then modeled to the height of the rotor. These models may under-predict wind speed that will be encountered when the turbine is erected. Higher wind speed will result in noise exceeding model predictions.

Low frequency noise from a wind turbine is generally not easily perceived beyond ½ mile. However, if a turbine is subject to aerodynamic modulation because of shear caused by terrain (mountains, trees, buildings) or different wind conditions through the rotor plane, turbine noise may be heard at greater distances.

Unlike low frequency noise, shadow flicker can affect individuals outdoors as well as indoors, and may be noticeable inside any building. Flicker can be eliminated by placement of wind turbines outside of the path of the sun as viewed from areas of concern, or by appropriate setbacks.

Prediction of complaint likelihood during project planning depends on: 1) good noise modeling including characterization of potential sources of aerodynamic modulation noise and characterization of nighttime wind conditions and noise; 2) shadow flicker modeling; 3) visibility of the wind turbines; and 4) interests of nearby residents and community.

VII. Recommendations

To assure informed decisions:

- Wind turbine noise estimates should include cumulative impacts (40-50 dB(A) isopleths) of all wind turbines.
- Isopleths for dB(C) - dB(A) greater than 10 dB should also be determined to evaluate the low frequency noise component.
- Potential impacts from shadow flicker and turbine visibility should be evaluated.

Any noise criteria beyond current state standards used for placement of wind turbines should reflect priorities and attitudes of the community.

Noise Control Regulations for Industry and Commerce

(1) Standards and Regulations:

(a) Existing Noise Sources. No person owning or controlling an existing industrial or commercial noise source shall cause or permit the operation of that noise source if the statistical noise levels generated by that source and measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, exceed the levels specified in Table 7, except as otherwise provided in these rules.

(b) New Noise Sources:

(A) New Sources Located on Previously Used Sites. No person owning or controlling a new industrial or commercial noise source located on a previously used industrial or commercial site shall cause or permit the operation of that noise source if the statistical noise levels generated by that new source and measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, exceed the levels specified in Table 8, except as otherwise provided in these rules. For noise levels generated by a wind energy facility including wind turbines of any size and any associated equipment or machinery, subparagraph (1)(b)(B)(iii) applies.

(B) New Sources Located on Previously Unused Site:

(i) No person owning or controlling a new industrial or commercial noise source located on a previously unused industrial or commercial site shall cause or permit the operation of that noise source if the noise levels generated or indirectly caused by that noise source increase the ambient statistical noise levels, L10 or L50, by more than 10 dBA in any one hour, or exceed the levels specified in Table 8, as measured at an appropriate measurement point, as specified in subsection (3)(b) of this rule, except as specified in subparagraph (1)(b)(B)(iii).

(ii) The ambient statistical noise level of a new industrial or commercial noise source on a previously unused industrial or commercial site shall include all noises generated or indirectly caused by or attributable to that source including all of its related activities. Sources exempted from the requirements of section (1) of this rule, which are identified in subsections (5)(b) - (f), (j), and (k) of this rule, shall not be excluded from this ambient measurement.

(iii) For noise levels generated or caused by a wind energy facility:

(I) The increase in ambient statistical noise levels is based on an assumed background L50 ambient noise level of 26 dBA or the actual ambient background level. The person owning the wind energy facility may conduct measurements to determine the actual ambient L10 and L50 background level .

(II) The “actual ambient background level” is the measured noise level at the appropriate measurement point as specified in subsection (3)(b) of this rule using generally accepted noise engineering measurement practices. Background noise measurements shall be obtained at the appropriate measurement point, synchronized with windspeed measurements of hub height conditions at the nearest wind turbine location. “Actual ambient background level” does not include noise generated or caused by the wind energy facility.

(III) The noise levels from a wind energy facility may increase the ambient statistical noise levels L₁₀ and L₅₀ by more than 10 dBA (but not above the limits specified in Table 8), if the person who owns the noise sensitive property executes a legally effective easement or real covenant that benefits the property on which the wind energy facility is located. The easement or covenant must authorize the wind energy facility to increase the ambient statistical noise levels, L₁₀ or L₅₀ on the sensitive property by more than 10 dBA at the appropriate measurement point.

(IV) For purposes of determining whether a proposed wind energy facility would satisfy the ambient noise standard where a landowner has not waived the standard, noise levels at the appropriate measurement point are predicted assuming that all of the proposed wind facility's turbines are operating between cut-in speed and the wind speed corresponding to the maximum sound power level established by IEC 61400-11 (version 2002-12). These predictions must be compared to the highest of either the assumed ambient noise level of 26 dBA or to the actual ambient background L₁₀ and L₅₀ noise level, if measured. The facility complies with the noise ambient background standard if this comparison shows that the increase in noise is not more than 10 dBA over this entire range of wind speeds.

(V) For purposes of determining whether an operating wind energy facility complies with the ambient noise standard where a landowner has not waived the standard, noise levels at the appropriate measurement point are measured when the facility's nearest wind turbine is operating over the entire range of wind speeds between cut-in speed and the windspeed corresponding to the maximum sound power level and no turbine that could contribute to the noise level is disabled. The facility complies with the noise ambient background standard if the increase in noise over either the assumed ambient noise level of 26 dBA or to the actual ambient background L₁₀ and L₅₀ noise level, if measured, is not more than 10 dBA over this entire range of wind speeds.

(VI) For purposes of determining whether a proposed wind energy facility would satisfy the Table 8 standards, noise levels at the appropriate measurement point are predicted by using the turbine's maximum sound power level following procedures established by IEC 61400-11 (version 2002-12), and assuming that all of the proposed wind facility's turbines are operating at the maximum sound power level.

(VII) For purposes of determining whether an operating wind energy facility satisfies the Table 8 standards, noise generated by the energy facility is measured at the appropriate measurement point when the facility's nearest wind turbine is operating at the windspeed corresponding to the maximum sound power level and no turbine that could contribute to the noise level is disabled.

(c) Quiet Areas. No person owning or controlling an industrial or commercial noise source located either within the boundaries of a quiet area or outside its boundaries shall cause or permit the operation of that noise source if the statistical noise levels generated by that source exceed the levels specified in Table 9 as measured within the quiet area and not less than 400 feet (122 meters) from the noise source.

(d) Impulse Sound. Notwithstanding the noise rules in Tables 7 through 9, no person owning or controlling an industrial or commercial noise source shall cause or permit the operation of that noise source if an impulsive sound is emitted in air by that source which exceeds the sound pressure levels specified below, as measured at an appropriate measurement point, as specified in subsection (3)(b) of this rule:

(A) Blasting. 98 dBC, slow response, between the hours of 7 a.m. and 10 p.m. and 93 dBC, slow response, between the hours of 10 p.m. and 7 a.m.

(B) All Other Impulse Sounds. 100 db, peak response, between the hours of 7 a.m. and 10 p.m. and 80 dB, peak response, between the hours of 10 p.m. and 7 a.m.

(f) Octave Bands and Audible Discrete Tones. When the Director has reasonable cause to believe that the requirements of subsection (1)(a), (b), or (c) of this rule do not adequately protect the health, safety, or welfare of the public as provided for in ORS Chapter 467, the Department may require the noise source to meet the following rules:

(A) Octave Bands. No person owning or controlling an industrial or commercial noise source shall cause or permit the operation of that noise source if such operation generates a median octave band sound pressure level which, as measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, exceeds applicable levels specified in Table 10.

(B) One-third Octave Band. No person owning or controlling an industrial or commercial noise source shall cause or permit the operation of that noise source if such operation generates a median one-third octave band sound pressure level which, as measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, and in a one-third octave band at a preferred frequency, exceeds the arithmetic average of the median sound pressure levels of the two adjacent one-third octave bands by:

(i) 5 dB for such one-third octave band with a center frequency from 500 Hertz to 10,000 Hertz, inclusive. Provided: Such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band; or

(ii) 8 dB for such one-third octave band with a center frequency from 160 Hertz to 400 Hertz, inclusive. Provided: Such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band; or

(iii) 15 dB for such one-third octave band with a center frequency from 25 Hertz to 125 Hertz, inclusive. Provided: Such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band;

(iv) This rule shall not apply to audible discrete tones having a one-third octave band sound pressure level 10 dB or more below the allowable sound pressure levels specified in Table 10 for the octave band which contains such one-third octave band.

(2) Compliance. Upon written notification from the Director, the owner or controller of an industrial or commercial noise source operating in violation of the adopted rules shall submit a compliance schedule acceptable to the Department. The schedule will set forth the dates, terms, and conditions by which the person responsible for the noise source shall comply with the adopted rules.

(3) Measurement:

(a) Sound measurements procedures shall conform to those procedures which are adopted by the Commission and set forth in Sound Measurement Procedures Manual (NPCS-1), or to such other procedures as are approved in writing by the Department;

(b) Unless otherwise specified, the appropriate measurement point shall be that point on the noise sensitive property, described below, which is further from the noise source:

(A) 25 feet (7.6 meters) toward the noise source from that point on the noise sensitive building nearest the noise source;

(B) That point on the noise sensitive property line nearest the noise source.

(4) Monitoring and Reporting:

(a) Upon written notification from the Department, persons owning or controlling an industrial or commercial noise source shall monitor and record the statistical noise levels and operating times of equipment, facilities, operations, and activities, and shall submit such data to the Department in the form and on the schedule requested by the Department. Procedures for such measurements shall conform to those procedures which are adopted by the Commission and set forth in Sound Measurement Procedures Manual (NPCS-1);

(b) Nothing in this rule shall preclude the Department from conducting separate or additional noise tests and measurements. Therefore, when requested by the Department, the owner or operator of an industrial or commercial noise source shall provide the following:

(A) Access to the site;

(B) Reasonable facilities, where available, including but not limited to, electric power and ladders adequate to perform the testing;

(C) Cooperation in the reasonable operation, manipulation, or shutdown of various equipment or operations as needed to ascertain the source of sound and measure its emission.

(5) Exemptions: Except as otherwise provided in subparagraph (1)(b)(B)(ii) of this rule, the rules in section (1) of this rule shall not apply to:

(a) Emergency equipment not operated on a regular or scheduled basis;

(b) Warning devices not operating continuously for more than 5 minutes;

(c) Sounds created by the tires or motor used to propel any road vehicle complying with the noise standards for road vehicles;

(d) Sounds resulting from the operation of any equipment or facility of a surface carrier engaged in interstate commerce by railroad only to the extent that such equipment or facility is regulated by pre-emptive federal regulations as set forth in Part 201 of Title 40 of the Code of Federal Regulations, promulgated pursuant to Section 17 of the Noise Control Act of 1972, 86 Stat. 1248, Public Law 92-576; but this exemption does not apply to any standard, control, license, regulation, or restriction necessitated by special local conditions which is approved by the Administrator of the EPA after consultation with the Secretary of Transportation pursuant to procedures set forth in Section 17(c)(2) of the Act;

(e) Sounds created by bells, chimes, or carillons;

(f) Sounds not electronically amplified which are created by or generated at sporting, amusement, and entertainment events, except those sounds which are regulated under other noise standards. An event is a noteworthy happening and does not include informal, frequent, or ongoing activities such as, but not

limited to, those which normally occur at bowling alleys or amusement parks operating in one location for a significant period of time;

(g) Sounds that originate on construction sites.

(h) Sounds created in construction or maintenance of capital equipment;

(i) Sounds created by lawn care maintenance and snow removal equipment;

(j) Sounds generated by the operation of aircraft and subject to pre-emptive federal regulation. This exception does not apply to aircraft engine testing, activity conducted at the airport that is not directly related to flight operations, and any other activity not pre-emptively regulated by the federal government or controlled under OAR 340-035-0045;

(k) Sounds created by the operation of road vehicle auxiliary equipment complying with the noise rules for such equipment as specified in OAR 340-035-0030(1)(e);

(l) Sounds created by agricultural activities;

(m) Sounds created by activities related to the growing or harvesting of forest tree species on forest land as defined in subsection (1) of ORS 526.324.

(6) Exceptions: Upon written request from the owner or controller of an industrial or commercial noise source, the Department may authorize exceptions to section (1) of this rule, pursuant to rule 340-035-0010, for:

(a) Unusual and/or infrequent events;

(b) Industrial or commercial facilities previously established in areas of new development of noise sensitive property;

(c) Those industrial or commercial noise sources whose statistical noise levels at the appropriate measurement point are exceeded by any noise source external to the industrial or commercial noise source in question;

(d) Noise sensitive property owned or controlled by the person who controls or owns the noise source;

(e) Noise sensitive property located on land zoned exclusively for industrial or commercial use.

[ED. NOTE: The Table(s) referenced in this rule are not printed in the OAR Compilation. Copies are available from the agency.]

[Publication: The Publication(s) referred to or incorporated by reference in this rule are available from the agency.]

Wind Turbines, Health, Ridgelines, and Valleys

Montpelier, VT, May 7 2010

It is a medical fact that sleep disturbance and perceived stress result in ill effects, including and especially cardiovascular disease, but also chronic feelings of depression, anger, helplessness, and, in the aggregate, the banishment of happiness and reduced quality of life.

Cardiovascular disease, as we all now, leads to reduced life expectancy. Try and get reasonably priced life insurance if you are hypertensive or have suffered a heart attack.

If industrial wind turbines installed in close proximity to human habitation result in sleep disturbance and stress, then it follows as surely as day follows night that wind turbines will, over the long term, result in these serious health effects and reduced quality of life.

The question is, then, do they?

In my investigation of Mars Hill, Maine, 22 out of about 30 adults ('exposed') who live within 3500 feet of a ridgeline arrangement of 28 1.5 MW wind turbines were evaluated to date, and compared with 27 people of otherwise similar age and occupation living about 3 miles away (Not Exposed).

Here is what was found:

82% (18/22) of exposed subjects reported new or worsened chronic sleep deprivation, versus 4% (1 person) in the non-exposed group. 41% of exposed people reported new chronic headaches vs 4% in the control group. 59% (13/22) of the exposed reported 'stress' versus none in the control group, and 77% (17/22) persistent anger versus none in the people living 3 miles away. More than a third of the study subjects had new or worsened depression, with none in the control group. 95% (21/22) of the exposed subjects perceived reduced quality of life, versus 0% in the control group. Underlining these findings, there were 26 new prescription medications offered to the exposed subjects, of which 15 were accepted, compared to 4 new or increased prescriptions in the control group. The prescriptions ranged

from anti-hypertensives and antidepressants to anti migraine medications among the exposed. The new medications for the non exposed group were anti-hypertensives and anti-arthritics.

The Mars Hill study will soon be completed and is being prepared for publication. Preliminary findings have been presented to the Chief Medical Officer for Ontario, and have been presented to Health Canada, by invitation. Earlier partial results were presented to the Maine Medical Association, which passed a Resolution calling for caution, further study, and appropriate modification of siting regulations, at its annual meeting in 2009.

There is absolutely no doubt that people living within 3500 feet of a ridgeline arrangement of turbines 1.5 MW or larger turbines in a rural environment will suffer negative effects.

The study was undertaken as a pilot project to evaluate for a cluster of symptoms after numerous media reports, in order to present data to the Maine Medical Association, after the Maine CDC failed to more fully investigate.

While the study is not perfect, it does suggest a real problem that warrants not only further more detailed investigation, but the tenderest caution, in the meantime, when decisions on how to site industrial wind turbines are made.

What is it about northeast USA ridgelines that contribute to these ill effects, and how can they be avoided?

Consider, the Northeast is prone to icing conditions. Icing will increase the sound coming off of turbines by up to 6 dBA. As the icing occurs symmetrically on all blades, imbalance detectors do not kick on, and the blades keep turning, contrary to wind industry claims.

Sound is amplified coming off of ridgelines into valleys. This is because the background noise in rural valleys is low to begin with, increasing the sensitivity to changes, particularly the beating, pulsatile nature of wind turbine noise, and sound sources at elevation do not undergo the same attenuation that occurs from groundcover when noise sources are at ground level. The noise travels farther and hits homes and people at greater

amplitude that it would from a lower elevation. Even though this is not rocket science, it was conclusively proven in a NASA funded study in 1990.

Snow pack and ice contribute to increased noise transmission. Vermont valleys have both, I believe.

Preconstruction sound modeling fails to take the tendency of the homes that people live in to respond and vibrate perceptibly to sound at frequencies that the occupants of the dwellings cannot necessarily hear. They hear, and feel, the walls and windows rattle, and the floors vibrate, in a pulsing manner at a frequency or the turbine rpm.

When pre construction modeling fails to take the pulsatile nature, propensity for icing, and ridgeline elevation into account, as well as a linear as opposed to point source of noise, problems can be expected. What distance is safe? It depends on the terrain, the climate, the size of the project and the turbines themselves. Accurate preconstruction modeling with safe targets in mind is critical. The WHO says that 30dbA is ideal, and noise levels of above 40dbA have definite health consequences. At Mars Hill, where affected homes are present at 3500 feet, sound levels have been measured at over 52.5dbA. The fiasco there has been acknowledged by the local wind energy company, and by a former Maine governor.

Vermont would do well to learn from the affected people in Mars Hill.

I have seen the preliminary plans for the planned Deerfield Wind Facility, and have particular concerns regarding the dwellings to the north and northeast of the northernmost extension of the turbine layout. These homes are well within a mile, generally downwind, and downhill from what I am told may well be 2 MW turbines (or larger?), in a snowy and icy part of the Northeast.

The parallels to Mars Hill are striking.

We know that preconstruction sound modeling failed at Mars Hill. No matter what the preconstruction modeling at Deerfield shows, the real world experiment at Mars Hill suggests that there will be problems for homes at the setbacks that seem to be planned for Deerfield on the attached image.

The people who live within 3500 feet at Mars Hill are truly suffering. Learn from Mars Hill. It is not a matter of not having wind turbines. It is a matter of putting them where they will not affect people's health.

Newer technology to accurately measure sound at a quantum level improvement in temporal, frequency and amplitude resolution over commonly used acoustician's equipment now exists, though it is costly and not readily available. But it will be widespread, soon, well within the tenure of the individuals responsible for making siting decisions today.

Avail yourselves of these findings and familiarize yourselves with the new technologies. You will not only be future proofing your current decisions, you will also be helping people who would otherwise end up too close to industrial wind turbines escape the fate of the exposed residents of Mars Hill, and many other sites in North America (Mars Hill, Maine, merely represents the first small 'controlled' study).

I have seen the results of this cutting edge equipment, and how it has revealed drastic short duration excesses over allowed sound levels, levels that set homes vibrating and rendering them unlivable, but also levels of lower frequency transient noise at the audible level, that demonstrates not only failure of preconstruction sound modeling as currently practiced, but also the inadequacy of the measuring tools in the toolkit of the everyday practicing acoustician-consultant who generates reports for industry and local government.

2 MW turbines?

Effects of sleep deprivation
 Losing sleep, even for one night, can trigger a flood of changes throughout the body. Scientists don't fully understand how the sleep-starved body goes awry, but many studies find clear relationships between sleep and the health and function of body systems.

Thyroid
 The thyroid system regulates metabolism.

Stomach
 Hunger and sleep

Pancreas
 The pancreas releases insulin and regulates the level of blood sugar.

Fat layer
 Body mass index and sleep

Muscle
 The body's muscle mass and strength.

Brain

People who get less sleep are more likely to have a higher level of glucose in their blood, which is a risk factor for diabetes.

Attention and sleep

People's performance on an attention test declines with sleep loss, even though they don't feel particularly tired, according to researchers.

Heart

High blood pressure and sleep

Joints

People who get less sleep are more likely to have a higher level of glucose in their blood, which is a risk factor for diabetes.

Metabolism

People who get less sleep are more likely to have a higher level of glucose in their blood, which is a risk factor for diabetes.

The metabolic syndrome

**Deputation
to the Standing Committee on General
Government
Regarding Bill C-150
April 22 2009**

By Dr. Robert McMurtry M.D., F.R.C.S (C), F.A.C.S

**Deputation to the Standing Committee on General Government
Regarding Bill C-150
April 22 2009**

First permit me to express my appreciation to the Committee for permitting me to speak and submit this deputation.

My presentation is in four parts:

- * Regulations in Canada
- * Low Frequency Noise and Wind Turbines
- * Report of Adverse Health Events
- * A Proposal

Regulations in Canada

Quite simply national regulations do not exist in Canada. According to a November 2008 letter from Morel Oprisan, (Deputy Director S&T, Renewable Energy Technologies, Government of Canada) in an electronic mail to Professor John Harrison (Queens University) he stated:

“As you correctly noted in your letter, the issue of the wind turbine set-back from a residence, is regulated locally (municipally or provincially).”

“As part of the work done by the federal government in this area, we have worked together with CSA and, internationally with IEC, to bring international standards to Canada. However, these standards, at this time, are not mandatory and their use is voluntary.”

To add to my concern regarding this regulatory uncertainty is the fact that this Provincial Ministry of the Environment has regulations with many flaws. One of these is the failure to measure for low frequency noise (LFN). Instead regulations are stated measure in A Weighted decibels or dBA only. To measure for LFN it is necessary to screen with C Weighted decibels or dBC.

It is not possible to develop authoritative guidelines for set-backs and monitoring of industrial wind turbines specifically if LFN is not taken into account.

Low Frequency Noise

Human auditory range is from 20 – 20,000 HZ. LFN is about 20-200 HZ. (1) It is an area of growing interest and for example there are 15,400,000 hits on Google (accessed April 20 2009) for “Low Frequency Noise”. However there appears to be a variance of opinion

in recognizing its significance. For example the wind developer IPC Energy contracted Avalon Consulting to do Environmental Screening. I contacted Avalon who indicated to me on 2 occasions that it is “not necessary” to monitor for LFN. The wind industry at large agrees as they also deny the need to monitor for LFN. The Ministry of the Environment of Ontario concurs as all its regulations are based on dBA (Decibels with A weighting) which is relatively insensitive to LFN. dBA however is adequate for higher frequency noises such as the characteristic “swoosh, swoosh, swoosh” of turbine blades which are in the mid-frequency range.

How important is LFN?

The World Health Organization in a 2000 publication (“Community Noise” by Berglund et al) made the following observations:

- "Since A-weighting underestimates the sound pressure level of noise with low frequency components, a better assessment of health effects would be to use C-weighting"
- "It should be noted that a large proportion of low frequency components in a noise may increase considerably the adverse effects on health"
- "The evidence on low frequency noise is sufficiently strong to warrant immediate concern" (2)

The answer is clear – LFN is very important.

However there is a crucial difference of opinion.

The author of the foregoing paper (H.G. Leventhall) who quoted the WHO denies that wind turbines generate LFN. He is the prime expert on the subject on behalf of the wind energy industry.

Others disagree.

For example Styles et al observed that there is “..clear evidence that wind turbines generate low frequency sound (infrasound) and acoustic signals which can be detected at considerable distances (many kilometres) from wind farms on infrasound detectors and low-frequency microphones.”

Kamperman and James have commented “Some residents living as far as 3 km (two miles) from a wind farm complain of sleep disturbance from the noise. Many residents living one-tenth this distance (300 m. or 1000 feet) from a wind farm are experiencing major sleep disruption and other serious medical problems from nighttime wind turbine noise”.

They further comment that “the single A-weighted (dBA) noise descriptor used in most jurisdictions for siting turbines is not adequate”. Clearly, as they conclude C-weighted (dBC) criteria should be used.

Adverse Health Events

There have been many reports of adverse health events. At the outset it must be made clear that there has not been any systematic epidemiological field study that could yield authoritative guidelines for the siting of wind turbines. Secondly there is no epidemiological study has been conducted that establishes either the safety or harmfulness of Industrial Wind Turbines. In short there is an absence of evidence. Accordingly until more authoritative information is available it is important to consider the growing number of reports of cases and case series of adverse health effects that are emerging.

Dr. Amanda Harry reported on 39 cases of people whose health and quality of life were compromised.

She concluded that “.....people living near turbines are genuinely suffering.” (5)

Dr. David Manley a Chartered Physicist, Acoustician and Engineer who worked with Dr. Harry stated: “Much work has been done by me near windfarms to evaluate the acoustic effects. It is found that people living within five miles of a windfarm cluster can be affected and if they are sensitive to low frequencies, they may be disturbed.”

“It has been found that an extensive seismic signal passes through the earth and may well at night time affect peoples sleep. It is admitted by fellow acousticians that much more research in this subject is needed and that none has been done since 1996 by the DTI. At many inquiries windfarm promoters will not accept there is an acoustic problem.”(6)

Todd et al recently found that the human ear is more sensitive to seismic vibration than to hearing. (7) In other words what you can't hear can otherwise be perceived.

Dr. Nina Pierpont has had a substantial experience with wind turbines She too has gathered cases (38 from 10 families) and plans to publish a book this year. (8)

The National Academy of Medicine of France has taken note of adverse health events in their report “Repercussions of the Operation of Wind Turbines on the Health of Man” (March 2006). Their recommendation is for a set-back of 1.5 kilometers for 2.5 MW wind turbines from dwellings. They also recommended an epidemiological investigation into the possible medical effects of wind turbines.

Of course the industry denies any problem and cite more than 20 years experience and at least 68,000 wind turbines in place without adverse health effects.

The European Platform Against Windfarms begs to differ. They currently have 319 organizations from 18 nations opposing windfarms. To quote from their web page

- that hundreds of associations, local initiatives and other groups are totally dissatisfied with wind farms;

- that intermittent, uncontrollable energy does not solve any of humanity's problems, even in part;
- that the only thing wind turbines do is cause considerable harm to people, the economy, national budgets and the environment.(9)

Closer to home those sentiments are clearly arising as this committee heard from Wind Concerns Ontario.

Let me be clear however as to my deepest concern : adverse health effects are occurring as we speak. Many victims have joined us today in the hope of being heard. There is no question that they are genuinely suffering and more people are at risk if the rules are not changes substantially.

The victims, lead by Carmen Krogh and Lorrie Gillis organized a survey of people living near wind installatons. (The methodology and detailed results are attached as part of the submission) Seventy-six people responded. Twenty-three denied any problem. Fifty-three indicated that they had experiencesd at least one symptom/complaint and on average had 5 complaints.

The findings are remarkably similar to other work quoted above and to the just released study by Dr. Michael Nissenbaum in Maine who reports on 15 further cases. Virtually always the commonest complaint is sleep disturbance (34). Already thirty-nine individuals indicate that their health has been affected as a consequence of what they are experiencing. One person has had to be admitted to hospital with an acute hypertensive episode, another experinced a cardiac arrythmia (atrial fibrillation), 15 experienced heart palpitations. Further details are in your packages.

Most disturbing of all are the comments describing the sheer anguish and sense of betrayal that many feel. Noone seems to care, noone appears to be listening to their plight. They feel they are losing their homes and their lives.

The situation has been exacerbated for many who have experienced denial, and abusive behaviour by Wind Turbine representatives and on occasion from Ministry of the Environment officials. All this victimizes them a second time.

These findings and victim accounts are new in Ontario but not elsewhere. They have been described too often in other countries.

A Proposal

There clearly are competing claims about LFN and health risks - those who are living the claims and those who deny them

There is a way out of this dilemma. Authoritative guidelines must be established based on sound science. A well-designed epidemiological study conducted by arms-length

investigators, mutually agreeable to all sides, must be done. In addition and far more simply is to engage sound engineers, (again mutually agreeable) to determine the presence or absence of LFN near existing wind farms in Ontario.

In the meantime listen to and help the victims.

Anything less would be an abandonment of responsibility by the government.

Summary

When uncertainty exists and the health and well-being of people are potentially at risk, assuredly it is appropriate to invoke the precautionary principle. Until and unless there are authoritative guidelines in place based on the best available evidence the Province of Ontario ought not to proceed with the development of Industrial Wind Turbines any further.

The development of these guidelines must be based on a rigorous epidemiological evaluation of health effects of these turbines.

- Do we have a right to subject the non coastal population of Maine to a 30 year prospective study?

Mars Hill ME DEP Nighttime Noise Variance 45=>50 dbA

“There are 4 protected locations where the noise level would be above 45 dBA, but less than 50 dBA, **which is approximately equivalent to the noise that songbirds make . . .** the Department finds that the applicants’ project will not have an unreasonable adverse impact . . . and therefore grants a variance from the noise standards for the windpower farm.”

DONE AND DATED AT AUGUSTA, MAINE, THIS 1ST DAY OF JUNE, 2004.

DEPARTMENT OF ENVIRONMENTAL PROTECTION

By: *Dawn R. Gallagher*
DAWN R. GALLAGHER, COMMISSIONER

PLEASE NOTE THE ATTACHED SHEET FOR GUIDANCE ON APPEAL PROCEDURES

Date of initial receipt of application January 12, 2004
Date of application acceptance January 22, 2004

Date filed with Board of Environmental Protection
RC/L21635AN/BN

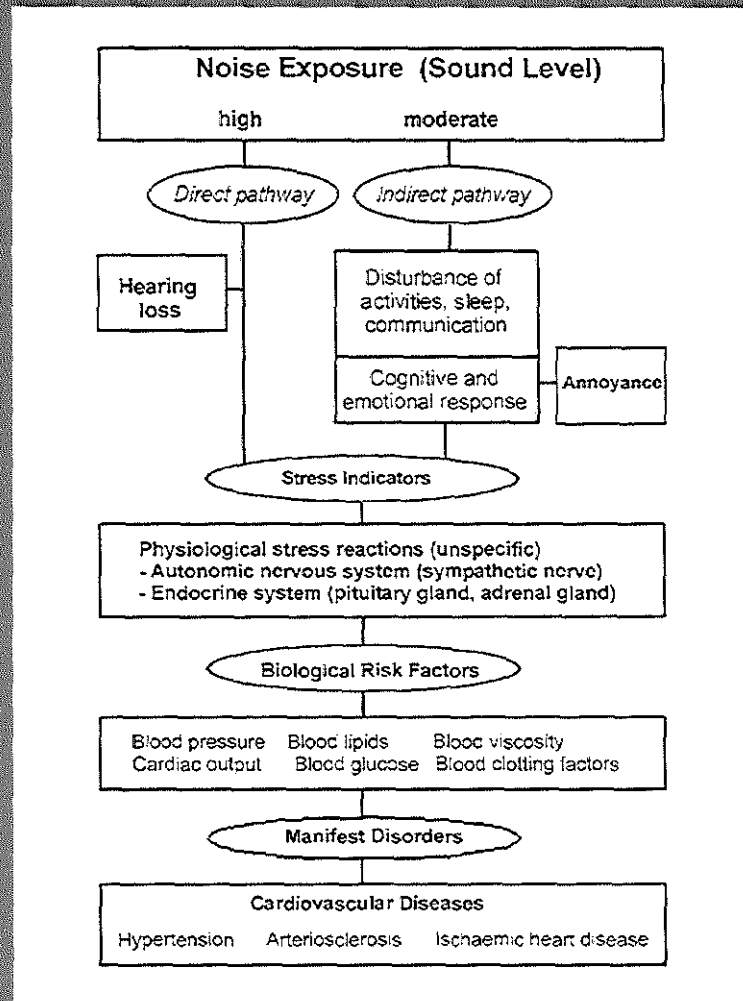

Mars Hill ME DEP Nighttime Noise Variance 45=>50 dbA

In fact, the turbines at Mars Hill produce night time readings 52.5 dBA, which Andrew Fisk of MDEP has characterized as 'substantially in compliance', and has issued a letter of compliance to First Wind/UPC.

He acknowledged, during a recent meeting in Fort Kent, that this reflected an average measurement which included downtime, though the statute is meant to regulate sound sources during operation.

Is this the Mars Hill Experience?

Preliminary findings are alarming

More detailed studies are required:

- Diurnal cortisol studies
- Larger population sample
- Detailed cardiovascular studies
- Detailed psychiatric assessments

***** 16 Children *** MUST be studied.**

Health Aspects of Extra-Aural Noise Research. W. Babisch. German Federal Environmental Agency
Noise and Health 2004. 6:22, 69-81

DO NO HARM

In light of these growing, serious medical concerns, we propose a moratorium on the building of any such "wind farms" until more research is done on the health impact that such facilities will have on the communities surrounding such technology. These communities and the Maine DEP and Health Services must be allowed time to study and learn from the European and Canadian experiences, as well as from the many affected families in Mars Hill, Maine, and put into place appropriate regulations and ordinances, prior to expanding the wind industry in the State of Maine.

Excerpt, Statement of the Medical Staff of NMMC, March 2009

DO NO HARM

The State of Maine has a vast, unpopulated hinterland. There is little need to site industrial wind developments in proximity to residential communities if there is a risk of negative health effects. Quality of life, quality of place, and a healthful environment should be the right of all residents of Maine, including those of the rural north.

Excerpt, Statement of the Medical Staff of NMMC, March 2009

Preliminary Findings are Alarming In the Meantime, DO NO HARM

Options:

- Request moratorium until more extensive medical studies are done and current state of knowledge is fully understood by authorities and regulations reflecting risks and hazards put into place
- Request siting setbacks reflecting current state of knowledge and non US jurisdictions' best practices (France, Germany, Australia) – including use of db(C) calibration
- Request a Wind Developer “Code of Conduct” be established and enforced by the State’s Attorney General’s Office (similar to NY State)

Further Studies Must be Done NOW

How is any medical scientist going to
conduct an epidemiological study of wind
turbine health effects when 'Good
Neighbor' and lease-holder gag clauses
exist in land lease contracts?

EXECUTIVE ORDER -- ENSURING LAWFUL INTERROGATIONS

IN THIS

Effective immediately, an individual in the custody or under the effective control of an officer, employee, or other agent of the United States Government, or detained within a facility owned, operated, or controlled by a department or agency of the United States, in any armed conflict, **shall not be subjected to any interrogation, technique or approach, or any treatment related to interrogation, that is not authorized by and listed in Army Field Manual 2 22.3**

*BARACK OBAMA**THE WHITE HOUSE.**January 22, 2009*

Sleep Deprivation is not permitted in Army Field Manual 2 22.3

WHO 2000 Guidelines:

Community Noise

- When low frequency components are present, noise measures based on dBA measurements are inappropriate - dBC is a better measure when health effects are to be minimized
- It should be noted that a large proportion of low frequency components may increase considerably the adverse effects on health and the evidence on low frequency noise is sufficiently strong to warrant immediate concern

Berglund et al., 2000

Wednesday, March 4, 2009

For Immediate Release:

At its monthly meeting held Tuesday, March 3, 2009, the Medical Staff of Northern Maine Medical Center unanimously approved the release of the following statement:

Health Concerns and the Need for Careful Siting of Wind Turbines

Members of Northern Maine Medical Center's medical staff endorse the use of alternative energies.

We echo the concerns of the Medical Staff of Rumford Community Hospital as regards an increasing body of literature and reports from Canada, the USA, and particularly from Europe suggesting that the deployment of industrial wind facilities in close proximity to places where people live, work or attend schools results in negative health effects, including and especially sleep deprivation and stress.

We know, as physicians, that sleep deprivation and chronic stress can result in many consequential negative health effects, some of them serious, over the long term.

These effects arise not only from audible noise frequencies but also from persistent inaudible low frequency noise waves of a cyclical nature which are felt, but not heard. There are a growing number of scientific observations and studies suggesting that people living up to 2 miles away from these industrial wind farms may be affected.

Many European nations with more than two decades of experience with industrial wind factories have now implemented regulations stipulating setbacks of 1-1.5 miles.

In light of these growing, serious medical concerns, we propose a

moratorium on the building of any such "wind farms" until more research is done on the health impact that such facilities will have on the communities surrounding such technology. These communities and the Maine DEP and Health Services must be allowed time to study and learn from the European and Canadian experiences, as well as from the many affected families in Mars Hill, Maine, and put into place appropriate regulations and ordinances, prior to expanding the wind industry in the State of Maine.

The State of Maine has a vast, unpopulated hinterland. There is little need to site industrial wind developments in proximity to residential communities if there is a risk of negative health effects. Quality of life, quality of place, and a healthful environment should be the right of all residents of Maine, including those of the rural north.

We also encourage the residents of Fort Kent, Maine, to exercise their rights and vote 'YES' at the next annual Town Meeting on March 23rd to a proposal to establish a moratorium in Fort Kent on the permitting of industrial wind development until such time as an ordinance to govern their siting is in place.

Signed,

Medical Staff, Northern Maine Medical Center

RE: Comments on Draft EIS for Whistling Ridge Energy Project

Dear EFSEC Council Members,

The thirteen members of the Board of Directors of the Skamania County Economic Development Council unanimously support approval of the Whistling Ridge Energy Project.

We have reviewed the Draft EIS and believe that it is objective, comprehensive, accurate and authoritative. The Draft EIS found;

- No significant impact on wildlife or bird populations.
- No significant impact on scenic views.
- No evidence of negative impact on tourism.

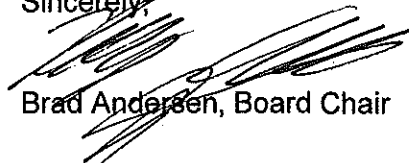

In addition to the clear benefits of clean renewable energy the Draft EIS substantiates the economic benefits that drive our organization's strong support. The Draft EIS found that:

- There will be considerable economic benefits to the tri-county area of Skamania, Klickitat and Hood River counties.
- The construction workforce hired to build the wind farm would average 143 workers, with a peak of approximately 265 workers.
- There will be an estimated \$1.3 million in local, non-labor purchases during construction.
- Annual property tax revenue to the County would increase by \$731,500.
- The White Salmon School District will see an estimated \$150,000 annually.
- 8-9 new permanent jobs will be created.

Of the 1,070,080 acres in Skamania County, less than 3% can be developed to grow a tax base to create economic sustainability that provides financial resources to support necessary services to residents and visitors. Due to excessive federal and other public ownership of its land base, Skamania County must take advantage of each opportunity it has to grow its tax base.

The Whistling Ridge Energy project is not only a sound economic development opportunity, but also a clean, safe, green, renewable energy resource that will provide a better future for generations to come.

Sincerely,

Brad Andersen, Board Chair

ENERGY FACILITY SITE
EVALUATION COUNCIL

RE: Whistling Ridge Energy Project DEIS

Dear Sirs,

I would like to express concerns about the proposed Whistling Ridge Energy Project's potential impacts on the National Scenic Area and in particular the Historic Columbia River Highway (HCRH), a district listed in the National Register of Historic Places.

I have been working with OPRD and ODOT on the restoration of Mitchell Point for several years and in particular the design of several overlooks to be located along the HCRH State Trail. I am concerned that the existing analysis does not adequately address this section of the HCRH Key viewing area. This area is due south of the proposed project and within the Special Management Area of the CRGNSA.

The HCRH is a linear scenic and historic resource in Oregon, extending from Troutdale to The Dalles. All of the HCRH is a Key Viewing Area within the Columbia River Gorge National Scenic Area (CRGNSA). Portions of the HCRH that are a trail are designated as a National Recreational Trail. Portions of the HCRH are closer to the proposed project than the sites chosen for visual resource analysis.

The Mitchell Point overlook is more visually sensitive than Interstate 84, both because it is higher in elevation and because it is a place where people stop and get out of their cars to take photos. It is closer to the proposed project than Viento State Park, Koberg Beach State Park and the Hood River to Mosier section of the Historic Columbia River Highway State Trail that were analyzed. This site should be analyzed for visual impact from the proposed project.

Thank you for the opportunity to comment on this DEIS.

Sincerely,

Brian E. Bainnson, ASLA

Stop The Whistling Ridge Wind Turbines Project -- Columbia Gorge

There has not been enough time for the average citizen to go through the EIS!

Most people I've spoken with haven't still have not seen the EIS. Residents do not even realize that if this project is built, most will never again be able to see anything but a full moon in the sky.

In the last month there have been a plethora of lawsuits across the county initiated by residents dealing with the harmful effects from wind turbines located in their local areas. A recent bird study in Klickitat County is not even mentioned in the EIS.

Please, do not rubber stamp this project!

Subject: Query on July DEIS deadline

Dear EFSEC,

At the last public hearing on Whistling Ridge, numerous public participants, including the Yakama Tribe asking for government to government contact, asked for more time to dissect the 1500+ DEIS for this proposed wind farm. Have you all made any decision to prolong the 30-day comment period? Frankly, 30 days is not enough time to dissect, digest, analyze, and make coherent comments upon, such a monster DEIS. I would like to see the public participation process extended to a more reasonable comment period. Thank you.

Subject: comment period for whistling ridge energy project

Gentlemen,

I am writing to request that you extend the comment period on the DEIS for the Whistling Ridge Energy Project. I recieved my hard copy of this 1500 page document on Monday, July 12, 2010. I requested it at the Underwood hearing on June 16th, after finding that looking at it online was not practical (hard to flip back and forth to cross-reference, etc.) and printing it on my printer impractical, too. When I tried to look at it at the library in White Salmon, I was only given the DEIS without the appendices.

To summarize, I have been given less than a week to review a complex, 1500 page document. I am probably not the only one. We were assured at the hearings by Jim Luce that hard copies would be available on request. I think he thought we would get them in a more timely manner. A week is not enough time to assimilate the information, let alone formulate constructive comments. I respectfully request that your agencies extend the comment period at least 60 days.

A cursory review of the document reveals much happy talk and shallow analysis of major issues associated with this project. I would like to provide detailed and meaningful input to this process, but will need more time. As I stated at the hearing, my community of Underwood, through which all construction traffic will be routed, feels like it is getting the bum's rush by your agencies and the applicant. As the first project of its kind in a forested, mountainous setting, on the doorstep of a internationally recognized scenic wonder, we hope that the process will be fair and thorough.

Sincerely,

Sally Newell

Subject: Whistling Ridge Energy Project DEIS (DOE/EIS-0419)

Dear Messrs. Wright, Montaño, and Posner:

I am writing on behalf of Friends of the Columbia Gorge to request that the agencies extend the deadline for written comments on the Whistling Ridge Energy Project DEIS. We request an extension of 45 days in order to have sufficient time to review the 1,500 pages of material in the DEIS and appendices and make meaningful, informed comments.

Until very recently, Friends' staff, consultants, and outside legal counsel have had a total of only two paper copies of the DEIS to use in our review. Essentially, nine different people in five different offices have had to share two paper copies. One of our consultants is often in the field and away from a computer; a paper copy has been essential for his review.

Friends' staff attended the June 16 and 17 public hearings in Underwood and Stevenson. At those meetings, EFSEC Chair Luce stated that paper copies would be provided to the public upon request. Friends' staff requested three additional copies of the DEIS by checking the appropriate box on the sign-in sheets. On June 21, I requested by phone and email four paper copies of the DEIS from EFSEC. On July 7, not having received the copies, I reiterated the request by email.

On July 12, Friends' staff finally received two additional paper copies. This was only one week before the comment deadline of July 19.

We certainly understand that the EFSEC and BPA staff are overwhelmed with the regular press of business, not to mention furlough days and special projects. We do not fault the agency staff for the delays in distributing paper copies.

However, we believe it is only fair for the agencies to extend the comment deadline, in order to give the public sufficient time to review and comment on the material in the DEIS.

We are also sympathetic to the impact on the citizens of the Gorge. I have spoken to other people who received their first and only paper copy this week, after requesting it almost a

month ago. Some citizens in rural areas of the Gorge are still using dial-up Internet access, or have no Internet access at all. For these citizens, obtaining electronic copies via the Internet was never an option. They are now left with an insufficient amount of time to digest 1,500 pages of material and write meaningful comments.

Friends respectfully requests an extension of the comment period on the DEIS. Thank you for considering this request.

Dear Messrs. Wright, Montano, Posner:

I would like to request an extension of 30-45 days for the deadline for written comments on the DEIS for the Whistling Ridge Energy Project in order to have sufficient time to review, digest and then make meaningful comments on this proposal since this will be the one and only opportunity as a concerned Gorge resident to do so.

This document along with its appendices is an enormous amount of material to try and make informed comments on since I only received my hard copy a matter of several weeks ago and I have dial-up internet at my home in the West end of Skamania county and simply can't download this material in any sort of realistic timeframe. I attended both the June 16th and 17th public hearings in Underwood and Stevenson where several other concerned citizens voiced their concerns that this is not an adequate amount of time for proper public review.

As a resident of the Columbia River Gorge living in Skamania county for the past 16 years, I respectfully request that you allow for an extension for the public comment period on this DEIS of the Whistling Ridge Wind Energy Project.

Thank you for your time and consideration,

Dear Messrs. Wright, Montano and Posner.

This office represents Save Our Scenic an interested party to the proposed Whistling Ridge Energy project. Given the length of the DEIS and the detailed materials found therein, we join in the request of Friends of the Columbia Gorge (Friends) to extend the comment period for 45 days to allow full opportunity to comment on this DEIS as well as to provide additional notice to interested persons.

We also note that the recently issued (June 29, 2010) Pre Hearing Conference Order Number 4 (PHO 4) in the EFSEC proceeding on the Whistling Ridge matter addressed issues regarding the DEIS. In that order, it was acknowledge that at the June 16 public hearing public comments "identified potentially serious errors in the draft EIS." PHO 4 also indicates the EFSEC "expects that the Applicant will incorporate into its direct presentation any information needed to address asserted significant flaws in the DEIS." SOSA and Friends have objected to this procedure. Equally, PHO 4 indicated that EFSEC was not going to prepare the final EIS prior to the adjudicative hearings. SOSA and Friends have also objected to this procedure. EFSEC has entered PHO 5 (July 9, 2010) which allowed parties and intervenors to the EFSEC proceedings to have until July 19 to respond to the SOSA/Friends objections (the same day comments on the DEIS are due).

To our knowledge, neither EFSEC or BPA has communicated to any recipients or interested commenters on the DEIS, other than the parties to the EFSEC proceedings, that it has made the decisions found in PHO 4. This would include federal or state agencies. No general notice of these decisions, as far as we know, have been placed in the Federal Register nor to persons that spoke at the public hearing or requested copies of the DEIS. The actions taken in PHO 4 may well modify comments that might come from

agencies or members of the public. For example, additional detail may be included in DEIS comments from interested agencies or members of the public knowing that such matters would be taken up at the adjudicatory hearings. Further DEIS commenters may wish to address the validity and appropriateness of the procedures announced in PHO 4.

Based on the foregoing, SOSA requests the following. First, that the comment period for the DEIS be extended for at least 45 days. Second, and in the alternative, that EFSEC and BPA provide notice, consistent with the usual notice for the availability of DEIS, of the decisions made regarding the use of the DEIS in PHO 4, i.e. a) that the draft EIS will be used in the adjudicative hearings (instead of the final EIS in the hearings and b) that the applicant is expected to incorporate in its direct presentation evidence regarding

"significant flaws" in the DEIS. The detail in such notice will be dependent on the anticipated rulings by EFSEC on the SOSA and Friends objections. If that ruling is delayed, such notice should provide a minimum of 45 days for comments after the issuance of the notice.

Thank you for your attention to these requests.

J. RICHARD ARAMBURU

Subject: Whistling Ridge Energy Project DEIS (DOE/EIS-0419)

Dear Messrs. Wright, Montaño, and Posner:

I am writing on behalf of Friends of the Columbia Gorge to request that the agencies extend the deadline for written comments on the Whistling Ridge Energy Project DEIS. We request an extension of 45 days in order to have sufficient time to review the 1,500 pages of material in the DEIS and appendices and make meaningful, informed comments.

Until very recently, Friends' staff, consultants, and outside legal counsel have had a total of only two paper copies of the DEIS to use in our review. Essentially, nine different people in five different offices have had to share two paper copies. One of our consultants is often in the field and away from a computer; a paper copy has been essential for his review.

Friends' staff attended the June 16 and 17 public hearings in Underwood and Stevenson. At those meetings, EFSEC Chair Luce stated that paper copies would be provided to the public upon request. Friends' staff requested three additional copies of the DEIS by checking the appropriate box on the sign-in sheets. On June 21, I requested by phone and email four paper copies of the DEIS from EFSEC. On July 7, not having received the copies, I reiterated the request by email.

On July 12, Friends' staff finally received two additional paper copies. This was only one week before the comment deadline of July 19.

We certainly understand that the EFSEC and BPA staff are overwhelmed with the regular press of business, not to mention furlough days and special

projects. We do not fault the agency staff for the delays in distributing paper copies.

However, we believe it is only fair for the agencies to extend the comment deadline, in order to give the public sufficient time to review and comment on the material in the DEIS.

We are also sympathetic to the impact on the citizens of the Gorge. I have spoken to other people who received their first and only paper copy this week, after requesting it almost a month ago. Some citizens in rural areas of the Gorge are still using dial-up Internet access, or have no Internet access at all. For these citizens, obtaining electronic copies via the Internet was never an option. They are now left with an insufficient amount of time to digest 1,500 pages of material and write meaningful comments.

Friends respectfully requests an extension of the comment period on the DEIS. Thank you for considering this request.

Nathan Baker, Staff Attorney
Friends of the Columbia Gorge

Hello Energy Facility Site Evaluation Council,

I have lived in the Columbia Gorge (White Salmon, WA.) since 1950 and just recently moved to The Dalles, OR. The Whistling Ridge Energy Project is ideally located, out of the Gorge Scenic area and would disturb very few people---if any.

I am 100% in favor of this project and hope you can see your way clear to approve this very worthy project without any further delay.

Doug Holliston

Sincerely,
DOUG HOLLISTON

Subject: Whistling Ridge Threatens Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

The Columbia River Gorge is a National Treasure that people travel from around the world to see and experience. The draw is it's natural beauty; waterfalls, cliffs, rivers, mountain vistas. One can drive or hike countless areas in the gorge and be surrounded by exquisite beauty. However, these pristine views are in jeopardy of being lost forever if Wind Turbines are not kept from intruding onto these skylines.

There is plenty of land in this country to support wind turbines. We need to be responsible with our placement of these wind farms. Forests should be protected from destruction in order to erect turbines. After all, wind energy is supposed to be better for the environment. If we destroy forests for wind energy then we have defeated the point of alternative energy sources. This country has millions of wide open plains and grasslands with steady winds that are far more suitable for wind farms.

Please, protect the views in the Columbia River National Scenic Area. The natural landscape is why this Scenic Act was created. There is nothing natural about seeing turbines on the skyline. Thank you for allowing me the opportunity to give my opinion. Sherri Irish
Gorge Resident

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. SDS is a very reputable company with strong ties to the community. This wind farm will give the Skamania & Klickitat County economy the boost it needs. We are too dependent on timber harvests and federal timber payments. Too many residents are stuck in low-income brackets while unemployment ranks far above the state average. Fortunately, Skamania has another natural resource to develop: wind. Bringing another industry here is exactly what our county needs. It will stimulate local spending, create jobs, and provide new tax revenues. How can that be a bad thing? Skamania County needs to diversify its resources and revenue, and Whistling Ridge can make that happen. I hope the Council approves the SDS application and that the project advances quickly.

Sincerely,
David Wasgatt

**Should a large-scale wind turbine development be sited in
Skamania County?**

Bob Davis, Energy Efficiency Engineer, Ecotope, Inc.
(Hood River Valley High School Class of 1980)

I appreciate the opportunity to comment on the Whistling Ridge Project.

Normally I would just say: yes, do it, it's a renewable. But the Columbia Gorge is a one-of-a-kind place. I grew up in the gorge; I spent a lot of my youth exploring it, including the forest lands in Skamania County. I observed up close the movement to establish the National Scenic Area. A primary reason the NSA was established was the poor stewardship of some of the Gorge's extraction industries such as SDS Lumber. The prevailing approach of SDS and their cohorts was and is to cut/quarry as fast as possible. In the past years, SDS cut to within an inch of the NSA and in full view of its core scenic assets (clear cuts across from Viento Park and nearby areas)

SDS would argue they were/are playing by the rules. Perhaps they were, but I suspect they found some sort of barely legal ways to bend the rules. The death of the viewsheds in the NSA is death by a thousand cuts. Some would argue there are already an interstate freeway and a railroad and a whole dam but that is exactly WHY the preservation of what remains of the viewshed is so important to the value of the NSA.

Much of the Columbia Gorge is now a National SCENIC area. We need to preserve the scenic quality whenever possible; the rules of the NSA are clear on that point. SDS has always viewed the NSA and the NPS with disdain and has done their darndest to stick their finger in the eye of those who love the Scenic Area. I don't think they should be allowed to do it again. They own lots of land (70,000 acres, according to Wally Stevenson) and can find another way to make money on it.

There is another reason I question this project. The Northwest Power and Conservation Council's 6th Plan ranks conservation ahead of wind power in terms of cost-effectiveness. I work on verifying conservation technologies and, for the most part, they do work. The hardest part has been finding someone to do the work (thankfully that is now changing) but the results have been proven in a number of regional studies that extending back to the early 1980s. There is still a lot of conservation to procure, and the economics are considerably more favorable than the economics of wind, especially when real utilization factors are employed. (That is, turbines even in very windy places only generate usable electricity about 40% of the time; most turbines have much lower utilization rates.) I urge EFSEC to consider these issues seriously when ruling on the siting application.

Subject: Whistling Ridge project should be denied

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

I am adamantly opposed to this project as it would violate the spirit of the law of the Columbia Gorge Scenic Area Act and destroy the intended viewshed of the area.

I am a supporter of alternative energy in general. But, I firmly believe that industrial wind turbine development should be installed in areas that are very remote from people and vital natural resources.

I also request that EFSEC and BPA extend the comment period in order to allow the public sufficient time to review and comment on the 1,578 pages of material contained in the DEIS and appendices. Please extend the comment period by 45 days.

To whom it may concern,

I would like to comment on the Draft Environmental Impact Statement prepared for the Whistling Ridge Energy Project proposed by Whistling Ridge Energy, LLC.

In order to complete a successful wind project, there are several hurdles a project must pass in order to be considered viable. If you look around locally, regionally, or nationally, there are very few sites that meet enough of these criteria to be considered viable. The Whistling Ridge Energy Project easily clears these hurdles:

Wind. The project proponents have studied wind on the project area extensively for several years. Along with the data collected, all of the trees in the project vicinity are "flagged" indicating strong westerly winds along the entire ridgeline of the project area.

Load. With Seattle and Portland populations nearby, there is plenty of electrical demand close to the project. Compared to some of the large scale projects in places like Eastern Wyoming where wind resources are superb, the Whistling Ridge Energy Project clearly has a leg up because not only does it have viable wind, but also nearby load.

Transmission. Whistling ridge Energy Project has a major BPA transmission line located right in the middle of the project area. The project's ability to efficiently tie into the grid without constructing miles of transmission lines greatly reduces the overall impact of the project. Many wind projects need to construct or upgrade miles of transmission lines in order to connect the projects to the transmission grid. Again this is a distinct plus for the Whistling Ridge Energy Project and greatly reduces the overall impact and necessary foot print of the project.

Ownership. The Whistling Ridge Energy Project is located entirely on lands owned by two private entities. There are no other private or public parcels intermingled. This may seem like a small detail. However, different ownerships have different management philosophies and perhaps different levels of commitment to a project and can jeopardize the project as a whole. Having essentially a single landowner ensures the commitment to the project and helps guarantee the success.

Regulatory restrictions: Whistling Ridge Energy Project is located entirely Outside the Columbia River Gorge National Scenic Area. While close, the fact that the project is outside the boundary is significant. In addition, the draft EIS found no significant impacts to plants and wildlife in the area. The lands in the project area are currently managed for intensive silviculture and have been harvested using heavy

machinery multiple times. This area is neither natural nor a pristine environment. These are "working" lands and have been for a very long time.

Revenue. The Whistling Ridge Energy Project is located in Skamania County, which is very significant for the local and regional economy. Skamania County is largely owned by the Federal Government with over 80% of available lands managed by the USFS. In the decades where Federal timber harvests were high, Skamania County received considerable funding from harvest dollars. Harvest levels and associated receipts to the County have disappeared. The County has spent considerable time and energy trying to maintain and replace this vital source of revenue. The Whistling Ridge Energy Project will contribute significant dollars to the County during the construction phase in addition to providing a large, stable source of annual tax revenue to the County. For this revenue, the County has to provide very little service in return. The project uses existing county roads and infrastructure. The County will have little burden both initially and on an ongoing basis.

It takes a very unique site and set of circumstances to meet all of these thresholds. I would urge any of the council members to try and find a site that "fits" any better than this one.

Washington voters passed Initiative 937 in 2006 requiring large utilities to obtain 15% of their electricity from new renewable resources such as solar and wind by 2020. Whistling Ridge Energy LLC has proposed a project to help meet the requirements of this initiative. I strongly urge the Council to see the value of this project for the short and long term local, regional, and national benefits to society and our goal toward a clean energy future.

Thank you for taking the time to review my comments.

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project.

It is very unfortunate that environmentalists and others have chosen to oppose this project when our global environment is already experiencing the impacts of climate change. What good is a scenic area if our global environment is polluted with carbon-emitting energy sources? It is indeed sad that wind turbines impact individual birds. As a birder and long time volunteer for a raptor rehabilitation center, I'm the last person who would want to see birds die. But they are dieing by the thousands---tens of thousands----across the globe because of climate change\'s impact on habitat. We simply cannot afford to pass up opportunities to create more renewable energy.

Washington State utilities must reach the goals set by Initiative 937. Wind is the most feasible and most cost-effective option for bringing 15% new renewable energy on the grid by 2020, which means we need to build more wind farms. Skamania County has the wind, SDS Lumber has the land: it is a match made in heaven. Many studies have shown that the environmental impact of the Whistling Ridge Energy Project would be minimal. For the last century, the site has been used in commercial forest operations. The land has already been cleared, roads built, transmission lines already installed, and wildlife habitats already fragmented. The impacts on a few other species that might be affected are rated low-risk. The environmental benefits are numerous. Wind is clean, renewable, and does not consume water or produce waste. Whistling Ridge will generate 75 megawatts of electricity; enough to power 20,000 homes a year, without contributing to global climate change. The choice is clear: support Whistling Ridge and Skamania County by approving this project.

Sincerely,
Ashley Henry

As a Skamania County resident who would be located near the area where the SDS' 75 megawatt wind farm would be sited, I am in full support of this project. It has no negative effects that will harm the environment, but will provide much needed energy and revenue for our area. I have lived near forest lands owned by SDS since 1983 and know that SDS has always been a responsible and considerate neighbor to us at the Northwestern Lake area. I give them my full endorsement without any reservations.

Subject: Whistling Ridge Energy Project

I am writing in support of the Whistling Ridge Energy Project. As a retiree of Skamania Co. PUD, I see a great need for alternative sources of energy.

Also, my husband and I do not believe their placement will hamper the beauty of the Columbia River Gorge. On a recent trip from Carson, WA to Pendleton, OR along I84, we actually stopped along the freeway to take pictures of the windmills there because we thought they were so awesome and beautiful!

Thank you for allowing us the opportunity to comment....

To Whom It May Concern:

I am writing to comment on the Whistling Ridge Energy Project Draft Environmental Impact Statement (DEIS). Please include my comments in the public record, and include my name on the mailing list for all future notices and decisions.

I have lived in the area of this proposed project for 18 years and have followed wind energy developments closely for most of that time, both here in the Columbia Gorge and nationally. I serve as an environmental representative on the technical advisory committees of three wind power projects in the area. I have participated in field visits to wind projects all over the West. I have a degree in biology and have read a great deal of the scientific literature pertaining to wildlife-turbine interactions. As someone who is well informed about both wind power and ecology, I have a number of concerns regarding the DEIS prepared for the Whistling Ridge Energy Project.

1. The evaluation of cumulative impacts is inadequate.

Under SEPA, EFSEC is required to consider whether multiple incremental impacts when considered together may cumulatively result in a significant adverse impact. WAC 197-11-792(2)(c)(iii). Unfortunately, the cumulative impacts analysis done for the Whistling Ridge DEIS only considered the impacts of 10 existing wind projects and three proposed wind projects. In fact, there are at least 15 major wind projects constructed or proposed in Klickitat County alone, and more than 45 major wind projects constructed or proposed along the Columbia River east of Whistling Ridge.

The pace and scale of wind turbine construction in this region has been unprecedented. Only five years ago, an EIS prepared by Klickitat County (which lies immediately to the north and east of the Whistling Ridge site) predicted the construction of four major wind projects, with a total installed capacity of 1,000 megawatts, over a 20-year period. In actuality, 10 major wind projects with a total installed capacity of more than 1,100 megawatts have already been constructed in Klickitat County, and permits are pending for another 500 megawatts. In other words, Klickitat County has seen twice as much wind development in five years as was predicted for 20 years.

Besides the many projects in Klickitat County, the BPA's interconnection queue shows approximately 35 additional projects in other nearby counties that are either permitted or awaiting permits. Other projects are proposed but not yet shown in the BPA queue. From Whistling Ridge to Walla Walla, wind developers are erecting (or proposing to erect) strings of turbines that stretch for more than 100 miles along the ridges on both sides of the Columbia River.¹

In Klickitat County, almost every inch of ridge-top land above the Columbia from Dallesport eastward is already under lease to wind developers.² Additional projects are proposed but not yet shown on this map because permit applications have not been filed.

The environmental impacts analysis for Whistling Ridge must consider the regional impacts of more than 40 major projects within the Columbia Plateau ecoregion. The scale and sprawl of this wind development has significant cumulative impacts on wildlife, habitat, scenic values and other natural resources.

The notion that projects in eastern Klickitat County are "too far away...to result in cumulative impacts" is mistaken. Many birds and bats travel long distances during migration, foraging, and other components of their life cycle. Also, genetic exchanges between individuals of any given species are essential for maintaining population viability.

More important, the notion that projects are too far away to have cumulative impacts is mistaken because significant adverse impacts typically occur at the population level, rather than at the level of individual animals affected by a particular wind project. While different wind projects may affect different individuals, the cumulative effect of combined mortalities at many contiguous sites can be population-level impacts—and perhaps even local extinctions over time.

The DEIS erred in relying on a cumulative impacts analysis published in 2007 for the Mid-Atlantic Highlands. Not only is the Mid-Atlantic region completely different from the Whistling Ridge site in habitat and species composition, but the 2007 study was published before the pace of wind development began to rapidly accelerate. It is inappropriate to base any cumulative impacts analysis for Whistling Ridge on a study done under very different circumstances and in a very different place.

It is also inappropriate to dismiss the cumulative impacts of wind turbines on wildlife because of other man-made effects such as mortalities from buildings and cats. These mortalities don't necessarily affect the same species as wind turbines do: For example, cats do not kill golden eagles, and skyscrapers do not kill species that make their homes

¹ **Current and Proposed Wind Project Interconnections to BPA Transmission Facilities**, Bonneville Power Administration, last updated May 10, 2010, http://www.transmission.bpa.gov/PlanProj/Wind/documents/BPA_wind_map_2010.pdf

² **Klickitat County Wind Projects**, Klickitat County, last updated June 7, 2010, <http://klickitatcounty.org/Planning/default.asp?fCategoryIDSelected=1258566697>

in remote rural areas. More important, these man-made impacts do not justify placing additional pressures on sensitive bird and bat populations from new man-made structures in more remote areas where wind projects may be the leading source of avian and bat fatalities. They merely illustrate the importance of minimizing any additional mortalities caused by wind projects. Two wrongs do not make a right.

The DEIS provides no evidence to substantiate the applicant's assertion that the proposed Whistling Ridge wind project will not cause mortality to birds and bats in sufficient quantities to affect population viability. The analysis does not include any reasonable estimates of current population levels of sensitive species, nor of the threshold population levels required to maintain viability.

2. The DEIS fails to address the potential expansion of the Whistling Ridge project onto Washington Department of Natural Resources public lands in Klickitat County.

The applicant has previously indicated plans to expand the project into Klickitat County, and applied for a lease from DNR to do so. These plans should be evaluated as part of this project, rather than piecemealed for later consideration.

3. The WEST report prepared for the Klickitat County Planning Department is not applicable to the proposed Whistling Ridge Energy Project, and cannot be relied upon to evaluate cumulative impacts.

The report prepared by Western EcoSystems Technology, Inc. (WEST) purports to be a cumulative impacts analysis for Klickitat County.³ Unfortunately, this report sheds little light on the cumulative impacts of wind power development on wildlife in Klickitat County, and it is even less relevant to a project proposed for Skamania County.

As the WEST report's title suggests, the Columbia Plateau Ecoregion is located in eastern Washington and Oregon, which have completely different plant and animal communities than the western Washington site proposed for the Whistling Ridge wind project. All of the projects evaluated in the WEST report are located in arid and un-forested lands, whereas Whistling Ridge is located in a coniferous forest that receives much more precipitation and has a much different plant and animal population. Impacts of wind projects on birds and bats are extremely site-specific, and because of that the WEST study has little applicability to the Whistling Ridge proposal. It is no more applicable than studies from the Altamont Pass Wind Resources Area in California, where significant population-level impacts on birds have been documented; or from the forested

³ **Avian, Bat and Habitat Cumulative Impacts Associated with Wind Energy Development in the Columbia Plateau Ecoregion of Eastern Washington and Oregon**, Prepared for Klickitat County Planning Department by Gregory D. Johnson and Wallace P. Erickson, Western EcoSystems Technology, Inc., February 2010

Mountaineer wind project in Appalachia, where significant population-level impacts on bats have been documented.

The WEST report contains fatality monitoring data from 12 projects around the Columbia Plateau Ecoregion. Only *one* of those projects, Big Horn, is actually located in Klickitat County—and the results from Big Horn show much higher raptor fatality rates than anywhere else in the Pacific Northwest. In other words, the WEST report underestimates the impacts of wind projects in Klickitat County by merging the Big Horn data with results from less lethal projects elsewhere in the region.

The WEST report also looked at 24 projects in the Pacific Northwest for which pre-construction estimates of avian use are available. Here too, the results from Klickitat County show a much higher likelihood of avian impacts than elsewhere in the region. Of the 24 projects evaluated in the report, the seven projects located in Klickitat County had much higher estimated use by both raptors and by birds of all types. For example, the highest raptor use estimated anywhere in our region is at the Linden Ranch in Klickitat County. Raptor use there is estimated to be 2.5 times the average for the Columbia Plateau ecoregion.

In other words, the WEST report does *not* give an accurate picture of cumulative impacts from expanding wind power here in Klickitat County, much less any indications of cumulative impacts to be expected in Skamania County. To the contrary, the WEST report uses data from projects in other parts of Oregon and eastern Washington to underestimate how many birds—especially raptors—are likely to be killed here.

The WEST report has another fundamental flaw. To arrive at a prediction of cumulative fatalities, the report's authors averaged existing fatalities in the region and then compared those averages with estimates of regional population size based on breeding bird surveys provided by the Partners in Flight North American Landbird Conservation Plan. However, the Partners in Flight estimates include relatively large standard errors, and are not accurate enough to serve as reliable population indicators. The estimates used in the WEST report were designed for detecting long-term population trends but not for estimating population size.

As Dr. K. Shawn Smallwood, an ecologist who is one of the nation's leading experts on the interactions between wildlife and wind turbines, points out in a review of the WEST report, the estimates from Partners in Flight are "unsuitable for the use that Johnson and Erickson made of them."⁴ Other researchers have pointed out this flaw but WEST continues to rely on these unsuitable estimates.

Smallwood further writes: "No studies or monitoring programs have been designed or implemented in the US to document wind energy-related population declines of any bird species. Most fatality monitoring programs have been much too brief to document

⁴ **Review of Cumulative Impacts Analysis of Wind Energy Expansion on the Columbia Plateau**, K. Shawn Smallwood, May 18, 2010.

declines, lasting one or two years. All monitoring programs have been too crude to document declines, and the majority of post-construction studies have not been designed to estimate population size of any bird species. Therefore, Johnson and Erickson's statement about wind energy impacts was misleading."

There is no peer-reviewed science in the DEIS submitted by the applicant. Instead the applicant relies on WEST, a wind industry contractor whose work has not been independently reviewed.

4. The DEIS underestimates the impacts of wind projects on long-lived raptor species.

Research on wildlife-turbine interactions in the Pacific Northwest and elsewhere has focused almost exclusively on estimating mortality rates. Although studies dealing with impacts on rare and endangered species are scarce, there is growing evidence that wind projects increase the extinction probability of long-lived species through incremental increases in mortality rates. In other words, while wind turbines may kill a relatively small number of individual birds during any given year, for rare and endangered species this increase can quickly add up to population extinction. A recently published study found that even though wind projects may cause only slight reductions in the survival of birds living in an area associated with wind turbines, those reductions can strongly impact the population viability of long-lived species—and can greatly reduce the time to extinction for those species.⁵

That is the situation we are currently seeing in Klickitat County with species such as ferruginous hawks. Wind projects have already killed at least three ferruginous hawks locally, and there are very few of these animals remaining. There have been no studies in Skamania County, Klickitat County, or anywhere else in the Pacific Northwest to determine the long-term impact of wind projects. Such studies are necessary in order to determine the cumulative impacts of continued industrial wind energy development at the scale now being proposed for Klickitat County.

As mentioned above, wind projects pose a threat to long-lived raptors that are already rare or endangered. There are ways to mitigate this problem, as pointed out in the scientific study cited above: "Unlike other non-natural causes of mortality difficult to eradicate or control, wind-farm fatalities can be lowered by powering down or removing risky turbines and/or farms, and by placing them outside areas critical for endangered birds."

⁵ **Large Scale Risk-Assessment of Wind-Farms on Population Viability of a Globally Endangered Long-Lived Raptor Species.** Martina Carrete, José A. Sánchez-Zapata, José R. Benítez, Manuel Lobón, and José A. Donázar in *Biological Conservation* 142:2954-2961, 2009.

The applicant claims there will be no population-level impacts on any species but has provided insufficient evidence to support this assertion. Currently, the Whistling Ridge proposal includes no provisions for temporary or permanent shutdowns of problem turbines, nor does it place turbines at a reasonable distance from important bird areas such as Spotted Owl Special Emphasis Areas. These provisions must be included to ensure that long-lived raptors and other species of concern are not driven to extinction locally.

In response to unavoidable impacts to wildlife, the applicant proposes “mitigations” including raptor nest surveys, post-construction monitoring studies, and the formation of a Technical Advisory Committee to oversee these activities. None of these actions qualify as mitigation measures. Mitigations are measures that remedy a problem. The applicant is merely proposing to study the problem, not to remedy it.

Mitigation cannot be left to a Technical Advisory Committee that is organized and overseen by the developer. I have served on several Technical Advisory Committees, and while such committees may recommend mitigation measures they are not typically empowered to require implementation of any of these measures.

5. Pre-construction estimates of avian and bat fatalities have not proved reliable.

Although no scientists have done a thorough comparison of pre-construction and post-construction mortality estimates, there is plenty of anecdotal evidence that post-construction mortalities often greatly exceed pre-construction estimates made using the same methodology as has been employed for the Whistling Ridge wind project.

For example, the Environmental Impact Statement (EIS) prepared prior to adoption of the Energy Overlay Zone in Klickitat County grossly underestimated the level of wildlife fatalities likely to result from wind development. At all of the wind projects in Klickitat County where monitoring has been completed or is under way, reports prepared by wildlife consultants show that fatalities of raptors and bats are far in excess of what was anticipated by the EIS. Whistling Ridge is using the same consultants and methodology as Klickitat County for its pre-construction fatality estimates.

At Big Horn, the first large wind project built in Klickitat County, the developer’s wildlife consultants did a full year of monitoring at 100 percent of the turbines, which makes this one of the most comprehensively monitored wind projects anywhere in the United States. The results of that monitoring study show that raptor fatalities are at least eight times higher than what the developer, PPM/Iberdrola, projected.⁶

An independent study of Big Horn’s monitoring results written by Dr. Smallwood concluded that raptor fatalities are up to 16 times higher than predicted prior to

⁶ **Big Horn Wind Power Project Wildlife Fatality Monitoring Study 2006-2007.** Prepared for PPM Energy and Big Horn Wind Project Technical Advisory Committee by Northwest Wildlife Consultants, Inc., 2008.

construction.⁷ Big Horn also kills twice as many bats as anticipated, according to fatality monitoring reports. Monitoring studies at other wind projects in Klickitat County are not yet completed, but the preliminary results from those projects suggest even higher fatality rates.

The above-cited independent scientific analysis based on the results from Big Horn (the first of only two projects in Klickitat County where fatality monitoring has been completed) reported a conservative estimate of 243 raptor fatalities annually in Klickitat County. That estimate of 243 raptor fatalities is for a level of development that does not exceed 1,000 megawatts. At its current rate of wind development, Klickitat County is likely to reach a level of 2,000 megawatts or more within the next year or so. For raptors in Klickitat County, these numbers are rapidly approaching population-level impacts. "There is probably no other human source of mortality that comes close to these levels," writes Dr. Smallwood.

At the second project in Klickitat County where monitoring has been completed, Goodnoe, the results are similar.⁸ The final monitoring report for Goodnoe calculated fatalities of 0.34 raptors per year per turbine, or 0.17 raptors per megawatt per turbine, or 16 fatalities per year for the project. Only one project reviewed in the WEST report had a higher raptor fatality rate than the one found for Goodnoe. The Goodnoe project is killing far more raptors than predicted by pre-construction surveys.

6. The DEIS underestimates potential impacts on northern spotted owls and other avian species.

The proposed project falls within critical habitat for the northern spotted owl, a species that is not only endangered but has continued to decline since the adoption of the Washington Department of Natural Resources' Habitat Conservation Plan for the species. This species has continued to decline on federal lands, which makes the state's HCP more important than ever. There are only an estimated 500 northern spotted owl pairs remaining in all of Washington state.

Even as the state's Habitat Conservation Plan is failing miserably, the applicant is proposing to undermine that plan by allowing commercial-scale energy development within a Spotted Owl Special Emphasis Area. A commercial wind energy project is *not* appropriate for habitat that is designated as a nesting, roosting and foraging area for a federally endangered species.

In materials distributed to the public prior to the mid-June 2010 hearings, SDS Lumber writes: "After years of timber harvest, there's no suitable habitat for the bird." It is ironic that

⁷ **Avian and Bat Mortality at the Big Horn Wind Energy Project, Klickitat County, Washington.** K. Shawn Smallwood, 2008.

⁸ **Goodnoe Hills Wind Project Avian Mortality Monitoring Report,** Prepared for PacifiCorp by URS Corporation, March 16, 2010.

the applicant is pointing the finger at its own destructive timber practices to justify further risk to northern spotted owls.

Regardless of whether spotted owls are currently nesting on or near this property, as they did in recent history, this area is designated as prime potential habitat for the species. The fact that Washington's Habitat Conservation Plan for spotted owls is not increasing the numbers of reproductive pairs makes it all the more important to restore this species' habitat—not to damage it even further.

The Environmental Impact Statement commissioned by Klickitat County for its Energy Overlay Zone stated (on page 2-15 of the Final EIS) that “forested areas host higher concentrations of owl and other sensitive species habitats.”⁹ The EIS recommended that areas with high concentrations of forested habitats be excluded from the Energy Overlay Zone because of their “higher potential for use by sensitive species and avian species likely to be impacted by wind turbines.” This sensitive forested habitat is exactly what is being proposed for development at Whistling Ridge.

Spotted owls are not the only species likely to be significantly impacted by the proposal. Klickitat County's Energy Overlay EIS also found high use of forested habitats by other raptors. The SDS map for the proposed project shows ridge-top locations for turbines, and these are typically the worst possible locations from an avian perspective—i.e., likely to result in the highest number of bird collisions.

7. The DEIS fails to assess compliance with state and federal laws protecting bald eagles, golden eagles, migratory birds, and endangered species.

There are reports of bald eagles and bald eagle nests at the proposed wind site. Yet there is no evidence that the proposed project will be in compliance with the state's Bald Eagle Protection Act, RCW chapter 77.12, and regulations associated with this act.

Nor is there any evidence that the proposed project will be in compliance with the federal Bald and Golden Eagle Protection Act, 16 USC § 668-668(d). This act prohibits any person, association, partnership or corporation from taking a bald or golden eagle at any time or by any manner without a permit. A permit may be issued only if the take would be compatible with the preservation of the species.

There is no evidence in the DEIS that the proposed project will be in compliance with the federal Migratory Bird Treaty Act (MBTA), 16 USC §§ 703-712. The MBTA requires that the U.S. Fish & Wildlife Service take enforcement against “any person, association, partnership or corporation” that “by any means or in any manner” pursues, hunts, takes, captures, kills, or attempts to take, capture or kill a migratory bird or any part, nest or eggs of any migratory bird. Under the MBTA, a corporation may take or kill a migratory bird only if the U.S. Fish & Wildlife Service determines that the take or kill is compatible with migratory

⁹ Klickitat County Energy Overlay Final Environmental Impact Statement, September 2004.

bird treaties. This determination must include an evaluation of the bird's species abundance and distribution, as well as its migratory and breeding habits. The killing of a single migratory bird is sufficient to create criminal liability, and does not need to be intentional.

There is no evidence in the DEIS that the proposed project will be in compliance with the federal Endangered Species Act (ESA) of 1973, 16 USC §§ 1531-1544. Under the ESA, "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Section 9 of the ESA prohibits any actions that would "take" an endangered species, as well as actions that would cause an act constituting a "take." The Ninth Circuit has held that "a habitat modification which significantly impairs the breeding and sheltering of a protected species amounts to 'harm' under the ESA.

It seems quite possible that the proposed Whistling Ridge wind project may kill a bald eagle, a migratory bird, or an endangered species. The DEIS must evaluate the likelihood of each of these possibilities, and whether Incidental Take Permits are required from the U.S. Fish & Wildlife Service. A recent court ruling in West Virginia has made it clear that such permits are required under federal law when a wind project is likely to kill any individual animals protected by the Endangered Species Act.

8. The DEIS erred in its analysis of the regional need for new sources of renewable energy.

The DEIS cites the Draft Sixth Northwest Power Plan released in September 2009 by the Northwest Power and Conservation Council. What the DEIS fails to quantify is that this 20-year energy plan for our region concluded that, although population and energy demands will continue to grow in the Pacific Northwest, we can meet more than 80 percent of expected future energy demands through conservation efforts and improved energy efficiency. Conservation efforts not only have less environmental impact than building new energy sources, they are also considerably less expensive.

Less than 20 percent of future needs must come from new sources of energy, according to the Council. And shown above, with 40 wind projects already constructed or proposed for this region, there are plenty of new sources to meet these needs. There is no demonstrated need for Whistling Ridge.

The dirty little secret of wind power in the Columbia Plateau Ecoregion is that most of the electricity being generated here by wind turbines is not needed or used in the Pacific Northwest. Instead it is sold to utilities in California. There is no *regional* need for new power sources; there is simply a *California* demand for electricity generated in Washington and Oregon.

On page 3-91 of the DEIS, the applicant claims that the Klickitat County Energy Overlay Zone Final EIS "recently evaluated the projected energy demand in Klickitat County, Washington, the county immediately adjacent to Skamania County." (In fact, this evaluation is already more than six years old). The DEIS then mentions the EIS

projection that “four wind power projects with total generating capacity of 1,000 MW” will be developed in Klickitat County by 2024.

In fact, Klickitat County has already approved more than a dozen projects, with a total generating capacity of almost 2,000 megawatts. Rather than suggesting that more energy is needed regionally, this rapid development of wind power in Klickitat County indicates that more than enough wind power is already under development to meet the region’s energy needs.

Existing wind projects in this region are already producing so much surplus power that there are times when these projects must be turned off to protect the regional grid. For example, see these recent articles on the surpluses in the Columbia River corridor:
<http://green.blogs.nytimes.com/2010/07/07/sudden-surplus-calls-for-quick-thinking/>
http://www.oregonlive.com/business/index.ssf/2010/06/swollen_columbia_river_churns.html

9. The DEIS fails to estimate the direct and cumulative impacts of this project on the Northwest power grid.

The breaktaking pace of wind development along the Columbia River has created serious challenges for BPA and the regional energy grid. There are limits to the amount of wind power that can be integrated into the grid, and we are already at or near these limits. BPA has expressed concerns about how it can integrate more than 6,000 megawatts of wind power into the grid, yet the DEIS fails to analyze these constraints and how they will be affected by the construction of yet another wind project.

Adding more wind power capacity to the grid requires not only new transmission lines but also new storage capability, because wind is an intermittent power source. Typically wind projects operate at only about 30 percent of their total generating capacity, which means that 70 percent of the time a backup power source must be available.

The DEIS has failed to analyze the environmental impacts of the proposed backup power source for Whistling Ridge. For example, if hydropower will be the backup, the DEIS must consider the indirect impacts of this project on fish, irrigation, navigation and other drawdown impacts.

The applicant has hinted at possible plans to construct a natural-gas-fired power plant, perhaps as a backup power source for when the wind is not blowing at Whistling Ridge. The applicant should be required to disclose those plans now, so that the impacts of a natural-gas-fired power plant can be considered along with the impacts of the wind project.

Also, Williams is proposing a new gas line for the Whistling Ridge area, and the substation and transmission inter-tie lines proposed for the Whistling Ridge area could

signal the advent of additional power plants in the area. These must be evaluated along with impacts of the infrastructure currently being proposed.

A recent study in Colorado found that wind power's supposed carbon emissions benefits are not being realized, because of the requirement for conventionally-generated backup power.¹⁰ Because all coal-fired power plants and some natural-gas-fired power plants produce greater emissions when they act as backup systems for wind power, thanks to inefficiencies associated with cycling on and off, the benefits of wind power in reducing carbon emissions are reduced.

Contrary to what the DEIS states, there is no evidence that the Whistling Ridge project will have a beneficial impact on air quality in the Columbia Gorge vicinity. No fossil-fuel-fired projects will be taken offline as a result. In fact, backup power from fossil-fuel-fired projects may be required for those times when the wind is not blowing.

10. The DEIS failed to evaluate the potential health effects of wind turbines on local residents.

There is ample evidence that low-frequency noises, shadow flicker, and nighttime lighting associated with wind turbines can be injurious to the physical and mental health of people living in the vicinity of turbines.¹¹ While many or even most people might not find noises, lights or flickers annoying or even noticeable, they can be severe—and in some cases life-changing—for a minority of the population. Regardless of whether these impacts affect everyone, they can affect some people, and must be evaluated in that light.

11. The DEIS failed to evaluate alternatives to the proposal.

SEPA and NEPA require consideration of alternatives. The applicant owns tens of thousands of acres of land, including other sites that would be more appropriate for wind power development than Whistling Ridge. The DEIS must evaluate potential alternatives, including alternative sites as well as alternative turbine layout configurations.

12. The DEIS overwhelms the public with quantity but not quality.

I am grateful for the extended comment period. Nevertheless, it is not reasonable to expect members of the general public to be able to digest and respond intelligently within just a few weeks to a record that is thousands of pages long and years in the making.

Despite this huge volume of material, there is very little scientific literature cited in the DEIS, and even less that is peer-reviewed science. The applicant has cherry-picked a few

¹⁰ **How Less Became More...Wind, Power and Unintended Consequences in the Colorado Energy Market**, Prepared by Bentek Energy LLC for the Independent Petroleum Association of Mountain States, April 16, 2010.

¹¹ "Summary of Recent Research on Adverse Health Effects of Wind Turbines," Compiled by Keith Stelling, October 20, 2009.

statistics and extrapolations from industry-sponsored reports and ignored the independent science and actual mortality studies that suggest major cumulative impacts are likely for wildlife given the pace and scope of wind power development in this region.

Thank you for the opportunity to comment on this project.

Sincerely,

Dawn Stover

Re: *Association of Washington Business comments on Draft Environmental Impact Statement for Whistling Ridge Wind Energy Project (EFSEC Application No. 2009-01)*

Dear Mr. Posner and Mr. Montaña:

On behalf of the Association of Washington Business (AWB), thank you for the opportunity to provide comments on the Whistling Ridge Draft Environmental Impact Statement (DEIS).

Formed in 1904, AWB is Washington's oldest and largest statewide business association, and includes more than 7,000 members representing over 650,000 employees. AWB serves as both the state's chamber of commerce and manufacturing and technology association. 90 percent of AWB members employ fewer than 100 people and more than half of AWB's members employ fewer than 10.

We write today in support of the May, 2010 DEIS and offer the following general and specific comments in support thereof.

I. GENERAL COMMENTS

Economic development and job creation

As AWB has noted previously, approval of the DEIS and final approval of the application is extremely important for current and future economic development in Skamania County, southwestern Washington, and for the state as a whole. This is particularly important during this historic economic recession and during the severe budget shortfalls for the state and local governments.

Paragraph 3.13 of the DEIS (Socioeconomics)(summarized in Table 1-1 of Paragraph 1.0) concludes, generally, that “[s]ocioeconomic impacts are expected to be beneficial in the form of additional jobs, increased sales, and increased tax revenues.”

Specifically, during construction of the project, the DEIS concludes that about 330 full and part-time jobs would be created. Approximately 25-35 percent of the construction workforce would be residents of the area and 65-75 percent of the workforce would be hired from outside of the three-county area. Project construction would also result in 71 indirect and induced jobs.

Moreover, indirect value added from the project is approximately \$3.9 million. According to Table 1-1, “[f]iscal impacts are expected to be positive, with a total of \$150 million in construction expenditures, of which approximately \$13.2 million would be spent in the local area.” In addition, the DEIS concludes most sales tax revenue would go to Skamania County.

With respect to ongoing operation of the site, the DEIS concludes that “[e]conomic impacts would be positive due to increased tax revenues, employment and local expenditures. Sales, use and other indirect business taxes to state and local governments are estimated at approximately \$50,000 per year.” The estimated value of the project is \$87.5 million, which would represent an increase of 6.5 percent in assessed value to the county. The corresponding increase in property tax revenue to the county would be \$731,500. On an ongoing basis, the project will employ 8-9 employees, likely hired from the local area.

Equally important to the positive economic attributes of the project are the negative consequences for the economy of southwestern Washington if the DEIS and application is ultimately not approved.

Visual resources/site location

The proposed Whistling Ridge project is also important because it would set a precedent for siting wind projects on designated forest land in this state. This is important because many potential wind generating sites are located on Washington’s forest lands. As the

Whistling Ridge DEIS shows, wind energy and forest management are highly compatible. Wind energy becomes an additional renewable resource to be managed on forest lands. Washington's ailing forest industry needs to diversify whenever and wherever possible. The potential for wind farm siting on forest lands creates additional revenue diversification opportunities for large and small forest land owners alike and will help keep forest lands from being developed or used in other manners incompatible with forest management. With each recession, timber producers are at the mercy of the markets. This most recent downturn has been particularly hard on the industry, its workers and suppliers, and communities like White Salmon, Bingen, Stevenson and Carson.

The proposed forest ridgeline site is low value for timber production. The proposed site provides great north/south topography for wind. The proposed site is also surrounded by mountains which significantly limits any visual impacts. Furthermore, the nearest existing residential structure to the proposed project is approximately 2500 feet, which is a greater setback distance than those structures located near the recently-approved Kittitas Valley Wind Power Project.

Regional need for new sources of renewable energy

According to Paragraph 1.2.3.1 of the DEIS Summary, based on the findings of the Northwest Power and Conservation Council's (NPCC) Fifth Power Plan (May 2005) and draft Sixth Power Plan (September 2009), the regional population in Idaho, Montana, Oregon and Washington is expected to grow from 12.7 million in 2007 to 16.3 million by 2030. This 3.6 million population increase will increase the demand for electricity. The draft Six Plan concludes that "[t]he Pacific Northwest consumed 19,000 a/MW or 166 million MW-hours of electricity in 2007. That demand is expected to grow to 25,000 a/MW by 2030. Between 2007 and 2030, demand is expected to increase by a total of 6,500 a/MW, growing on average by 270 a/MW, or 1.2 percent, per year.

In addition to the normal, free-market increase in demand accompanied by such population growth, states like Oregon, California and Washington have adopted Renewable Portfolio Standards (RPS), which mandate that qualifying public and private utilities obtain a certain percentage of defined "renewable" energy, not including hydropower, by a date certain. In Washington, Initiative 937 requires qualifying utilities to obtain 15% defined "renewable" energy by 2020.

The Summary concludes that "[t]he RPS, coupled with load growth in Washington's urban areas, has prompted investor-owned and public power utilities to seek new

sources, most often developed by independent power producers, to meet their resource goals.”

It is for this reason that adoption of the DEIS and, ultimately, approval of the applicant’s project is so important. In the coming decades, Washington will need new sources of electricity to meet market demand, as well as the artificial demand created by the “renewable” standards imposed by I-937. Furthermore, if utilities aren’t able to meet the RPS established by I-937, a \$50/MW hour shortfall penalty will be imposed on the utility and passed on to the ratepayers – Washington’s families and businesses.

II. SPECIFIC COMMENTS

Visual resources

AWB strongly supports the Paragraph 4.11 (pg. 4-9) DEIS interpretation of the Columbia River Gorge National Scenic Area Act (CRGNSA) and the corresponding “savings clause” found at 16 USC § 544O(a)(10). This project application is not, and should not be subject to the requirements of the CRGNSA.

The DEIS appropriately acknowledges the proposed site is located outside of, but immediately adjacent to, the northern boundary of the CRGNSA. The DEIS continues that “although the proposed project thus is in close proximity to the CRGNSA, the CRGNSA Act expressly states that:

Nothing in [this Act] shall . . . establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas.”

The DEIS concludes: “[a]ccordingly, because the proposed project is located outside of the CRGNSA, the provisions of the CRGNSA Act do not apply to the proposed project.” (Emphasis added)

We could not more strongly agree.

This accurate interpretation of the CRGNSA “savings clause” is also found in Paragraph 3.9.2.1 (Regional Landscape Setting) which concludes “[t]he project area is completely outside the Scenic Area, and therefore, is not subject to the Columbia River Gorge Scenic Area Management Plan or related regulatory requirements.” (Emphasis added)

This reasoning is continued at page 3-194 of the DEIS which concludes “. . . [t]his federal policy and Congressional mandate discourage projecting National Scenic Act policies, regulations and directives beyond the boundary of the Scenic Area.”

Federal regulation and zoning of development in an area that is largely private land, and the economic survival of existing counties and communities, were major concerns when the CRGNSA Act was debated in Congress. Several major compromises to the Act were adopted by amendment to address these issues before passage in its final form. These compromises included the purchase or trade of private lands that were highly scenic and would be heavily restricted in the SMA zone; less restriction on private lands in the GMA zone; and urban areas that were completely exempt from restriction and a boundary that was to be the absolute boundary with no buffer or setback outside of the CRGNSA.

This was the reasoning and intent behind the “savings clause” and the proposed project is exactly what was contemplated when it was adopted. The “savings clause” established a boundary – a boundary in every sense of the word – a place where regulation exists, and a line drawn where it ends. Beyond this boundary, it was intended that private landowners and counties would be allowed to have economic development activity without scenic restriction. Without the “savings clause”, Congress would not have enacted the CRGNSA and President Reagan would not have signed the bill in to law.

Visual resources methodologies

In drawing the conclusions reached in the DEIS, three federal methodologies were used to evaluate visual impact assessment of the proposed project: (1) the Federal Highway Administration methodology (FHWA); (2) the U.S. Forest Service methodology (USFS); and (3) the Bureau of Land Management methodology (BLM). In addition, a “hybrid” methodology (FHWA and USFS), used in the Kittitas Valley Wind Power Project (KVVPP), was also used, totaling four visual impact assessment methodologies.

Visual impacts are purely subjective in nature and vary greatly from person to person. AWB believes the four methodologies used in the DEIS are sound, comprehensive and sufficiently objective to measure potential visual impacts in reaching the DEIS conclusions – particularly when adding the fourth KVVPP standard, which is the most rigorous and comprehensive standard. Opponents of the KVVPP challenged the visual assessment before the Washington Supreme Court, with a unanimous court rejecting that challenge.

For purposes of certainty, predictability and fairness, methodologies among various projects should be consistent. Proximity to (not inclusion in) a National Scenic Area should not impose a different standard. To do so would not only establish a buffer on the Scenic Area, but also would set a dangerous precedent of inconsistent visual standards and be very problematic for wind power development throughout the state. In addition, this wouldn't just set a bad precedent for future wind projects – a new, higher standard for proximity to a scenic area could exclude other, non-wind, development such as electrical transmission, residential, commercial or industrial development that is otherwise compliant and consistent with applicable land use laws and regulations, and essential to Washington's economic viability and ongoing prosperity.

Notwithstanding this fact, the methodologies used to evaluate this project have been even more rigorous than KVVPP, Wildhorse, and other previously-sited wind projects.

Joint EFSEC/BPA preparation

As the DEIS introduction at paragraph 1.1 clearly states, both the Energy Facility Site Evaluation Council (EFSEC) and the Bonneville Power Administration (BPA) have jointly prepared the DEIS to be consistent with the requirements of both the Washington State Environmental Policy Act (SEPA) and the National Environmental Policy Act (NEPA). Although the document is consistent with SEPA requirements, its form has been modified, adjusted and expanded where appropriate to ensure compliance with NEPA as well. Accordingly, the DEIS is now a federal NEPA document and not just an EIS generated by the project applicant.

Scientific review

With the completion of this DEIS, more biological review has been done than on any other previously sited wind project anywhere in the Northwest, let alone Washington state. To our knowledge, no other wind energy project has completed the multiple years of biological surveys, including three years of bat survey work.

In addition, the DEIS has been prepared in direct collaboration with a sufficiently wide range of state and federal wildlife agencies and tribal governments (8), including: the Washington Dept. of Archeology and Historic Preservation, Washington Department of Fish and Wildlife, Washington State Department of Natural Resources, Washington State Department of Transportation, U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, and the Yakama Nation.

The pre-development biological survey work was done in collaboration with the Washington and U.S. Fish and Wildlife Departments. In its "Section 7" consultation letter dated July 19, 2010, the USFWS confirmed that the project will no impact Northern Spotted Owls – a determination that should be considered conclusive on this issue.

I.V. U.S. DEPARTMENT OF THE INTERIOR COMMENTS

AWB recently received a copy of the U.S. Department of the Interior (Department) DEIS comment letter dated July 19, 2010. The Department raises concerns about visibility of the proposed project from the nationally designated Lewis and Clark National Historic Trail (NHT) and suggests elimination of several visible turbines from the site. AWB disagrees with this assertion.

AWB is extremely concerned with the Department's comments on this application. The National Trail System Act, 16 USC §§ 1241-1251 (NTSA) does not, by mandate or implication, authorize the Department to regulate or restrict private lands or to even negatively comment on or oppose private projects proposed on private lands. In fact, the reference to this Act as authority for the comment letter is an abuse of federal authority and exceeds the policy directives of the NTSA. The Department's comments are particularly egregious here, where the comment would necessitate the conclusion that any land development or activity visible from any trail designated throughout the Western United States under the NTSA should be prohibited. Many thousands of miles of trails are designated throughout the Western United States under the NTSA. Here, the "trail" at issue is coextensive with U.S. Interstate 84 and Washington State Highway 14. These are not pristine "trail" segments – they are major, busy transportation corridors.

It should be abundantly clear to the Department that man-made structures and activities are visible and will be seen along these highways where the most visible "impacts" on travelers are the many automobiles, semi-trucks, trains, transmission lines, and dams, as well as residences, commercial buildings and industrial facilities.

Finally, consistent with the concerns raised above, elimination of visible turbines from view/proximity of the NHT would similarly be a direct violation of the CRGNSA "savings clause." The National Trails System does not have regulatory authority to affect such an outcome. Again, this would set a bad precedent and have negative implications for other non-wind related projects such as electrical transmissions systems, dams, and residential, commercial and industrial development.

Thank you again for the opportunity to provide comments on this important matter.

Sincerely,

Re: Association of Washington Business comments on Draft Environmental Impact Statement for Whistling Ridge Wind Energy Project (EFSEC Application No. 2009-01)

Dear Mr. Posner and Mr. Montaña:

On behalf of the Association of Washington Business (AWB), thank you for the opportunity to provide comments on the Whistling Ridge Draft Environmental Impact Statement (DEIS).

Formed in 1904, AWB is Washington's oldest and largest statewide business association, and includes more than 7,000 members representing over 650,000 employees. AWB serves as both the state's chamber of commerce and manufacturing and technology association. 90 percent of AWB members employ fewer than 100 people and more than half of AWB's members employ fewer than 10.

We write today in support of the May, 2010 DEIS and offer the following general and specific comments in support thereof.

I. GENERAL COMMENTS

Economic development and job creation

As AWB has noted previously, approval of the DEIS and final approval of the application is extremely important for current and future economic development in Skamania County, southwestern Washington, and for the state as a whole. This is particularly important during this historic economic recession and during the severe budget shortfalls for the state and local governments.

Paragraph 3.13 of the DEIS (Socioeconomics)(summarized in Table 1-1 of Paragraph 1.0) concludes, generally, that “[s]ocioeconomic impacts are expected to be beneficial in the form of additional jobs, increased sales, and increased tax revenues.”

Specifically, during construction of the project, the DEIS concludes that about 330 full and part-time jobs would be created. Approximately 25-35 percent of the construction workforce would be residents of the area and 65-75 percent of the workforce would be hired from outside of the three-county area. Project construction would also result in 71 indirect and induced jobs.

Moreover, indirect value added from the project is approximately \$3.9 million. According to Table 1-1, “[f]iscal impacts are expected to be positive, with a total of \$150 million in construction expenditures, of which approximately \$13.2 million would be spent in the local area.” In addition, the DEIS concludes most sales tax revenue would go to Skamania County.

With respect to ongoing operation of the site, the DEIS concludes that “[e]conomic impacts would be positive due to increased tax revenues, employment and local expenditures. Sales, use and other indirect business taxes to state and local governments are estimated at approximately \$50,000 per year.” The estimated value of the project is \$87.5 million, which would represent an increase of 6.5 percent in assessed value to the county. The corresponding increase in property tax revenue to the county would be \$731,500. On an ongoing basis, the project will employ 8-9 employees, likely hired from the local area.

Equally important to the positive economic attributes of the project are the negative consequences for the economy of southwestern Washington if the DEIS and application is ultimately not approved.

Visual resources/site location

The proposed Whistling Ridge project is also important because it would set a precedent for siting wind projects on designated forest land in this state. This is important because many potential wind generating sites are located on Washington’s forest lands. As the

Whistling Ridge DEIS shows, wind energy and forest management are highly compatible. Wind energy becomes an additional renewable resource to be managed on forest lands. Washington's ailing forest industry needs to diversify whenever and wherever possible. The potential for wind farm siting on forest lands creates additional revenue diversification opportunities for large and small forest land owners alike and will help keep forest lands from being developed or used in other manners incompatible with forest management. With each recession, timber producers are at the mercy of the markets. This most recent downturn has been particularly hard on the industry, its workers and suppliers, and communities like White Salmon, Bingen, Stevenson and Carson.

The proposed forest ridgeline site is low value for timber production. The proposed site provides great north/south topography for wind. The proposed site is also surrounded by mountains which significantly limits any visual impacts. Furthermore, the nearest existing residential structure to the proposed project is approximately 2500 feet, which is a greater setback distance than those structures located near the recently-approved Kittitas Valley Wind Power Project.

Regional need for new sources of renewable energy

According to Paragraph 1.2.3.1 of the DEIS Summary, based on the findings of the Northwest Power and Conservation Council's (NPCC) Fifth Power Plan (May 2005) and draft Sixth Power Plan (September 2009), the regional population in Idaho, Montana, Oregon and Washington is expected to grow from 12.7 million in 2007 to 16.3 million by 2030. This 3.6 million population increase will increase the demand for electricity. The draft Six Plan concludes that "[t]he Pacific Northwest consumed 19,000 a/MW or 166 million MW-hours of electricity in 2007. That demand is expected to grow to 25,000 a/MW by 2030. Between 2007 and 2030, demand is expected to increase by a total of 6,500 a/MW, growing on average by 270 a/MW, or 1.2 percent, per year.

In addition to the normal, free-market increase in demand accompanied by such population growth, states like Oregon, California and Washington have adopted Renewable Portfolio Standards (RPS), which mandate that qualifying public and private utilities obtain a certain percentage of defined "renewable" energy, not including hydropower, by a date certain. In Washington, Initiative 937 requires qualifying utilities to obtain 15% defined "renewable" energy by 2020.

The Summary concludes that "[t]he RPS, coupled with load growth in Washington's urban areas, has prompted investor-owned and public power utilities to seek new

sources, most often developed by independent power producers, to meet their resource goals.”

It is for this reason that adoption of the DEIS and, ultimately, approval of the applicant’s project is so important. In the coming decades, Washington will need new sources of electricity to meet market demand, as well as the artificial demand created by the “renewable” standards imposed by I-937. Furthermore, if utilities aren’t able to meet the RPS established by I-937, a \$50/MW hour shortfall penalty will be imposed on the utility and passed on to the ratepayers – Washington’s families and businesses.

II. SPECIFIC COMMENTS

Visual resources

AWB strongly supports the Paragraph 4.11 (pg. 4-9) DEIS interpretation of the Columbia River Gorge National Scenic Area Act (CRGNSA) and the corresponding “savings clause” found at 16 USC § 544O(a)(10). This project application is not, and should not be subject to the requirements of the CRGNSA.

The DEIS appropriately acknowledges the proposed site is located outside of, but immediately adjacent to, the northern boundary of the CRGNSA. The DEIS continues that “although the proposed project thus is in close proximity to the CRGNSA, the CRGNSA Act expressly states that:

Nothing in [this Act] shall . . . establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas.”

The DEIS concludes: “[a]ccordingly, because the proposed project is located outside of the CRGNSA, the provisions of the CRGNSA Act do not apply to the proposed project.” (Emphasis added)

We could not more strongly agree.

This accurate interpretation of the CRGNSA “savings clause” is also found in Paragraph 3.9.2.1 (Regional Landscape Setting) which concludes “[t]he project area is completely outside the Scenic Area, and therefore, is not subject to the Columbia River Gorge Scenic Area Management Plan or related regulatory requirements.” (Emphasis added)

This reasoning is continued at page 3-194 of the DEIS which concludes “. . . [t]his federal policy and Congressional mandate discourage projecting National Scenic Act policies, regulations and directives beyond the boundary of the Scenic Area.”

Federal regulation and zoning of development in an area that is largely private land, and the economic survival of existing counties and communities, were major concerns when the CRGNSA Act was debated in Congress. Several major compromises to the Act were adopted by amendment to address these issues before passage in its final form. These compromises included the purchase or trade of private lands that were highly scenic and would be heavily restricted in the SMA zone; less restriction on private lands in the GMA zone; and urban areas that were completely exempt from restriction and a boundary that was to be the absolute boundary with no buffer or setback outside of the CRGNSA.

This was the reasoning and intent behind the “savings clause” and the proposed project is exactly what was contemplated when it was adopted. The “savings clause” established a boundary – a boundary in every sense of the word – a place where regulation exists, and a line drawn where it ends. Beyond this boundary, it was intended that private landowners and counties would be allowed to have economic development activity without scenic restriction. Without the “savings clause”, Congress would not have enacted the CRGNSA and President Reagan would not have signed the bill in to law.

Visual resources methodologies

In drawing the conclusions reached in the DEIS, three federal methodologies were used to evaluate visual impact assessment of the proposed project: (1) the Federal Highway Administration methodology (FHWA); (2) the U.S. Forest Service methodology (USFS); and (3) the Bureau of Land Management methodology (BLM). In addition, a “hybrid” methodology (FHWA and USFS), used in the Kittitas Valley Wind Power Project (KVVWPP), was also used, totaling four visual impact assessment methodologies.

Visual impacts are purely subjective in nature and vary greatly from person to person. AWB believes the four methodologies used in the DEIS are sound, comprehensive and sufficiently objective to measure potential visual impacts in reaching the DEIS conclusions – particularly when adding the fourth KVVWPP standard, which is the most rigorous and comprehensive standard. Opponents of the KVVWPP challenged the visual assessment before the Washington Supreme Court, with a unanimous court rejecting that challenge.

For purposes of certainty, predictability and fairness, methodologies among various projects should be consistent. Proximity to (not inclusion in) a National Scenic Area should not impose a different standard. To do so would not only establish a buffer on the Scenic Area, but also would set a dangerous precedent of inconsistent visual standards and be very problematic for wind power development throughout the state. In addition, this wouldn't just set a bad precedent for future wind projects – a new, higher standard for proximity to a scenic area could exclude other, non-wind, development such as electrical transmission, residential, commercial or industrial development that is otherwise compliant and consistent with applicable land use laws and regulations, and essential to Washington's economic viability and ongoing prosperity.

Notwithstanding this fact, the methodologies used to evaluate this project have been even more rigorous than KVVPP, Wildhorse, and other previously-sited wind projects.

Joint EFSEC/BPA preparation

As the DEIS introduction at paragraph 1.1 clearly states, both the Energy Facility Site Evaluation Council (EFSEC) and the Bonneville Power Administration (BPA) have jointly prepared the DEIS to be consistent with the requirements of both the Washington State Environmental Policy Act (SEPA) and the National Environmental Policy Act (NEPA). Although the document is consistent with SEPA requirements, its form has been modified, adjusted and expanded where appropriate to ensure compliance with NEPA as well. Accordingly, the DEIS is now a federal NEPA document and not just an EIS generated by the project applicant.

Scientific review

With the completion of this DEIS, more biological review has been done than on any other previously sited wind project anywhere in the Northwest, let alone Washington state. To our knowledge, no other wind energy project has completed the multiple years of biological surveys, including three years of bat survey work.

In addition, the DEIS has been prepared in direct collaboration with a sufficiently wide range of state and federal wildlife agencies and tribal governments (8), including: the Washington Dept. of Archeology and Historic Preservation, Washington Department of Fish and Wildlife, Washington State Department of Natural Resources, Washington State Department of Transportation, U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, and the Yakama Nation.

The pre-development biological survey work was done in collaboration with the Washington and U.S. Fish and Wildlife Departments. In its “Section 7” consultation letter dated July 19, 2010, the USFWS confirmed that the project will no impact Northern Spotted Owls – a determination that should be considered conclusive on this issue.

I.V. U.S. DEPARTMENT OF THE INTERIOR COMMENTS

AWB recently received a copy of the U.S. Department of the Interior (Department) DEIS comment letter dated July 19, 2010. The Department raises concerns about visibility of the proposed project from the nationally designated Lewis and Clark National Historic Trail (NHT) and suggests elimination of several visible turbines from the site. AWB disagrees with this assertion.

AWB is extremely concerned with the Department’s comments on this application. The National Trail System Act, 16 USC §§ 1241-1251 (NTSA) does not, by mandate or implication, authorize the Department to regulate or restrict private lands or to even negatively comment on or oppose private projects proposed on private lands. In fact, the reference to this Act as authority for the comment letter is an abuse of federal authority and exceeds the policy directives of the NTSA. The Department’s comments are particularly egregious here, where the comment would necessitate the conclusion that any land development or activity visible from any trail designated throughout the Western United States under the NTSA should be prohibited. Many thousands of miles of trails are designated throughout the Western United States under the NTSA. Here, the “trail” at issue is coextensive with U.S. Interstate 84 and Washington State Highway 14. These are not pristine “trail” segments – they are major, busy transportation corridors.

It should be abundantly clear to the Department that man-made structures and activities are visible and will be seen along these highways where the most visible “impacts” on travelers are the many automobiles, semi-trucks, trains, transmission lines, and dams, as well as residences, commercial buildings and industrial facilities.

Finally, consistent with the concerns raised above, elimination of visible turbines from view/proximity of the NHT would similarly be a direct violation of the CRGNSA “savings clause.” The National Trails System does not have regulatory authority to affect such an outcome. Again, this would set a bad precedent and have negative implications for other non-wind related projects such as electrical transmissions systems, dams, and residential, commercial and industrial development.

Thank you again for the opportunity to provide comments on this important matter.

Sincerely,

From: Teresa Kurtzhall [REDACTED]
Sent: Thursday, July 29, 2010 9:51 AM
To: EFSEC (UTC)
Subject: Whistling Ridge Threatens Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a fair and balanced alternative analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS and issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Electronically Filed

July 19, 2010

Andrew M. Montafio
Environmental Project Manager
Bonneville Power Administration – KEC-4
P.O. Box 3621
Portland, Oregon 97208

Dear Mr. Montafio:

The U.S. Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (DEIS) for the Bonneville Power Administration's Whistling Ridge Energy Project, Skamania County, Washington. The Department offers the following comments for use in developing the Final Environmental Impact Statement for the project.

Lewis and Clark National Historic Trail

The proposed Whistling Ridge Energy project is located within five miles of the Lewis and Clark National Historic Trail (NHT), a congressionally-designated NHT, which follows the Columbia River and is within the area analyzed in the DEIS for potential visual impacts. In addition, US Interstate 84 and Washington Route 14 are the state-designated Lewis and Clark auto tour routes in the project area. Many visitors experience Lewis and Clark NHT by traveling the auto tour routes and stopping at interpretive and recreational sites along the way. The Department considers the viewshed along the river and auto tour routes to be a critical part of the trail visitor experience.

The Lewis and Clark NHT was established by Congress in an amendment to the National Trails System Act in 1978. 16 U.S.C. § 1244(a). As administrator of the trail, the National Park Service (NPS) is charged under this Act with the identification and protection of the historic route, remnants, and artifacts of the trail for public use and enjoyment.

Based on the analysis of visual impacts in the DEIS, it appears that a varying number of turbines will be visible from the trail's historic river and auto tour routes from near

Koberg Beach State Park to Lindsey Creek State Park. This approximately 15-mile stretch of the Columbia River Gorge has numerous recreational opportunities and scenic views that add significantly to enjoyment of the historic trail. Of the five viewpoints along US Interstate 84 analyzed in the DEIS, Viewpoint 14 at Viento State Park, is rated in Table 3.9-2 as having an anticipated moderate to high level of visual impact. However, on page 3-193 of the DEIS, the potential visual impact for this viewpoint is stated as only moderate. Furthermore, it appears that the turbines were inadvertently omitted in the photomontage in Figure 3.9-11. While difficult to discern the impact at this location without clarification on the accuracy of the visual simulation, we believe that the impact should be rated as high given the placement of turbines on the skyline within four miles of a park located along the auto tour route.

Turbine string A1-A7 would be highly visible from numerous locations along the trail due to its placement on a ridgeline close to the Columbia River Gorge. The NPS recommends removing or relocating these seven turbines, if feasible. This would significantly reduce the impact to visual resources along the historic trail. The visual resources in this region—Columbia River Gorge National Scenic Area and Lewis and Clark NHT—are important resources that should be protected.

SPECIFIC COMMENTS

Water Resources Section 3.3

Pg. 3-26: Section 3.3.1.3 lacks sufficient information on the existing groundwater environment to support the finding of little or no impact. Suggest the section more fully address the depth to groundwater, flow direction, and transmissivity (permeability) of the aquifer as it relates to possible affects on the area domestic and agricultural ground-water resources (also see section 3.3.1.5). Helsel et.al. (2002) is a good reference for this type of analysis.

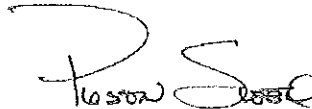

Pg. 3-29: Because section 3.3.3 addresses mitigation procedures for the isolation of groundwater from chemical spills, we assume that chemicals will be present on site during both construction and operation. Suggest the document include a discussion of potential chemical spills, and aquifer transmissivity (permeability), as it relates to the potential movement of contaminants toward nearby domestic or agricultural water wells.

RESOLUTION 2010-51

(A Resolution Demanding Retraction of the Department of Interior Comments on the Draft Environmental Impact Statement for the Whistling Ridge Wind Energy Project and explanation of its Actions in Commenting without Authority or Jurisdiction against the Secretary's and Administration Policy)

WHEREAS, Whistling Ridge Energy Project filed an Application for Site Certification to the Washington Energy Facility Site Evaluation Council ("EFSEC") on March 10, 2009 for the Whistling Ridge Energy Project; and

WHEREAS, EFSEC is lead agency pursuant to the State Environmental Policy Act, and Bonneville Power Administration ("BPA") is federal lead agency pursuant to the National Environmental Policy Act; and

WHEREAS, EFSEC and BPA have independently issued a joint Draft Environmental Impact Statement for this Project and are seeking public comment on the DEIS; and

WHEREAS, the entire project is located outside of the Columbia River Gorge National Scenic Area ("Scenic Area") on privately owned lands in Skamania County; and

WHEREAS, Federal Government regulation of private lands as well as the economic survival of Skamania, other local counties and communities were major concerns when the Columbia River Gorge National Scenic Area ("Scenic Area Act") was debated in Congress; which resulted in several major compromises to address these concerns before passage of the Scenic Area Act in its final form, without which, Congress would not have enacted the Scenic Area Act and President Reagan would not have signed it into law. These compromises included the purchase or trade of private lands that were regulated for the protection of scenery in the Special Management Areas, the designation of Urban Areas that are completely exempt from restrictions and the designation of an external boundary that by Congressional direction is the absolute boundary with no buffers or setbacks outside of the Scenic Area. Congressional intent is found in the "Savings Provision" at 16 USC § 544o(a)(10) which states:

Nothing in [this Act] shall . . . establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas."; and

WHEREAS, The National Trail System Act, 16 USC §§ 1241 – 1251 authorizes Congress to designate National Scenic and Historic Trails but does not, by mandate or implication, authorize Interior to regulate or restrict private lands or to even negatively comment on or oppose private projects proposed on private lands nearby, or visible from, designated trail sections; and

WHEREAS, Skamania County recently received a copy of the U.S. Department of the Interior (“Interior”) DEIS comment letter dated July 19, 2010, wherein Interior raises concerns about visibility of the proposed project from the Scenic Area and the nationally designated Lewis and Clark National Historic Trail and suggests elimination of Whistling Ridge wind turbines that are visible from both the Scenic Area and the Lewis and Clark National Historic Trail; and

WHEREAS, many thousands of miles of trails are designated throughout the Western United States under the National Trail System Act. With the exception of federal lands, and lands acquired by the Federal Government for preservation of trails, the Federal Government has no authority to regulate or restrict the use of private lands near trails designated under the National Trail System Act, for any reason, especially for purported visual effects on trail segments. Moreover, as described in the Interior letter, the “trail” at issue here is coextensive with US Interstate 84 and Washington State Highway 14 which are not pristine “trail” segments—they are major, busy multi-modal transportation corridors, including the only sea level train route (on both sides of the Columbia River) through the Cascades, with over 80 commercial trains transiting per day.

NOW, THEREFORE, BE IT RESOLVED THAT THE Board of Commissioners being concerned and alarmed with Interior’s comments and apparent attempt at inappropriate Federal intervention on the consideration of the Whistling Ridge application, find as follows:

The Board finds: Interior’s reference to the National Trail Systems Act and the Scenic Area as authority for the comment letter is an abuse of federal authority that exceeds the legal and policy directives and Congressional intent of both the National Trail Systems Act and the Scenic Area Act. Interior’s comments are particularly egregious where they recommend that renewable wind energy construction (proposed on private lands outside of the Scenic Area and miles away from any trail segments in Skamania County) that are visible from the National Trail Systems Act and the Scenic Area should be eliminated from the Project, or that the proponent must justify “feasibility” for the locations visible from I-84.

The Board finds: Many man-made structures and activities are visible and will be visible along these “trails” that follow Interstate highways, where the most visible of “impacts” on travelers are the many semi trucks, trains, transmission lines, dams, industrial facilities, mines, and coal, gas and nuclear power generating facilities, as well as many cities, homes, commercial buildings, advertising signs and billboards, that they pass by. It is a gross abuse of federal authority to negatively comment on, and seek to obstruct a renewable energy project on private lands merely because a small portion is remotely visible from an Interstate highway.

The Board finds: Consistent with our concerns raised above regarding National Trail Systems Act authority, that Interior’s recommendation of restricting private land development in view of the Scenic Area is in direct violation of the critically important Scenic Area Act compromises and Savings Provisions the intent of which was to allow local counties economic development opportunity for their continued survival.

The Board finds: Interior's comments and recommendations have serious policy implications not only for renewable energy development but also for other non-wind energy related projects that are visible from the Scenic Area and National Historic Trails, such as electrical transmissions systems, dams, rail transportation, interstate commerce and traffic, as well as residential, commercial and industrial development in Skamania and other Counties near the Scenic Area and/or Counties located near similarly designated trails under the National Trails System Act.

The Board finds: Interiors comments contradict both the Secretary's publicly stated policy as it pertains to renewable energy as well as contradicting the clear energy policy direction of the current Administration.

The Board finds: Finally, in addition to the comment concerning the Scenic Area and the Interstate Highway corridor, Interior provided specific comments related to purported groundwater issues—issues raised by local citizen neighbor opponents at the NEPA/SEPA comment hearing. Skamania County has regulatory responsibility for groundwater issues, and will work with EFSEC to address the citizen comment. This is *not* a federal issue. Interior has no authority to insert itself into this uniquely local issue, and its decision to do so demonstrates its lack of regard for Skamania County's authority: strongly suggesting inappropriate collaboration with Whistling Ridge project opponents.

NOW, THEREFORE, BE IT FINALLY RESOLVED THAT THE Board of Commissioners reacting to this clear abuse of authority without jurisdiction, hereby demand, in the strongest possible terms, that Interior's comments be immediately retracted and removed from the public record on this matter, and further respectfully request that the Secretary and the Administration clarify how Interior has acted within its authority, consistent with the stated policy direction of the Secretary and the Administration, and what this letter means for the implementation of the Administration's declared land management and energy policies.

DATED this 3rd day of August 2010.

IN REPLY REFER TO:
ER10/492

Electronically Filed

July 19, 2010

Andrew M. Montaña
Environmental Project Manager
Bonneville Power Administration – KEC-4
P.O. Box 3621
Portland, Oregon 97208

Dear Mr. Montaña:

The U.S. Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (DEIS) for the Bonneville Power Administration's Whistling Ridge Energy Project, Skamania County, Washington. The Department offers the following comments for use in developing the Final Environmental Impact Statement for the project.

Lewis and Clark National Historic Trail

The proposed Whistling Ridge Energy project is located within five miles of the Lewis and Clark National Historic Trail (NHT), a congressionally-designated NHT, which follows the Columbia River and is within the area analyzed in the DEIS for potential visual impacts. In addition, US Interstate 84 and Washington Route 14 are the state-designated Lewis and Clark auto tour routes in the project area. Many visitors experience Lewis and Clark NHT by traveling the auto tour routes and stopping at interpretive and recreational sites along the way. The Department considers the viewshed along the river and auto tour routes to be a critical part of the trail visitor experience.

The Lewis and Clark NHT was established by Congress in an amendment to the National Trails System Act in 1978. 16 U.S.C. § 1244(a). As administrator of the trail, the National Park Service (NPS) is charged under this Act with the identification and protection of the historic route, remnants, and artifacts of the trail for public use and enjoyment.

Based on the analysis of visual impacts in the DEIS, it appears that a varying number of turbines will be visible from the trail's historic river and auto tour routes from near

Koberg Beach State Park to Lindsey Creek State Park. This approximately 15-mile stretch of the Columbia River Gorge has numerous recreational opportunities and scenic views that add significantly to enjoyment of the historic trail. Of the five viewpoints along US Interstate 84 analyzed in the DEIS, Viewpoint 14 at Viento State Park, is rated in Table 3.9-2 as having an anticipated moderate to high level of visual impact. However, on page 3-193 of the DEIS, the potential visual impact for this viewpoint is stated as only moderate. Furthermore, it appears that the turbines were inadvertently omitted in the photomontage in Figure 3.9-11. While difficult to discern the impact at this location without clarification on the accuracy of the visual simulation, we believe that the impact should be rated as high given the placement of turbines on the skyline within four miles of a park located along the auto tour route.

Turbine string A1-A7 would be highly visible from numerous locations along the trail due to its placement on a ridgeline close to the Columbia River Gorge. The NPS recommends removing or relocating these seven turbines, if feasible. This would significantly reduce the impact to visual resources along the historic trail. The visual resources in this region—Columbia River Gorge National Scenic Area and Lewis and Clark NHT—are important resources that should be protected.

Please add the following people to the federal agency distribution list for this project:

SPECIFIC COMMENTS

Water Resources Section 3.3

Pg. 3-26: Section 3.3.1.3 lacks sufficient information on the existing groundwater environment to support the finding of little or no impact. Suggest the section more fully address the depth to groundwater, flow direction, and transmissivity (permeability) of the aquifer as it relates to possible affects on the area domestic and agricultural ground-water resources (also see section 3.3.1.5). Helsel et.al. (2002) is a good reference for this type of analysis.

Pg. 3-29: Because section 3.3.3 addresses mitigation procedures for the isolation of groundwater from chemical spills, we assume that chemicals will be present on site during both construction and operation. Suggest the document include a discussion of potential chemical spills, and aquifer transmissivity (permeability), as it relates to the potential movement of contaminants toward nearby domestic or agricultural water wells.

Subject: Whistling Ridge Threatens Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood area, along the Skamania and Klickitat county lines.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a fair and balanced alternative analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat and would degrade the outstanding scenic beauty of the Columbia River Gorge National Scenic Area.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS and issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: Whistling Ridge wind energy project -- comment

Hello,

I am a Portland resident with a second home in White Salmon, Wa. I have a view of Mt Hood and Underwood mountain (among other things). I am opposed to adding windmills to the views in the Gorge, as long as that is possible. As a citizenry here in the US we try to preserve a small number of exceptional areas. The Gorge (and the US citizens) deserve as gorgeous a Gorge as possible. There is lots of windy land in these United States that is not protected as a national treasure. Seeing windmills from anywhere in the Gorge Scenic Area would be a further loss. I am still adjusting to the changed landscape around Maryhill with the addition of windmills there in the last couple of years. They are interesting to see, but they detract from the formerly simply grand landscape. Please don't bring tall, moving, unnatural structures into view in Skamania County! Any additional mechanical objects on the horizon WILL detract from the wonderful and unique Columbia Gorge experience.

Sincerely, Ruth Warbington.

(360) 956-2063
stephen.posner@commerce.wa.gov

Dear Mr. Posner,

In response to the Draft EIS, this letter is submitted to you to document our continued support for the Whistling Ridge Energy Project. As Chiefs of the Klickitat and Cascades Tribes of the Yakama Nation, we have worked closely with Jason Spadaro, President of SDS Lumber Company, on the Whistling Ridge Energy Project for several years. SDS Lumber Company approached us cooperatively and very early in their process, asking us to review their property and identify any concerns we may have with a wind energy project in the area.

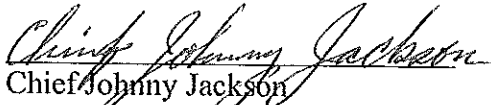

We have reviewed the Draft EIS and would like to bring to your attention Section 3.10, specifically page 3-204 which accurately summarizes our position. Several times, we have reviewed the property where SDS proposes to develop wind energy and have never found any issues related to cultural resources or traditional cultural properties of concern to us as Chiefs of the Klickitat and Cascades Tribes of the Yakama Nation. We provided this information directly to the applicant's specialists who wrote the cultural resources report used for the Draft EIS.

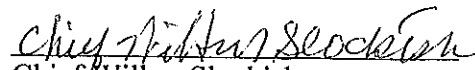

This area where SDS Lumber proposes wind energy is within our homeland and we feel that we are uniquely qualified to determine what areas have been traditionally used by our people and what traditional cultural properties for this area are. As knowledgeable individuals with ancestral ties to the Columbia River Gorge in the immediate vicinity of the Whistling Ridge Energy Project, we have been consulted with in the past on other development projects, and have provided information on traditional properties so that they could be avoided. There are no traditional properties within the Whistling Ridge Energy Project area. The site has been in commercial timber production for many years. Prior to timber harvesting on the site, it was heavily forested. The area of the project is surrounded by steep terrain, there are no streams or significant east-facing views and the land is rocky and rigid with a lot of natural brush. Our people have never used this area as a vision quest site, burial area, resource gathering area, travel route, or for any other significant purposes.

We strongly believe wind energy development should be encouraged in appropriate areas because it is clean energy. We believe the SDS land being proposed is a very appropriate area because the SDS wildlife surveys have shown no threatened or endangered plants or

animals exist in the area and we do not find any cultural resource concerns to our Tribes. We believe everyone should be supportive of wind energy in places such as this because it is clean energy and should be encouraged over traditional energy resources like natural gas and coal fired plants that consume large amounts of water and pollute our air, hydroelectric dams that destroy our fish and nuclear power plants that poison our people.

Sincerely,

Chief Johnny Jackson
Cascades Tribe of Yakama Nation

Chief Wilbur Slockish
Klickitat Tribe of Yakama Nation

**U.S. POPULATION GROWTH AND THE FUTURE
OF THE COLUMBIA RIVER WATER RESOURCES****ENERGY FACILITY SITE
EVALUATION COUNCIL**

Dale W. Glasgow*

On April 14-16, 2008, the 76th Western Snow Conference was held at the Best Western Hood River Inn, Hood river, Oregon. Climatologists, hydrologists, meteorologists, and geoscientists attended. They were from the universities of California, Washington, Oregon State, Portland State, Idaho, Idaho State, Boise State, Wyoming, Utah, Colorado State, and Nevada. Others attending were from the U. S. Army Corp of Engineers, U. S. Dept of Agriculture, U. S. Bureau of Reclamation, National Weather Service, National Aeronautics and Space Administration, National Oceanic and Atmospheric Administration, U. S. Geological Survey, NASA Ames Research Center, Natural Resources Conservation Service, California Dept of Water Resources, San Francisco Hetch-Hetchy Water System, Bonneville Power Administration (BPA), British Columbia Hydro, and Portland General Electric.

The theme of the conference was the impact of global warming and climate change on the following: 1. water storage and early melting of the snow packs in the Washington and Oregon Cascade mountains, Colorado and Canadian Rocky mountains, and the California Sierra Nevada mountains; 2. melting and receding glaciers in the western U. S. and Canada; 3. changing hydrology of western rivers; 4. drastic reductions of the water levels of Lake Powell and Lake Mead, which are only one-half full; 5. water deliveries to the lower Colorado River Compact states; 6. increasing extreme drought conditions in the Southwest; and 7. increasing severe wildfires in the West. It was all about water, energy, and people.

The impact of global warming in the western U. S. may be worse than the assessments of the Intergovernmental Panel on Climate Change. During the conference the subject of water for the increasing populations of the western U. S. was introduced. The compound increase in the U. S. population could easily cancel out a 20% increase in water and energy conservation. The Population Division of the U. S. Census Bureau has published a report, GCT-TI-P Data Set-2007, which states that the U. S. is the third most populous country in the world, with about 304 million as of July, 2008. The U. S. population is increasing at a rate of 0.95% per year (1.8 million per year), which is the highest of any industrialized nation and which is expected to reach 418 million just 34 years from now. The U. S. Census Bureau states that California had a population of 36,553,000 on July 1, 2007, which is now increasing by one-half million per year. California has more people than the combined population of the states of Washington, Oregon, Idaho, Nevada, Arizona, Montana, Wyoming, North and South Dakota, Colorado, Utah, New

Mexico, and Nebraska. California has as many representatives in Congress as all of the above-mentioned states. California has 3.5 times more representatives in Congress than the Columbia River Basin states of Oregon, Washington, and Idaho. This power bloc in Congress could be detrimental to these states.

The U. S. Dept of Energy states that the U. S. consumes nearly 100 Quads of energy per year, which is just over one-fourth of the world's consumption. A Quad of energy is nearly 1 exa joules (1 billion billion joules), or 1 peta BTUs (1 million billion BTUs), The U.S. energy consumption is projected to increase by 1.5% in the same 34-year time period.

It is only a matter of time before the expanding populations of the Southwest will require more electric power and water above and beyond that saved by conservation. Who will supply the power?

There is a high probability that no more power generating dams and nuclear fission power plants will be built in the near future in the Northwest. The additional power will probably come from the development of more wind farms. Some of the wind-powered generated electricity from the Northwest is already going to California. Eastern Washington and part of eastern Oregon is the home of six wind farms, with 924 wind turbines generating about 1.1 billion watts peak power when the wind is blowing. With an efficacy of about 0.33, the average power is about 356 million watts, which is enough electricity for 226,000 homes. The Biglow Canyon Wind Farm in Sherman County, Oregon, plus two other proposed wind farms in eastern Oregon, when completed will add another 800-950 megawatt peak power to the BPA grid.

The yearly energy output of the Washington wind farms is about 3127 gigawatt hours, which is slightly more than the 2892 gigawatt hours of the Rock Island Dam on the Columbia River and about 60% of the energy output of the Little Goose Dam on the Lower Snake River. The yearly electrical energy output of 91,928 gigawatt hours from the 11 dams on the U. S. portion of the Columbia River is 29 times greater than the output of the six Washington wind farms. These seem like very large numbers; however, the potential for more wind power in eastern Washington and Oregon is encouraging since only about one 1% of the leased or owned land around the wind farm is now utilized.

Who will supply the water? The Colorado River is presently the source of much of the water for Las Vegas, Nevada and Phoenix, Arizona. The allocation of Colorado River Basin water to Colorado, Wyoming, New Mexico, Utah, Arizona, Nevada, and California is governed by the 1922 Colorado

River Compact which promised 7.5 million acre feet of water to California, Arizona, and Nevada. An acre foot is the amount of water covering an acre of ground to a depth of one foot or the amount of water used by a typical U. S. family in one year.

The 7.5 million acre feet (maf) was one-half of the annual flow of the Colorado River and was not depriving the up-stream states of water. However, the growing populations of these upper stream states now need more of the flow, and the Compact is now under more political stress. The scheduled depletions for this year total 11.8 maf, which will be unsustainable in the future.

Global climate models don't always agree with each other in the predictions of rain and snow fall, but they universally agree the U. S. Southwest is drying up. There is a 50% chance that lakes Mead, Powell, and Mojave will dry up by 2021. Besides Las Vegas, Nevada, and Phoenix, Arizona, other cities that will be drastically affected will be Los Angeles and its surrounding area, and San Diego, California.

Developers have expanded the environs of these cities without much thought regarding the future water supply. So where will the water come from? Flash distillation of 10 maf of Pacific Ocean water would be extremely energy intensive and would require the construction of many huge solar or nuclear power plants, which would raise the cry "not in my back yard." The population of California is predicted to increase by 10 million by 2028, while the Colorado River flow will be drastically reduced. It was remarked at the conference that obtaining water for the increasing population is already a problem and is rapidly getting worse. It was also brought up that the Columbia River could supply 10 maf to California without stressing the Columbia River Basin since the average yearly water outflow at Bonneville Dam is 137.5 maf. Nothing was discussed regarding the environment of the Columbia River Gorge or the salmon.

The Southwest states are aware that the diversion of 10 maf through an aqueduct over the plateau of eastern Oregon to the California border would be much easier and less expensive than the 1000-mile-long Trans Alaska Pipeline, which crosses three mountain ranges, 800 or more rivers and streams, and costs nine billion dollars. This aqueduct would parallel the existing high-voltage electrical transmission lines starting near The Dalles, Oregon, and extending 255 miles to the California border south of Klamath Falls, Oregon (elevation 4105 feet). The extension from the California border to Shasta Lake is about 75 miles downhill. Some of the energy lost in pumping Columbia River water up onto and along the eastern Oregon

plateau would be recovered by in-line hydroelectric generating systems utilizing the water falling down from higher elevations to Shasta Lake.

Engineers have much experience in designing and building large pumping systems and pipelines. There are no show stoppers, with the electrical energy coming from the expanded eastern Oregon and Washington wind farms.

The states of Arizona and Nevada know that an aqueduct skirting east of the Cascade and Sierra Nevada mountains extending to the Colorado River near Las Vegas is also quite feasible. We only need to remember a plan to divert Columbia River water to California (in the 1950s), which was blocked by Washington senators Henry Jackson and Warren Magnuson, who were chairmen of important Senate committees. It is now clear that the issue is not dead and will be revived. People in the Southwest are now talking about water for their children and also for the next generation.

THE WHISTLING RIDGE ENERGY PROJECT

The Whistling Ridge Energy Project is the right kind of renewable energy at the right time, but at the wrong location. Why is this the wrong location? Figure 3.8-2 of the Draft Environmental Impact Statement (DEIS) indicates that the Underwood and Mill A residents are much closer to the visible wind farm than any others, including the residents of Bingen, White Salmon, and Hood River. The tips of the wind turbine blades of the southern most wind towers will rotate within a few feet of the boundary of the Columbia River Gorge National Scenic Area. The wind towers will be highly visible from Underwood and Mill A, and other locations up and down the gorge. We believe this is a visible insult to the unique beauty of the scenic area and the Lewis and Clark trail. How long will it be before developers start building wind turbine sites in juxtaposition to Mt. Rainier, Crater Lake, Yellowstone, Grand Canyon, etc., national parks?

A specification for The Whistling Ridge Energy Project enumerated in the DEIS clearly indicates that construction of the project will be a major industrial development in and juxtaposition to the Scenic Area. The project construction requires:

- a. 150, 150- ft long, 17.5 ft high, 14.5 ft wide, 55 ton gross wt specialized truck loads of power sections traversing State Route 14 and Cook Underwood Road to the SDS logging roads. It is one thing for an empty log truck to go up onto Whistling Ridge and come down with a load of logs. It is a completely different situation for the large heavy specialized trucks to travel up the steep logging roads. Will this require D-8 caterpillar tractors pushing and pulling the trucks?
- b. 150, 150- ft. long specialized truck loads of wind turbine blades traversing the same logging roads.
- c. 5000, 20-ton truck loads of construction gravel.
- d. 2000, concrete mixer truck loads (5 cubic yards per mixer load).
- e. 50 20-ton tuck loads of construction reinforcing steel for the concrete power bases.
- f. 2, 500-ton capacity cranes for erecting the power hub, nacel, and turbin blades.
- g. Many low boy trucks to haul all of the bull dozers, back hoes, front end loaders, etc.

- h. Many truck loads required for the construction of the supporting structures for the wind farm.

Needless to say, all of the thousands of trucks will pass within 50 ft of our house on Cook Underwood Road. The DEIS paints a rosy picture as viewed from Olympia, but not on our road.

WIND POWER

The generation of electricity by wind powered systems has the potential to be a nonpolluting source of energy. In areas with steady wind velocities of 15 to 16 miles per hour, such as the great plains states of Texas, Oklahoma, Nevada, North and South Dakota, eastern Montana and Wyoming, and also eastern Washington and Oregon, it is possible to generate electricity from wind farms for as low as 3.5 to 4 cents per kilowatt hour (KWh). Current tax incentives of 1.5 to 1.7 cents per KWh makes the generation of electricity by wind farms very competitive with electricity generated from the burning of hydrocarbon fuels such as coal and natural gas. Wind turbine farms do not spew carbon dioxide, nitrogen oxide, and sulfur oxides into the atmosphere, the atmosphere so they meet the definition of green energy systems.

An extensive systems analysis indicates that the price of wind generated electrical power is now less than electrical power generated from burning coal. The price of electricity derived from a new 500 megawatt coal-powered plant is about 5 cents per kilowatt hours (KWh), which is more than wind-powered generation. The carbon dioxide, nitrogen oxide, and sulfur oxide emission from coal-powered plants create acid rain, smog, degradation of visibility, carbon dioxide, which seem to be warming of the planet. Some of these emissions increase the probability of cardiovascular diseases, asthma, respiratory problems, and human mortality. When the cost of all of these human health and environmental degradation are factored into the systems analysis, the cost of coal-powered electricity is approaching 8 cents per KWh.

Three blade wind turbine generators are not simple windmills since large variations in wind velocities subject the longest propeller blades ever made to constantly changing stresses and strains. Wind velocities may vary over time for periods of days, hours, minutes, and even seconds (micro wind bursts). These winds create a host of aerodynamic conditions such as laminar flow, turbulence, vortices, and variable angle of attack on the blades, flexing of the blades, tower wind-wake, and ground boundary layer effects.

For 100 meter rotor diameter and revolution times of 1 per second, the rotor tips have the velocity of 700 mph, which exceed the local velocity of sound and as such produce audible shock waves. It is obvious that the servo mechanism must rapidly furl the blades to save the system from destruction. A practical operating regime of 3 seconds per revolution produces rotor tip velocities of 230 MPH and noise levels of around 50 decibels. A wind turbine with an efficacy of 0.33 and a lifetime of 20 to 30 years may rotate 95 to 142 million times. These millions of propeller rotations produce flexings and stresses in the three blades which can lead to dislocations and stress fractures in the blades.

Three-dimensional mathematical modeling of the aerodynamics and stresses associated with revolving turbine blades require the use of large parallel processing computers to solve the tensor Navier Stokes equations and the tensor stress strain equations covering the surface and volume of the turbine blades, rotor, and tower. The computer results are compared to the scaled-up data resulting from aerodynamic wind tunnel tests of smaller versions of the wind turbine, which leads to more efficient designs.

Wind-driven electrical power generation is environmentally and economically superior to any of the hydrocarbon electrical power generation. The hydro generation of electricity is still superior to the wind generation. The electrical power derived from the 11 dams on the Columbia River and the 4 on the Snake River generate electricity that is delivered to the PUD's at a price of about 2.5 to 2.75 cents per KWh.

Expansion of the Northwest hydroelectric systems have already reached their maximum limit. Probably no more dams will be built on the Columbia and Snake River drainage areas because of environmental concerns. We now see the great potential for the increased development of large wind farms in eastern Washington and Oregon but not in the scenic part of the gorge. It is now only a matter of time before population pressures will necessitate more power production, even with conservation; hence, Northwest wind farms must increase in number. Go wind power in eastern Washington and Oregon but not in the gorge!!

Dear Mr. Montañó and Mr. Posner:

Thank you for the opportunity to comment on the draft environmental impact statement for the Whistling Ridge Energy project located about seven miles north of the City of White Salmon in Skamania County. The Department of Ecology (Ecology) reviewed the information provided and has the following comment(s):

TOXICS CLEANUP: Connie Groven (360) 407-6254

Toxics Cleanup program comments submitted May 12, 2009, still apply to the project described (see enclosure). There are no new comments submitted at this time.

Ecology's comments are based upon information provided by the lead agency. As such, they may not constitute an exhaustive list of the various authorizations that must be obtained or legal requirements that must be fulfilled in order to carry out the proposed action.

If you have any questions or would like to respond to these comments, please contact the appropriate reviewing staff listed above.

Mr. Allen Fisksdal, EFSEC Manager
Energy Facility Site Evaluation Council
PO Box 43172
Olympia, WA 98504-3172

Dear Mr. Fisksdal:

Thank you for the opportunity to comment on the determination of significance scoping notice for the Whistling Ridge Energy project (Application No. 2009-01) located in Skamania County as proposed by Whistling Ridge Energy LLC. The Department of Ecology (Ecology) reviewed the environmental checklist and has the following comment(s):

SEPA REGIONAL PROJECT LEAD: Sarah Lukas (360) 407-7459

SHORELANDS:

The submitted scoping notice identifies the intent of preparing a floodplain and wetland assessment as part of the analysis used in the draft environmental impact statement (DEIS). The assessment should include: An inventory of all wetlands and areas of floodplain in the project area and within the vicinity of the proposal; the environmental values these aquatic features provide to the landscape; what and how the floodplain areas and wetlands will be impacted by the proposal; what environmental values will be lost from these impacts; and mitigation measures to offset the proposed environmental impacts that cannot be avoided.

The DEIS should also include an analysis of all other surface water bodies in, and within the vicinity of, the project site. An equivalent documentation of existing environmental values, proposed impacts, and proposed mitigation measures to unavoidable impacts should be outlined in the DEIS as requested for the wetlands and floodplain areas above.

TOXICS CLEANUP: Connie Groven (360) 407-6254

If contamination is currently known or suspected during construction, testing of the potentially contaminated media must be conducted. If contamination of soil or groundwater is readily visible, or is revealed by testing, Ecology must be notified. Contact the Environmental Report Tracking System Coordinator at the Southwest Regional Office at (360) 407-6300. For assistance and information about subsequent cleanup and to identify the type of testing that will be required contact Connie Groven with the Toxic Cleanup Program at the Southwest Regional Office at the phone number given above.

WATER QUALITY: Roberta Woods (360) 407-6269

Any discharge of sediment-laden runoff or other pollutants to waters of the state is in violation of Chapter 90.48 RCW, Water Pollution Control, and WAC 173-201A, Water Quality Standards for Surface Waters of the State of Washington, and is subject to enforcement action.

Erosion control measures must be in place prior to any clearing, grading, or construction. These control measures must be effective to prevent stormwater runoff from carrying soil and other

pollutants into surface water or storm drains that lead to waters of the state. Sand, silt, clay particles, and soil will damage aquatic habitat and are considered to be pollutants.

Proper disposal of construction debris must be on land in such a manner that debris cannot enter buffers and [waters of the state](#) or cause water quality degradation of state waters.

During construction, all releases of oils, hydraulic fluids, fuels, other petroleum products, paints, solvents, and other deleterious materials must be contained and removed in a manner that will prevent their discharge to waters and soils of the state. The cleanup of spills should take precedence over other work on the site.

Clearing limits and/or any easements or required buffers should be identified and marked in the field, prior to the start of any clearing, grading, or construction. Some suggested methods are staking and flagging or high visibility fencing.

A permanent vegetative cover should be established on denuded areas at final grade if they are not otherwise permanently stabilized.

All temporary erosion control systems should be designed to contain the runoff from the developed two year, 24-hour design storm without eroding.

Coverage under the National Pollution Discharge Elimination System (NPDES) and State Waste Discharge General Permit for Stormwater Discharges Associated with Construction Activities is required for construction sites which disturb an area of one acre or more and which have or will have a discharge of stormwater to surface water or a storm sewer. An application can be downloaded from Ecology's website at <http://www.ecy.wa.gov/programs/wq/stormwater/construction/#Application> or you can contact Josh Klimek at (360) 407-7451 for an application form. To avoid project delays, we encourage the applicant(s) to submit a completed application form and to publish public notice more than 60 days before the planned start of the project.

Ecology's comments are based upon information provided by the lead agency. As such, they may not constitute an exhaustive list of the various authorizations that must be obtained or legal requirements that must be fulfilled in order to carry out the proposed action.

If you have any questions or would like to respond to these comments, please contact the appropriate reviewing staff listed above.

Olympia, WA 98504-3172

Dear Mr. Montañó and Mr. Posner :

Thank you for the opportunity to comment on the draft environmental impact statement for the Whistling Ridge project located in Skamania County. The Department of Ecology (Ecology) reviewed the information provided and has the following comment(s):

AIR QUALITY: Qing Chen (360) 407-6809

Best Management Practice for minimization of track out and windblown dust should be required in applicable permitting.

TOXICS CLEANUP: Connie Groven (360) 407-6254

Toxics Cleanup program comments submitted May 12, 2009, still apply to the project described (see enclosure). There are no new comments submitted at this time.

WASTE 2 RESOURCES: Mike Drumright (360) 407-6397

All grading and filling of land must utilize only clean fill, i.e., dirt or gravel. All other materials, including waste concrete and asphalt, are considered to be solid waste and permit approval must be obtained through the local jurisdictional health department prior to filling. Standards apply as defined by Washington Administrative Code (WAC) 173-350-990-Criteria for Inert Waste.

Property owners, developers, and contractors are encouraged to recycle all possible leftover construction, demolition, and land clearing (CDL) materials and reduce waste generated. Recycling construction debris is often less expensive than landfill disposal. Please visit <http://1800recycle.wa.gov> or call the 1-800-RECYCLE hotline to find facilities that that will accept your CDL materials for reuse or recycling.

WATER RESOURCES: Vicki Cline (360) 407-0278

All water wells shall be constructed in accordance with the provisions of Chapter 173-160 WAC by a driller licensed in the State of Washington. Well reports must be submitted to Ecology within 30 days after completion of a well.

August 25, 2010

Page 2

All water wells that may be drilled must be a minimum of 100 feet from any known, suspected, or potential source of contamination. Wells shall not be located within 1,000 feet of a solid waste landfill. WAC 173-160-171(1) The proposed water well shall be located where it is not subject to ponding and is not in the floodway, except as provided in Chapter 86.16 RCW. (2) It shall be protected from a one hundred year flood and from any surface or subsurface drainage capable of impairing the quality of the ground water supply.

The Growth Management Act (Section 63) requires an applicant to submit evidence of an adequate water supply before a building permit can be issued for any building requiring potable water.

Any ground water withdrawals anticipated exceeding 5,000 gallons a day for domestic uses or for commercial/industrial uses require a water right permit. Any modification to existing water rights must be approved by Ecology's Water Resources Program.

Ecology's comments are based upon information provided by the lead agency. As such, they may not constitute an exhaustive list of the various authorizations that must be obtained or legal requirements that must be fulfilled in order to carry out the proposed action.

If you have any questions or would like to respond to these comments, please contact the appropriate reviewing staff listed above.

RE: DNR Comments on Whistling Ridge DEIS

Dear Stephen:

Thank you for the opportunity to review and comment on the joint NEPA SEPA Whistling Ridge draft environmental impact statement (DEIS). We looked primarily at fire hazard, plant species and communities, northern spotted owls and WA Department of Natural Resources' Habitat Conservation Plan (DNR HCP), forest practice requirements, and surface mines and reclamation.

Some of our concerns include: the presence or impacts to Oregon white oak/Idaho fescue plant communities; northern spotted owls, their habitat and associated HCPs; forest practice requirements for this proposal, and a permitted source of aggregate for roads and structures. Our adjacent HCP land to the north is managed to provide habitat that makes a significant contribution to demographic support, maintenance of species distribution and facilitation of owl dispersal. The DEIS on page 3-56 states there are no HCPs in or near the project area. Forest practices owl protection requirements were also not correctly explained. Please also note that state agency wildlife species review is typically done by WA Department of Fish and Wildlife (WDFW), and DNR biologists did not look at impacts to species not protected under the DNR forest land HCP in eastern Washington, other than compliance with Forest Practices Rules.

FPA conversion permits and DNR surface mining reclamation permits (SMRP) are required for timber harvest and rock or gravel mining associated with conversion of forest land and the associated building or construction at the wind tower sites. This was not clear in the DEIS and the SMRP was not listed in Table 4-1. For more details as to DNR concerns and specific requests for DEIS corrections or DEIS additions on the topics noted above please see the following text. Staff contacts are also included for more information or questions.

Fire Hazard

DNR has fire protection responsibility on a significant portion of the land within the project area. After review of the DEIS, we believe that implementation of the fire related mitigation measures listed in Chapter 3, section 3.6.3 of the DEIS (5/1/2010) would adequately address fire prevention responsibility and response on those lands. Thank you for this consideration.

Contact:

Darrel Johnston
Phone: (360) 902-2112
darrel.johnston@dnr.wa.gov

Plant Species and Communities

Issues:

- The EIS appears to adequately address 'Special Status Plant Species.' They appear to have queried appropriate sources of information and to have done on-the-ground surveys at the appropriate times. Thank you for this consideration.
- On page 3-43, there is mention of the Oregon white oak/Idaho fescue plant community. However, there is no subsequent mention of it. Was it surveyed for and not found? Was it not surveyed for, because there was no requirement to do so?

Request:

Add a statement(s?) about the Oregon white oak/Idaho fescue plant community on page 3-74 where the impacts to special status plant species are discussed.

Contact:

John Gamon
(360) 902-1661
john.gamon@dnr.wa.gov

Northern Spotted Owls and Associated DNR HCP

Note: State agency wildlife species review is typically done by WDFW. DNR biologists looked at impacts to those species protected under our DNR forest land HCP in the range of the northern spotted owl, not other eastern Washington wildlife species. See also DNR comments as to Forest Practice Rule requirements related to spotted owls in the next DNR comment section.

- Whistling Ridge Energy Project Draft EIS, Page 3-50 states surveys were conducted for northern spotted owl presence in 2008-2009 using the 1992 USFWS survey protocol. No spotted owls were detected during these surveys. Page 3-52 states that the longstanding absence of any northern spotted owls at the historic

site centers suggest that these site centers likely no longer qualify for special protection. Page 3-53 states that the Turnstone and DNR/NCASI surveys affirmatively documented the absence of northern spotted owl site centers in these historic sites. They also state that surveys conducted in and near the project area indicate that spotted owls are not present. Additional surveys were conducted during three daytime site visits over the seasonal breeding window in 2009 to determine if spotted owls may be in the vicinity but were not vocalizing due to the presence of barred owls. No spotted owls were detected.

Comment: It is widely understood that one of the most serious threats facing the northern spotted owl is the recent range expansion of another closely related owl species, the barred owl, *Strix varia*. Because barred owls may attack and kill spotted owls, spotted owls are known to vocalize less when around barred owls. This poses a serious problem when the primary means of establishing spotted owl presence is spotted owl vocal response to simulated calls. Hence, vocalization survey results may be unreliable as spotted owls are unlikely to vocalize due to the presence of barred owls, which was the case during the surveys for this project.

Request:

Please note that DNR biologists do not believe that three daytime visits over one season is sufficient evidence to determine that spotted owls are not in the vicinity and are just not vocalizing. Vocalization survey results may be unreliable.

- Whistling Ridge Energy Project Draft EIS, Page 3-56 “A review of USFWS habitat conservation plans issued in the Pacific region indicates there are no spotted owl-related habitat conservation plans applicable in or near the project area.” (USFWS 2009b)

Literature citation: U.S. Fish and Wildlife Service (USFWS). 2009b. Conservation Plan and Agreement Database. Accessed via the Internet at:
http://ecos.fws.gov/conserv_plans/public.jsp

Comment: DNR accessed this website and found the Washington Dept. of Natural Resources HCP identified with 5 listed species covered under this HCP. One of the listed species identified is the northern spotted owl. The area covered under the Washington Dept. of Natural Resources HCP conservation strategy for the northern spotted owl covers DNR managed land directly adjacent to the Whistling Ridge Energy Project to the north.

Hence, the information provided in the Whistling Ridge Energy Project Draft EIS that “...there are no spotted owl-related habitat conservation plans applicable in or near the project area”.... is incorrect.

Comment: This project may interfere with a spotted owl’s ability to disperse from the DNR HCP conservation area to other areas in the vicinity. The state trust lands *HCP Amendment #1 Administrative Amendment to the Northern Spotted Owl Conservation Strategy for the Klickitat HCP Planning Unit*, April 2004 has designated areas for northern spotted owl Nesting, Roosting, and Foraging (NRF) habitat management located directly adjacent to this project’s northern boundary. The DNR conservation objective for the northern spotted owl is to provide habitat that makes a significant contribution to demographic support, maintenance of species distribution and facilitation of dispersal.

Request:

Please correct the DEIS text concerning DNR HCP location. You might also reconsider and reword your conclusion that no project impacts are expected to spotted owls.

Contact:

Tami Miketa (360) 902-1481

Forest Practices

Resources at risk by section (from DNR Forest Practices Risk Assessment Tracking GIS data):

- All sections in the proposal are within the Bull Trout overlay delineated in state FP rules (WAC- 222).
- T3N-R10E-S5 There is an F type stream with possible Bull Trout required protections. There are potential unstable slopes indicated.
- T3N-R10E-S6 There is an F type stream with possible Bull Trout required protections. There are potential unstable slopes indicated. There is a Spotted Owl circle.
- T3N-R10E-S7 There is an historic site and there are potential unstable slopes indicated.
- T3N-R10E-S8 There is an historic site.
- T3N-R9E-S12 No issues
- T3N-R9E-S13 There are potential unstable slopes indicated.

Applicable FP rules that may be relevant to the project. Most of these would come into play if there is logging or road building near any waters.

- 222-16-030 Water typing systems
- 222-16-050 Classes of Forest Practices
- 222-20-010 Applications and Notifications
- 222-24-030 Road construction
- 222-24-040 Water crossing structures
- 222-24-052 Road maintenance
- 222-30-020 Harvest unit planning and designs (wetland management zones)
- 222-30-022 Eastern Washington RMZs
- 222-30-050 Felling and Bucking
- 222-30-070 Ground based logging systems.

Comments, concerns and potential mitigation that would be required (for specific DEIS page numbers):

- 2-9, 2-15. Harvesting trees in areas that are not already cleared. This would require an approved Forest Practices Application prior to harvest. Need for Forest Practices Application is already listed in required permits on page 4-3.
- 2-11. The map shows a riparian area. The wetland is described in 3-24. County protection measures are described on 3-39 for category II wetlands.

Request:

If this is on forest land you should verify if it is a Type A or Type B wetland and that the 100 foot buffer would also meet or exceed any FP Rule requirements for a Type A or B wetland (WAC 222-30-020) for that location.

- 3-11. The potential for landslides is described with building of the wind towers. On 3-12, it is stated that there will be no impact to drainages and on 3-12 and 3-13 are mitigation measures.

Request:

Acknowledge that unstable slopes with potential to deliver to public resources would require appropriate protection under forest practices rules to minimize impacts to any unstable areas and associated public resources and/or public safety. This mitigation requirement is not noted.

- 3-28. Approximately 22 acres of the site will be converted from timber management to non forestry use around the wind turbine sites. All of the Forest Practices Applications that were applied for in the area

indicated that the sites would be kept in forestry, not converted to a non-forestry use. This appears to be a violation of the Forest Practices Rules. Potential conversion impacts were not considered. Any future FPAs to harvest trees near wind tower locations will require a conversion FPA (Class IV-General) and any current timber harvesting under current FPAs may be in violation as well. State law (RCW 76.09.460) allows that Skamania County may deny any conversion permits for up to six years on any sites where FPAs were not submitted as conversion FPAs. Under Forest Practices Rules and Regulations (WAC 222-34) DNR requires reforestation to occur on all harvested acres that will remain in forestry.

Request:

All applicable FPAs should be amended or reapplied for to reflect conversion activities (RCW 76.09.470). Any new Class IV-General FPAs must await completion of the final EIS before they can be approved for harvest by DNR.

- 3-50. The comment is made that the project is not sited in or near any Spotted Owls or Spotted Owl activity site centers. There are two Spotted Owl circles within portions of the proposal area.

Request:

Please correct the inaccurate statement concerning spotted owls.

- 3-50 and 3-53. “The two Spotted Owl site centers are no longer considered to be occupied pursuant to USF&W protocols and state law.” This is an inaccurate statement. The two Spotted Owl circles are still in the state data base and have not been decertified as of this date. Forest Practices rules and regulations still require appropriate protections (WAC 222-16-080(6)).

Request:

Please correct the inaccurate statement concerning spotted owls and correctly state the appropriate FP Rule mitigation measures that are required.

- 3-75 and 3-78. “The proposal would not impact the White Salmon SOSEA’s 40% suitable Spotted Owl habitat level.” This is an inaccurate statement. The habitat level is calculated on a circle by circle basis, not over the entire SOSEA. There is a small mapped portion of potential habitat in one of the two circles in the proposal.

Request:

Please document whether this proposal (including all of the associated timber harvests) will harvest suitable owl habitat (WAC 222-16-085) and or impact the suitable habitat totals for one of the spotted owl circles, if that is the case (WAC 222-10-040).

- 3-209 “The Haran Farmstead is recommended as ineligible for the NRHP.” This statement may or may not be accurate. This site has been listed in DNR’s GIS FP Risk Assessment Tool as a site that may require protection if there is any potential for disturbance to the site. Any potential impacts to the historic site may require a site protection plan.

Request:

Contact the Washington State Department of Archaeology and Historic Preservation. Document why there will be no adverse impacts or how such impacts can be mitigated with a site protection plan if necessary.

joe.blazek@dnr.wa.gov

Surface Mines and Reclamation

Issue:

DNR permits and regulates surface mining reclamation on state and private lands. The proposal calls for at least 2.5 miles of new road construction as well as significant improvements and widening of the existing forestry roads to handle the oversized loads not associated with timber management. Since this work as proposed is being performed primarily to facilitate a wind power project, the DNR will not allow the use of aggregate from pits or quarries that do not have an active surface mine reclamation permit.

Request:

Please note that aggregate used to improve/construct roads, or for construction of Whistling Ridge project related foundations and infrastructure must come from a permitted surface mine, not from a forestry pit or quarry locations (exempt/unpermitted surface mine sites).

RE: DNR Comments on Whistling Ridge DEIS

Dear Stephen:

Thank you for the opportunity to review and comment on the joint NEPA SEPA Whistling Ridge draft environmental impact statement (DEIS). We looked primarily at fire hazard, plant species and communities, northern spotted owls and WA Department of Natural Resources' Habitat Conservation Plan (DNR HCP), forest practice requirements, and surface mines and reclamation.

Some of our concerns include: the presence or impacts to Oregon white oak/Idaho fescue plant communities; northern spotted owls, their habitat and associated HCPs; forest practice requirements for this proposal, and a permitted source of aggregate for roads and structures. Our adjacent HCP land to the north is managed to provide habitat that makes a significant contribution to demographic support, maintenance of species distribution and facilitation of owl dispersal. The DEIS on page 3-56 states there are no HCPs in or near the project area. Forest practices owl protection requirements were also not correctly explained. Please also note that state agency wildlife species review is typically done by WA Department of Fish and Wildlife (WDFW), and DNR biologists did not look at impacts to species not protected under the DNR forest land HCP in eastern Washington, other than compliance with Forest Practices Rules.

FPA conversion permits and DNR surface mining reclamation permits (SMRP) are required for timber harvest and rock or gravel mining associated with conversion of forest land and the associated building or construction at the wind tower sites. This was not clear in the DEIS and the SMRP was not listed in Table 4-1. For more details as to DNR concerns and specific requests for DEIS corrections or DEIS additions on the topics noted above please see the following text. Staff contacts are also included for more information or questions.

Fire Hazard

DNR has fire protection responsibility on a significant portion of the land within the project area. After review of the DEIS, we believe that implementation of the fire related mitigation measures listed in Chapter 3, section 3.6.3 of the DEIS (5/1/2010) would adequately address fire prevention responsibility and response on those lands. Thank you for this consideration.

Plant Species and Communities

Issues:

- The EIS appears to adequately address 'Special Status Plant Species.' They appear to have queried appropriate sources of information and to have done on-the-ground surveys at the appropriate times. Thank you for this consideration.
- On page 3-43, there is mention of the Oregon white oak/Idaho fescue plant community. However, there is no subsequent mention of it. Was it surveyed for and not found? Was it not surveyed for, because there was no requirement to do so?

Request:

Add a statement(s?) about the Oregon white oak/Idaho fescue plant community on page 3-74 where the impacts to special status plant species are discussed.

Contact:

John Gamon

(360) 902-1661

john.gamon@dnr.wa.gov

Northern Spotted Owls and Associated DNR HCP

Note: State agency wildlife species review is typically done by WDFW. DNR biologists looked at impacts to those species protected under our DNR forest land HCP in the range of the northern spotted owl, not other eastern Washington wildlife species. See also DNR comments as to Forest Practice Rule requirements related to spotted owls in the next DNR comment section.

- Whistling Ridge Energy Project Draft EIS, Page 3-50 states surveys were conducted for northern spotted owl presence in 2008-2009 using the 1992 USFWS survey protocol. No spotted owls were detected during these surveys. Page 3-52 states that the longstanding absence of any northern spotted owls at the historic site centers suggest that these site centers likely no longer qualify for special protection. Page 3-53 states that the Turnstone and DNR/NCASI surveys affirmatively documented the absence of northern spotted owl site centers in these historic sites. They also state that surveys conducted in and near the project area indicate that spotted owls are not present. Additional surveys were conducted during three daytime site visits over the seasonal breeding window in 2009 to determine if spotted owls may be in the vicinity but were not vocalizing due to the presence of barred owls. No spotted owls were detected.

Comment: It is widely understood that one of the most serious threats facing the northern spotted owl is the recent range expansion of another closely related owl species, the barred owl, *Strix varia*. Because barred owls may attack and kill spotted owls, spotted owls are

known to vocalize less when around barred owls. This poses a serious problem when the primary means of establishing spotted owl presence is spotted owl vocal response to simulated calls. Hence, vocalization survey results may be unreliable as spotted owls are unlikely to vocalize due to the presence of barred owls, which was the case during the surveys for this project.

Request:

Please note that DNR biologists do not believe that three daytime visits over one season is sufficient evidence to determine that spotted owls are not in the vicinity and are just not vocalizing. Vocalization survey results may be unreliable.

- Whistling Ridge Energy Project Draft EIS, Page 3-56 “A review of USFWS habitat conservation plans issued in the Pacific region indicates there are no spotted owl-related habitat conservation plans applicable in or near the project area.” (USFWS 2009b)

Literature citation: U.S. Fish and Wildlife Service (USFWS). 2009b. Conservation Plan and Agreement Database. Accessed via the Internet at:
http://ecos.fws.gov/conserv_plans/public.jsp

Comment: DNR accessed this website and found the Washington Dept. of Natural Resources HCP identified with 5 listed species covered under this HCP. One of the listed species identified is the northern spotted owl. The area covered under the Washington Dept. of Natural Resources HCP conservation strategy for the northern spotted owl covers DNR managed land directly adjacent to the Whistling Ridge Energy Project to the north.

Hence, the information provided in the Whistling Ridge Energy Project Draft EIS that “...there are no spotted owl-related habitat conservation plans applicable in or near the project area”... is incorrect.

Comment: This project may interfere with a spotted owl’s ability to disperse from the DNR HCP conservation area to other areas in the vicinity. The state trust lands *HCP Amendment #1 Administrative Amendment to the Northern Spotted Owl Conservation Strategy for the Klickitat HCP Planning Unit*, April 2004 has designated areas for northern spotted owl Nesting, Roosting, and Foraging (NRF) habitat management located directly adjacent to this project’s northern boundary. The DNR conservation objective for the northern spotted owl is to provide habitat that makes a significant contribution to demographic support, maintenance of species distribution and facilitation of dispersal.

Request:

Please correct the DEIS text concerning DNR HCP location. You might also reconsider and reword your conclusion that no project impacts are expected to spotted owls.

Forest Practices

Resources at risk by section (from DNR Forest Practices Risk Assessment Tracking GIS data):

- All sections in the proposal are within the Bull Trout overlay delineated in state FP rules (WAC- 222).
- T3N-R10E-S5 There is an F type stream with possible Bull Trout required protections. There are potential unstable slopes indicated.
- T3N-R10E-S6 There is an F type stream with possible Bull Trout required protections. There are potential unstable slopes indicated. There is a Spotted Owl circle.
- T3N-R10E-S7 There is an historic site and there are potential unstable slopes indicated.
- T3N-R10E-S8 There is an historic site.
- T3N-R9E-S12 No issues
- T3N-R9E-S13 There are potential unstable slopes indicated.

Applicable FP rules that may be relevant to the project. Most of these would come into play if there is logging or road building near any waters.

- 222-16-030 Water typing systems
- 222-16-050 Classes of Forest Practices
- 222-20-010 Applications and Notifications
- 222-24-030 Road construction
- 222-24-040 Water crossing structures
- 222-24-052 Road maintenance
- 222-30-020 Harvest unit planning and designs (wetland management zones)
- 222-30-022 Eastern Washington RMZs
- 222-30-050 Felling and Bucking
- 222-30-070 Ground based logging systems.

Comments, concerns and potential mitigation that would be required (for specific DEIS page numbers):

- 2-9, 2-15. Harvesting trees in areas that are not already cleared. This would require an approved Forest Practices Application prior to harvest. Need for Forest Practices Application is already listed in required permits on page 4-3.
- 2-11. The map shows a riparian area. The wetland is described in 3-24. County protection measures are described on 3-39 for category II wetlands.

Request:

If this is on forest land you should verify if it is a Type A or Type B wetland and that the 100 foot buffer would also meet or exceed any FP Rule requirements for a Type A or B wetland (WAC 222-30-020) for that location.

- 3-11. The potential for landslides is described with building of the wind towers. On 3-12, it is stated that there will be no impact to drainages and on 3-12 and 3-13 are mitigation measures.

Request:

Acknowledge that unstable slopes with potential to deliver to public resources would require appropriate protection under forest practices rules to minimize impacts to any

unstable areas and associated public resources and/or public safety. This mitigation requirement is not noted.

- 3-28. Approximately 22 acres of the site will be converted from timber management to non forestry use around the wind turbine sites. All of the Forest Practices Applications that were applied for in the area indicated that the sites would be kept in forestry, not converted to a non-forestry use. This appears to be a violation of the Forest Practices Rules. Potential conversion impacts were not considered. Any future FPAs to harvest trees near wind tower locations will require a conversion FPA (Class IV-General) and any current timber harvesting under current FPAs may be in violation as well. State law (RCW 76.09.460) allows that Skamania County may deny any conversion permits for up to six years on any sites where FPAs were not submitted as conversion FPAs. Under Forest Practices Rules and Regulations (WAC 222-34) DNR requires reforestation to occur on all harvested acres that will remain in forestry.

Request:

All applicable FPAs should be amended or reapplied for to reflect conversion activities (RCW 76.09.470). Any new Class IV-General FPAs must await completion of the final EIS before they can be approved for harvest by DNR.

- 3-50. The comment is made that the project is not sited in or near any Spotted Owls or Spotted Owl activity site centers. There are two Spotted Owl circles within portions of the proposal area.

Request:

Please correct the inaccurate statement concerning spotted owls.

- 3-50 and 3-53. "The two Spotted Owl site centers are no longer considered to be occupied pursuant to USF&W protocols and state law." This is an inaccurate statement. The two Spotted Owl circles are still in the state data base and have not been decertified as of this date. Forest Practices rules and regulations still require appropriate protections (WAC 222-16-080(6)).

Request:

Please correct the inaccurate statement concerning spotted owls and correctly state the appropriate FP Rule mitigation measures that are required.

- 3-75 and 3-78. "The proposal would not impact the White Salmon SOSEA's 40% suitable Spotted Owl habitat level." This is an inaccurate statement. The habitat level is calculated on a circle by circle basis, not over the entire SOSEA. There is a small mapped portion of potential habitat in one of the two circles in the proposal.

Request:

Please document whether this proposal (including all of the associated timber harvests) will harvest suitable owl habitat (WAC 222-16-085) and or impact the suitable habitat totals for one of the spotted owl circles, if that is the case (WAC 222-10-040).

- 3-209 "The Haran Farmstead is recommended as ineligible for the NRHP." This statement may or may not be accurate. This site has been listed in DNR's GIS FP Risk Assessment Tool as a site that may require protection if there is any potential for disturbance to the site. Any potential impacts to the historic site may require a site

protection plan.

Request:

Contact the Washington State Department of Archaeology and Historic Preservation. Document why there will be no adverse impacts or how such impacts can be mitigated with a site protection plan if necessary.

Surface Mines and Reclamation

Issue:

DNR permits and regulates surface mining reclamation on state and private lands. The proposal calls for at least 2.5 miles of new road construction as well as significant improvements and widening of the existing forestry roads to handle the oversized loads not associated with timber management. Since this work as proposed is being performed primarily to facilitate a wind power project, the DNR will not allow the use of aggregate from pits or quarries that do not have an active surface mine reclamation permit.

Request:

Please note that aggregate used to improve/construct roads, or for construction of Whistling Ridge project related foundations and infrastructure must come from a permitted surface mine, not from a forestry pit or quarry locations (exempt/unpermitted surface mine sites).

RE: DNR Comments on Whistling Ridge DEIS

Dear Stephen:

Thank you for the opportunity to review and comment on the joint NEPA SEPA Whistling Ridge draft environmental impact statement (DEIS). We looked primarily at fire hazard, plant species and communities, northern spotted owls and WA Department of Natural Resources' Habitat Conservation Plan (DNR HCP), forest practice requirements, and surface mines and reclamation.

Some of our concerns include: the presence or impacts to Oregon white oak/Idaho fescue plant communities; northern spotted owls, their habitat and associated HCPs; forest practice requirements for this proposal, and a permitted source of aggregate for roads and structures. Our adjacent HCP land to the north is managed to provide habitat that makes a significant contribution to demographic support, maintenance of species distribution and facilitation of owl dispersal. The DEIS on page 3-56 states there are no HCPs in or near the project area. Forest practices owl protection requirements were also not correctly explained. Please also note that state agency wildlife species review is typically done by WA Department of Fish and Wildlife (WDFW), and DNR biologists did not look at impacts to species not protected under the DNR forest land HCP in eastern Washington, other than compliance with Forest Practices Rules.

FPA conversion permits and DNR surface mining reclamation permits (SMRP) are required for timber harvest and rock or gravel mining associated with conversion of forest land and the associated building or construction at the wind tower sites. This was not clear in the DEIS and the SMRP was not listed in Table 4-1. For more details as to DNR concerns and specific requests for DEIS corrections or DEIS additions on the topics noted above please see the following text. Staff contacts are also included for more information or questions.

Fire Hazard

DNR has fire protection responsibility on a significant portion of the land within the project area. After review of the DEIS, we believe that implementation of the fire related mitigation measures listed in Chapter 3, section 3.6.3 of the DEIS (5/1/2010) would adequately address fire prevention responsibility and response on those lands. Thank you for this consideration.

Plant Species and Communities

Issues:

- The EIS appears to adequately address 'Special Status Plant Species.' They appear to have queried appropriate sources of information and to have done on-the-ground surveys at the appropriate times. Thank you for this consideration.
- On page 3-43, there is mention of the Oregon white oak/Idaho fescue plant community. However, there is no subsequent mention of it. Was it surveyed for and not found? Was it not surveyed for, because there was no requirement to do so?

Request:

Add a statement(s?) about the Oregon white oak/Idaho fescue plant community on page 3-74 where the impacts to special status plant species are discussed.

Contact:

John Gamon

(360) 902-1661

john.gamon@dnr.wa.gov

Northern Spotted Owls and Associated DNR HCP

Note: State agency wildlife species review is typically done by WDFW. DNR biologists looked at impacts to those species protected under our DNR forest land HCP in the range of the northern spotted owl, not other eastern Washington wildlife species. See also DNR comments as to Forest Practice Rule requirements related to spotted owls in the next DNR comment section.

- Whistling Ridge Energy Project Draft EIS, Page 3-50 states surveys were conducted for northern spotted owl presence in 2008-2009 using the 1992 USFWS survey protocol. No spotted owls were detected during these surveys. Page 3-52 states that the longstanding absence of any northern spotted owls at the historic site centers suggest that these site centers likely no longer qualify for special protection. Page 3-53 states that the Turnstone and DNR/NCASI surveys affirmatively documented the absence of northern spotted owl site centers in these historic sites. They also state that surveys conducted in and near the project area indicate that spotted owls are not present. Additional surveys were conducted during three daytime site visits over the seasonal breeding window in 2009 to determine if spotted owls may be in the vicinity but were not vocalizing due to the presence of barred owls. No spotted owls were detected.

Comment: It is widely understood that one of the most serious threats facing the northern spotted owl is the recent range expansion of another closely related owl species, the barred owl, *Strix varia*. Because barred owls may attack and kill spotted owls, spotted owls are

known to vocalize less when around barred owls. This poses a serious problem when the primary means of establishing spotted owl presence is spotted owl vocal response to simulated calls. Hence, vocalization survey results may be unreliable as spotted owls are unlikely to vocalize due to the presence of barred owls, which was the case during the surveys for this project.

Request:

Please note that DNR biologists do not believe that three daytime visits over one season is sufficient evidence to determine that spotted owls are not in the vicinity and are just not vocalizing. Vocalization survey results may be unreliable.

- Whistling Ridge Energy Project Draft EIS, Page 3-56 “A review of USFWS habitat conservation plans issued in the Pacific region indicates there are no spotted owl-related habitat conservation plans applicable in or near the project area.” (USFWS 2009b)

Literature citation: U.S. Fish and Wildlife Service (USFWS). 2009b. Conservation Plan and Agreement Database. Accessed via the Internet at:
http://ecos.fws.gov/conserv_plans/public.jsp

Comment: DNR accessed this website and found the Washington Dept. of Natural Resources HCP identified with 5 listed species covered under this HCP. One of the listed species identified is the northern spotted owl. The area covered under the Washington Dept. of Natural Resources HCP conservation strategy for the northern spotted owl covers DNR managed land directly adjacent to the Whistling Ridge Energy Project to the north.

Hence, the information provided in the Whistling Ridge Energy Project Draft EIS that “...there are no spotted owl-related habitat conservation plans applicable in or near the project area”.... is incorrect.

Comment: This project may interfere with a spotted owl’s ability to disperse from the DNR HCP conservation area to other areas in the vicinity. The state trust lands *HCP Amendment #1 Administrative Amendment to the Northern Spotted Owl Conservation Strategy for the Klickitat HCP Planning Unit*, April 2004 has designated areas for northern spotted owl Nesting, Roosting, and Foraging (NRF) habitat management located directly adjacent to this project’s northern boundary. The DNR conservation objective for the northern spotted owl is to provide habitat that makes a significant contribution to demographic support, maintenance of species distribution and facilitation of dispersal.

Request:

Please correct the DEIS text concerning DNR HCP location. You might also reconsider and reword your conclusion that no project impacts are expected to spotted owls.

Contact:

Tami Miketa (360) 902-1481
tamara.miketa@dnr.wa.gov

Forest Practices

Resources at risk by section (from DNR Forest Practices Risk Assessment Tracking GIS data):

- All sections in the proposal are within the Bull Trout overlay delineated in state FP rules (WAC- 222).
- T3N-R10E-S5 There is an F type stream with possible Bull Trout required protections. There are potential unstable slopes indicated.
- T3N-R10E-S6 There is an F type stream with possible Bull Trout required protections. There are potential unstable slopes indicated. There is a Spotted Owl circle.
- T3N-R10E-S7 There is an historic site and there are potential unstable slopes indicated.
- T3N-R10E-S8 There is an historic site.
- T3N-R9E-S12 No issues
- T3N-R9E-S13 There are potential unstable slopes indicated.

Applicable FP rules that may be relevant to the project. Most of these would come into play if there is logging or road building near any waters.

- 222-16-030 Water typing systems
- 222-16-050 Classes of Forest Practices
- 222-20-010 Applications and Notifications
- 222-24-030 Road construction
- 222-24-040 Water crossing structures
- 222-24-052 Road maintenance
- 222-30-020 Harvest unit planning and designs (wetland management zones)
- 222-30-022 Eastern Washington RMZs
- 222-30-050 Felling and Bucking
- 222-30-070 Ground based logging systems.

Comments, concerns and potential mitigation that would be required (for specific DEIS page numbers):

- 2-9, 2-15. Harvesting trees in areas that are not already cleared. This would require an approved Forest Practices Application prior to harvest. Need for Forest Practices Application is already listed in required permits on page 4-3.
- 2-11. The map shows a riparian area. The wetland is described in 3-24. County protection measures are described on 3-39 for category II wetlands.

Request:

If this is on forest land you should verify if it is a Type A or Type B wetland and that the 100 foot buffer would also meet or exceed any FP Rule requirements for a Type A or B wetland (WAC 222-30-020) for that location.

- 3-11. The potential for landslides is described with building of the wind towers. On 3-12, it is stated that there will be no impact to drainages and on 3-12 and 3-13 are mitigation measures.

Request:

Acknowledge that unstable slopes with potential to deliver to public resources would require appropriate protection under forest practices rules to minimize impacts to any

unstable areas and associated public resources and/or public safety. This mitigation requirement is not noted.

- 3-28. Approximately 22 acres of the site will be converted from timber management to non forestry use around the wind turbine sites. All of the Forest Practices Applications that were applied for in the area indicated that the sites would be kept in forestry, not converted to a non-forestry use. This appears to be a violation of the Forest Practices Rules. Potential conversion impacts were not considered. Any future FPAs to harvest trees near wind tower locations will require a conversion FPA (Class IV-General) and any current timber harvesting under current FPAs may be in violation as well. State law (RCW 76.09.460) allows that Skamania County may deny any conversion permits for up to six years on any sites where FPAs were not submitted as conversion FPAs. Under Forest Practices Rules and Regulations (WAC 222-34) DNR requires reforestation to occur on all harvested acres that will remain in forestry.

Request:

All applicable FPAs should be amended or reapplied for to reflect conversion activities (RCW 76.09.470). Any new Class IV-General FPAs must await completion of the final EIS before they can be approved for harvest by DNR.

- 3-50. The comment is made that the project is not sited in or near any Spotted Owls or Spotted Owl activity site centers. There are two Spotted Owl circles within portions of the proposal area.

Request:

Please correct the inaccurate statement concerning spotted owls.

- 3-50 and 3-53. “The two Spotted Owl site centers are no longer considered to be occupied pursuant to USF&W protocols and state law.” This is an inaccurate statement. The two Spotted Owl circles are still in the state data base and have not been decertified as of this date. Forest Practices rules and regulations still require appropriate protections (WAC 222-16-080(6)).

Request:

Please correct the inaccurate statement concerning spotted owls and correctly state the appropriate FP Rule mitigation measures that are required.

- 3-75 and 3-78. “The proposal would not impact the White Salmon SOSEA’s 40% suitable Spotted Owl habitat level.” This is an inaccurate statement. The habitat level is calculated on a circle by circle basis, not over the entire SOSEA. There is a small mapped portion of potential habitat in one of the two circles in the proposal.

Request:

Please document whether this proposal (including all of the associated timber harvests) will harvest suitable owl habitat (WAC 222-16-085) and or impact the suitable habitat totals for one of the spotted owl circles, if that is the case (WAC 222-10-040).

- 3-209 “The Haran Farmstead is recommended as ineligible for the NRHP.” This statement may or may not be accurate. This site has been listed in DNR’s GIS FP Risk Assessment Tool as a site that may require protection if there is any potential for disturbance to the site. Any potential impacts to the historic site may require a site

protection plan.

Request:

Contact the Washington State Department of Archaeology and Historic Preservation. Document why there will be no adverse impacts or how such impacts can be mitigated with a site protection plan if necessary.

Surface Mines and Reclamation

Issue:

DNR permits and regulates surface mining reclamation on state and private lands. The proposal calls for at least 2.5 miles of new road construction as well as significant improvements and widening of the existing forestry roads to handle the oversized loads not associated with timber management. Since this work as proposed is being performed primarily to facilitate a wind power project, the DNR will not allow the use of aggregate from pits or quarries that do not have an active surface mine reclamation permit.

Request:

Please note that aggregate used to improve/construct roads, or for construction of Whistling Ridge project related foundations and infrastructure must come from a permitted surface mine, not from a forestry pit or quarry locations (exempt/unpermitted surface mine sites).

Subject: Whistling Ridge Energy Project (Your Reference: KEC-4)

Dear Mr. Montano:

This letter responds to your request for consultation under section 7(a)(2) of the Endangered Species Act of 1973, (ESA) as amended (16 U.S.C. 1531 *et seq.*) on the proposed Whistling Ridge Energy Project LLC (Project). Your biological assessment (BA), dated June 8, 2010, was received by the U.S. Fish and Wildlife Service's (Service) Washington Fish and Wildlife Office on June 9, 2010. You requested concurrence with your determination that the Project "may affect, but is not likely to adversely affect" the threatened northern spotted owl (*Strix occidentalis caurina*) (spotted owl). No designated spotted owl critical habitat occurs on or near the Project; therefore, no critical habitat will be affected.

This letter is based on information provided in the BA, the 2009 Final Report "*Results of Northern Owl, Western Gray Squirrel and Northern Goshawk Surveys Conducted for the Whistling Ridge Wind Energy Project*", the Draft Environmental Impact Statement, a field trip to the Project attended by staff of the Service and the Washington Department of Fish and Wildlife on May 14, 2009, and a meeting between Service and Washington Department of Fish and Wildlife staff on August 28, 2009.

Project Location

The proposed Project is located on private land, approximately 7 miles northwest of the city of White Salmon in Skamania County, Washington. The Project encompasses approximately 1,152 acres of land in sections 5, 6, 7, 8, and 18 of Township 3 North, Range 10 East, and in section 13 of Township 3 North, Range 9 East, Willamette Meridian.

TAKE PRIDE
IN AMERICA 

Andrew Montano

2

Summary of the Proposed Action

The Bonneville Power Administration (BPA) is proposing to interconnect up to 70 megawatts (MW) of new wind energy from the proposed Project to the North Bonneville-Midway 230-kilovolt transmission line. The interconnect would occur at a new sub-station to be built about 5 miles west of BPA's Underwood Substation in Skamania County. The interconnect was requested by the Project proponent, SDS Lumber Company, in Bingen, Washington. The SDS Lumber Company has created a new limited liability company called Whistling Ridge Energy LLC (WRE) that would finance, develop, and operate the Project. The Project is expected to operate for at least 30 years. The proposed Project would consist of no more than 50, 1.2 MW- to 2.5- MW wind turbines up to 426 feet tall, as well as infrastructure such as newly constructed and improved roads, transformers, underground energy-collector lines, a substation, and an operations and maintenance facility. The Project area consists of 1,152 acres of mostly commercial forests in various age categories, of which 384 acres would be disturbed by the Project, and all but 61 acres would remain in commercial forest. Most of the property where the turbine strings are planned has been recently clear-cut harvested and will be further disturbed with the development of the turbine pads.

Status of Spotted Owls in the Project Area

Two spotted owl territories are located on Washington State Department of Natural Resources (DNR) and National Forest lands located north of and adjacent to the Project. The site center for the Mill Creek owl (MSNO#0991) is located in Township 4 North, Range 10 East, Section 28 and the site center for the Moss Creek owl (MSNO#1003) is located in Township 4 North, Range 9 East, Section 35. Both of these owl territories are within Washington State's White Salmon Spotted Owl Special Emphasis Area, which provides added protection for spotted owls located on private lands through the Washington State Forest Practices Rules. Both of the 70 acre core areas are located on DNR lands and are provided additional protection from their Habitat Conservation Plan for the State Trust Lands.

The estimated median annual home range size for the spotted owl in this physiographic province is approximately 6,657 acres, which for regulatory purposes is assumed to lie within a 1.8-mile radius circle. Best available science indicates that when the amount of suitable spotted owl habitat within a circle falls below 40 percent, there is a likelihood of "take" under section 9 of the ESA. Each of these territories contains more than 40 percent suitable spotted owl habitat (J. Spadaro pers. com. 2009). A small portion of the Moss Creek circle overlaps the northern end of the Project and contains dispersal habitat and some foraging habitat. However, removal of this small amount of habitat (2 acres) would not reduce the habitat acreage below 40 percent in either territory.

Protocol spotted owl surveys were conducted within these estimated home ranges during the 2003, 2004, 2008, and 2009 breeding seasons. Numerous barred owls (*Strix varia*) were detected, but no spotted owls were detected; however, because of the presence of barred owls with these territories, it is possible that spotted owls were present but did not vocalize. The 2009 surveys followed the Service's revised 2010 protocol to better elicit spotted owl responses in the presence of barred owls (USFWS 2010) (the consultant contacted the U.S. Fish and Wildlife

Andrew Montano

3

Service on May 29, 2009, how to call for spotted owls in light of the numerous barred owl detections north of the Project and was provided the changes to the 1992 surveying protocol prior to the release of the 2010 revised protocol on February 18, 2010). However, in 2010 surveys were continued in the Project area. On May 6, 2010, a single male spotted owl was detected while conducting a night visit in the far north edge of the Mill Creek provincial range on DNR property. On May 7th, the biologist conducted a follow-up visit during the daytime. The bird exhibited non-nesting behaviors. On May 29, the biologist conducted a second visit and located what appeared to be the same male owl that was detected on May 7th. The bird on both survey visits took and consumed mice, indicating that it is a single male not supporting young. Spotted owl survey protocol requires 3 sightings of a spotted owl single within the same area within the breeding season to be regarded as a territorial single. This does not change the analyses of effects of the Project to spotted owls, as addressed below, regardless of whether or not a territorial status is established.

Effects from Construction

Approximately 2 acres of spotted owl dispersal habitat (with some patches of foraging habitat) would be removed from the Moss Creek spotted owl site by the construction of the Project from the northern end of the turbine string. This habitat is located at the southern extremity of the circle and is on the edge of the Project that has already been clear-cut by SDS Lumber Company, and would not remove suitable spotted owl habitat below 40 percent in the territory (J. Spadaro pers. com. 2009). The discovery of the new owl in 2010 in the extreme north of the Moss Creek owl circle is located more than 2 miles northwest of the northern most turbine. Because of this, and since the remainder of the Project does not contain suitable spotted owl habitat, we believe that potential effects to spotted owls as a result of habitat loss or degradation is expected to be insignificant.

Effects from Maintenance

The effects of the operation and maintenance of the Project are anticipated to be minor. Maintenance of the Project would occur primarily around the turbine pads, inside the nacelle (the nacelle is the part of the turbine that houses the generator, transmission gears, and the shaft that turns the generator that, on its opposite end, bolts to the hub that the blades attach to) and the blades. In addition, because the landscape will be maintained as young second-growth forest we do not expect disturbance to nesting owls from maintenance because owls are not likely to nest in these younger forest stands (non-habitat).

Risk of Spotted Owl Collision with Wind Turbines

Bird mortality from collisions with wind turbines is well documented and varies greatly by bird species and flight behavior (Smallwood et al. 2009). Spotted owls are forest-dwelling birds that are strongly associated with older conifer forests. Spotted owls primarily use closed-canopy forested habitats throughout their entire lives for nesting, roosting, foraging, and dispersal (Forsman et al. 1984). Because spotted owls are non-migratory, forest-dwelling owls, they are at much lower risk of exposure to wind turbines than many other bird species, which typically use non-forested upland habitats for foraging and migration.

Andrew Montano

4

Spotted owls less commonly use recent clear-cuts or burned areas for foraging, but spotted owls do occasionally cross such areas while dispersing between patches of older forest (Forsman et al. 1984; 2002). Although spotted owls do occasionally disperse across open areas, they usually avoid crossing such areas by travelling through corridors of forested habitat (Forsman et al. 1984). The typical flight behavior of the spotted owls is described in the *Birds of North America*:

“Quick wingbeats interspersed with gliding flight. Not a fast flier. Long flights unusual except during dispersal... Flight labored when attempting to fly to a higher perch or up to nest sites. When gaining altitude in the forest canopy, makes a series of short climbing flights rather than continuous flight. Flights above the forest canopy probably rare except during dispersal. (Gutierrez et al 1995, p. 9).”

During natal dispersal, spotted owls will occasionally cross open areas and, as noted above, may occasionally fly above the level of the forest canopy. Considering spotted owl flight behavior, above-canopy flights are most likely to occur in steep-walled valley settings, where the spotted owl may choose to fly across a valley above the level of the forest canopy on the valley floor. The Whistling Ridge site is located on a forested ridge top that will be maintained as a cleared area for the wind turbines. Spotted owls dispersing across the ridge are more likely to disperse through forested areas along the perimeter of the site, rather than crossing the open areas near the turbines. If a spotted owl were to fly through the turbine array, it would most likely cross at an altitude that is at or below the level of the adjacent forest canopy, and well below the height of the lower of the wind turbine blades (164 – 425 ft. above ground level).

To assess the risk of owl collision with the turbine blades or towers, we convened a review panel of three spotted owl biologists from this office and one spotted owl biologist from the Washington Department of Fish and Wildlife. Based on our knowledge of spotted owl flight behaviors and habitat preferences, the group concluded that the risk of spotted owl collisions with turbines at this site is low.

Considering the strong association of spotted owls with the forest canopy, and spotted owl flight behaviors, we conclude that it is unlikely that spotted owls would cross the Whistling Ridge site at an altitude that would put the owls at risk of collision with turbine blades. Therefore, the risk of a spotted owl collision at this site is considered to be discountable.

Concurrence

Considering the current status of spotted owls in the Project area, and the anticipated Project effects, we concur that the Project is not likely to adversely affect the spotted owl.

This concludes informal consultation pursuant to the regulations implementing the ESA (50 CFR 402.13). This action should be re-analyzed if new information reveals effects of the action that may affect listed species or designated critical habitat in a manner or to an extent not considered in this consultation; if the action is subsequently modified in a manner that causes an effect to a listed species or designated critical habitat that was not considered in this consultation; and/or, if a new species or critical habitat is designated that may be affected by this Project.

Andrew Montano

Other Comments

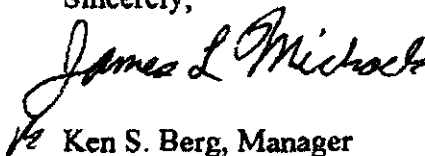

While reading through the DEIS for this Project, we found some issues that require your attention. On Page 4-4, first paragraph, last sentence "As described in Section 3.4 Biological Resources, no listed species or critical habitat are anticipated to be affected by the Project. This statement equates to a finding of no effect. To the contrary, the biological assessment prepared by BPA made a finding of "may affect, not likely to adversely affect"; hence, the need for this informal consultation.

On page 4-5, 4.5 Migratory Bird Treaty Act, both the interpretation of this Act and the effects of the Project to avian species are in error. Both avian studies and the analyses in Section 3.4 Biological Resources state that many avian species occur within the Project and that some of those individuals will be killed (collisions with blades or tower) and contrary to the statements provided in the Biological effects Section. Within this context, how is it concluded at 4.5, that impacts to migratory birds could only occur through temporary disturbance during construction?

On page 4-5, 4.7 Bald Eagle Protection Act, the last statement "Because the Project would not involve intentional acts or acts in wanton disregard of bald or golden eagles, this Project is not considered to be subject to compliance with the Act.", is an inaccurate statement. Federal Law Enforcement and the U.S Department of Justice decide whether or not an eagle killed by a project is subject to compliance under this Act.

The Service appreciates your efforts to protect listed species and the habitats on which they depend while meeting your mission to provide the public with reliable electricity. If you have any questions regarding this consultation or your responsibilities under the Act, please contact Jim Michaels of this office at (360) 753-7767.

Sincerely,

Ken S. Berg, Manager
Washington Fish and Wildlife Office

Andrew Montano

RE: Whistling Ridge Wind Project

Mr. Luce:

The White Salmon Valley School District Board of Directors understands that wind energy farms are potentially divisive, particularly in the Underwood portion of the school district. However, the Whistling Ridge Wind Project would have the effect of broadening the tax base when paying for school levies and bonds.

This project would add approximately \$100-\$150 million of new taxable value to the school district. It would lower the levy rate for everyone in the district considerably, thereby reducing everyone's taxes, possibly enabling the district to pass future levies more readily.

Using 2010 levy rates, the amount of reduction per thousand dollars of assessed valuation would range from 16 cents to 23 cents. A homeowner with a home assessed at \$250,000 would save between \$38.00 and \$55.00 per year. A homeowner with a home assessed at \$500,000 would save between \$76.00 and \$111.00 per year. Due to unique characteristics of our school district, we have recently lost important statewide levy equalization funds. As a result of this, and the general reductions in statewide education funding, the approval of levies might be an increasingly important source of revenues to our district in the future.

Economically this project has the potential to benefit the community and the school district by adding revenues, without creating additional demands for services or impacts on the school system.

Sincerely

Jerry A. Lewis
Superintendent

Re: Comments on Draft EIS for Whistling Ridge Energy Project DOE EIS - 0419:
Recreation and Land Use Section

Dear Messrs. Montaña and Posner:

This office represents Save Our Scenic Area (SOSA), a Washington corporation representing persons interested in the scenic, recreational and natural values of the Columbia Gorge. SOSA's primary mission is to preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. WRE proposes to construct as many as 50 wind turbines on ridge lines on their property in Skamania County to produce a minimum of 70 MW. I write today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

In this letter, I provide comments on behalf of SOSA regarding the "Land Use and Recreation" chapter of the DEIS found at Section 3.8 at page 3-134 to 3-155. SOSA's comments will be divided between the recreation and land use sections.

1. RECREATION IMPACTS.

The DEIS provides only a listing of recreational resources in the area with minimal discussion of the impacts that the wind turbine facilities will have on such areas. This discussion is inadequate. The DEIS should not only disclose the affected areas, but also the impacts on such areas.

Of particular concern is the impact that the turbine operations will have on these areas, particularly visual impacts. This section should be expanded to include impacts on key viewing areas within the scenic area and other areas affected by visual and noise impacts from wind turbine operations. Discussion of mitigation measures should be included which describe alternatives of reduction or relocation of turbines as well as alternative site locations.

2. LAND USE REGULATION.

This section of the DEIS includes discussion of applicable land use regulations. The only land use regulations discussed are the Skamania County's comprehensive plan and land use regulations.

EFSEC has previously taken up the issue of land use consistency during proceedings held on May 6, 2009. Comments and briefs were filed by various parties during that time, including SOSA. Instead of making a decision on land use consistency at the time, EFSEC decided that this issue would be passed to the project adjudicative hearings. Accordingly, we find it inconsistent with the Council's responsibility to enter conclusions regarding land use consistency in the DEIS before it hears evidence in adjudicatory hearings. This is plainly prejudgment of a matter before the Council in violation of the appearance of fairness doctrine.

As to the sections of the DEIS dealing with land use regulation, a determination made that the proposal is "consistent" with the Skamania County comprehensive plan and development regulations is erroneous. SOSA has provided comments on that subject in its letter to the Council dated May 6, 2009 which is attached hereto and incorporated by reference herein. In that letter SOSA provided detailed legal authority and factual background that demonstrated that the construction and operation of wind turbines at the location proposed by the applicant is clearly contrary to the 2007 Skamania County Comprehensive Plan. Since the zoning code of the county preceded the 2007 comprehensive plan, it cannot be considered to implement any of its terms.

Fundamentally, Skamania County has never considered whether or not wind turbines are appropriate in any part of the County, much less within the conservancy designation in the comprehensive plan. As described in SOSA's May 6, 2009 letter, consideration of a draft ordinance that might have regulated the wind turbines was abruptly dropped, and never taken up again, by the Skamania County Commissioners after they learned they had to do an environmental impact statement before considering it. The apparent attempt of the DEIS to blame "local interest groups" for keeping the old zoning ordinance in effect is accordingly misplaced. The statement in the DEIS at page 3-145 that the "proposed updates are currently under appeal by local interest groups" is wrong. As noted in SOSA's May 6, 2009 letter attached hereto, Skamania County did not appeal the ruling against it by the Hearing Examiner and her decision is final.

In summary, the proposal is not consistent with local planning and zoning regulations and the findings and conclusions regarding this ISSUE should be revised for the final EIS.

3. FOREST LAND UNDER G.M.A.

In addition, this section of the DEIS fails to discuss or describe the impact of the Growth Management Act, RCW ch. 36.70A and its regulations on the subject proposal. Though Skamania County is not a county required to plan under GMA, it is required by GMA to designate natural resource land, including:

(b) Forest lands that are not already characterized by urban growth and that have long-term significance for the commercial production of timber[.]

RCW 36.70A.170. The purpose of such designation is to assure that forest lands of long term commercial significance will be protected by appropriate land use regulation.

It is apparent from the discussion in the EIS that the project site meets the definition of forest lands of long term commercial significance. As the DEIS indicates:

This site has been in commercial forestry use for the last century, during which the site has been logged over a series of approximately 50 year rotations.

DEIS at page 2-18. See also DEIS at page 1-9, "the site has a long history of commercial logging . . . "

The reason that forest lands are required to be identified is that such lands are intended to be protected and preserved from nonforestry uses. In the present case, industrial wind turbines are intended to cover significant portions of this commercial forest land, contrary to GMA's directives.

Further, this proposal is the first, or one of the first, to be sited in the timbered forest lands near the Columbia Gorge. Under these circumstances, the FEIS must consider whether this project will serve as a precedent for other or future projects impacting the scenic values of the Gorge and forested areas.

Finally, the DEIS at page 3-151 says that there will be no "changes to existing land uses, land use activities or development patterns." This conclusionary statement is unsupported by any objective evidence and is incorrect. It is well known that the placement of industrial wind turbines has a significant adverse impact on residential uses and tourism activities. This is true for most wind turbine locations, but is especially true in areas highly valued for scenic resources, including the Columbia Gorge, which

ARAMBURU & EUSTIS, LLP

July 16, 2010

Page 4

are prized for their aesthetic surroundings. Much more detailed analysis is required for adequate consideration of these issues.

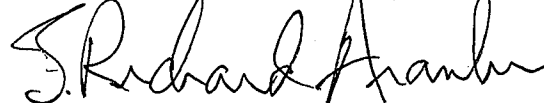

4. SOLAR ENERGY FACILITY

The DEIS discusses only the development of the site for wind energy facilities. The consideration of alternatives should be expanded to consider other alternate energy sources such as solar energy. Recently, a proposal for a 75 MW solar reserve has been made in Kittitas County (the Teamaway Solar Reserve, or "TSR"). The proposal will consist of approximately 145 acres for photovoltaic solar panels spread out over 900 acres. Such a proposal would reduce visual impacts and eliminate the noise impacts associated with wind turbine facilities, as well as eliminating the need for transportation of large towers and blades for wind turbines. This alternative should be fully considered in the DFEIS or FEIS.

Thank you for this opportunity to comment on the DEIS. SOSA trusts that the FEIS will provide facts and analysis discussed herein.

Sincerely yours,

ARAMBURU & EUSTIS, LLP

Re: Certificate of Land Use Consistency Review for
Whistling Ridge Wind Energy Project

Dear EFSEC:

This office represents the Save Our Scenic Area (SOSA), a Washington non-profit corporation concerned with the preservation of scenic, recreational and residential values and assets in the Columbia Gorge.

SOSA has closely followed the proposal of SDS Timber Company's Saddleback wind turbine proposal since its public announcement in late 2007. SDS changed the name of the proposal to the "Whistling Ridge Energy Project" (herein "WREP") when it applied to EFSEC. Most recently, SOSA was an appellant before the Skamania County Hearing Examiner in a successful challenge to the issuance of a determination of nonsignificance issued by Skamania County for its zoning code revisions. The Hearing Examiner has ruled that an environmental impact statement (EIS) will be required for the adoption of the new zoning code by the County.

SOSA writes today in response to the notice issued by EFSEC of a hearing on the question of whether the SDS proposal is consistent with local land use plans and zoning codes. The proposal is for multiple

wind turbines (50) on property located in eastern Skamania County. As will be demonstrated herein, the WREP proposal is not consistent with local zoning and there is no basis upon which EFSEC should attempt to preempt this local zoning.

1. STRUCTURE OF SKAMANIA COUNTY PLANNING AND ZONING.

Skamania County planning and zoning is governed by RCW 36.70, the County Planning Enabling Act. It is not one of the counties governed by the Growth Management Act RCW ch. 36.70A (GMA) and has not exercised the option to become a GMA county.

Skamania County first adopted a comprehensive plan in 1977, which was revised in 1991 with the creation of the Columbia River Gorge National Scenic Area (the "Scenic Area"). The 1977 Comprehensive Plan ("the 1977 Plan") is attached hereto as Attachment A. As will be described below, Skamania County recently (June, 2007) adopted a completely revised Comprehensive Plan, referenced herein as the "2007 Plan."

The County originally adopted a zoning code and map in 1985, which has been amended at various times over the years, the most recent of which was by Ordinance 2005-02 in 2005. The existing zoning code would presumably be consistent with the then adopted comprehensive plan from 1977.¹

After review by the planning commission, Skamania County adopted a new comprehensive plan in June, 2007. In the fall of 2007, Skamania County proposed a new zoning ordinance to implement the new comprehensive plan.

The adoption of the new zoning code requires procedural and substantive compliance with the terms of the State Environmental Policy Act, RCW 43.21C (SEPA). Skamania County has also adopted a local SEPA ordinance that governs the County's procedures under

¹ The Council is requested to take judicial notice of both the 2007 Plan and the current Skamania County zoning code.

SEPA. Skamania County is required by SEPA and its SEPA ordinance to make a "threshold determination" as to whether to prepare an EIS for its new zoning ordinance. This new zoning ordinance, for the first time in the history of planning and zoning in Skamania County, had specific provisions for large scale wind turbine facilities. ²

Skamania County's responsible SEPA official, Planning Director Karen Witherspoon, issued a "mitigated determination of nonsignificance" or MDNS for the new zoning code proposal, which included large scale wind turbine regulations. Consistent with the terms of the Skamania County SEPA ordinance, the responsible official's MDNS was appealed to the Skamania County Hearing Examiner by both SOSA and the Friends of the Gorge. The Hearing Examiner held an open record hearing on January 21 and 22 at which the County vigorously defended its MDNS decision.

According to testimony from county officials at the hearing before the County's Hearing Examiner, representative of SDS had met several times with the Skamania County staff to discuss their proposed Saddleback project, but never submitted an application. BPA officials also were in attendance at such meetings according to Ms. Witherspoon's testimony.

On February 19, 2009, the Hearing Examiner entered her decision reversing the MDNS issued by the Responsible Official. See Attachment B hereto. As may be seen from the Findings and Decision, the testimony at the hearing focused on the adverse environmental impacts from wind turbines, centering on SDS's Saddleback proposal. That decision was not appealed by the County to Superior Court and is final. Under this ruling, before any decision is made by Skamania County on a zoning code map, an environmental impact statement must be prepared. Because the environmental impact statement must "accompany the proposal through the agency review process" (SEPA), the Skamania County Planning Commission must also reconsider any decisions it makes on the zoning ordinance based on the upcoming EIS.

² A copy of this proposed zoning ordinance is attached to the WREP application as Appendix F.

As of the date of this submission, no steps have been taken by Skamania County to prepare an environmental impact statement on its proposed zoning code and map.

2. THE WIND TURBINE PROPOSAL IS NOT CONSISTENT WITH THE EXISTING COMPREHENSIVE PLAN.

As noted above, Skamania County adopted a new comprehensive plan for the County in June, 2007. That ordinance replaced a now 30 year old comprehensive plan. See the 2007 Plan at 7.

The 2007 Plan adopted three land use designations, Rural I, Rural II and Conservancy. Rural I was intend to "foster the optimum utilization of land within growing areas of the county. . . ." See page 23. Rural I is the only one of the three designations that allows commercial activity and light or heavy industry. The Rural II designation "is intended to provide for rural living without significant encroachment for land used for agricultural and timber." Page 24. The Conservancy designation is "intended to provide for the conservation and management of existing natural resources" and "logging, timber management, agricultural and mineral extraction are the main use activities that take place in this area." 2007 Plan page 25. Importantly, there has been no effort to amend the comprehensive plan since its adoption in June 2007 by the applicant here or any other party. In this regard, it is important to note that the state Growth Management Act requires that all counties designate "natural resource land" pursuant to RCW 36.70A.170 which includes forest, agricultural and mineral lands of "long term commercial significance." The County recognizes its responsibilities under GMA in the comprehensive plan at page 9 of the 2007 Plan. However, the County has not made a formal designation of such lands. The 2007 Plan essentially provides that designation in the Conservancy designation, which meets the RCW 36.70A.170 criteria: "Conservancy areas are intended to conserve and manage existing natural resources in order to maintain a sustained yield and/or utilization." 2007 Plan at page 25. The WREP is located in the Conservancy and Rural II land use designations.

Significantly, there is no mention of allowance for wind turbines or wind energy in the Rural II or Conservancy designations. "Industry" is permitted in the Rural I category, but not in the other two designations. The Conservancy designation includes only the following relating to utilities:

Public facilities and utilities, such as parks, public water access, libraries, schools, utility substations and telecommunication facilities.

2007 Plan, p. 25-26. The 2007 comprehensive plan does not allow "private" or "semi-public facilities and utilities." Once again, the failure to include these uses as "appropriate uses" within the 2007 Plan is significant. These uses were defined in the existing zoning ordinance in the "Definition-Interpretation" section at SCC 21.08.010:

"Semi-public facilities" means facilities intended for public use which may be owned and operated by a private entity.

That this definition was not incorporated into the 2007 Plan is indicative of the intent of the legislative body not to allow such uses and that they were not included within the 2007 Plan indicates a deliberate exclusion. Further, note that the 2007 Plan does not mention electrical energy facilities at all, indicating such facilities are not allowed.

It cannot be that the failure to mention wind energy facilities or wind turbines was a matter of oversight. As the Skamania County Hearing Examiner found in her MDNS decision, there was interest expressed by the applicant here in developing a wind farm well before the Comprehensive Plan was adopted:

However, SDS Lumber has approached Skamania County on multiple occasions over the past several years to discuss a possible large-scale wind energy project (Saddleback Project) on its property within the County. Ms. Witherspoon (the Skamania County Planning Director) met with representatives of SDS and entities such as the Bonneville Power Administration on two or three occasions

for "pre-application meetings" to discuss the permitting requirements for the project. Multiple pre-application meetings have been held because of changes in the development team. The project, if developed, would consist of at least 40 wind turbines. Although the last formal pre-application meeting was approximately two years ago, individuals associated with the project have been involved in the County's code update process and the president of SDS was present at the subject appeal hearing.

Findings, Conclusions and Decision of the Hearing Examiner for Skamania County ("FCD"), Finding 37, page 13. In fact, as the Hearing Examiner found:

The Bonneville Power Administration (BPA) has produced a map entitled "Current and Proposed Wind Energy Interconnections to BPA Transmission Facilities" (Exhibit D.4). This map depicts the SDS Saddleback project as a proposed wind generation facility of 70 megawatts (MW).

FCD, Finding 38, p. 14. Skamania County and its commissioners have long been aware of the Energy Overlay Zone adopted by the neighboring county to the east (Klickitat); indeed, testimony at the Hearing Examiner hearing on the MDNS revealed that Skamania County was asked by Klickitat County to participate in the EIS process for its overlay zone, but Skamania County declined.

As described herein, the 2007 Comprehensive Plan does not authorize or permit electrical energy or wind turbines within the County. Policy LU6.1 deals with uses authorized under the comprehensive plan:

Three types of uses should be established for each land use designation under this plan and for any zone established to implement this plan. If any use is not listed as one of the following types of developments, then the use is prohibited within that land use designation.

The Plan goes on to describe uses that may be listed as allowable uses, review uses and conditional uses. Policy LU6.2 specifies that:

In the development regulations, land uses which are neither allowed without review by the Planning Department, permitted subject to conditions, nor named as a conditional use under a land use designation made in this plan or in an ordinance implementing this plan should be prohibited without proof of a substantial change in circumstances.

As such, uses not described as appropriate under each land use designation are to be prohibited. As applied to the WREP proposal, wind turbines are not mentioned as an allowable, review or conditional use in either the Conservancy or Rural II designations and are thus not allowed.

Under the County Planning Enabling Act, RCW ch. 36.70, a county is required to prepare and adopt a comprehensive plan. RCW 36.70.320 provides that:

Each planning agency shall prepare a comprehensive plan for the orderly physical development of the county, or any portion thereof, and may include any land outside its boundaries which, in the judgment of the planning agency, relates to planning for the county. The plan shall be referred to as the comprehensive plan, and, after hearings by the commission and approval by motion of the board, shall be certified as the comprehensive plan. Amendments or additions to the comprehensive plan shall be similarly processed and certified

The statute goes on to proscribe that the comprehensive plan will be the basic source of reference when the County reviews any proposed project under RCW 36.70.450:

After a board has approved by motion and certified all or parts of a comprehensive plan for a county or for any part of a county, the planning agency shall use such plan as the

basic source of reference and as a guide in reporting upon or recommending any proposed project, public or private, as to its purpose, location, form, alignment and timing.

The report of the planning agency on any project shall indicate wherein the proposed project does or does not conform to the purpose of the comprehensive plan and may include proposals which, if effected, would make the project conform. If the planning agency finds that a proposed project reveals the justification or necessity for amending the comprehensive plan or any part of it, it may institute proceedings to accomplish such amendment, and in its report to the board on the project shall note that appropriate amendments to the comprehensive plan, or part thereof, are being initiated.

Unlike the GMA, zoning codes and maps are not required in counties operating under the county enabling act as RCW 36.70.550 provides:

From time to time, the planning agency may, or if so requested by the board shall, cause to be prepared official controls which, when adopted by ordinance by the board, will further the objectives and goals of the comprehensive plan. The planning agency may also draft such regulations, programs and legislation as may, in its judgment, be required to preserve the integrity of the comprehensive plan and assure its systematic execution, and the planning agency may recommend such plans, regulations, programs and legislation to the board for adoption.

As may be seen above, the 2007 Plan does not permit or allow wind turbine facilities by its terms. The County and this Council must apply the 2007 Plan as the "basic source of reference" in reviewing the SDS proposal and conclude that the present proposal is inconsistent with that plan.

3. PROPOSAL INCONSISTENT WITH SKAMANIA COUNTY ZONING ORDINANCE.

As described above, the proposal is inconsistent with the recently

adopted (June 2007) Skamania County Comprehensive Plan. Notwithstanding this defect, the applicant urges that the proposal is consistent with the existing zoning code. However, the existing zoning ordinance was adopted before the adoption of the 2007 Comprehensive Plan. Neither the Skamania County Planning Commission nor County Commissioners have adopted the existing zoning code as consistent with the 2007 Plan. Accordingly, the policies of the 2007 Comprehensive Plan cannot be applied to that code. Moreover, it is clear that the existing zoning ordinance does not permit the subject proposal.

Under Washington state law, development regulations or the zoning code must be consistent with the adopted Comprehensive Plan:

36.70.545. Development regulations--Consistency with comprehensive plan. Beginning July 1, 1992, the development regulations of each county that does not plan under RCW 36.70A.040 shall not be inconsistent with the county's comprehensive plan. For the purposes of this section, "development regulations" has the same meaning as set forth in RCW 36.70A.030.

Accordingly, if the existing development regulations are not consistent with the adopted 2007 Comprehensive Plan, then the zoning regulations are ineffective.

The applicant makes two attempts to demonstrate that its wind turbine proposal is consistent with the existing code, neither of which is persuasive.

This analysis begins with the important fact that the existing zoning code does not make wind turbines, wind energy or wind farms an allowable, review or conditional use in any zone. It is significant that "geothermal energy facilities" are listed as a conditional use in the FOR/AG10 and 20, Rural Estate zones. See SCC 21.56.030, 21.44.030. Indeed, "geothermal energy" is a specific type of an "Alternative energy resource" under the EFSEC statute at RCW 80.50.020(18). This indicates that the county was aware of types of alternate energy facilities, but only chose to allow only "geothermal

energy" as a conditional use, whereas "wind," another specifically listed "alternate energy resource" under RCW 80.50.020(18), is not permitted anywhere. Once again, this is not an oversight as "wind turbines" are specifically mentioned in the current code as exempt from height limitations in SCC 21.70.050. However, wind turbines, wind farms or a use related thereto is not listed as a permitted review use or conditional use in the zoning code. The only conclusion to be reached is that wind turbines are not authorized or permitted under the existing code.

The applicant also argues that Table 2-1 in the 2007 Plan at page 23 declares that certain uses are permissible in certain zones. The applicant states at page 4.2-6 of its application that:

There are three land use designations outside of the specific subarea plans: Rural I, Rural II, and Conservancy. The project area is designated as "Conservancy." Table 2-1 of the Comprehensive Plan identifies zones that are consistent with the Conservancy designation, including: Residential 10 (R-10), Rural Estates 20 (RES-20), Forest Land 20 (FL 20), Commercial Resource Land 40 (CRL 40), Natural (NAT) and Unmapped (UNM). The project site is located in the FL 20, R-10, and UNM zones, all of which are consistent with the Conservancy designation.

However, Table 2-1 refers not to the current code, but to code that might be adopted after the 2007 Plan was adopted. This is clear from the explanation of the table at page 22:

Table 2-1 shows the comprehensive plan designations and consistency of each potential zoning classification. The Plan Designation to Zoning Classification table is provided to identify those zoning districts that are consistent with each plan designation. Those districts, which are not consistent with the plan designation, are not permitted within the plan designation. This information is necessary to determine when, where and under what circumstances these designations should be applied in the future.

(Emphasis supplied). Thus the table references "potential" and "future" zoning classifications, not ones under the existing code. This is further demonstrated by the fact that the zoning classifications in Table 2-1 do not refer to the existing code, but to future code classifications. Thus, the "Commercial Resource Land 40" zone is a potential new zone as referenced in the draft zoning ordinance at Appendix F to the application. Under the existing code, the like zone is the Resource Production Zone or (FOR/AG20) zone, which is not mentioned in Table 2.1.

Thus Table 2-1 does not establish consistency with the existing code, but serves as a guide to a new zoning code, which has not yet been adopted and cannot be until an environmental impact statement is prepared under the Hearing Examiner's ruling.

The applicant argues that wind turbines are allowed as a use under the terms of the "Unmapped" area of the code. However, the terms of the 2007 Comprehensive Plan specifically provide that if a use is not listed as a conditional or allowable use within the land use designation under the plan then it will be prohibited. See discussion above and 2007 Plan at pages 30-31. The 2007 Comprehensive Plan also specifically provides under Policy LU2.6 that: "Building permits, septic tank permits, or other development permits issued by the County for any project will be in conformance with this Comprehensive Plan." (Emphasis supplied.) Since the "Unmapped" areas do not have a specific zone designation they must be regulated by the designation given by the 2007 Plan.

In addition, to determine the meaning of language within the 2007 comprehensive plan, it is useful to review the 1977 comprehensive plan it replaced. A copy of that plan is Attachment A hereto. That plan had identical land use designations, Rural 1, Rural 2 and Conservancy. See pages 91-92. Importantly, the 1977 comprehensive plan "Conservancy" designation provided:

The following inappropriate uses may be allowed on a conditional or temporary basis:

- a. Industrial
- b. Commercial

See page 92. The "NOTE" at the bottom of page 92 states:

Land uses which are considered by this plan to be inappropriate, may be established in Rural 2 and Conservancy land use areas, subject to public review and approval by the Board of County Commissioners. Such uses might include light industrial facilities, small commercial businesses, airstrips, portable sawmills, and other wood processing equipment.

(Emphasis in original). When the 2007 comprehensive plan was adopted, it retained verbatim the sentence setting the purpose and objective:

"Conservancy areas are intended to conserve and manage existing natural resources in order to maintain a sustained resource yield and/or utilization."

Compare page 25 of the 2007 comprehensive plan with page 92 of the 1977 comprehensive plan. However, the 2007 comprehensive plan removed any allowance for "Industrial" or "Commercial" uses either as permitted, review or conditional uses in the Conservancy designation.

The inclusion in the 1977 Plan of the "inappropriate" industrial and commercial uses also explains why the "Unmapped" zone (guided by the 1977 Plan) allowed uses which were "not nuisances," to take account of their characterization as "inappropriate." However, with the adoption of the 2007 comprehensive plan, and the elimination of any possibility of any "inappropriate uses," allowance of uses that were not nuisances became inconsistent with the comprehensive plan and thus illegal.

In addition, the applicant contends that its private wind turbine proposal should be considered "semi-public facilities and utilities" and thus an allowable conditional use in the existing FOR/AG10 and 20 zones. However, the Comprehensive Plan says that "Public Facilities and Utilities" (emphasis supplied) are allowed in the Conservancy and Rural II Land Use Designations, not "Semi-public Facilities and Utilities." Since both of these uses are defined terms in the existing

code, it is very clear that when the Commissioners chose to include only one in the comprehensive plan, it was a deliberate decision. In addition, the 1977 plan made specific provisions in the Rural 2 zone for "Semi-public" uses. See page 91. "Semi-public" uses were specifically eliminated from the 2007 comprehensive plan in all land use designations, including "Conservancy." See 2007 Plan, p. 24-26. Further, the provision in the comprehensive plan gives examples of the kinds of "public facilities and utilities" which are appropriate in the zone "such as parks, public water access, libraries, schools, utility substations and telecommunication facilities." It cannot be said up to 50, 425 foot tall wind turbines as the WREP would intend, with an extensive road network, can be equated to such modest and common place uses as parks, public accesses and schools. If these were intended to include wind turbines, wind farms and other alternative energy facilities, the comprehensive plan would have said so by simply adding a definition of such uses. Of course if there was a proposal to include large wind farms within the 2007 Plan, it would have likely ignited significant controversy.

In essence, inclusion of a large scale wind farm as a "facility and utility" permissible in the Conservancy designation is a de facto amendment of the comprehensive plan. It does so without adherence to the requirement that the planning commission first review the comprehensive plan or any amendments under RCW 36.70.320 and .410, that there be a public hearing and a final decision by the Commissioners. RCW 36.70.380 and .420. In addition, the inclusion of wind turbine or other facilities in the comprehensive plan would have required new SEPA compliance. Given that the inclusion in the zoning code of provisions for wind farms has resulted in the requirement for an environmental impact statement, the same would likely be true for the comprehensive plan adoption.

In addition to the foregoing, the issue of consistency between the existing zoning code and the comprehensive plan arose in the hearing before the Skamania County on the appeal of SOSA and Friends challenging the County MDNS for the new zoning code. SOSA in particular alleged that the 2007 Comprehensive Plan was inconsistent with the proposed zoning ordinance. In response, the County argued that the allowance of wind turbines in the proposed

zoning ordinance did not have a significant impact because wind turbines were already allowed. This issue was resolved in favor of SOSA when the Hearing Examiner found:

The 2007 Comprehensive Plan does not contemplate the type of energy facilities described in the Planning Commission Recommended Draft.

FCD, Finding 18, page 8. As an issue regarding the comprehensive plan, which was actually litigated between the County, SOSA and Friends, the County is now prevented from contesting this conclusion under the doctrine of claim preclusion or *res judicata*. Washington law is clear that *res judicata* applies to administrative proceedings:

Res judicata, modernly called claim preclusion, P. Trautman, Claim and Issue Preclusion in Civil Litigation in Washington, 60 Wash.L.Rev. 805 (1985), applies to quasi-judicial decisions by administrative tribunals as well as to judicial decisions by courts. *State v. Dupard*, 93 Wn. 2d 268, 274, 609 P.2d 961 (1980); *Miller v. St. Regis Paper Co.*, 60 Wn. 2d 484, 485, 374 P.2d 675 (1962); see *McCarthy v. Department of Social and Health Servs.*, 110 Wn. 2d 812, 823, 759 P.2d 351 (1988) (collateral estoppel); *Malland v. Department of Retirement Sys.*, 103 Wn. 2d 484, 490, 694 P.2d 16 (1985) (same). The Board's 1985 decision was quasi-judicial because it denied a proposed plat, and an administrative decision denying a proposed plat is quasi-judicial. *Miller v. Port Angeles*, 38 Wn. App. 904, 908, 691 P.2d 229 (1984), review denied, 103 Wn. 2d 1024 (1985); *Lechelt v. Seattle*, 32 Wn. 2d 831, 835, 650 P.2d 240 (1982), review denied, 99 Wn. 2d 1005 (1983); see RCW 58.17.100 (findings of fact required); RCW 58.17.180 (review is by writ of review). Therefore, the Board's 1985 decision was subject to *res judicata* at such time as it became final. *Columbia Rentals, Inc. v. State*, 89 Wn. 2d 819, 821, 576 P.2d 62 (1978) (final judgment is *res judicata*); *Pinkney v. Ayers*, 77 Wn. 2d 795, 796, 466 P.2d 853 (1970) (interlocutory order is not *res judicata*).

Lejeune v. Clallam County, 64 Wn. App. 257, 264-265, 823 P.2d 1144, (1992).

The finding by the Hearing Examiner that the 2007 comprehensive plan did not contemplate the wind energy facilities described in the zoning ordinance is binding on the County. Further, the existing zoning code, even if adopted by the County to implement the 2007 Plan (which it was not), does not permit large scale wind facilities.

5. THE RECOMMENDED DRAFT OF THE PLANNING DEPARTMENT CANNOT BE CONSIDERED BY EFSEC.

At Appendix F of its application, SDS argues that the EFSEC should consider a draft, unadopted zoning code and map. EFSEC will commit error if it considers the proposed code for two reasons.

First, zoning codes do not become effective until they are adopted by the legislative body with jurisdiction. Zoning codes and maps are considered "official controls" under RCW 36.70.02(11):

(11) "Official controls" means legislatively defined and enacted policies, standards, precise detailed maps and other criteria, all of which control the physical development of a county or any part thereof or any detail thereof, and are the means of translating into regulations and ordinances all or any part of the general objectives of the comprehensive plan. Such official controls may include, but are not limited to, ordinances establishing zoning, subdivision control, platting, and adoption of detailed maps.

See also RCW 36.70.560. RCW 36.70.570 specifically requires that:

Official controls shall be adopted by ordinance and shall further the purpose and objectives of a comprehensive plan and parts thereof.

(Emphasis supplied). Zoning ordinances and zoning maps may only be

adopted after a public hearing and recommendations by the Planning Commission under RCW 36.70.320 and .420. There is no provision in EFSEC legislation to consider unadopted codes, or ones under consideration.

Second, the Skamania County Hearing Examiner has ruled the MDNS issued by the responsible official in Skamania County was issued in error. The ruling of the Examiner is as follows:

The Determination of Nonsignificance is reversed, and remanded to the County for preparation of an Environmental Impact Statement for the zoning code map and text amendments.

FCD, p. 29.

Under the terms of SEPA, the EIS when completed "shall accompany the proposal through the agency review processes; . . ." RCW 43.21.030(2)(d). In the present case, the Planning Enabling Act requires that before an agency adopts a zoning ordinance or maps, a public hearing must be held by the Planning Commission under RCW 36.70.580:

Before recommending an official control or amendment to the board for adoption, the commission shall hold at least one public hearing.

Following the public hearing, the Planning Commission must make a recommendation to the County Commissioners under RCW 36.70.600.

The recommendation to the board of any official control or amendments thereto by the planning agency shall be by the affirmative vote of not less than a majority of the total members of the commission. Such approval shall be by a recorded motion which shall incorporate the findings of fact of the commission and the reasons for its action and the motion shall refer expressly to the maps, descriptive and other matters intended by the commission to constitute the plan, or amendment, addition or extension thereto.

The indication of approval by the commission shall be recorded on the map and descriptive matter by the signatures of the chairman and the secretary of the commission and of such others as the commission in its rules may designate.

For SEPA purposes, the "existing agency review process" involves, at a minimum, public hearings before the Planning Commission, a recommendation by the Planning Commission and action by the County Commissioners. Each of these processes will require that a final EIS be prepared and available for those bodies. Thus any action previously taken, or recommendations made, must be reconsidered in light of Hearing Examiner's requirement that an EIS be prepared. Since the County has not yet prepared an EIS on its zoning ordinance, any existing drafts of a proposed ordinance may not be considered by EFSEC.

6. THE ROAD ACCESS TO THE SITE IS NOT PERMITTED BY SCENIC AREA RULES.

The application filed herein describes the improvement and widening of a road that appears to be the primary access to the site. Approximately 2.1 acres of this road are located in the National Scenic Area and are controlled by Skamania County Scenic Area regulations. The Friends of the Columbia River Gorge has addressed this issue in correspondence and SOSA adopts by reference the position stated by Friends on this issue in their submission.

7. SKAMANIA COUNTY CERTIFICATE OF LAND USE CONSISTENCY.

SOSA has just received Skamania County Resolution 2009-22 which purports to adopt a Certificate of Land Use Consistency for the WREP proposal. This Resolution was adopted on May 5, 2007 by the Skamania County Commissioners. Copies of the Resolution and its accompanying 28 page staff analysis were not available prior to adoption. Because of its late adoption, and lack of notice, SOSA is not able to provide a detailed response to the Resolution at this time. Neither county staff nor the commissioners provided notice of the

May 6, 2009

Page 18

content of what was intended to be adopted and there were no public hearings on the matter. The Planning Commission for Skamania County was neither contacted or consulted regarding this matter. Accordingly, SOSA requests a two week delay in the close of the record on the land use consistency hearing to provide comments on the county's resolution.

SOSA does have one preliminary comment. As noted above, the County's 2007 comprehensive plan contains no provisions for wind energy facilities in any land use designation. Notwithstanding this obvious deficiency, the County Commissioners proposed a zoning ordinance and map that would allow wind energy facilities in Conservancy designations. The County's decision not to prepare an environmental impact statement on the zoning code and map was appealed to Skamania County's own Hearing Examiner. She not only reversed the MDNS issued by the County (see Attachment B), but also ruled that the "2007 Comprehensive Plan does not contemplate the type of energy facilities [among them large scale wind energy facilities] described in the Planning Commission Recommended Draft." The County did not appeal the Hearing Examiner decision to the Superior Court.

Now, in the letter accompanying the submission of Resolution 2009-22 to this Council, everyone is told that:

Since this decision (of the Hearing Examiner requiring the environmental impact statement) the map and updates for the Zoning Ordinance project have been permanently placed on hold. It has not been decided whether or not the County will continue with this project or start from scratch when the zoning update process resumes.

May 4, 2009 letter from Karen Witherspoon to EFSEC, page 2.

It is clear that the County, having been denied the approval of wind turbines in legally appropriate processes, has now decided to go through the "back door" to try to legalize large scale wind farms by simply deciding that they are consistent with existing codes. However, as demonstrated above, the adopted comprehensive plan and zoning ordinances do not allow such facilities. It is likely that the County's

May 6, 2009
Page 19

actions, as interpretations of land use codes, will be challenged as illegal under the Washington Land Use Petition Act. In the meantime, EFSEC should refuse to consider the county's position on this matter or dismiss it and hold that the proposed project is not consistent with the comprehensive plan and zoning ordinances.

Based on the foregoing, SOSA submits that the WREP is inconsistent with the 2007 Skamania County Comprehensive Plan and current zoning code and EFSEC should so conclude.

Thank you in advance for your consideration of our views.

Sincerely yours,

Re: Comments on Draft EIS for Whistling Ridge Energy Project DOE EIS - 0419:
Recreation and Land Use Section

Dear Messrs. Montañó and Posner:

This office represents Save Our Scenic Area (SOSA), a Washington corporation representing persons interested in the scenic, recreational and natural values of the Columbia Gorge. SOSA's primary mission is to preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. WRE proposes to construct as many as 50 wind turbines on ridge lines on their property in Skamania County to produce a minimum of 70 MW. I write today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

In this letter, I provide comments on behalf of SOSA regarding the "Land Use and Recreation" chapter of the DEIS found at Section 3.8 at page 3-134 to 3-155. SOSA's comments will be divided between the recreation and land use sections.

1. RECREATION IMPACTS.

The DEIS provides only a listing of recreational resources in the area with minimal discussion of the impacts that the wind turbine facilities will have on such areas. This discussion is inadequate. The DEIS should not only disclose the affected areas, but also the impacts on such areas.

Of particular concern is the impact that the turbine operations will have on these areas, particularly visual impacts. This section should be expanded to include impacts on key viewing areas within the scenic area and other areas affected by visual and noise impacts from wind turbine operations. Discussion of mitigation measures should be included which describe alternatives of reduction or relocation of turbines as well as alternative site locations.

2. LAND USE REGULATION.

This section of the DEIS includes discussion of applicable land use regulations. The only land use regulations discussed are the Skamania County's comprehensive plan and land use regulations.

EFSEC has previously taken up the issue of land use consistency during proceedings held on May 6, 2009. Comments and briefs were filed by various parties during that time, including SOSA. Instead of making a decision on land use consistency at the time, EFSEC decided that this issue would be passed to the project adjudicative hearings. Accordingly, we find it inconsistent with the Council's responsibility to enter conclusions regarding land use consistency in the DEIS before it hears evidence in adjudicatory hearings. This is plainly prejudgment of a matter before the Council in violation of the appearance of fairness doctrine.

As to the sections of the DEIS dealing with land use regulation, a determination made that the proposal is "consistent" with the Skamania County comprehensive plan and development regulations is erroneous. SOSA has provided comments on that subject in its letter to the Council dated May 6, 2009 which is attached hereto and incorporated by reference herein. In that letter SOSA provided detailed legal authority and factual background that demonstrated that the construction and operation of wind turbines at the location proposed by the applicant is clearly contrary to the 2007 Skamania County Comprehensive Plan. Since the zoning code of the county preceded the 2007 comprehensive plan, it cannot be considered to implement any of its terms.

Fundamentally, Skamania County has never considered whether or not wind turbines are appropriate in any part of the County, much less within the conservancy designation in the comprehensive plan. As described in SOSA's May 6, 2009 letter, consideration of a draft ordinance that might have regulated the wind turbines was abruptly dropped, and never taken up again, by the Skamania County Commissioners after they learned they had to do an environmental impact statement before considering it. The apparent attempt of the DEIS to blame "local interest groups" for keeping the old zoning ordinance in effect is accordingly misplaced. The statement in the DEIS at page 3-145 that the "proposed updates are currently under appeal by local interest groups" is wrong. As noted in SOSA's May 6, 2009 letter attached hereto, Skamania County did not appeal the ruling against it by the Hearing Examiner and her decision is final.

ARAMBURU & EUSTIS, LLP

July 16, 2010

Page 3

In summary, the proposal is not consistent with local planning and zoning regulations and the findings and conclusions regarding this ISSUE should be revised for the final EIS.

3. FOREST LAND UNDER G.M.A.

In addition, this section of the DEIS fails to discuss or describe the impact of the Growth Management Act, RCW ch. 36.70A and its regulations on the subject proposal. Though Skamania County is not a county required to plan under GMA, it is required by GMA to designate natural resource land, including:

(b) Forest lands that are not already characterized by urban growth and that have long-term significance for the commercial production of timber[.]

RCW 36.70A.170. The purpose of such designation is to assure that forest lands of long term commercial significance will be protected by appropriate land use regulation.

It is apparent from the discussion in the EIS that the project site meets the definition of forest lands of long term commercial significance. As the DEIS indicates:

This site has been in commercial forestry use for the last century, during which the site has been logged over a series of approximately 50 year rotations.

DEIS at page 2-18. See also DEIS at page 1-9, "the site has a long history of commercial logging . . . "

The reason that forest lands are required to be identified is that such lands are intended to be protected and preserved from nonforestry uses. In the present case, industrial wind turbines are intended to cover significant portions of this commercial forest land, contrary to GMA's directives.

Further, this proposal is the first, or one of the first, to be sited in the timbered forest lands near the Columbia Gorge. Under these circumstances, the FEIS must consider whether this project will serve as a precedent for other or future projects impacting the scenic values of the Gorge and forested areas.

Finally, the DEIS at page 3-151 says that there will be no "changes to existing land uses, land use activities or development patterns." This conclusionary statement is unsupported by any objective evidence and is incorrect. It is well known that the placement of industrial wind turbines has a significant adverse impact on residential uses and tourism activities. This is true for most wind turbine locations, but is especially true in areas highly valued for scenic resources, including the Columbia Gorge, which

ARAMBURU & EUSTIS, LLP

July 16, 2010

Page 4

are prized for their aesthetic surroundings. Much more detailed analysis is required for adequate consideration of these issues.

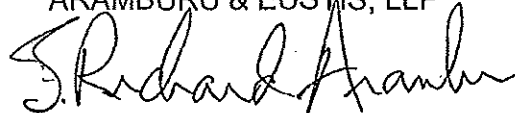

4. SOLAR ENERGY FACILITY

The DEIS discusses only the development of the site for wind energy facilities. The consideration of alternatives should be expanded to consider other alternate energy sources such as solar energy. Recently, a proposal for a 75 MW solar reserve has been made in Kittitas County (the Teamaway Solar Reserve, or "TSR"). The proposal will consist of approximately 145 acres for photovoltaic solar panels spread out over 900 acres. Such a proposal would reduce visual impacts and eliminate the noise impacts associated with wind turbine facilities, as well as eliminating the need for transportation of large towers and blades for wind turbines. This alternative should be fully considered in the DFEIS or FEIS.

Thank you for this opportunity to comment on the DEIS. SOSA trusts that the FEIS will provide facts and analysis discussed herein.

Sincerely yours,

ARAMBURU & EUSTIS, LLP

Re: Certificate of Land Use Consistency Review for
Whistling Ridge Wind Energy Project

Dear EFSEC:

This office represents the Save Our Scenic Area (SOSA), a Washington non-profit corporation concerned with the preservation of scenic, recreational and residential values and assets in the Columbia Gorge.

SOSA has closely followed the proposal of SDS Timber Company's Saddleback wind turbine proposal since its public announcement in late 2007. SDS changed the name of the proposal to the "Whistling Ridge Energy Project" (herein "WREP") when it applied to EFSEC. Most recently, SOSA was an appellant before the Skamania County Hearing Examiner in a successful challenge to the issuance of a determination of nonsignificance issued by Skamania County for its zoning code revisions. The Hearing Examiner has ruled that an environmental impact statement (EIS) will be required for the adoption of the new zoning code by the County.

SOSA writes today in response to the notice issued by EFSEC of a hearing on the question of whether the SDS proposal is consistent with local land use plans and zoning codes. The proposal is for multiple

May 6, 2009

Page 2

wind turbines (50) on property located in eastern Skamania County. As will be demonstrated herein, the WREP proposal is not consistent with local zoning and there is no basis upon which EFSEC should attempt to preempt this local zoning.

1. STRUCTURE OF SKAMANIA COUNTY PLANNING AND ZONING.

Skamania County planning and zoning is governed by RCW 36.70, the County Planning Enabling Act. It is not one of the counties governed by the Growth Management Act RCW ch. 36.70A (GMA) and has not exercised the option to become a GMA county.

Skamania County first adopted a comprehensive plan in 1977, which was revised in 1991 with the creation of the Columbia River Gorge National Scenic Area (the "Scenic Area"). The 1977 Comprehensive Plan ("the 1977 Plan") is attached hereto as Attachment A. As will be described below, Skamania County recently (June, 2007) adopted a completely revised Comprehensive Plan, referenced herein as the "2007 Plan."

The County originally adopted a zoning code and map in 1985, which has been amended at various times over the years, the most recent of which was by Ordinance 2005-02 in 2005. The existing zoning code would presumably be consistent with the then adopted comprehensive plan from 1977.¹

After review by the planning commission, Skamania County adopted a new comprehensive plan in June, 2007. In the fall of 2007, Skamania County proposed a new zoning ordinance to implement the new comprehensive plan.

The adoption of the new zoning code requires procedural and substantive compliance with the terms of the State Environmental Policy Act, RCW 43.21C (SEPA). Skamania County has also adopted a local SEPA ordinance that governs the County's procedures under

¹ The Council is requested to take judicial notice of both the 2007 Plan and the current Skamania County zoning code.

May 6, 2009

Page 3

SEPA. Skamania County is required by SEPA and its SEPA ordinance to make a "threshold determination" as to whether to prepare an EIS for its new zoning ordinance. This new zoning ordinance, for the first time in the history of planning and zoning in Skamania County, had specific provisions for large scale wind turbine facilities.²

Skamania County's responsible SEPA official, Planning Director Karen Witherspoon, issued a "mitigated determination of nonsignificance" or MDNS for the new zoning code proposal, which included large scale wind turbine regulations. Consistent with the terms of the Skamania County SEPA ordinance, the responsible official's MDNS was appealed to the Skamania County Hearing Examiner by both SOSA and the Friends of the Gorge. The Hearing Examiner held an open record hearing on January 21 and 22 at which the County vigorously defended its MDNS decision.

According to testimony from county officials at the hearing before the County's Hearing Examiner, representative of SDS had met several times with the Skamania County staff to discuss their proposed Saddleback project, but never submitted an application. BPA officials also were in attendance at such meetings according to Ms. Witherspoon's testimony.

On February 19, 2009, the Hearing Examiner entered her decision reversing the MDNS issued by the Responsible Official. See Attachment B hereto. As may be seen from the Findings and Decision, the testimony at the hearing focused on the adverse environmental impacts from wind turbines, centering on SDS's Saddleback proposal. That decision was not appealed by the County to Superior Court and is final. Under this ruling, before any decision is made by Skamania County on a zoning code map, an environmental impact statement must be prepared. Because the environmental impact statement must "accompany the proposal through the agency review process" (SEPA), the Skamania County Planning Commission must also reconsider any decisions it makes on the zoning ordinance based on the upcoming EIS.

² A copy of this proposed zoning ordinance is attached to the WREP application as Appendix F.

As of the date of this submission, no steps have been taken by Skamania County to prepare an environmental impact statement on its proposed zoning code and map.

2. THE WIND TURBINE PROPOSAL IS NOT CONSISTENT WITH THE EXISTING COMPREHENSIVE PLAN.

As noted above, Skamania County adopted a new comprehensive plan for the County in June, 2007. That ordinance replaced a now 30 year old comprehensive plan. See the 2007 Plan at 7.

The 2007 Plan adopted three land use designations, Rural I, Rural II and Conservancy. Rural I was intended to "foster the optimum utilization of land within growing areas of the county. . . ." See page 23. Rural I is the only one of the three designations that allows commercial activity and light or heavy industry. The Rural II designation "is intended to provide for rural living without significant encroachment for land used for agricultural and timber." Page 24. The Conservancy designation is "intended to provide for the conservation and management of existing natural resources" and "logging, timber management, agricultural and mineral extraction are the main use activities that take place in this area." 2007 Plan page 25. Importantly, there has been no effort to amend the comprehensive plan since its adoption in June 2007 by the applicant here or any other party. In this regard, it is important to note that the state Growth Management Act requires that all counties designate "natural resource land" pursuant to RCW 36.70A.170 which includes forest, agricultural and mineral lands of "long term commercial significance." The County recognizes its responsibilities under GMA in the comprehensive plan at page 9 of the 2007 Plan. However, the County has not made a formal designation of such lands. The 2007 Plan essentially provides that designation in the Conservancy designation, which meets the RCW 36.70A.170 criteria: "Conservancy areas are intended to conserve and manage existing natural resources in order to maintain a sustained yield and/or utilization." 2007 Plan at page 25. The WREP is located in the Conservancy and Rural II land use designations.

May 6, 2009

Page 5

Significantly, there is no mention of allowance for wind turbines or wind energy in the Rural II or Conservancy designations. "Industry" is permitted in the Rural I category, but not in the other two designations. The Conservancy designation includes only the following relating to utilities:

Public facilities and utilities, such as parks, public water access, libraries, schools, utility substations and telecommunication facilities.

2007 Plan, p. 25-26. The 2007 comprehensive plan does not allow "private" or "semi-public facilities and utilities." Once again, the failure to include these uses as "appropriate uses" within the 2007 Plan is significant. These uses were defined in the existing zoning ordinance in the "Definition-Interpretation" section at SCC 21.08.010:

"Semi-public facilities" means facilities intended for public use which may be owned and operated by a private entity.

That this definition was not incorporated into the 2007 Plan is indicative of the intent of the legislative body not to allow such uses and that they were not included within the 2007 Plan indicates a deliberate exclusion. Further, note that the 2007 Plan does not mention electrical energy facilities at all, indicating such facilities are not allowed.

It cannot be that the failure to mention wind energy facilities or wind turbines was a matter of oversight. As the Skamania County Hearing Examiner found in her MDNS decision, there was interest expressed by the applicant here in developing a wind farm well before the Comprehensive Plan was adopted:

However, SDS Lumber has approached Skamania County on multiple occasions over the past several years to discuss a possible large-scale wind energy project (Saddleback Project) on its property within the County. Ms. Witherspoon (the Skamania County Planning Director) met with representatives of SDS and entities such as the Bonneville Power Administration on two or three occasions

for "pre-application meetings" to discuss the permitting requirements for the project. Multiple pre-application meetings have been held because of changes in the development team. The project, if developed, would consist of at least 40 wind turbines. Although the last formal pre-application meeting was approximately two years ago, individuals associated with the project have been involved in the County's code update process and the president of SDS was present at the subject appeal hearing.

Findings, Conclusions and Decision of the Hearing Examiner for Skamania County ("FCD"), Finding 37, page 13. In fact, as the Hearing Examiner found:

The Bonneville Power Administration (BPA) has produced a map entitled "Current and Proposed Wind Energy Interconnections to BPA Transmission Facilities" (Exhibit D.4). This map depicts the SDS Saddleback project as a proposed wind generation facility of 70 megawatts (MW).

FCD, Finding 38, p. 14. Skamania County and its commissioners have long been aware of the Energy Overlay Zone adopted by the neighboring county to the east (Klickitat); indeed, testimony at the Hearing Examiner hearing on the MDNS revealed that Skamania County was asked by Klickitat County to participate in the EIS process for its overlay zone, but Skamania County declined.

As described herein, the 2007 Comprehensive Plan does not authorize or permit electrical energy or wind turbines within the County. Policy LU6.1 deals with uses authorized under the comprehensive plan:

Three types of uses should be established for each land use designation under this plan and for any zone established to implement this plan. If any use is not listed as one of the following types of developments, then the use is prohibited within that land use designation.

May 6, 2009

Page 7

The Plan goes on to describe uses that may be listed as allowable uses, review uses and conditional uses. Policy LU6.2 specifies that:

In the development regulations, land uses which are neither allowed without review by the Planning Department, permitted subject to conditions, nor named as a conditional use under a land use designation made in this plan or in an ordinance implementing this plan should be prohibited without proof of a substantial change in circumstances.

As such, uses not described as appropriate under each land use designation are to be prohibited. As applied to the WREP proposal, wind turbines are not mentioned as an allowable, review or conditional use in either the Conservancy or Rural II designations and are thus not allowed.

Under the County Planning Enabling Act, RCW ch. 36.70, a county is required to prepare and adopt a comprehensive plan. RCW 36.70.320 provides that:

Each planning agency shall prepare a comprehensive plan for the orderly physical development of the county, or any portion thereof, and may include any land outside its boundaries which, in the judgment of the planning agency, relates to planning for the county. The plan shall be referred to as the comprehensive plan, and, after hearings by the commission and approval by motion of the board, shall be certified as the comprehensive plan. Amendments or additions to the comprehensive plan shall be similarly processed and certified

The statute goes on to proscribe that the comprehensive plan will be the basic source of reference when the County reviews any proposed project under RCW 36.70.450:

After a board has approved by motion and certified all or parts of a comprehensive plan for a county or for any part of a county, the planning agency shall use such plan as the

May 6, 2009

Page 8

basic source of reference and as a guide in reporting upon or recommending any proposed project, public or private, as to its purpose, location, form, alignment and timing.

The report of the planning agency on any project shall indicate wherein the proposed project does or does not conform to the purpose of the comprehensive plan and may include proposals which, if effected, would make the project conform. If the planning agency finds that a proposed project reveals the justification or necessity for amending the comprehensive plan or any part of it, it may institute proceedings to accomplish such amendment, and in its report to the board on the project shall note that appropriate amendments to the comprehensive plan, or part thereof, are being initiated.

Unlike the GMA, zoning codes and maps are not required in counties operating under the county enabling act as RCW 36.70.550 provides:

From time to time, the planning agency may, or if so requested by the board shall, cause to be prepared official controls which, when adopted by ordinance by the board, will further the objectives and goals of the comprehensive plan. The planning agency may also draft such regulations, programs and legislation as may, in its judgment, be required to preserve the integrity of the comprehensive plan and assure its systematic execution, and the planning agency may recommend such plans, regulations, programs and legislation to the board for adoption.

As may be seen above, the 2007 Plan does not permit or allow wind turbine facilities by its terms. The County and this Council must apply the 2007 Plan as the "basic source of reference" in reviewing the SDS proposal and conclude that the present proposal is inconsistent with that plan.

3. PROPOSAL INCONSISTENT WITH SKAMANIA COUNTY ZONING ORDINANCE.

As described above, the proposal is inconsistent with the recently

May 6, 2009

Page 9

adopted (June 2007) Skamania County Comprehensive Plan. Notwithstanding this defect, the applicant urges that the proposal is consistent with the existing zoning code. However, the existing zoning ordinance was adopted before the adoption of the 2007 Comprehensive Plan. Neither the Skamania County Planning Commission nor County Commissioners have adopted the existing zoning code as consistent with the 2007 Plan. Accordingly, the policies of the 2007 Comprehensive Plan cannot be applied to that code. Moreover, it is clear that the existing zoning ordinance does not permit the subject proposal.

Under Washington state law, development regulations or the zoning code must be consistent with the adopted Comprehensive Plan:

36.70.545. Development regulations--Consistency with comprehensive plan. Beginning July 1, 1992, the development regulations of each county that does not plan under RCW 36.70A.040 shall not be inconsistent with the county's comprehensive plan. For the purposes of this section, "development regulations" has the same meaning as set forth in RCW 36.70A.030.

Accordingly, if the existing development regulations are not consistent with the adopted 2007 Comprehensive Plan, then the zoning regulations are ineffective.

The applicant makes two attempts to demonstrate that its wind turbine proposal is consistent with the existing code, neither of which is persuasive.

This analysis begins with the important fact that the existing zoning code does not make wind turbines, wind energy or wind farms an allowable, review or conditional use in any zone. It is significant that "geothermal energy facilities" are listed as a conditional use in the FOR/AG10 and 20, Rural Estate zones. See SCC 21.56.030, 21.44.030. Indeed, "geothermal energy" is a specific type of an "Alternative energy resource" under the EFSEC statute at RCW 80.50.020(18). This indicates that the county was aware of types of alternate energy facilities, but only chose to allow only "geothermal

May 6, 2009

Page 10

energy" as a conditional use, whereas "wind," another specifically listed "alternate energy resource" under RCW 80.50.020(18), is not permitted anywhere. Once again, this is not an oversight as "wind turbines" are specifically mentioned in the current code as exempt from height limitations in SCC 21.70.050. However, wind turbines, wind farms or a use related thereto is not listed as a permitted review use or conditional use in the zoning code. The only conclusion to be reached is that wind turbines are not authorized or permitted under the existing code.

The applicant also argues that Table 2-1 in the 2007 Plan at page 23 declares that certain uses are permissible in certain zones. The applicant states at page 4.2-6 of its application that:

There are three land use designations outside of the specific subarea plans: Rural I, Rural II, and Conservancy. The project area is designated as "Conservancy." Table 2-1 of the Comprehensive Plan identifies zones that are consistent with the Conservancy designation, including: Residential 10 (R-10), Rural Estates 20 (RES-20), Forest Land 20 (FL 20), Commercial Resource Land 40 (CRL 40), Natural (NAT) and Unmapped (UNM). The project site is located in the FL 20, R-10, and UNM zones, all of which are consistent with the Conservancy designation.

However, Table 2-1 refers not to the current code, but to code that might be adopted after the 2007 Plan was adopted. This is clear from the explanation of the table at page 22:

Table 2-1 shows the comprehensive plan designations and consistency of each potential zoning classification. The Plan Designation to Zoning Classification table is provided to identify those zoning districts that are consistent with each plan designation. Those districts, which are not consistent with the plan designation, are not permitted within the plan designation. This information is necessary to determine when, where and under what circumstances these designations should be applied in the future.

(Emphasis supplied). Thus the table references "potential" and "future" zoning classifications, not ones under the existing code. This is further demonstrated by the fact that the zoning classifications in Table 2-1 do not refer to the existing code, but to future code classifications. Thus, the "Commercial Resource Land 40" zone is a potential new zone as referenced in the draft zoning ordinance at Appendix F to the application. Under the existing code, the like zone is the Resource Production Zone or (FOR/AG20) zone, which is not mentioned in Table 2.1.

Thus Table 2-1 does not establish consistency with the existing code, but serves as a guide to a new zoning code, which has not yet been adopted and cannot be until an environmental impact statement is prepared under the Hearing Examiner's ruling.

The applicant argues that wind turbines are allowed as a use under the terms of the "Unmapped" area of the code. However, the terms of the 2007 Comprehensive Plan specifically provide that if a use is not listed as a conditional or allowable use within the land use designation under the plan then it will be prohibited. See discussion above and 2007 Plan at pages 30-31. The 2007 Comprehensive Plan also specifically provides under Policy LU2.6 that: "Building permits, septic tank permits, or other development permits issued by the County for any project will be in conformance with this Comprehensive Plan." (Emphasis supplied.) Since the "Unmapped" areas do not have a specific zone designation they must be regulated by the designation given by the 2007 Plan.

In addition, to determine the meaning of language within the 2007 comprehensive plan, it is useful to review the 1977 comprehensive plan it replaced. A copy of that plan is Attachment A hereto. That plan had identical land use designations, Rural 1, Rural 2 and Conservancy. See pages 91-92. Importantly, the 1977 comprehensive plan "Conservancy" designation provided:

The following inappropriate uses may be allowed on a conditional or temporary basis:

- a. Industrial
- b. Commercial

See page 92. The "NOTE" at the bottom of page 92 states:

Land uses which are considered by this plan to be inappropriate, may be established in Rural 2 and Conservancy land use areas, subject to public review and approval by the Board of County Commissioners. Such uses might include light industrial facilities, small commercial businesses, airstrips, portable sawmills, and other wood processing equipment.

(Emphasis in original). When the 2007 comprehensive plan was adopted, it retained verbatim the sentence setting the purpose and objective:

"Conservancy areas are intended to conserve and manage existing natural resources in order to maintain a sustained resource yield and/or utilization."

Compare page 25 of the 2007 comprehensive plan with page 92 of the 1977 comprehensive plan. However, the 2007 comprehensive plan removed any allowance for "Industrial" or "Commercial" uses either as permitted, review or conditional uses in the Conservancy designation.

The inclusion in the 1977 Plan of the "inappropriate" industrial and commercial uses also explains why the "Unmapped" zone (guided by the 1977 Plan) allowed uses which were "not nuisances," to take account of their characterization as "inappropriate." However, with the adoption of the 2007 comprehensive plan, and the elimination of any possibility of any "inappropriate uses," allowance of uses that were not nuisances became inconsistent with the comprehensive plan and thus illegal.

In addition, the applicant contends that its private wind turbine proposal should be considered "semi-public facilities and utilities" and thus an allowable conditional use in the existing FOR/AG10 and 20 zones. However, the Comprehensive Plan says that "Public Facilities and Utilities" (emphasis supplied) are allowed in the Conservancy and Rural II Land Use Designations, not "Semi-public Facilities and Utilities." Since both of these uses are defined terms in the existing

code, It is very clear that when the Commissioners chose to include only one in the comprehensive plan, it was a deliberate decision. In addition, the 1977 plan made specific provisions in the Rural 2 zone for "Semi-public" uses. See page 91. "Semi-public" uses were specifically eliminated from the 2007 comprehensive plan in all land use designations, including "Conservancy." See 2007 Plan, p. 24-26. Further, the provision in the comprehensive plan gives examples of the kinds of "public facilities and utilities" which are appropriate in the zone "such as parks, public water access, libraries, schools, utility substations and telecommunication facilities." It cannot be said up to 50, 425 foot tall wind turbines as the WREP would intend, with an extensive road network, can be equated to such modest and common place uses as parks, public accesses and schools. If these were intended to include wind turbines, wind farms and other alternative energy facilities, the comprehensive plan would have said so by simply adding a definition of such uses. Of course if there was a proposal to include large wind farms within the 2007 Plan, it would have likely ignited significant controversy.

In essence, inclusion of a large scale wind farm as a "facility and utility" permissible in the Conservancy designation is a de facto amendment of the comprehensive plan. It does so without adherence to the requirement that the planning commission first review the comprehensive plan or any amendments under RCW 36.70.320 and .410, that there be a public hearing and a final decision by the Commissioners. RCW 36.70.380 and .420. In addition, the inclusion of wind turbine or other facilities in the comprehensive plan would have required new SEPA compliance. Given that the inclusion in the zoning code of provisions for wind farms has resulted in the requirement for an environmental impact statement, the same would likely be true for the comprehensive plan adoption.

In addition to the foregoing, the issue of consistency between the existing zoning code and the comprehensive plan arose in the hearing before the Skamania County on the appeal of SOSA and Friends challenging the County MDNS for the new zoning code. SOSA in particular alleged that the 2007 Comprehensive Plan was inconsistent with the proposed zoning ordinance. In response, the County argued that the allowance of wind turbines in the proposed

May 6, 2009

Page 14

zoning ordinance did not have a significant impact because wind turbines were already allowed. This issue was resolved in favor of SOSA when the Hearing Examiner found:

The 2007 Comprehensive Plan does not contemplate the type of energy facilities described in the Planning Commission Recommended Draft.

FCD, Finding 18, page 8. As an issue regarding the comprehensive plan, which was actually litigated between the County, SOSA and Friends, the County is now prevented from contesting this conclusion under the doctrine of claim preclusion or *res judicata*. Washington law is clear that *res judicata* applies to administrative proceedings:

Res judicata, modernly called claim preclusion, P. Trautman, Claim and Issue Preclusion in Civil Litigation in Washington, 60 Wash.L.Rev. 805 (1985), applies to quasi-judicial decisions by administrative tribunals as well as to judicial decisions by courts. *State v. Dupard*, 93 Wn. 2d 268, 274, 609 P.2d 961 (1980); *Miller v. St. Regis Paper Co.*, 60 Wn. 2d 484, 485, 374 P.2d 675 (1962); see *McCarthy v. Department of Social and Health Servs.*, 110 Wn. 2d 812, 823, 759 P.2d 351 (1988) (collateral estoppel); *Malland v. Department of Retirement Sys.*, 103 Wn. 2d 484, 490, 694 P.2d 16 (1985) (same). The Board's 1985 decision was quasi-judicial because it denied a proposed plat, and an administrative decision denying a proposed plat is quasi-judicial. *Miller v. Port Angeles*, 38 Wn. App. 904, 908, 691 P.2d 229 (1984), review denied, 103 Wn. 2d 1024 (1985); *Lechelt v. Seattle*, 32 Wn. 2d 831, 835, 650 P.2d 240 (1982), review denied, 99 Wn. 2d 1005 (1983); see RCW 58.17.100 (findings of fact required); RCW 58.17.180 (review is by writ of review). Therefore, the Board's 1985 decision was subject to *res judicata* at such time as it became final. *Columbia Rentals, Inc. v. State*, 89 Wn. 2d 819, 821, 576 P.2d 62 (1978) (final judgment is *res judicata*); *Pinkney v. Ayers*, 77 Wn. 2d 795, 796, 466 P.2d 853 (1970) (interlocutory order is not *res judicata*).

Lejeune v. Clallam County, 64 Wn. App. 257, 264-265, 823 P.2d 1144, (1992).

The finding by the Hearing Examiner that the 2007 comprehensive plan did not contemplate the wind energy facilities described in the zoning ordinance is binding on the County. Further, the existing zoning code, even if adopted by the County to implement the 2007 Plan (which it was not), does not permit large scale wind facilities.

5. THE RECOMMENDED DRAFT OF THE PLANNING DEPARTMENT CANNOT BE CONSIDERED BY EFSEC.

At Appendix F of its application, SDS argues that the EFSEC should consider a draft, unadopted zoning code and map. EFSEC will commit error if it considers the proposed code for two reasons.

First, zoning codes do not become effective until they are adopted by the legislative body with jurisdiction. Zoning codes and maps are considered "official controls" under RCW 36.70.02(11):

(11) "Official controls" means legislatively defined and enacted policies, standards, precise detailed maps and other criteria, all of which control the physical development of a county or any part thereof or any detail thereof, and are the means of translating into regulations and ordinances all or any part of the general objectives of the comprehensive plan. Such official controls may include, but are not limited to, ordinances establishing zoning, subdivision control, platting, and adoption of detailed maps.

See also RCW 36.70.560. RCW 36.70.570 specifically requires that:

Official controls shall be adopted by ordinance and shall further the purpose and objectives of a comprehensive plan and parts thereof.

(Emphasis supplied). Zoning ordinances and zoning maps may only be

May 6, 2009

Page 16

adopted after a public hearing and recommendations by the Planning Commission under RCW 36.70.320 and .420. There is no provision in EFSEC legislation to consider unadopted codes, or ones under consideration.

Second, the Skamania County Hearing Examiner has ruled the MDNS issued by the responsible official in Skamania County was issued in error. The ruling of the Examiner is as follows:

The Determination of Nonsignificance is reversed, and remanded to the County for preparation of an Environmental Impact Statement for the zoning code map and text amendments.

FCD, p. 29:

Under the terms of SEPA, the EIS when completed "shall accompany the proposal through the agency review processes; . . ." RCW 43.21.030(2)(d). In the present case, the Planning Enabling Act requires that before an agency adopts a zoning ordinance or maps, a public hearing must be held by the Planning Commission under RCW 36.70.580:

Before recommending an official control or amendment to the board for adoption, the commission shall hold at least one public hearing.

Following the public hearing, the Planning Commission must make a recommendation to the County Commissioners under RCW 36.70.600.

The recommendation to the board of any official control or amendments thereto by the planning agency shall be by the affirmative vote of not less than a majority of the total members of the commission. Such approval shall be by a recorded motion which shall incorporate the findings of fact of the commission and the reasons for its action and the motion shall refer expressly to the maps, descriptive and other matters intended by the commission to constitute the plan, or amendment, addition or extension thereto.

The indication of approval by the commission shall be recorded on the map and descriptive matter by the signatures of the chairman and the secretary of the commission and of such others as the commission in its rules may designate.

For SEPA purposes, the "existing agency review process" involves, at a minimum, public hearings before the Planning Commission, a recommendation by the Planning Commission and action by the County Commissioners. Each of these processes will require that a final EIS be prepared and available for those bodies. Thus any action previously taken, or recommendations made, must be reconsidered in light of Hearing Examiner's requirement that an EIS be prepared. Since the County has not yet prepared an EIS on its zoning ordinance, any existing drafts of a proposed ordinance may not be considered by EFSEC.

6. THE ROAD ACCESS TO THE SITE IS NOT PERMITTED BY SCENIC AREA RULES.

The application filed herein describes the improvement and widening of a road that appears to be the primary access to the site. Approximately 2.1 acres of this road are located in the National Scenic Area and are controlled by Skamania County Scenic Area regulations. The Friends of the Columbia River Gorge has addressed this issue in correspondence and SOSA adopts by reference the position stated by Friends on this issue in their submission.

7. SKAMANIA COUNTY CERTIFICATE OF LAND USE CONSISTENCY.

SOSA has just received Skamania County Resolution 2009-22 which purports to adopt a Certificate of Land Use Consistency for the WREP proposal. This Resolution was adopted on May 5, 2007 by the Skamania County Commissioners. Copies of the Resolution and its accompanying 28 page staff analysis were not available prior to adoption. Because of its late adoption, and lack of notice, SOSA is not able to provide a detailed response to the Resolution at this time. Neither county staff nor the commissioners provided notice of the

May 6, 2009
Page 18

content of what was intended to be adopted and there were no public hearings on the matter. The Planning Commission for Skamania County was neither contacted or consulted regarding this matter. Accordingly, SOSA requests a two week delay in the close of the record on the land use consistency hearing to provide comments on the county's resolution.

SOSA does have one preliminary comment. As noted above, the County's 2007 comprehensive plan contains no provisions for wind energy facilities in any land use designation. Notwithstanding this obvious deficiency, the County Commissioners proposed a zoning ordinance and map that would allow wind energy facilities in Conservancy designations. The County's decision not to prepare an environmental impact statement on the zoning code and map was appealed to Skamania County's own Hearing Examiner. She not only reversed the MDNS issued by the County (see Attachment B), but also ruled that the "2007 Comprehensive Plan does not contemplate the type of energy facilities [among them large scale wind energy facilities] described in the Planning Commission Recommended Draft." The County did not appeal the Hearing Examiner decision to the Superior Court.

Now, in the letter accompanying the submission of Resolution 2009-22 to this Council, everyone is told that:

Since this decision (of the Hearing Examiner requiring the environmental impact statement) the map and updates for the Zoning Ordinance project have been permanently placed on hold. It has not been decided whether or not the County will continue with this project or start from scratch when the zoning update process resumes.

May 4, 2009 letter from Karen Witherspoon to EFSEC, page 2.

It is clear that the County, having been denied the approval of wind turbines in legally appropriate processes, has now decided to go through the "back door" to try to legalize large scale wind farms by simply deciding that they are consistent with existing codes. However, as demonstrated above, the adopted comprehensive plan and zoning ordinances do not allow such facilities. It is likely that the County's

May 6, 2009
Page 19

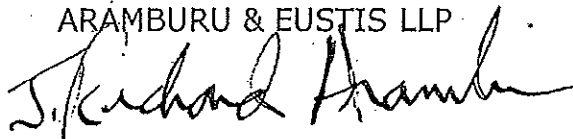

actions, as interpretations of land use codes, will be challenged as illegal under the Washington Land Use Petition Act. In the meantime, EFSEC should refuse to consider the county's position on this matter or dismiss it and hold that the proposed project is not consistent with the comprehensive plan and zoning ordinances.

Based on the foregoing, SOSA submits that the WREP is inconsistent with the 2007 Skamania County Comprehensive Plan and current zoning code and EFSEC should so conclude.

Thank you in advance for your consideration of our views.

Sincerely yours,

Re: Comments on Draft EIS for Whistling Ridge Energy Project DOE EIS - 0419:
Recreation and Land Use Section

Dear Messrs. Montaña and Posner:

This office represents Save Our Scenic Area (SOSA), a Washington corporation representing persons interested in the scenic, recreational and natural values of the Columbia Gorge. SOSA's primary mission is to preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. WRE proposes to construct as many as 50 wind turbines on ridge lines on their property in Skamania County to produce a minimum of 70 MW. I write today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

In this letter, I provide comments on behalf of SOSA regarding the "Land Use and Recreation" chapter of the DEIS found at Section 3.8 at page 3-134 to 3-155. SOSA's comments will be divided between the recreation and land use sections.

1. RECREATION IMPACTS.

The DEIS provides only a listing of recreational resources in the area with minimal discussion of the impacts that the wind turbine facilities will have on such areas. This discussion is inadequate. The DEIS should not only disclose the affected areas, but also the impacts on such areas.

Of particular concern is the impact that the turbine operations will have on these areas, particularly visual impacts. This section should be expanded to include impacts on key viewing areas within the scenic area and other areas affected by visual and noise impacts from wind turbine operations. Discussion of mitigation measures should be included which describe alternatives of reduction or relocation of turbines as well as alternative site locations.

2. LAND USE REGULATION.

This section of the DEIS includes discussion of applicable land use regulations. The only land use regulations discussed are the Skamania County's comprehensive plan and land use regulations.

EFSEC has previously taken up the issue of land use consistency during proceedings held on May 6, 2009. Comments and briefs were filed by various parties during that time, including SOSA. Instead of making a decision on land use consistency at the time, EFSEC decided that this issue would be passed to the project adjudicative hearings. Accordingly, we find it inconsistent with the Council's responsibility to enter conclusions regarding land use consistency in the DEIS before it hears evidence in adjudicatory hearings. This is plainly prejudgment of a matter before the Council in violation of the appearance of fairness doctrine.

As to the sections of the DEIS dealing with land use regulation, a determination made that the proposal is "consistent" with the Skamania County comprehensive plan and development regulations is erroneous. SOSA has provided comments on that subject in its letter to the Council dated May 6, 2009 which is attached hereto and incorporated by reference herein. In that letter SOSA provided detailed legal authority and factual background that demonstrated that the construction and operation of wind turbines at the location proposed by the applicant is clearly contrary to the 2007 Skamania County Comprehensive Plan. Since the zoning code of the county preceded the 2007 comprehensive plan, it cannot be considered to implement any of its terms.

Fundamentally, Skamania County has never considered whether or not wind turbines are appropriate in any part of the County, much less within the conservancy designation in the comprehensive plan. As described in SOSA's May 6, 2009 letter, consideration of a draft ordinance that might have regulated the wind turbines was abruptly dropped, and never taken up again, by the Skamania County Commissioners after they learned they had to do an environmental impact statement before considering it. The apparent attempt of the DEIS to blame "local interest groups" for keeping the old zoning ordinance in effect is accordingly misplaced. The statement in the DEIS at page 3-145 that the "proposed updates are currently under appeal by local interest groups" is wrong. As noted in SOSA's May 6, 2009 letter attached hereto, Skamania County did not appeal the ruling against it by the Hearing Examiner and her decision is final.

In summary, the proposal is not consistent with local planning and zoning regulations and the findings and conclusions regarding this ISSUE should be revised for the final EIS.

3. FOREST LAND UNDER G.M.A.

In addition, this section of the DEIS fails to discuss or describe the impact of the Growth Management Act, RCW ch. 36.70A and its regulations on the subject proposal. Though Skamania County is not a county required to plan under GMA, it is required by GMA to designate natural resource land, including:

(b) Forest lands that are not already characterized by urban growth and that have long-term significance for the commercial production of timber[.]

RCW 36.70A.170. The purpose of such designation is to assure that forest lands of long term commercial significance will be protected by appropriate land use regulation.

It is apparent from the discussion in the EIS that the project site meets the definition of forest lands of long term commercial significance. As the DEIS indicates:

This site has been in commercial forestry use for the last century, during which the site has been logged over a series of approximately 50 year rotations.

DEIS at page 2-18. See also DEIS at page 1-9, "the site has a long history of commercial logging . . . "

The reason that forest lands are required to be identified is that such lands are intended to be protected and preserved from nonforestry uses. In the present case, industrial wind turbines are intended to cover significant portions of this commercial forest land, contrary to GMA's directives.

Further, this proposal is the first, or one of the first, to be sited in the timbered forest lands near the Columbia Gorge. Under these circumstances, the FEIS must consider whether this project will serve as a precedent for other or future projects impacting the scenic values of the Gorge and forested areas.

Finally, the DEIS at page 3-151 says that there will be no "changes to existing land uses, land use activities or development patterns." This conclusionary statement is unsupported by any objective evidence and is incorrect. It is well known that the placement of industrial wind turbines has a significant adverse impact on residential uses and tourism activities. This is true for most wind turbine locations, but is especially true in areas highly valued for scenic resources, including the Columbia Gorge, which

ARAMBURU & EUSTIS, LLP

July 16, 2010

Page 4

are prized for their aesthetic surroundings. Much more detailed analysis is required for adequate consideration of these issues.

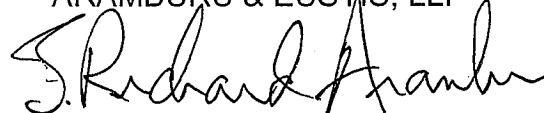

4. SOLAR ENERGY FACILITY

The DEIS discusses only the development of the site for wind energy facilities. The consideration of alternatives should be expanded to consider other alternate energy sources such as solar energy. Recently, a proposal for a 75 MW solar reserve has been made in Kittitas County (the Teamaway Solar Reserve, or "TSR"). The proposal will consist of approximately 145 acres for photovoltaic solar panels spread out over 900 acres. Such a proposal would reduce visual impacts and eliminate the noise impacts associated with wind turbine facilities, as well as eliminating the need for transportation of large towers and blades for wind turbines. This alternative should be fully considered in the DFEIS or FEIS.

Thank you for this opportunity to comment on the DEIS. SOSA trusts that the FEIS will provide facts and analysis discussed herein.

Sincerely yours,

ARAMBURU & EUSTIS, LLP

Re: Certificate of Land Use Consistency Review for
Whistling Ridge Wind Energy Project

Dear EFSEC:

This office represents the Save Our Scenic Area (SOSA), a Washington non-profit corporation concerned with the preservation of scenic, recreational and residential values and assets in the Columbia Gorge.

SOSA has closely followed the proposal of SDS Timber Company's Saddleback wind turbine proposal since its public announcement in late 2007. SDS changed the name of the proposal to the "Whistling Ridge Energy Project" (herein "WREP") when it applied to EFSEC. Most recently, SOSA was an appellant before the Skamania County Hearing Examiner in a successful challenge to the issuance of a determination of nonsignificance issued by Skamania County for its zoning code revisions. The Hearing Examiner has ruled that an environmental impact statement (EIS) will be required for the adoption of the new zoning code by the County.

SOSA writes today in response to the notice issued by EFSEC of a hearing on the question of whether the SDS proposal is consistent with local land use plans and zoning codes. The proposal is for multiple

wind turbines (50) on property located in eastern Skamania County. As will be demonstrated herein, the WREP proposal is not consistent with local zoning and there is no basis upon which EFSEC should attempt to preempt this local zoning.

1. STRUCTURE OF SKAMANIA COUNTY PLANNING AND ZONING.

Skamania County planning and zoning is governed by RCW 36.70, the County Planning Enabling Act. It is not one of the counties governed by the Growth Management Act RCW ch. 36.70A (GMA) and has not exercised the option to become a GMA county.

Skamania County first adopted a comprehensive plan in 1977, which was revised in 1991 with the creation of the Columbia River Gorge National Scenic Area (the "Scenic Area"). The 1977 Comprehensive Plan ("the 1977 Plan") is attached hereto as Attachment A. As will be described below, Skamania County recently (June, 2007) adopted a completely revised Comprehensive Plan, referenced herein as the "2007 Plan."

The County originally adopted a zoning code and map in 1985, which has been amended at various times over the years, the most recent of which was by Ordinance 2005-02 in 2005. The existing zoning code would presumably be consistent with the then adopted comprehensive plan from 1977.¹

After review by the planning commission, Skamania County adopted a new comprehensive plan in June, 2007. In the fall of 2007, Skamania County proposed a new zoning ordinance to implement the new comprehensive plan.

The adoption of the new zoning code requires procedural and substantive compliance with the terms of the State Environmental Policy Act, RCW 43.21C (SEPA). Skamania County has also adopted a local SEPA ordinance that governs the County's procedures under

¹ The Council is requested to take judicial notice of both the 2007 Plan and the current Skamania County zoning code.

SEPA. Skamania County is required by SEPA and its SEPA ordinance to make a "threshold determination" as to whether to prepare an EIS for its new zoning ordinance. This new zoning ordinance, for the first time in the history of planning and zoning in Skamania County, had specific provisions for large scale wind turbine facilities. ²

Skamania County's responsible SEPA official, Planning Director Karen Witherspoon, issued a "mitigated determination of nonsignificance" or MDNS for the new zoning code proposal, which included large scale wind turbine regulations. Consistent with the terms of the Skamania County SEPA ordinance, the responsible official's MDNS was appealed to the Skamania County Hearing Examiner by both SOSA and the Friends of the Gorge. The Hearing Examiner held an open record hearing on January 21 and 22 at which the County vigorously defended its MDNS decision.

According to testimony from county officials at the hearing before the County's Hearing Examiner, representative of SDS had met several times with the Skamania County staff to discuss their proposed Saddleback project, but never submitted an application. BPA officials also were in attendance at such meetings according to Ms. Witherspoon's testimony.

On February 19, 2009, the Hearing Examiner entered her decision reversing the MDNS issued by the Responsible Official. See Attachment B hereto. As may be seen from the Findings and Decision, the testimony at the hearing focused on the adverse environmental impacts from wind turbines, centering on SDS's Saddleback proposal. That decision was not appealed by the County to Superior Court and is final. Under this ruling, before any decision is made by Skamania County on a zoning code map, an environmental impact statement must be prepared. Because the environmental impact statement must "accompany the proposal through the agency review process" (SEPA), the Skamania County Planning Commission must also reconsider any decisions it makes on the zoning ordinance based on the upcoming EIS.

² A copy of this proposed zoning ordinance is attached to the WREP application as Appendix F.

As of the date of this submission, no steps have been taken by Skamania County to prepare an environmental impact statement on its proposed zoning code and map.

2. THE WIND TURBINE PROPOSAL IS NOT CONSISTENT WITH THE EXISTING COMPREHENSIVE PLAN.

As noted above, Skamania County adopted a new comprehensive plan for the County in June, 2007. That ordinance replaced a now 30 year old comprehensive plan. See the 2007 Plan at 7.

The 2007 Plan adopted three land use designations, Rural I, Rural II and Conservancy. Rural I was intend to "foster the optimum utilization of land within growing areas of the county. . . ." See page 23. Rural I is the only one of the three designations that allows commercial activity and light or heavy industry. The Rural II designation "is intended to provide for rural living without significant encroachment for land used for agricultural and timber." Page 24. The Conservancy designation is "intended to provide for the conservation and management of existing natural resources" and "logging, timber management, agricultural and mineral extraction are the main use activities that take place in this area." 2007 Plan page 25. Importantly, there has been no effort to amend the comprehensive plan since its adoption in June 2007 by the applicant here or any other party. In this regard, it is important to note that the state Growth Management Act requires that all counties designate "natural resource land" pursuant to RCW 36.70A.170 which includes forest, agricultural and mineral lands of "long term commercial significance." The County recognizes its responsibilities under GMA in the comprehensive plan at page 9 of the 2007 Plan. However, the County has not made a formal designation of such lands. The 2007 Plan essentially provides that designation in the Conservancy designation, which meets the RCW 36.70A.170 criteria: "Conservancy areas are intended to conserve and manage existing natural resources in order to maintain a sustained yield and/or utilization." 2007 Plan at page 25. The WREP is located in the Conservancy and Rural II land use designations.

Significantly, there is no mention of allowance for wind turbines or wind energy in the Rural II or Conservancy designations. "Industry" is permitted in the Rural I category, but not in the other two designations. The Conservancy designation includes only the following relating to utilities:

Public facilities and utilities, such as parks, public water access, libraries, schools, utility substations and telecommunication facilities.

2007 Plan, p. 25-26. The 2007 comprehensive plan does not allow "private" or "semi-public facilities and utilities." Once again, the failure to include these uses as "appropriate uses" within the 2007 Plan is significant. These uses were defined in the existing zoning ordinance in the "Definition-Interpretation" section at SCC 21.08.010:

"Semi-public facilities" means facilities intended for public use which may be owned and operated by a private entity.

That this definition was not incorporated into the 2007 Plan is indicative of the intent of the legislative body not to allow such uses and that they were not included within the 2007 Plan indicates a deliberate exclusion. Further, note that the 2007 Plan does not mention electrical energy facilities at all, indicating such facilities are not allowed.

It cannot be that the failure to mention wind energy facilities or wind turbines was a matter of oversight. As the Skamania County Hearing Examiner found in her MDNS decision, there was interest expressed by the applicant here in developing a wind farm well before the Comprehensive Plan was adopted:

However, SDS Lumber has approached Skamania County on multiple occasions over the past several years to discuss a possible large-scale wind energy project (Saddleback Project) on its property within the County. Ms. Witherspoon (the Skamania County Planning Director) met with representatives of SDS and entities such as the Bonneville Power Administration on two or three occasions

for "pre-application meetings" to discuss the permitting requirements for the project. Multiple pre-application meetings have been held because of changes in the development team. The project, if developed, would consist of at least 40 wind turbines. Although the last formal pre-application meeting was approximately two years ago, individuals associated with the project have been involved in the County's code update process and the president of SDS was present at the subject appeal hearing.

Findings, Conclusions and Decision of the Hearing Examiner for Skamania County ("FCD"), Finding 37, page 13. In fact, as the Hearing Examiner found:

The Bonneville Power Administration (BPA) has produced a map entitled "Current and Proposed Wind Energy Interconnections to BPA Transmission Facilities" (Exhibit D.4). This map depicts the SDS Saddleback project as a proposed wind generation facility of 70 megawatts (MW).

FCD, Finding 38, p. 14. Skamania County and its commissioners have long been aware of the Energy Overlay Zone adopted by the neighboring county to the east (Klickitat); indeed, testimony at the Hearing Examiner hearing on the MDNS revealed that Skamania County was asked by Klickitat County to participate in the EIS process for its overlay zone, but Skamania County declined.

As described herein, the 2007 Comprehensive Plan does not authorize or permit electrical energy or wind turbines within the County. Policy LU6.1 deals with uses authorized under the comprehensive plan:

Three types of uses should be established for each land use designation under this plan and for any zone established to implement this plan. If any use is not listed as one of the following types of developments, then the use is prohibited within that land use designation.

The Plan goes on to describe uses that may be listed as allowable uses, review uses and conditional uses. Policy LU6.2 specifies that:

In the development regulations, land uses which are neither allowed without review by the Planning Department, permitted subject to conditions, nor named as a conditional use under a land use designation made in this plan or in an ordinance implementing this plan should be prohibited without proof of a substantial change in circumstances.

As such, uses not described as appropriate under each land use designation are to be prohibited. As applied to the WREP proposal, wind turbines are not mentioned as an allowable, review or conditional use in either the Conservancy or Rural II designations and are thus not allowed.

Under the County Planning Enabling Act, RCW ch. 36.70, a county is required to prepare and adopt a comprehensive plan. RCW 36.70.320 provides that:

Each planning agency shall prepare a comprehensive plan for the orderly physical development of the county, or any portion thereof, and may include any land outside its boundaries which, in the judgment of the planning agency, relates to planning for the county. The plan shall be referred to as the comprehensive plan, and, after hearings by the commission and approval by motion of the board, shall be certified as the comprehensive plan. Amendments or additions to the comprehensive plan shall be similarly processed and certified

The statute goes on to proscribe that the comprehensive plan will be the basic source of reference when the County reviews any proposed project under RCW 36.70.450:

After a board has approved by motion and certified all or parts of a comprehensive plan for a county or for any part of a county, the planning agency shall use such plan as the

basic source of reference and as a guide in reporting upon or recommending any proposed project, public or private, as to its purpose, location, form, alignment and timing.

The report of the planning agency on any project shall indicate wherein the proposed project does or does not conform to the purpose of the comprehensive plan and may include proposals which, if effected, would make the project conform. If the planning agency finds that a proposed project reveals the justification or necessity for amending the comprehensive plan or any part of it, it may institute proceedings to accomplish such amendment, and in its report to the board on the project shall note that appropriate amendments to the comprehensive plan, or part thereof, are being initiated.

Unlike the GMA, zoning codes and maps are not required in counties operating under the county enabling act as RCW 36.70.550 provides:

From time to time, the planning agency may, or if so requested by the board shall, cause to be prepared official controls which, when adopted by ordinance by the board, will further the objectives and goals of the comprehensive plan. The planning agency may also draft such regulations, programs and legislation as may, in its judgment, be required to preserve the integrity of the comprehensive plan and assure its systematic execution, and the planning agency may recommend such plans, regulations, programs and legislation to the board for adoption.

As may be seen above, the 2007 Plan does not permit or allow wind turbine facilities by its terms. The County and this Council must apply the 2007 Plan as the "basic source of reference" in reviewing the SDS proposal and conclude that the present proposal is inconsistent with that plan.

3. PROPOSAL INCONSISTENT WITH SKAMANIA COUNTY ZONING ORDINANCE.

As described above, the proposal is inconsistent with the recently

adopted (June 2007) Skamania County Comprehensive Plan. Notwithstanding this defect, the applicant urges that the proposal is consistent with the existing zoning code. However, the existing zoning ordinance was adopted before the adoption of the 2007 Comprehensive Plan. Neither the Skamania County Planning Commission nor County Commissioners have adopted the existing zoning code as consistent with the 2007 Plan. Accordingly, the policies of the 2007 Comprehensive Plan cannot be applied to that code. Moreover, it is clear that the existing zoning ordinance does not permit the subject proposal.

Under Washington state law, development regulations or the zoning code must be consistent with the adopted Comprehensive Plan:

36.70.545. Development regulations--Consistency with comprehensive plan. Beginning July 1, 1992, the development regulations of each county that does not plan under RCW 36.70A.040 shall not be inconsistent with the county's comprehensive plan. For the purposes of this section, "development regulations" has the same meaning as set forth in RCW 36.70A.030.

Accordingly, if the existing development regulations are not consistent with the adopted 2007 Comprehensive Plan, then the zoning regulations are ineffective.

The applicant makes two attempts to demonstrate that its wind turbine proposal is consistent with the existing code, neither of which is persuasive.

This analysis begins with the important fact that the existing zoning code does not make wind turbines, wind energy or wind farms an allowable, review or conditional use in any zone. It is significant that "geothermal energy facilities" are listed as a conditional use in the FOR/AG10 and 20, Rural Estate zones. See SCC 21.56.030, 21.44.030. Indeed, "geothermal energy" is a specific type of an "Alternative energy resource" under the EFSEC statute at RCW 80.50.020(18). This indicates that the county was aware of types of alternate energy facilities, but only chose to allow only "geothermal

energy" as a conditional use, whereas "wind," another specifically listed "alternate energy resource" under RCW 80.50.020(18), is not permitted anywhere. Once again, this is not an oversight as "wind turbines" are specifically mentioned in the current code as exempt from height limitations in SCC 21.70.050. However, wind turbines, wind farms or a use related thereto is not listed as a permitted review use or conditional use in the zoning code. The only conclusion to be reached is that wind turbines are not authorized or permitted under the existing code.

The applicant also argues that Table 2-1 in the 2007 Plan at page 23 declares that certain uses are permissible in certain zones. The applicant states at page 4.2-6 of its application that:

There are three land use designations outside of the specific subarea plans: Rural I, Rural II, and Conservancy. The project area is designated as "Conservancy." Table 2-1 of the Comprehensive Plan identifies zones that are consistent with the Conservancy designation, including: Residential 10 (R-10), Rural Estates 20 (RES-20), Forest Land 20 (FL 20), Commercial Resource Land 40 (CRL 40), Natural (NAT) and Unmapped (UNM). The project site is located in the FL 20, R-10, and UNM zones, all of which are consistent with the Conservancy designation.

However, Table 2-1 refers not to the current code, but to code that might be adopted after the 2007 Plan was adopted. This is clear from the explanation of the table at page 22:

Table 2-1 shows the comprehensive plan designations and consistency of each potential zoning classification. The Plan Designation to Zoning Classification table is provided to identify those zoning districts that are consistent with each plan designation. Those districts, which are not consistent with the plan designation, are not permitted within the plan designation. This information is necessary to determine when, where and under what circumstances these designations should be applied in the future.

(Emphasis supplied). Thus the table references "potential" and "future" zoning classifications, not ones under the existing code. This is further demonstrated by the fact that the zoning classifications in Table 2-1 do not refer to the existing code, but to future code classifications. Thus, the "Commercial Resource Land 40" zone is a potential new zone as referenced in the draft zoning ordinance at Appendix F to the application. Under the existing code, the like zone is the Resource Production Zone or (FOR/AG20) zone, which is not mentioned in Table 2.1.

Thus Table 2-1 does not establish consistency with the existing code, but serves as a guide to a new zoning code, which has not yet been adopted and cannot be until an environmental impact statement is prepared under the Hearing Examiner's ruling.

The applicant argues that wind turbines are allowed as a use under the terms of the "Unmapped" area of the code. However, the terms of the 2007 Comprehensive Plan specifically provide that if a use is not listed as a conditional or allowable use within the land use designation under the plan then it will be prohibited. See discussion above and 2007 Plan at pages 30-31. The 2007 Comprehensive Plan also specifically provides under Policy LU2.6 that: "Building permits, septic tank permits, or other development permits issued by the County for any project will be in conformance with this Comprehensive Plan." (Emphasis supplied.) Since the "Unmapped" areas do not have a specific zone designation they must be regulated by the designation given by the 2007 Plan.

In addition, to determine the meaning of language within the 2007 comprehensive plan, it is useful to review the 1977 comprehensive plan it replaced. A copy of that plan is Attachment A hereto. That plan had identical land use designations, Rural 1, Rural 2 and Conservancy. See pages 91-92. Importantly, the 1977 comprehensive plan "Conservancy" designation provided:

The following inappropriate uses may be allowed on a conditional or temporary basis:

- a. Industrial
- b. Commercial

See page 92. The "NOTE" at the bottom of page 92 states:

Land uses which are considered by this plan to be inappropriate, may be established in Rural 2 and Conservancy land use areas, subject to public review and approval by the Board of County Commissioners. Such uses might include light industrial facilities, small commercial businesses, airstrips, portable sawmills, and other wood processing equipment.

(Emphasis in original). When the 2007 comprehensive plan was adopted, it retained verbatim the sentence setting the purpose and objective:

"Conservancy areas are intended to conserve and manage existing natural resources in order to maintain a sustained resource yield and/or utilization."

Compare page 25 of the 2007 comprehensive plan with page 92 of the 1977 comprehensive plan. However, the 2007 comprehensive plan removed any allowance for "Industrial" or "Commercial" uses either as permitted, review or conditional uses in the Conservancy designation.

The inclusion in the 1977 Plan of the "inappropriate" industrial and commercial uses also explains why the "Unmapped" zone (guided by the 1977 Plan) allowed uses which were "not nuisances," to take account of their characterization as "inappropriate." However, with the adoption of the 2007 comprehensive plan, and the elimination of any possibility of any "inappropriate uses," allowance of uses that were not nuisances became inconsistent with the comprehensive plan and thus illegal.

In addition, the applicant contends that its private wind turbine proposal should be considered "semi-public facilities and utilities" and thus an allowable conditional use in the existing FOR/AG10 and 20 zones. However, the Comprehensive Plan says that "Public Facilities and Utilities" (emphasis supplied) are allowed in the Conservancy and Rural II Land Use Designations, not "Semi-public Facilities and Utilities." Since both of these uses are defined terms in the existing

code, it is very clear that when the Commissioners chose to include only one in the comprehensive plan, it was a deliberate decision. In addition, the 1977 plan made specific provisions in the Rural 2 zone for "Semi-public" uses. See page 91. "Semi-public" uses were specifically eliminated from the 2007 comprehensive plan in all land use designations, including "Conservancy." See 2007 Plan, p. 24-26. Further, the provision in the comprehensive plan gives examples of the kinds of "public facilities and utilities" which are appropriate in the zone "such as parks, public water access, libraries, schools, utility substations and telecommunication facilities." It cannot be said up to 50, 425 foot tall wind turbines as the WREP would intend, with an extensive road network, can be equated to such modest and common place uses as parks, public accesses and schools. If these were intended to include wind turbines, wind farms and other alternative energy facilities, the comprehensive plan would have said so by simply adding a definition of such uses. Of course if there was a proposal to include large wind farms within the 2007 Plan, it would have likely ignited significant controversy.

In essence, inclusion of a large scale wind farm as a "facility and utility" permissible in the Conservancy designation is a de facto amendment of the comprehensive plan. It does so without adherence to the requirement that the planning commission first review the comprehensive plan or any amendments under RCW 36.70.320 and .410, that there be a public hearing and a final decision by the Commissioners. RCW 36.70.380 and .420. In addition, the inclusion of wind turbine or other facilities in the comprehensive plan would have required new SEPA compliance. Given that the inclusion in the zoning code of provisions for wind farms has resulted in the requirement for an environmental impact statement, the same would likely be true for the comprehensive plan adoption.

In addition to the foregoing, the issue of consistency between the existing zoning code and the comprehensive plan arose in the hearing before the Skamania County on the appeal of SOSA and Friends challenging the County MDNS for the new zoning code. SOSA in particular alleged that the 2007 Comprehensive Plan was inconsistent with the proposed zoning ordinance. In response, the County argued that the allowance of wind turbines in the proposed

zoning ordinance did not have a significant impact because wind turbines were already allowed. This issue was resolved in favor of SOSA when the Hearing Examiner found:

The 2007 Comprehensive Plan does not contemplate the type of energy facilities described in the Planning Commission Recommended Draft.

FCD, Finding 18, page 8. As an issue regarding the comprehensive plan, which was actually litigated between the County, SOSA and Friends, the County is now prevented from contesting this conclusion under the doctrine of claim preclusion or *res judicata*. Washington law is clear that *res judicata* applies to administrative proceedings:

Res judicata, modernly called claim preclusion, P. Trautman, Claim and Issue Preclusion in Civil Litigation in Washington, 60 Wash.L.Rev. 805 (1985), applies to quasi-judicial decisions by administrative tribunals as well as to judicial decisions by courts. *State v. Dupard*, 93 Wn. 2d 268, 274, 609 P.2d 961 (1980); *Miller v. St. Regis Paper Co.*, 60 Wn. 2d 484, 485, 374 P.2d 675 (1962); see *McCarthy v. Department of Social and Health Servs.*, 110 Wn. 2d 812, 823, 759 P.2d 351 (1988) (collateral estoppel); *Malland v. Department of Retirement Sys.*, 103 Wn. 2d 484, 490, 694 P.2d 16 (1985) (same). The Board's 1985 decision was quasi-judicial because it denied a proposed plat, and an administrative decision denying a proposed plat is quasi-judicial. *Miller v. Port Angeles*, 38 Wn. App. 904, 908, 691 P.2d 229 (1984), review denied, 103 Wn. 2d 1024 (1985); *Lechelt v. Seattle*, 32 Wn. 2d 831, 835, 650 P.2d 240 (1982), review denied, 99 Wn. 2d 1005 (1983); see RCW 58.17.100 (findings of fact required); RCW 58.17.180 (review is by writ of review). Therefore, the Board's 1985 decision was subject to *res judicata* at such time as it became final. *Columbia Rentals, Inc. v. State*, 89 Wn. 2d 819, 821, 576 P.2d 62 (1978) (final judgment is *res judicata*); *Pinkney v. Ayers*, 77 Wn. 2d 795, 796, 466 P.2d 853 (1970) (interlocutory order is not *res judicata*).

Lejeune v. Clallam County, 64 Wn. App. 257, 264-265, 823 P.2d 1144, (1992).

The finding by the Hearing Examiner that the 2007 comprehensive plan did not contemplate the wind energy facilities described in the zoning ordinance is binding on the County. Further, the existing zoning code, even if adopted by the County to implement the 2007 Plan (which it was not), does not permit large scale wind facilities.

5. THE RECOMMENDED DRAFT OF THE PLANNING DEPARTMENT CANNOT BE CONSIDERED BY EFSEC.

At Appendix F of its application, SDS argues that the EFSEC should consider a draft, unadopted zoning code and map. EFSEC will commit error if it considers the proposed code for two reasons.

First, zoning codes do not become effective until they are adopted by the legislative body with jurisdiction. Zoning codes and maps are considered "official controls" under RCW 36.70.02(11):

(11) "Official controls" means legislatively defined and enacted policies, standards, precise detailed maps and other criteria, all of which control the physical development of a county or any part thereof or any detail thereof, and are the means of translating into regulations and ordinances all or any part of the general objectives of the comprehensive plan. Such official controls may include, but are not limited to, ordinances establishing zoning, subdivision control, platting, and adoption of detailed maps.

See also RCW 36.70.560. RCW 36.70.570 specifically requires that:

Official controls shall be adopted by ordinance and shall further the purpose and objectives of a comprehensive plan and parts thereof.

(Emphasis supplied). Zoning ordinances and zoning maps may only be

adopted after a public hearing and recommendations by the Planning Commission under RCW 36.70.320 and .420. There is no provision in EFSEC legislation to consider unadopted codes, or ones under consideration.

Second, the Skamania County Hearing Examiner has ruled the MDNS issued by the responsible official in Skamania County was issued in error. The ruling of the Examiner is as follows:

The Determination of Nonsignificance is reversed, and remanded to the County for preparation of an Environmental Impact Statement for the zoning code map and text amendments.

FCD, p. 29.

Under the terms of SEPA, the EIS when completed "shall accompany the proposal through the agency review processes; . . ." RCW 43.21.030(2)(d). In the present case, the Planning Enabling Act requires that before an agency adopts a zoning ordinance or maps, a public hearing must be held by the Planning Commission under RCW 36.70.580:

Before recommending an official control or amendment to the board for adoption, the commission shall hold at least one public hearing.

Following the public hearing, the Planning Commission must make a recommendation to the County Commissioners under RCW 36.70.600.

The recommendation to the board of any official control or amendments thereto by the planning agency shall be by the affirmative vote of not less than a majority of the total members of the commission. Such approval shall be by a recorded motion which shall incorporate the findings of fact of the commission and the reasons for its action and the motion shall refer expressly to the maps, descriptive and other matters intended by the commission to constitute the plan, or amendment, addition or extension thereto.

The indication of approval by the commission shall be recorded on the map and descriptive matter by the signatures of the chairman and the secretary of the commission and of such others as the commission in its rules may designate.

For SEPA purposes, the "existing agency review process" involves, at a minimum, public hearings before the Planning Commission, a recommendation by the Planning Commission and action by the County Commissioners. Each of these processes will require that a final EIS be prepared and available for those bodies. Thus any action previously taken, or recommendations made, must be reconsidered in light of Hearing Examiner's requirement that an EIS be prepared. Since the County has not yet prepared an EIS on its zoning ordinance, any existing drafts of a proposed ordinance may not be considered by EFSEC.

6. THE ROAD ACCESS TO THE SITE IS NOT PERMITTED BY SCENIC AREA RULES.

The application filed herein describes the improvement and widening of a road that appears to be the primary access to the site. Approximately 2.1 acres of this road are located in the National Scenic Area and are controlled by Skamania County Scenic Area regulations. The Friends of the Columbia River Gorge has addressed this issue in correspondence and SOSA adopts by reference the position stated by Friends on this issue in their submission.

7. SKAMANIA COUNTY CERTIFICATE OF LAND USE CONSISTENCY.

SOSA has just received Skamania County Resolution 2009-22 which purports to adopt a Certificate of Land Use Consistency for the WREP proposal. This Resolution was adopted on May 5, 2007 by the Skamania County Commissioners. Copies of the Resolution and its accompanying 28 page staff analysis were not available prior to adoption. Because of its late adoption, and lack of notice, SOSA is not able to provide a detailed response to the Resolution at this time. Neither county staff nor the commissioners provided notice of the

May 6, 2009

Page 18

content of what was intended to be adopted and there were no public hearings on the matter. The Planning Commission for Skamania County was neither contacted or consulted regarding this matter. Accordingly, SOSA requests a two week delay in the close of the record on the land use consistency hearing to provide comments on the county's resolution.

SOSA does have one preliminary comment. As noted above, the County's 2007 comprehensive plan contains no provisions for wind energy facilities in any land use designation. Notwithstanding this obvious deficiency, the County Commissioners proposed a zoning ordinance and map that would allow wind energy facilities in Conservancy designations. The County's decision not to prepare an environmental impact statement on the zoning code and map was appealed to Skamania County's own Hearing Examiner. She not only reversed the MDNS issued by the County (see Attachment B), but also ruled that the "2007 Comprehensive Plan does not contemplate the type of energy facilities [among them large scale wind energy facilities] described in the Planning Commission Recommended Draft." The County did not appeal the Hearing Examiner decision to the Superior Court.

Now, in the letter accompanying the submission of Resolution 2009-22 to this Council, everyone is told that:

Since this decision (of the Hearing Examiner requiring the environmental impact statement) the map and updates for the Zoning Ordinance project have been permanently placed on hold. It has not been decided whether or not the County will continue with this project or start from scratch when the zoning update process resumes.

May 4, 2009 letter from Karen Witherspoon to EFSEC, page 2.

It is clear that the County, having been denied the approval of wind turbines in legally appropriate processes, has now decided to go through the "back door" to try to legalize large scale wind farms by simply deciding that they are consistent with existing codes. However, as demonstrated above, the adopted comprehensive plan and zoning ordinances do not allow such facilities. It is likely that the County's

May 6, 2009
Page 19

actions, as interpretations of land use codes, will be challenged as illegal under the Washington Land Use Petition Act. In the meantime, EFSEC should refuse to consider the county's position on this matter or dismiss it and hold that the proposed project is not consistent with the comprehensive plan and zoning ordinances.

Based on the foregoing, SOSA submits that the WREP is inconsistent with the 2007 Skamania County Comprehensive Plan and current zoning code and EFSEC should so conclude.

Thank you in advance for your consideration of our views.

Sincerely yours,

ARAMBURU & EUSTIS LLP

Re: Comments on Draft EIS for Whistling Ridge Energy Project
DOE EIS - 0419: Failure to Consider Alternatives

Dear Messrs. Posner and Montaña:

This office represents Save Our Scenic Area (SOSA), a Washington corporation representing persons interested in the Whistling Ridge Energy Project (WRE). SOSA's primary mission is to preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. I write today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

WRE proposes to construct as many as 50 wind turbines on ridge lines on its property in Skamania County to produce a minimum of 70 MW. The project includes the construction and operation of a substation to be owned and operated by BPA that will connect the project to the Federal Columbia River Transmission System (FCRTS or the Grid). As discussed herein the project includes the turbines, the electrical connection system, the necessary infrastructure and the BPA substation. Though this project has been under development for some time, the applicant has identified only a range of wind turbine generators which "would likely range in size from 1.2 to 2.5 MW." DEIS at 1-9. However, the larger capacity turbines have larger diameter rotors (up to 100 meters), so it is unknown what the size of the machines would actually be. The proposal has multiple serious environmental impacts, including severe impacts on the visual surroundings of the Columbia River Gorge National Scenic Area.

A severe deficiency in the EIS is the failure to consider any alternative other than the applicant's minimum 70 MW proposal on its own property. Page 1-13 of the "Alternate Project Locations" includes only sites within the ownership of SDS. On page 1-14, the EIS states that the applicant considered a lesser number of turbines, but rejected such an alternative because it did not fit within SDS's concept of "economic feasibility." The failure to consider either alternate locations or alternate site configurations (with fewer wind turbines) is a fundamental and fatal defect in the DEIS, as was previously pointed out at the public hearing on the document. The responsible official must prepare a supplemental DEIS to address and thoroughly consider reasonable alternatives. This supplemental DEIS should be circulated for comment in the same manner as any DEIS under NEPA/SEPA rules and regulations.

After the DEIS was issued, the EFSEC and BPA issued Council Order No. 848 (June 29, 2010), which acknowledged public comments during the DEIS comment hearing on June 16, 2010 that identified "potentially serious errors in, or omissions from, the draft EIS." See page 2 of Order 848. That order requested that the applicant "incorporate into its direct presentation any information needed to address asserted significant flaws in the DEIS." Order 848 also indicated that the Final Environmental Impact Statement (FEIS) would not be issued before the adjudicative hearings began on December 8, 2010. SOSA and Friends of the Columbia Gorge (Friends) objected to Order 848 on July 8, 2010, requesting that the Council's responsible official require that the FEIS be issued prior to the commencement of the adjudicative hearings.

In its Order 850, the Council responded to the objections of Friends and SOSA. In that order, the Council indicated that:

The comments [on the DEIS] are reviewed, responses are prepared and then the general agency practice is that the responsible official issues a draft final EIS (DFEIS).

The DFEIS precedes the beginning of the adjudicative hearing. Its information is public and available. The environmental record is received in evidence; its information is available to the parties and the public during the adjudicative hearing. The content of the DFEIS is the equivalent of a FEIS. At the conclusion of the hearing process, the responsible official issues a FEIS, which may incorporate additional information received in the adjudicative hearing.

Order 850 at pages 3-4. Order 850 raises multiple issues regarding the proper procedures under SEPA and NEPA, as well as several unanswered questions, as follows:

1. There are no procedures under SEPA or NEPA by which an agency can issue a "DFEIS." Accordingly, it cannot be considered part of the SEPA or NEPA process.
2. Order 850 does not indicate whether interested parties may comment on the "DFEIS." Given that it is a draft document (though not one authorized by SEPA or NEPA), the DFEIS, if issued, should be properly noticed to agencies and persons who commented on the DEIS. There should be a comment period of a minimum of 45 days on the DFEIS.
3. Order 850 does not explain how the responsible official "may incorporate additional information received in the adjudicative hearing." Will the responsible official go through the entire administrative record to revise the DFEIS? More information is required on how that process will be implemented.

Based on the foregoing, SOSA still believes that the correct procedure to be followed, and one authorized by the rules under both SEPA and NEPA, is to issue a supplemental DEIS (SDEIS) correcting basic errors in the issued DEIS. The SDEIS would be subject to comment by interested agencies and members of the public. Our legal basis for this request is as follows:

The starting point for analysis of the alternative requirement is SEPA itself. RCW 43.21C.030(1)(c)(iii) makes clear that the "detailed statement" (which is now the environmental impact statement requirement) must consider "alternatives to the proposed action." Alternatives are so important under SEPA that each state agency, including EFSEC, has the responsibility to:

Study, develop and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources.

The details of consideration of alternatives in an EIS is found at WAC 197-11-440(5).

Under NEPA Rules, the consideration of alternatives is considered the heart of the EIS:

Sec. 1502.14 Alternatives including the proposed action.

This section is the heart of the environmental impact statement. Based on the information and analysis presented in the sections on the Affected Environment (Sec. 1502.15) and the Environmental Consequences (Sec. 1502.16), it should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. In this section agencies shall:

- (a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.
- (b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.
- (c) Include reasonable alternatives not within the jurisdiction of the lead agency.
- (d) Include the alternative of no action.
- (e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference.
- (f) Include appropriate mitigation measures not already included in the proposed action or alternatives.

(Emphasis supplied.)

As noted above, based on the applicant's own opinion of financial feasibility, the DEIS has not considered other alternatives; a position which appears to be unquestioned by the drafters of the DEIS. However, the applicant has not provided any information on financial feasibility and cannot so stricture and limit its proposal to avoid alternatives.

It appears that the applicant asserts, and EFSEC and BPA concur, that the proposal is for a private project on private property. See 197-11-440(5)(d). This exemption does not apply if the project includes a rezone or:

if other locations for the type of proposed use have not been included or considered in existing planning or zoning documents.

The portion of the DEIS addressing land use regulation does not disclose that wind turbines were ever included or considered in planning documents adopted in Skamania County. See DEIS at pages 3-140 to 3-155.

The failure of the DEIS to consider alternatives is a fatal flaw for several reasons.

First, there are serious issues as to whether the proposal is consistent with local zoning. While the DEIS seems to claim that the project is consistent with Skamania County's comprehensive plan and zoning code, there are many reasons to believe it is not. On May 6, 2009 SOSA filed a lengthy letter directed to both Skamania County and EFSEC challenging the consistency of the proposal with local zoning. Among other matters, that letter pointed out that wind turbines or wind farms are not listed as permitted uses in the

Skamania County Zoning Ordinance or in the 2007 Skamania County Comprehensive plan.

The latter conclusion is confirmed by decision of the Skamania County Hearing Examiner made in February 2009 in a SEPA challenge to a determination of nonsignificance for adoption of a new zoning ordinance for Skamania County, which ordinance proposed regulating wind turbine development. Questions arose during the course of that hearing regarding whether the 2007 Skamania County Comprehensive Plan actually permitted or considered wind energy facilities. In her decision, the Hearing Examiner found as follows:

The 2007 Comprehensive Plan does not contemplate the type of energy facilities described in the Planning Commission Recommended Draft.

See Findings and Decision, Finding 18 at page 8. The Hearing Examiner went on to rule that Skamania County was required to prepare an environmental impact statement prior to the adoption of its new zoning ordinance. Skamania County has never prepared the environmental impact statement ordered by the Examiner and the proposed zoning ordinance was not adopted.

Since Skamania County has adopted a zoning ordinance that does not provide for wind energy facilities, and its comprehensive plan does not contemplate such facilities, the exception in the SEPA Rules does not apply. Either WRE must apply for a rezone (which it has not) or EFSEC must preempt local zoning. The preemption decision by EFSEC would be the functional equivalent of a rezone because it provides approval for a previously unpermitted use.

In fact, EFSEC must make a determination of land use consistency and held a hearing on that subject on May 6, 2010. However, EFSEC did not make a decision on land use consistency at that time and has deferred such decision to be made in the course of the adjudicative hearings.

The consistency of the proposed project with local zoning has yet to be determined. The responsible official under SEPA, the EFSEC manager, accordingly cannot determine whether the WRE project is consistent with local zoning. If it is not, the Council may preempt local zoning, which would be the functional equivalent of a rezone for the project. Alternatives must accordingly be fully considered.

Second, the proposal is not a private project within the meaning of the SEPA Rules. This issue was previously considered in a Washington Supreme Court decision:

Under the present statutes and administrative code, the question now before the court as to whether the EIS is adequate turns on whether the proposed project is a "public project" or a "private project".FN1

FN1. It is unnecessary in this case to determine whether the "public"/ "private" distinction drawn in the administrative code accords with SEPA policy. We recognize that one commentator has suggested that in certain cases, the distinction may be unsound. See Richard L. Settle, The Washington State Environmental Policy Act: A Legal and Policy Analysis §14(b)(ii) (4th ed. 1993).

WAC 197-11-440(5)(d) provides in relevant part:

When a proposal is for a private project on a specific site, the lead agency shall be required to evaluate only the no action alternative plus other reasonable alternatives for achieving the proposal's objective *on the same site*....

(Italics ours.) A "private project" is defined in WAC 197-11-780: "Private project" means any proposal primarily initiated or sponsored by an individual or entity other than an agency."

Weyerhaeuser v. Pierce County, 124 Wn. 2d 26, 38-39, 873 P.2d 498, 505 (1994).

The project in *Weyerhaeuser* was a land fill proposed by a private applicant on private property. However, the court concluded it was a public project because of the close relationship between the county actions and the supposedly private project. The court went on to hold:

We agree with the Weyerhaeusers that, as a matter of law, the proposed landfill is a public project, and the EIS must contain a sufficient discussion of offsite alternative proposals. Because it does not do so, it is inadequate as a matter of law.

The WRE project is similarly public for several reasons. First, the DEIS contains extensive discussion as to need for electric power to meet public needs for the region. See DEIS pages 1-4 to 1-7. This is clear in the DEIS at page 1-4: "The Applicant's purpose in proposing the Whistling Ridge Energy Project is to help meet the future need for energy resources." SDS also seeks to provide an additional renewable resource for electric utilities in Washington. Second, this project has been referenced by its proponents as a "semi-public" facility under the Skamania County zoning ordinance. See DEIS at page 3-147 to 149.

The WRE proposal is not exempt from alternatives analysis under SEPA or NEPA as it must be classified as a public facility.

Third, the DEIS cites numerous public documents that the project will supposedly comply with, including the Fifth Northwest Electric Power and Conservation Plan (DEIS at 1-4), the draft Sixth Northwest Electric Power Plan ("NPCC 2009", DEIS at 1-5), the "establishment of Renewable Portfolio Standards (RPS) at the state level" (DEIS at 1-

5), the requirement for "qualified alternative energy products" pursuant to state law (DEIS at 1-5). Each of these regulations and policies is substantially similar to the relationship between Pierce County and the developer in the *Weyerhaeuser* case. The DEIS touts the current proposal as meeting public needs and legislative mandates. WRE cannot promote the project "public" for one purpose, but claim it is "private" for another, especially where careful review of alternatives is required by SEPA and NEPA.

The result of the *Weyerhaeuser* case was as follows:

The hearing examiner's decisions on the conditional use permit and the EIS appeal are reversed. The EIS must be revised to adequately address alternatives to the proposed project. In any new public hearing on this proposed project where county-staff-authored reports and an environmental impact statement are involved, the opportunity for oral cross examination of the staff members must be accorded.

124 Wn.2d at 47. The failure of the BPA and EFSEC to consider alternatives, including alternate locations and different configurations are fatal flaws in the DEIS. The current EIS should be withdrawn and a supplemental EIS complying with NEPA/SEPA rules and guidelines must be circulated for comment.

Fourth, there is considerable discussion of the need for the project's resources on a regional basis. See DEIS at 1-4 and 1-5. However, there are real questions as to need for this variable energy facility.

At the outset, it appears that most wind energy is not, as indicated at page 1-4 of the DEIS, used or useful in the Northwest. As indicated in the April 12, 2010 submission of BPA to the Federal Energy Regulatory Commission (FERC) on their docket Docket No. RM10-11-000 regarding regulation of "variable energy resources" (VER) at page 2:

The need to clearly define balancing authority roles and responsibilities is especially important to BPA, because approximately 80 percent of the almost 2,800 MW of wind generation currently on BPA's system is exported to other balancing authorities, and BPA's preference customers should not bear costs of integrating wind generation that is exported to serve load outside of BPA's balancing authority.

Thus the EIS must consider whether the WR project or other wind projects actually meet loads in the Northwest.

In addition, as the BPA submission to FERC makes clear, it is necessary for balancing power to be available to meet loads when the wind does not blow. As noted by BPA in their comments on Docket No. RM10-11-000, at page 5, there are additional problems with balancing loads when wind energy resources are exported to California or to other

sink authorities. These facilities might include increased reliance on hydro resources or peaking facilities such as gas turbine plants. The EIS should consider whether additions of a VER like WR will result in the need for other peaking facilities to balance loads and whether the addition of a VER like WR is consistent with meeting demand.

Fifth, the DEIS repeatedly refers to the "economic feasibility" of the project when referring to the minimum output (70 MW) that is acceptable to the applicant. DEIS at 1-14. There is also reference to what utilities might require for the project at page 2-20 (project objectives "include providing a minimum level of generation to be attractive to utilities seeking to fulfill their RPS requirements, as well as providing a return on investment to the applicant."). However, most of this discussion is self-serving conclusions with no backup documentation. If the applicant seeks unilaterally to foreclose alternatives, then it must provide the economic and financial information to support these conclusions. The necessary data consists of costs of each of the various project elements, including labor and materials costs, costs for construction of roads, transmission lines and the substation, all leading to the overall cost and cost per kW or MW.

On the other side of the equation, the applicant must produce estimations of sales prices for the energy from the project, as well as actual support for the proposition that there is a minimum output that utilities would require. Further, actual land costs, by way of leases or property purchase, should be compared with other sites. Given the representations of the applicant, and the investment to date in the permitting, this "pro forma" type financial material should be readily available.

In addition, the EIS should consider whether placing a VER like WR on line will simply require construction of other facilities to balance loads, such as gas turbines or other facilities.

Sixth, the alternatives section of the DEIS must consider the problems of integrating wind power into the existing electric grid. These issues are discussed in the May 22, 2010 edition of the Seattle Times, which is incorporated by reference.

Because wind turbines only work while wind is blowing, other energy sources must be turned on when the wind stops or turned off or ramped down when the wind blows. This is illustrated by the recent review of the "BPA Balancing Authority Load and Total Wind, Hydro, and Thermal Generation, Near-Real-Time" for the period August 10-17, 2010. See Attachment A hereto. The load balancing data shows that wind generation on August 10, 2010 went from 2,202 MW to only 168 MW in just 12 hours. The simple meteorological explanation is that wind conditions went from higher speeds to near calm over this period. The new supplemental EIS should discuss the issues and problems related to integrating the Northwest power grid with wind power from this and other wind turbine projects.

Of more importance, the period of highest wind production did not correlate with increased electric loads for the Northwest. Thus when wind production was essentially zero on July 8-9, total loads in the BPA region were over 12,000 MW due to greater demand for cooling during this very hot spell. (The Clackamas weather station showed a high of 99°F on July 8 and 95°F on July 9.) When wind power generation rose on July 12 with increasing winds, loads dropped because of cooler temperatures (a high of 70°F on July 13.) Thus, if the wind is not blowing, base loads in the BPA region must be met by other power sources.¹ Accordingly, to meet loads, new wind power projects must be accompanied by new, firm, baseload power resources. While the region relies extensively on hydro power, in low water years, hydro power can be problematic. Indeed, according to the Seattle Times the BPA grid recently has cut back on receipt of wind energy because of capacity issues.

The new supplemental DEIS should discuss the erratic nature of wind energy and whether the addition of small quantities of wind energy will actually provide meaningful solutions to energy needs.

Seventh, in examining alternatives, the draft needs to compare the impacts of developing the proposed project with other alternate sources of wind energy being developed within the jurisdiction of EFSEC.

There are serious impacts related to the WRE proposal based largely on its location. The Underwood location will have serious visual and aesthetic impacts to extremely valuable and unique scenic resources found in the Columbia River Gorge, where because of its elevation the project will be seen by many persons over a broad area. Further, this forested location increases substantially the risks of bird and bat collisions with the turbine blades. Other environmental impacts are of concern because of the location of the turbines on steep ridgelines, which may restrict options for micro-siting and increase impacts due to road building. This location should be compared with other possible sites, especially in southeast Washington where wind turbines are located away from populated areas and have lesser risk for bird or bat collisions.

Eighth, the section on alternatives in SEPA explicitly calls for an analysis of the alternative of future development of the proposal under WAC 197-11-440(5)(c) where the alternatives section of the EIS includes obligation to:

(vii) Discuss the benefits and disadvantages of reserving for some future time the implementation of the proposal, as compared with possible approval at this time. The agency perspective should be that each

¹The phenomenon is not limited to summer conditions. During the 10 day cold spell in January 2008, BPA records show very high loads, but no contribution from wind energy projects for more than 10 days.

generation is, in effect, a trustee of the environment for succeeding generations. Particular attention should be given to the possibility of foreclosing future options by implementing the proposal.

For the present application, the DEIS must discuss the alternative of delaying the implementation of the WR proposal. In light of visual impacts, bird and bat kills and other serious impacts of the WR proposal, the DEIS should discuss the option of reserving the WRE project until such time as projects with lesser impacts have been permitted and constructed. The DEIS should accordingly discuss potential wind turbine sites, including those permitted, those under application, and those in areas where new applications are likely, for example, where land commitments in the form of leases are made by property owners to wind turbine developers.

Ninth, the proposed project requires an interconnection with the BPA transmission line together with the construction of a substation. That is clearly a public project, not a private project, and thus alternatives must be fully considered. As related to the substation it is understood that the BPA substation must be built with capacity to receive additional electric energy for interconnection with the FCRTS. Thus, the EIS must consider whether the BPA substation will act as an attraction for other energy projects to locate nearby. In this regard, SOSA notes that a natural gas pipeline traverses the north portion of the project area. See DEIS, Figure 2-3. In the recent past, the land owner SDS has promoted plans for a gas turbine for electrical generation in this area. The EIS must consider the possibility of a gas turbine project in the area, especially one that may have enhanced financial feasibility because of the proximity to both a fuel source (the gas pipeline) and a substation to connect that energy to the FCRTS. Given the need for balancing resources for VERs like WR, location of such a facility nearby appears more likely. Accordingly, the EIS must consider the impacts of such a gas turbine facility, including air emissions, noise, wildlife impacts and other impacts common to these facilities.

In addition, reports indicate that this year 68% of new wind turbine energy will be sold to California. The FEIS should identify whether power from the WR project will be sold and used in California or at any other location outside the state of Washington. Further, analysis should be made as to the capacity of transmission lines to accept the power from the WR project. Any contract or informal commitment between this applicant and public or private utilities should be identified in the FEIS and whether such parties are providing up front costs for this application and construction. If the power from this project is to be sold to out of state public or private consumers, then alternatives should be considered closer to where the power will be consumed.

Tenth, while SEPA contains the public v. private distinction, NEPA and the NEPA Guidelines contain no such exception. Since this DEIS is to meet NEPA requirements, there must be a full exploration of available alternatives under the terms of both NEPA

ARAMBURU & EUSTIS, LLP

July 16, 2010

Page 11

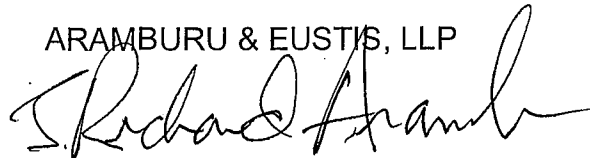

and SEPA rules. As cited above, the NEPA Guidelines require consideration of alternatives even though they may not be within the agency's jurisdiction.

Given the importance of alternatives analysis under both NEPA and SEPA, the failure of EFSEC and BPA to do this analysis now may mean that upcoming processes will have to be repeated should a court determine that the procedure adopted is illegal, resulting in a huge waste of time and resources of all involved.

In summary, the failure of the DEIS to discuss reasonable alternatives is a fatal flaw in that document. EFSEC and BPA should immediately withdraw the noncompliant DEIS and prepare a supplemental DEIS that considers all reasonable alternatives, not just those identified in this letter. The supplemental DEIS should be circulated for comment as required for any DEIS and no work on the final EIS should begin until all comments are in for the supplement.

Sincerely yours,

ARAMBURU & EUSTIS, LLP

Re: Comments on Draft EIS for Whistling Ridge Energy Project
DOE EIS - 0419: Failure to Consider Alternatives

Dear Messrs. Posner and Montaña:

This office represents Save Our Scenic Area (SOSA), a Washington corporation representing persons interested in the Whistling Ridge Energy Project (WRE). SOSA's primary mission is to preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. I write today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

WRE proposes to construct as many as 50 wind turbines on ridge lines on its property in Skamania County to produce a minimum of 70 MW. The project includes the construction and operation of a substation to be owned and operated by BPA that will connect the project to the Federal Columbia River Transmission System (FCRTS or the Grid). As discussed herein the project includes the turbines, the electrical connection system, the necessary infrastructure and the BPA substation. Though this project has been under development for some time, the applicant has identified only a range of wind turbine generators which "would likely range in size from 1.2 to 2.5 MW." DEIS at 1-9. However, the larger capacity turbines have larger diameter rotors (up to 100 meters), so it is unknown what the size of the machines would actually be. The proposal has multiple serious environmental impacts, including severe impacts on the visual surroundings of the Columbia River Gorge National Scenic Area.

A severe deficiency in the EIS is the failure to consider any alternative other than the applicant's minimum 70 MW proposal on its own property. Page 1-13 of the "Alternate Project Locations" includes only sites within the ownership of SDS. On page 1-14, the EIS states that the applicant considered a lesser number of turbines, but rejected such an alternative because it did not fit within SDS's concept of "economic feasibility." The failure to consider either alternate locations or alternate site configurations (with fewer wind turbines) is a fundamental and fatal defect in the DEIS, as was previously pointed out at the public hearing on the document. The responsible official must prepare a supplemental DEIS to address and thoroughly consider reasonable alternatives. This supplemental DEIS should be circulated for comment in the same manner as any DEIS under NEPA/SEPA rules and regulations.

After the DEIS was issued, the EFSEC and BPA issued Council Order No. 848 (June 29, 2010), which acknowledged public comments during the DEIS comment hearing on June 16, 2010 that identified "potentially serious errors in, or omissions from, the draft EIS." See page 2 of Order 848. That order requested that the applicant "incorporate into its direct presentation any information needed to address asserted significant flaws in the DEIS." Order 848 also indicated that the Final Environmental Impact Statement (FEIS) would not be issued before the adjudicative hearings began on December 8, 2010. SOSA and Friends of the Columbia Gorge (Friends) objected to Order 848 on July 8, 2010, requesting that the Council's responsible official require that the FEIS be issued prior to the commencement of the adjudicative hearings.

In its Order 850, the Council responded to the objections of Friends and SOSA. In that order, the Council indicated that:

The comments [on the DEIS] are reviewed, responses are prepared and then the general agency practice is that the responsible official issues a draft final EIS (DFEIS).

The DFEIS precedes the beginning of the adjudicative hearing. Its information is public and available. The environmental record is received in evidence; its information is available to the parties and the public during the adjudicative hearing. The content of the DFEIS is the equivalent of a FEIS. At the conclusion of the hearing process, the responsible official issues a FEIS, which may incorporate additional information received in the adjudicative hearing.

Order 850 at pages 3-4. Order 850 raises multiple issues regarding the proper procedures under SEPA and NEPA, as well as several unanswered questions, as follows:

1. There are no procedures under SEPA or NEPA by which an agency can issue a "DFEIS." Accordingly, it cannot be considered part of the SEPA or NEPA process.
2. Order 850 does not indicate whether interested parties may comment on the "DFEIS." Given that it is a draft document (though not one authorized by SEPA or NEPA), the DFEIS, if issued, should be properly noticed to agencies and persons who commented on the DEIS. There should be a comment period of a minimum of 45 days on the DFEIS.
3. Order 850 does not explain how the responsible official "may incorporate additional information received in the adjudicative hearing." Will the responsible official go through the entire administrative record to revise the DFEIS? More information is required on how that process will be implemented.

Based on the foregoing, SOSA still believes that the correct procedure to be followed, and one authorized by the rules under both SEPA and NEPA, is to issue a supplemental DEIS (SDEIS) correcting basic errors in the issued DEIS. The SDEIS would be subject to comment by interested agencies and members of the public. Our legal basis for this request is as follows:

The starting point for analysis of the alternative requirement is SEPA itself. RCW 43.21C.030(1)(c)(iii) makes clear that the "detailed statement" (which is now the environmental impact statement requirement) must consider "alternatives to the proposed action." Alternatives are so important under SEPA that each state agency, including EFSEC, has the responsibility to:

Study, develop and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources.

The details of consideration of alternatives in an EIS is found at WAC 197-11-440(5).

Under NEPA Rules, the consideration of alternatives is considered the heart of the EIS:

Sec. 1502.14 Alternatives including the proposed action.
This section is the heart of the environmental impact statement. Based on the information and analysis presented in the sections on the Affected Environment (Sec. 1502.15) and the Environmental Consequences (Sec. 1502.16), it should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. In this section agencies shall:

- (a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.
- (b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.
- (c) Include reasonable alternatives not within the jurisdiction of the lead agency.
- (d) Include the alternative of no action.
- (e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference.
- (f) Include appropriate mitigation measures not already included in the proposed action or alternatives.

(Emphasis supplied.)

As noted above, based on the applicant's own opinion of financial feasibility, the DEIS has not considered other alternatives; a position which appears to be unquestioned by the drafters of the DEIS. However, the applicant has not provided any information on financial feasibility and cannot so stricture and limit its proposal to avoid alternatives.

It appears that the applicant asserts, and EFSEC and BPA concur, that the proposal is for a private project on private property. See 197-11-440(5)(d). This exemption does not apply if the project includes a rezone or:

if other locations for the type of proposed use have not been included or considered in existing planning or zoning documents.

The portion of the DEIS addressing land use regulation does not disclose that wind turbines were ever included or considered in planning documents adopted in Skamania County. See DEIS at pages 3-140 to 3-155.

The failure of the DEIS to consider alternatives is a fatal flaw for several reasons.

First, there are serious issues as to whether the proposal is consistent with local zoning. While the DEIS seems to claim that the project is consistent with Skamania County's comprehensive plan and zoning code, there are many reasons to believe it is not. On May 6, 2009 SOSA filed a lengthy letter directed to both Skamania County and EFSEC challenging the consistency of the proposal with local zoning. Among other matters, that letter pointed out that wind turbines or wind farms are not listed as permitted uses in the

Skamania County Zoning Ordinance or in the 2007 Skamania County Comprehensive plan.

The latter conclusion is confirmed by decision of the Skamania County Hearing Examiner made in February 2009 in a SEPA challenge to a determination of nonsignificance for adoption of a new zoning ordinance for Skamania County, which ordinance proposed regulating wind turbine development. Questions arose during the course of that hearing regarding whether the 2007 Skamania County Comprehensive Plan actually permitted or considered wind energy facilities. In her decision, the Hearing Examiner found as follows:

The 2007 Comprehensive Plan does not contemplate the type of energy facilities described in the Planning Commission Recommended Draft.

See Findings and Decision, Finding 18 at page 8. The Hearing Examiner went on to rule that Skamania County was required to prepare an environmental impact statement prior to the adoption of its new zoning ordinance. Skamania County has never prepared the environmental impact statement ordered by the Examiner and the proposed zoning ordinance was not adopted.

Since Skamania County has adopted a zoning ordinance that does not provide for wind energy facilities, and its comprehensive plan does not contemplate such facilities, the exception in the SEPA Rules does not apply. Either WRE must apply for a rezone (which it has not) or EFSEC must preempt local zoning. The preemption decision by EFSEC would be the functional equivalent of a rezone because it provides approval for a previously unpermitted use.

In fact, EFSEC must make a determination of land use consistency and held a hearing on that subject on May 6, 2010. However, EFSEC did not make a decision on land use consistency at that time and has deferred such decision to be made in the course of the adjudicative hearings.

The consistency of the proposed project with local zoning has yet to be determined. The responsible official under SEPA, the EFSEC manager, accordingly cannot determine whether the WRE project is consistent with local zoning. If it is not, the Council may preempt local zoning, which would be the functional equivalent of a rezone for the project. Alternatives must accordingly be fully considered.

Second, the proposal is not a private project within the meaning of the SEPA Rules. This issue was previously considered in a Washington Supreme Court decision:

Under the present statutes and administrative code, the question now before the court as to whether the EIS is adequate turns on whether the proposed project is a "public project" or a "private project".FN1

FN1. It is unnecessary in this case to determine whether the "public"/ "private" distinction drawn in the administrative code accords with SEPA policy. We recognize that one commentator has suggested that in certain cases, the distinction may be unsound. See Richard L. Settle, The Washington State Environmental Policy Act: A Legal and Policy Analysis §14(b)(ii) (4th ed. 1993).

WAC 197-11-440(5)(d) provides in relevant part:

When a proposal is for a private project on a specific site, the lead agency shall be required to evaluate only the no action alternative plus other reasonable alternatives for achieving the proposal's objective *on the same site*....

(Italics ours.) A "private project" is defined in WAC 197-11-780: "'Private project' means any proposal primarily initiated or sponsored by an individual or entity other than an agency."

Weyerhaeuser v. Pierce County, 124 Wn. 2d 26, 38-39, 873 P.2d 498, 505 (1994).

The project in *Weyerhaeuser* was a land fill proposed by a private applicant on private property. However, the court concluded it was a public project because of the close relationship between the county actions and the supposedly private project. The court went on to hold:

We agree with the Weyerhaeusers that, as a matter of law, the proposed landfill is a public project, and the EIS must contain a sufficient discussion of offsite alternative proposals. Because it does not do so, it is inadequate as a matter of law.

The WRE project is similarly public for several reasons. First, the DEIS contains extensive discussion as to need for electric power to meet public needs for the region. See DEIS pages 1-4 to 1-7. This is clear in the DEIS at page 1-4: "The Applicant's purpose in proposing the Whistling Ridge Energy Project is to help meet the future need for energy resources." SDS also seeks to provide an additional renewable resource for electric utilities in Washington. Second, this project has been referenced by its proponents as a "semi-public" facility under the Skamania County zoning ordinance. See DEIS at page 3-147 to 149.

The WRE proposal is not exempt from alternatives analysis under SEPA or NEPA as it must be classified as a public facility.

Third, the DEIS cites numerous public documents that the project will supposedly comply with, including the Fifth Northwest Electric Power and Conservation Plan (DEIS at 1-4), the draft Sixth Northwest Electric Power Plan ("NPCC 2009", DEIS at 1-5), the "establishment of Renewable Portfolio Standards (RPS) at the state level" (DEIS at 1-

5), the requirement for "qualified alternative energy products" pursuant to state law (DEIS at 1-5). Each of these regulations and policies is substantially similar to the relationship between Pierce County and the developer in the *Weyerhaeuser* case. The DEIS touts the current proposal as meeting public needs and legislative mandates. WRE cannot promote the project "public" for one purpose, but claim it is "private" for another, especially where careful review of alternatives is required by SEPA and NEPA.

The result of the *Weyerhaeuser* case was as follows:

The hearing examiner's decisions on the conditional use permit and the EIS appeal are reversed. The EIS must be revised to adequately address alternatives to the proposed project. In any new public hearing on this proposed project where county-staff-authored reports and an environmental impact statement are involved, the opportunity for oral cross examination of the staff members must be accorded.

124 Wn.2d at 47. The failure of the BPA and EFSEC to consider alternatives, including alternate locations and different configurations are fatal flaws in the DEIS. The current EIS should be withdrawn and a supplemental EIS complying with NEPA/SEPA rules and guidelines must be circulated for comment.

Fourth, there is considerable discussion of the need for the project's resources on a regional basis. See DEIS at 1-4 and 1-5. However, there are real questions as to need for this variable energy facility.

At the outset, it appears that most wind energy is not, as indicated at page 1-4 of the DEIS, used or useful in the Northwest. As indicated in the April 12, 2010 submission of BPA to the Federal Energy Regulatory Commission (FERC) on their docket Docket No. RM10-11-000 regarding regulation of "variable energy resources" (VER) at page 2:

The need to clearly define balancing authority roles and responsibilities is especially important to BPA, because approximately 80 percent of the almost 2,800 MW of wind generation currently on BPA's system is exported to other balancing authorities, and BPA's preference customers should not bear costs of integrating wind generation that is exported to serve load outside of BPA's balancing authority.

Thus the EIS must consider whether the WR project or other wind projects actually meet loads in the Northwest.

In addition, as the BPA submission to FERC makes clear, it is necessary for balancing power to be available to meet loads when the wind does not blow. As noted by BPA in their comments on Docket No. RM10-11-000, at page 5, there are additional problems with balancing loads when wind energy resources are exported to California or to other

sink authorities. These facilities might include increased reliance on hydro resources or peaking facilities such as gas turbine plants. The EIS should consider whether additions of a VER like WR will result in the need for other peaking facilities to balance loads and whether the addition of a VER like WR is consistent with meeting demand.

Fifth, the DEIS repeatedly refers to the "economic feasibility" of the project when referring to the minimum output (70 MW) that is acceptable to the applicant. DEIS at 1-14. There is also reference to what utilities might require for the project at page 2-20 (project objectives "include providing a minimum level of generation to be attractive to utilities seeking to fulfill their RPS requirements, as well as providing a return on investment to the applicant."). However, most of this discussion is self-serving conclusions with no backup documentation. If the applicant seeks unilaterally to foreclose alternatives, then it must provide the economic and financial information to support these conclusions. The necessary data consists of costs of each of the various project elements, including labor and materials costs, costs for construction of roads, transmission lines and the substation, all leading to the overall cost and cost per kW or MW.

On the other side of the equation, the applicant must produce estimations of sales prices for the energy from the project, as well as actual support for the proposition that there is a minimum output that utilities would require. Further, actual land costs, by way of leases or property purchase, should be compared with other sites. Given the representations of the applicant, and the investment to date in the permitting, this "pro forma" type financial material should be readily available.

In addition, the EIS should consider whether placing a VER like WR on line will simply require construction of other facilities to balance loads, such as gas turbines or other facilities.

Sixth, the alternatives section of the DEIS must consider the problems of integrating wind power into the existing electric grid. These issues are discussed in the May 22, 2010 edition of the Seattle Times, which is incorporated by reference.

Because wind turbines only work while wind is blowing, other energy sources must be turned on when the wind stops or turned off or ramped down when the wind blows. This is illustrated by the recent review of the "BPA Balancing Authority Load and Total Wind, Hydro, and Thermal Generation, Near-Real-Time" for the period August 10-17, 2010. See Attachment A hereto. The load balancing data shows that wind generation on August 10, 2010 went from 2,202 MW to only 168 MW in just 12 hours. The simple meteorological explanation is that wind conditions went from higher speeds to near calm over this period. The new supplemental EIS should discuss the issues and problems related to integrating the Northwest power grid with wind power from this and other wind turbine projects.

Of more importance, the period of highest wind production did not correlate with increased electric loads for the Northwest. Thus when wind production was essentially zero on July 8-9, total loads in the BPA region were over 12,000 MW due to greater demand for cooling during this very hot spell. (The Clackamas weather station showed a high of 99°F on July 8 and 95°F on July 9.) When wind power generation rose on July 12 with increasing winds, loads dropped because of cooler temperatures (a high of 70°F on July 13.) Thus, if the wind is not blowing, base loads in the BPA region must be met by other power sources.¹ Accordingly, to meet loads, new wind power projects must be accompanied by new, firm, baseload power resources. While the region relies extensively on hydro power, in low water years, hydro power can be problematic. Indeed, according to the Seattle Times the BPA grid recently has cut back on receipt of wind energy because of capacity issues.

The new supplemental DEIS should discuss the erratic nature of wind energy and whether the addition of small quantities of wind energy will actually provide meaningful solutions to energy needs.

Seventh, in examining alternatives, the draft needs to compare the impacts of developing the proposed project with other alternate sources of wind energy being developed within the jurisdiction of EFSEC.

There are serious impacts related to the WRE proposal based largely on its location. The Underwood location will have serious visual and aesthetic impacts to extremely valuable and unique scenic resources found in the Columbia River Gorge, where because of its elevation the project will be seen by many persons over a broad area. Further, this forested location increases substantially the risks of bird and bat collisions with the turbine blades. Other environmental impacts are of concern because of the location of the turbines on steep ridgelines, which may restrict options for micro-siting and increase impacts due to road building. This location should be compared with other possible sites, especially in southeast Washington where wind turbines are located away from populated areas and have lesser risk for bird or bat collisions.

Eighth, the section on alternatives in SEPA explicitly calls for an analysis of the alternative of future development of the proposal under WAC 197-11-440(5)(c) where the alternatives section of the EIS includes obligation to:

- (vii) Discuss the benefits and disadvantages of reserving for some future time the implementation of the proposal, as compared with possible approval at this time. The agency perspective should be that each

¹The phenomenon is not limited to summer conditions. During the 10 day cold spell in January 2008, BPA records show very high loads, but no contribution from wind energy projects for more than 10 days.

generation is, in effect, a trustee of the environment for succeeding generations. Particular attention should be given to the possibility of foreclosing future options by implementing the proposal.

For the present application, the DEIS must discuss the alternative of delaying the implementation of the WR proposal. In light of visual impacts, bird and bat kills and other serious impacts of the WR proposal, the DEIS should discuss the option of reserving the WRE project until such time as projects with lesser impacts have been permitted and constructed. The DEIS should accordingly discuss potential wind turbine sites, including those permitted, those under application, and those in areas where new applications are likely, for example, where land commitments in the form of leases are made by property owners to wind turbine developers.

Ninth, the proposed project requires an interconnection with the BPA transmission line together with the construction of a substation. That is clearly a public project, not a private project, and thus alternatives must be fully considered. As related to the substation it is understood that the BPA substation must be built with capacity to receive additional electric energy for interconnection with the FCRTS. Thus, the EIS must consider whether the BPA substation will act as an attraction for other energy projects to locate nearby. In this regard, SOSA notes that a natural gas pipeline traverses the north portion of the project area. See DEIS, Figure 2-3. In the recent past, the land owner SDS has promoted plans for a gas turbine for electrical generation in this area. The EIS must consider the possibility of a gas turbine project in the area, especially one that may have enhanced financial feasibility because of the proximity to both a fuel source (the gas pipeline) and a substation to connect that energy to the FCRTS. Given the need for balancing resources for VERs like WR, location of such a facility nearby appears more likely. Accordingly, the EIS must consider the impacts of such a gas turbine facility, including air emissions, noise, wildlife impacts and other impacts common to these facilities.

In addition, reports indicate that this year 68% of new wind turbine energy will be sold to California. The FEIS should identify whether power from the WR project will be sold and used in California or at any other location outside the state of Washington. Further, analysis should be made as to the capacity of transmission lines to accept the power from the WR project. Any contract or informal commitment between this applicant and public or private utilities should be identified in the FEIS and whether such parties are providing up front costs for this application and construction. If the power from this project is to be sold to out of state public or private consumers, then alternatives should be considered closer to where the power will be consumed.

Tenth, while SEPA contains the public v. private distinction, NEPA and the NEPA Guidelines contain no such exception. Since this DEIS is to meet NEPA requirements, there must be a full exploration of available alternatives under the terms of both NEPA

ARAMBURU & EUSTIS, LLP

July 16, 2010

Page 11

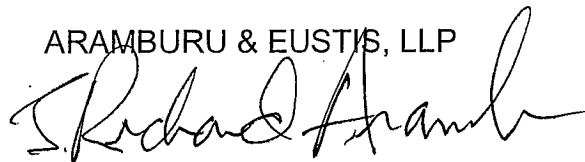

and SEPA rules. As cited above, the NEPA Guidelines require consideration of alternatives even though they may not be within the agency's jurisdiction.

Given the importance of alternatives analysis under both NEPA and SEPA, the failure of EFSEC and BPA to do this analysis now may mean that upcoming processes will have to be repeated should a court determine that the procedure adopted is illegal, resulting in a huge waste of time and resources of all involved.

In summary, the failure of the DEIS to discuss reasonable alternatives is a fatal flaw in that document. EFSEC and BPA should immediately withdraw the noncompliant DEIS and prepare a supplemental DEIS that considers all reasonable alternatives, not just those identified in this letter. The supplemental DEIS should be circulated for comment as required for any DEIS and no work on the final EIS should begin until all comments are in for the supplement.

Sincerely yours,

ARAMBURU & EUSTIS, LLP

Re: Whistling Ridge Energy Project Draft Environmental Impact Statement: Comments

To Whom It May Concern:

Counsel for the Environment (CFE) appreciates this opportunity to comment on the Whistling Ridge Energy Project (Whistling Ridge) Draft Environmental Impact Statement (DEIS). The following comments seek to ensure that the Final Environmental Impact Statement (FEIS) fully captures and analyzes the proposed project's environmental impacts, potential mitigation measures, and reasonable off-site and on-site alternatives so that permitting authorities can make a fully informed decision. CFE takes no position regarding the merits of the project at this time.

1.0 Summary and Purpose of and Need for Action

1.4 ALTERNATIVES ANALYSIS

The Alternatives Analysis is limited to a No Action alternative. While the DEIS states that other locations, project sizes and project configurations were considered, it fails to identify these alternative locations or configurations, or adequately explain why they were not worthy of additional analysis. As described in more detail below, the off-site and on-site alternative analyses should be expanded to include in-depth descriptions of the criteria used to select the proposed site and the proposed project configuration, as well as a focused discussion about why other sites and project configurations were excluded from further review.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 2

1.4.1 Proposed Action

The second bulleted factor in this section indicates that the site must be large enough to accommodate enough wind turbines to produce a minimum of 70 MW of electricity. Because the wind does not blow at a constant rate, wind turbines rarely operate at 100% percent capacity. Accordingly, references to wind generating capacity should be expressed in nameplate generation capacity.

The fourth bulleted factor in this section states: “The site has a long history of commercial logging and associated absence of *native* habitat, reducing or eliminating the need to clear additional forest land.” This and similar statements regarding the “absence of native habitat” are made in several places in the document (*e.g.*, 3.4.1.1), and the statement is misleading. With the exception of the weeds identified at the site and disclosed elsewhere in the document, grass, forb, shrub, and tree species at the site are predominantly native. A more accurate statement would be that the site is heavily managed and manipulated and is not in a *natural* state, being maintained in a state of disclimax and with monotypic forest stands. The affected environment description provided in Chapter 3 (3.4.1.1 and 3.4.1.2) is far more accurate.

The final paragraph in this section states that the project would have a total nameplate capacity of “up to 75 MW.” The second bulleted factor in this section states that project’s minimum nameplate capacity is 70 MW. It is unclear how these two figures relate to one another. The project’s maximum and minimum nameplate generating capacity levels should be clearly identified and described in a single location.

1.4.1.1 Wind Turbines

The generating capacity should be referenced as nameplate capacity. This section should also clarify whether the size of the turbines will be consistent throughout the project or whether the size will vary from tower to tower.

1.4.2 No Action Alternative

This section states that the only circumstance the project will not be built is if the responsible agencies (BPA or EFSEC) withhold their authorization. There are a multitude of reasons why a proposed project may not be built. This statement is not accurate and should be removed from the FEIS.

1.4.3 Alternatives Considered But Eliminated From Detailed Study

This section explains why the no action alternative was the only alternative analyzed. In doing so, it references a set of technical and economic requirements that purportedly eliminated all other potential project sites from consideration. None of the eliminated off-site locations,

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 3

however, are identified, and the DEIS does not contain the underlying technical and economic data the Applicant used to eliminate the undisclosed sites from further consideration. At a minimum, the FEIS should include detailed information regarding the economic and technical data underlying the site selection criteria, as well as the locations of all potential alternative sites considered so that the decision to limit review to the No Action alternative can be independently verified.

1.4.3.1 Alternative Project Locations

The DEIS states that the Applicant applied the following criteria to determine whether alternative project locations were available for EIS review: adequate wind supply, applicant ownership of land, ability to operate wind turbines without impacting commercial timber operations, and proximity to high voltage transmission lines. The DEIS analysis and discussion of the alternative location selection process is set forth in a single sentence:

No other sites were identified that are under the ownership of the Applicant or as close to transmission infrastructure facilities.

DEIS at p. 1-14. This summary analysis should be expanded to include a detailed description of the criteria used to select the project site, the location of the alternative sites that were considered, and discussion regarding why these alternative sites were ultimately eliminated from further consideration.¹ The FEIS should also be expanded to consider the Middle Mountain Project, which is only 12 miles from the proposed project site, as an alternative wind generation site.

1.4.3.2 Larger or Smaller Generation Facility Size

The FEIS should be expanded to address on-site alternatives that reduce the number of turbines and/or reconfigure the turbine strings. The purpose of the alternatives analysis is to explore whether the needs of the project can be accomplished through less environmentally impactful means. During the scoping hearings, the public and National Parks Service raised concerns regarding the project's visual impacts, particularly regarding the location of Turbine String A.²

¹ Ideally, this discussion would include information sufficient to independently verify the decision to eliminate these alternative sites from further consideration. This would include the location of SDS holdings in Southern Washington and Northern Oregon, wind resources available in those areas, the location of transmission lines, economic parameters for the project, as well as economic information regarding the project's interrelationship with timber harvesting activities.

² Turbine String A is also unique in that it contains the turbines in closest proximity to residential dwellings and is located on a parcel of land that is zoned FOR/AG 20, which would require issuance of a conditional use permit under Skamania County's land use laws. See DEIS at p. 3-153.

August 27, 2010

Page 4

This section asserts that the project must be reviewed as an “integrated whole” from which no piece may be eliminated and that if turbines are removed from the project design, “other locations must be found to replace those turbines to maintain the minimum necessary capacity.” These assertions are unsupported by analysis and appear to be inconsistent with the project description in both the Site Certification Application (SCA) and the DEIS. Both the SCA and the DEIS state that the project will have a total nameplate generating capacity of approximately 75 MW and will be comprised of up to 50 towers equipped with turbines with nameplate generating capacities ranging from 1.2 to 2.5 MW.³ Assuming that a 2 MW turbine is selected, the maximum generating capacity of 75 MW could be satisfied with the installation of 38 turbines (resulting in a reduction of 12 turbines).⁴ If a 2.5 MW turbine is selected, the number of towers could be reduced to 30.

Reducing the number of turbines without sacrificing nameplate generating capacity is not merely hypothetical. The Kittitas Valley Wind Power Project recently reduced its total number of turbines from a maximum of 65 to a maximum of 52 turbines without any change in nameplate generating capacity. The FEIS should include a discussion regarding how the project may be reconfigured through the use of turbines with larger generating capacities.

The FEIS should include information regarding the strength and viability of wind resources found throughout the site. This would include information gathered from the on-site meteorological tower regarding the strength, quality, direction and location of on-site wind resources.

1.4.3.4 Alternative Project Configurations

See comments under § 1.4.3.2, Larger or Smaller Generation Facility Size.

1.4.3.6 Alternative Access Roads

Private logging road CG 2930 should be subject to detailed review as an alternative access road. The original Site Certification Application proposed accessing the site using this route. On October 12, 2009, the Applicant submitted an amended application that abandoned the CG 2930

³ The SCA at Section 2.3.3.1, for example, states that “[t]he project would consist of up to 50 wind turbines” and that each turbine would have a nameplate generating power of somewhere between 1.2- to 2.5 MW. (Emphasis added). The DEIS contains an identical description.³ See DEIS at §1.4.1.1. Both the SCA and DEIS also state that the project must have a generating capacity of “up to 75 MW.” See SCA at §2.3.2 (Project Overview – “up to 75 MW”); DEIS at §1.4.1 (“minimum of 70 MW;” “up to 75 MW”).

⁴ Recently permitted projects appear to be installing turbines with nameplate generation capacities of 2.0 MW or larger. The Desert Claim Wind Power Project, for example, will be installing 2 MW turbines. See Desert Claim Wind Power Project Final Supplemental EIS at 2-13. The recent expansion to the Wild Horse Wind Power Project also used 2.0 MW turbines.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 5

route in favor of the West Pit Road with the stated purpose of removing the entire project outside the CRGNSA boundary. *See* October 12, 2009 Letter from Whistling Ridge Energy Project to EFSEC re: Submittal of Amended Application 2009-01. Although removing this route from the project plan may dispose of certain regulatory hurdles, the West Pit Road is a longer route that traverses steeper terrain and will likely have a higher environmental impact than the CG 2930.⁵ Accordingly, this CG 2930 should be evaluated as an alternative.

1.6 SUMMARY OF POTENTIAL PROJECT IMPACTS AND MITIGATION MEASURES

Earth – p. 1-22 – Impact of Proposed Project: Much of the West Pit Road is located in a Class II Landslide Hazard Area. This section should summarize and address anticipated impacts, if any, related to Class II Landslide Hazard Areas.

Air Quality – p. 1-22 – Impact of No Action Alternative: This section identifies impacts from construction of fossil fuel power plants as a potential impact under the no action alternative. There is nothing in the record establishing that proposed project is being built in lieu of fossil fuel powered plant or that its construction will reduce the number of fossil fuel powered generation facilities in the future. Indeed, intermittent nature of wind generated power may require the construction of fossil fuel facilities to provide a back up power source.⁶

Biological Resources – p. 1-23 – Impact of No Action Alternative: *See* comments regarding Air Quality – p. 1-22 – Impact of No Action Alternative *infra*.

Biological Resources – p. 1-24 – Impact of Proposed Project: This section states that there “would likely be some mortality to birds and bats due to turbine collision and displacement.” This should be revised to state that operation of project “will result in mortality to some birds and bats . . .”

Biological Resources – p. 1-24 – Design and Mitigation Measures: Remove qualifier “extensive” from pre-project assessment of wildlife habitat conducted under WDFW Wind Power Guidelines.

⁵ Long sections of West Pit Road crosses land designated as a Class II landslide hazard area. *See* DEIS Figures 3.1-1, 3.1-4 and 3.11-2

⁶ The No Action Alternative analysis appearing on p. 3-92 and in other section of the DEIS contains a more accurate description of the possible impacts if no action is taken:

It is likely that the region’s power needs would be met through energy efficiency and conservation measures, existing power generation, or the development of new power generation. Base load demands would likely be filled through expansion of existing, or development of new thermal generation such as gas-fired combustion turbine technology. The impacts would depend on the type, location, and size of the facility proposed.

August 27, 2010

Page 6

Biological Resources - p. 1-24 – Design and Mitigation Measures: A Technical Advisory Committee (TAC) is described, including a description of the stakeholders comprising this group. Because the overarching concern for biological resources is bird and bat mortality, a representative of the Audubon Society should be specified and included in the TAC.⁷

Biological Resources - p. 1-25 – Design and Mitigation Measures: The post construction avian mortality monitoring should include bat mortality monitoring as so little is known about bat species' composition and mortality risk at the site. The monitoring program should also analyze the accuracy of the pre-construction risk and mortality predictions. Because the project is being proposed in a new habitat type (forested) for Washington wind energy projects, and because so little is known about bat use of the site, bird and bat monitoring should be conducted for five (5) years, rather than the proposed two (2) years.

Visual Resources – p. 1-28 – Impact of Proposed Project: This section should clearly state that as proposed the project **will** have low to moderate visual impacts from key viewpoints, including key viewpoints within the CRGNSA.

1.7 SUMMARY OF UNAVOIDABLE ADVERSE IMPACTS

This section should plainly identify and summarize unavoidable **adverse** impacts. References to beneficial impacts should be removed. The description of unavoidable visual impacts (Table 1-2, p. 1-35) should be re-drafted to read as follows:

This project will have unavoidable adverse visual impacts on the surrounding area. Visual impact analysis establishes that the project will have low to moderate visual impacts from key viewpoints, including viewpoints within the CRGNSA.

1.8 CUMULATIVE IMPACTS

The discussions of existing development in section 1.8.1.1 and reasonably foreseeable future development in section 1.8.1.2 appear to be inconsistent. In section 1.8.1.1, the authors considered wind projects located 35 to 70 miles from the proposed project in their cumulative analysis. In section 1.8.1.2, however, the authors chose to disregard two proposed wind power projects (Juniper Canyon and Summit Ridge) because they are “too far away (generally more than 20 miles) from the Whistling Ridge Energy Project site to result in cumulative impacts.” Given that the cumulative analysis of existing impacts considered projects that were located 70 miles away, the analysis of cumulative impacts relating to reasonably foreseeable future

⁷ The TAC should also be expanded to include representatives from local public interest groups, including interveners Friends of the Columbia Gorge and Save Our Scenic Area.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 7

development should apply similar criteria or include an explanation as to why different criteria were applied.

1.8.1 Projects Considered

The cumulative impact section should discuss the intermittent nature of wind energy generation and the need for easily dispatchable hydro-electric or fossil fuel generating plants to meet demand when the wind is not blowing.

2.0 Proposed Action and Alternatives

2.1 PROPOSED ACTION

2.1.2 Project Overview

Table 2-1 – Permanent disturbance areas should include the permanent parking areas adjacent to each turbine that will be necessary to conduct turbine repairs and maintenance. Also there appears to be some inconsistency in the road width used to determine the impact area outside the project.

2.1.3.7 Access Roads

Neither the Application nor the DEIS include a description of parking areas that will have to be maintained adjacent to each turbine for construction and maintenance purposes. The space consumed by these parking areas should also be included in the calculations for permanently disturbed environment.

2.1.4.1 Construction

The size and location of proposed laydown areas should be disclosed and evaluated in the FEIS.

The size and location of permanent parking lots next to each turbine should be included and evaluated in the FEIS.

This section should include a discussion regarding how concrete will be transported to the construction site. If a concrete batch plant is going to be used, its size and location should be disclosed in the FEIS. If concrete is going to be transported to the site, information regarding the trucking route and potential environmental impacts (air pollution, traffic, etc.) should be disclosed and evaluated in the FEIS.

2.1.6 Forest Harvest During Project Construction and Operation

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 8

Mitigation measures for construction of the project should include off-site mitigation for permanently disturbed or cleared areas that would constitute “forest conversions.” This would include turbine parking areas and any permanent laydown area at the site.

2.1.7 Project Decommissioning

The Applicant has indicated that the life of the project is expected to be 30 years, at which time the project will either be upgraded (“re-powered”) or decommissioned. If the current project receives EFSEC approval, any proposal to “re-power” the project or extend operation of the project beyond its anticipated life span should be reviewed by EFSEC as an amendment to the Site Certification Agreement. Such review should require an updated evaluation and assessment of the environmental impacts posed by the upgrade or extended life of the project.

2.3. NO ACTION ALTERNATIVE

See comments in response to Section 1.4.3 Summary of No Action Alternative.

2.3.6 Alternative Access Roads

See comments in response to Section 1.4.3.6 Alternative Access Roads.

2.4 BENEFITS AND DISADVANTAGES OF DELAYING PROJECT IMPLEMENTATION

This section summarizes the benefits and disadvantages that will result from delaying the project. It is drafted, however, in a way that minimizes the benefits and over-exaggerates the disadvantages of delay. For example, statements to the effect that a delay will prevent the creation of new construction jobs are simply not accurate. A delay in constructing the project will result in a delay in the creation of new construction jobs, just as a delay in constructing the project will delay visual impacts from the project.

2.5 COMPARISON OF ALTERNATIVES

Government action or inaction is not the only possible reason that the project will not be built. For the reasons discussed earlier, assertions that the No Action Alternative will only arise if EFSEC or BPA deny approval of the project should be redacted.

As discussed above, the DEIS should be expanded to include off site and on site alternatives. Without these additional alternatives, the comparison of the limited alternatives set forth in Table 2-5 is of questionable value for purposes of conducting meaningful environmental impact analysis under NEPA and SEPA.

August 27, 2010

Page 9

3.0 Affected Environment, Impacts and Mitigation

Generally, discussions in this section should be expanded to include off site and on site alternatives.

3.1 EARTH

3.1.1.4 Geologic Hazards

This section should be expanded to address geologic hazard issues related to the proposed access road (West Pit Road). That this road traverses lands identified as Class II Landslide Hazards is of particular concern. *See* Table 3.1-4.⁸

The DEIS should also be revised to include a discussion regarding the extent to which Skamania County has assessed whether the project site or the area traversed by the proposed access road contains Class I landslide hazards (Severe).⁹ If such an assessment has not been done, the discussion regarding landslide hazards should be expanded to determine whether there are affected areas that would otherwise meet the criteria for a Class I landslide hazards, even though they have not been formally designated as such by the County.

3.1.2.1 Proposed Actions

Access Road. This section should be expanded to include a discussion of geologic hazards and their impact on the access road during both the construction and operation of the proposed project, including the environmental impacts that may arise from locating the access road in a Class II landslide area.

Soil Contamination. The discussion regarding soils does not address possible presence of contaminants along the access road right of way or at the project site. The FEIS should include the results of a Phase I Environmental Site Assessment to determine if and where contaminated soils may exist.

Volcanic Activity. This section should discuss how ash from a volcanic eruption may impact the operation of wind turbines, transmission lines, and other elements of the project.

3.1.2.2 Mitigation Measures

⁸ Table 3.1-4 should be revised so that the locations of the proposed access road, as well as other access road alternatives, are easily discernable.

⁹ To qualify as a Class I landslide hazard, the location must be designated as such by the local legislative body, in this case Skamania County. *See* DEIS at § 3.1.1.4 *Landslides*.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 10

This section should describe containment and remediation measures that will be taken in the event contaminated soils are found during construction.

The scope of the mitigation measures should be expanded to address geologic hazards associated with the access road and address how the project will be accessed if the proposed access road is damaged or destroyed by a catastrophic geologic event.

The project is located in the vicinity of several volcanoes and the access road traverses land designated as a Class II landslide hazard. This section should describe and discuss mitigation measures designed to protect the environment and human health and safety in the event of a catastrophic geologic event.

3.4 BIOLOGICAL RESOURCES

3.4.1.2 Habitats

Conifer Forests – p.3-37. The second to the last sentence in this section states that “[t]he majority of coniferous forests within the project site is managed for commercial timber production, and is replanted following harvest.” “Majority” could mean anywhere from 51 percent to 100 percent. A more quantitative disclosure is needed here.

Conclusion - p. 3-39. The final sentence in this section states that “[t]he project site is not located within any known wildlife corridor, flyway, foraging area, or migratory route.” This statement is problematic as the site lies within the landscape-scale Pacific Flyway, which is adjacent to the Columbia River gorge (which, in turn, is a significant migratory flyway, particularly for water birds), and all north-south cordilleras in the state support at least a weak raptor migration. Elsewhere in the document (*e.g.*, p. 46), raptor activity at the site is ascribed to migratory behavior. Also, some of the bat behavior observed at the site is assumed to be foraging behavior, and birds and other wildlife are known to forage in the project area. Use of the term “known” is also problematic and suggests the need for additional study. For example, no data was collected to assess bird or bat migration activity at the site.

3.4.1.5 Special Status Wildlife Species

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 11

General Comments, Strike Risk Modeling: The avian surveys for the project use a very crude index to rank relative strike risk among the various species of birds recorded at the site. One of the three variables in the strike risk model relies on where in the vertical air column (in or out of the rotor swept zone) birds were initially detected when they were first seen.¹⁰ No observations of bird behavior were made over any extended period of time. The behavior was apparently not even recorded for all observations, as in some years the metric is absent. Furthermore, as highly mobile species, almost any bird will at some point cross the rotor-swept area.

Some very sophisticated strike risk models have been developed around wind energy towers. The validity of at least some of these models is still in question. Nonetheless, they attempt to quantify the amount of time a species spends in the rotor strike zone, and assign risk based in part on the size, speed, and flight paths of birds crossing the rotor swept area. While implementation of such complex models may not be necessary (at this point) for this project, reliance on the simplistic model used for this project is misleading and the results should be removed from the DEIS, or at the very least the model's limitations (which are discussed in some detail in avian survey reports) should be fully disclosed in the body of the DEIS to ensure that the reader is not misled.

The avian survey report (Appendix C-4) indicates that the index is formulated to help rank the relative risk each species might face in the presence of wind towers. At best, the index may give some insight among the species at this site, but comparison to other sites, particularly in different habitat types from the proposed project, is highly suspect and appears to be untested. Appendix C-4 also states "...no relationships have been observed between overall use by bird types other than raptors, and fatality rates of those bird types at wind-energy facility. Such a lack of predictive ability also speaks for a need for long-term follow up monitoring to assess the true impacts of the project on birds.

General Comment, Species Abundance: Discussion regarding the abundance of species at the site lack context. For example, the DEIS reports that fifteen (15) swifts were seen in fall 2004, four (4) in summer 2006, and eleven (11) in summer 2009. The DEIS, however, fails to place these types of figures into a context. Do these observations constitute "a lot"? "Very few"? Compared to the next watershed west, or the core of the species range? In the case of the swifts, and indeed most species recorded in the project area, subjectively it seems that few of any given species are represented. However, in the case of migrating birds (such as the 15 swifts observed in fall 2004), this could represent a rate. In other words, there could be 15 swifts per day, or per hour trying to migrate across the project site. There is simply no contextual information to put

¹⁰ Glancing at a bird and assigning it to "in" or "out" of the rotor swept area is an exceptionally poor predictor of mortality risk. For example, the avian survey report indicates that Horned Larks are often the most commonly found birds killed at wind tower sites. Horned Larks spend a significant amount of time on the ground. Accordingly, it is likely that an index of this species' strike risk formulated based on this project's model would forecast a low mortality risk and be a very poor predictor.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 12

these numbers into a wider perspective. Similar information subject to this same criticism is provided for other species of concern.

Introduction, p. 3-45: The introductory paragraph states that “[t]wo additional special status species, Keen’s myotis (*Myotis keenii*) and Townsend’s big-eared bat (*Corynorhinus townsendii*), may occur but have not been identified in prior surveys.” A more accurate statement would be that these two species could occur at the site, but surveys conducted at the site were incapable of identifying these or any other bats, except the hoary bat, to the species level.¹¹

Northern Spotted Owl, *Historical Activity Centers*, p. 3-52: This section should be revised to discuss and analyze a May 2010 record of a Spotted Owl in one of the owl circles north of the site. The remaining section addressing Spotted Owl issues should be updated to reflect this finding.

Northern Spotted Owl, *Conservation Support Area*, p. 3.54: Although managed forest is not optimal for spotted owls, it is likely better than wind towers which pose greater mortality risk than young even-aged stands of trees. To that end, the project can only be contrary to the purpose of the CSA. It may be just 0.27% of the area, but it is still a loss that should be disclosed in the discussion (including cumulative impacts).

Northern Spotted Owl, *Spotted Owl Special Emphasis Centers*, p. 3-56: The discussion on this point is obtuse and would benefit from illustration on a map.

The footnote to this discussion indicates that DNR reports that the Mill Creek site has 48 percent of the recommended 40 percent minimum suitable habitat for a spotted owl special emphasis center. The discussion in this section should be expanded to identify what fraction of that suitable habitat occurs where the 1.4 mile circle overlaps with the northwest corner of the project site.

Olive-sided flycatcher, p. 3-56: This section should be expanded to address the following issues. According to Breeding Bird Survey data, this species declined at the rate of 3.3 percent per year between 1966 and 2001. Loss of winter habitat is thought to be one causal mechanism. Another is that managed forests, which superficially replicate the fire-altered forests the birds depend on, may not offer all that the birds need to meet life history requirements.

The last sentence in this paragraph states “none were recorded during the fall of 2004 or the winter of 2008–2009.” The Olive-sided Flycatcher is a late spring arrival and departs in late

¹¹ On page 3-59 states: “Bat surveys conducted during 2007, 2008, and 2009 (Appendices C-8, C-9, and C-10) did not have the ability to detect individual species of bats. Instead, bats were grouped into species with either “high frequency” calls or “low frequency” calls.”

August 27, 2010

Page 13

summer. Recording the species at the site in fall or winter would be most unusual.

Vaux's Swift, p. 3-57. *See General Comment*, Species Abundance above.

Keen's Myotis and Townsend's Big-eared Bat, pp. 59-60: The bat survey, and consequently the distilled discussion in the DEIS, are lacking in detail. The Keen's Myotis discussion discloses "[b]at surveys conducted during 2007, 2008, and 2009 . . . did not have the ability to detect individual species of bats." That species composition at the site could not be determined serves to emphasize that too little is known about the bat fauna. At a minimum, this lack of knowledge demands that there be post-construction studies to evaluate bat mortality and species composition of fatalities. Also, as (potentially) the first wind energy site to be built in a forest setting in the Pacific Northwest, this project should be used to study the impacts of such development on bats and birds. The U.S. Fish and Wildlife Service Wind Turbine Guidelines Advisory Committee draft report of March, 2010 states, "[o]ur current state of knowledge about bat-wind turbine interactions . . . does not allow a quantitative link between pre-construction acoustic assessments of bat activity and operations fatalities."¹² The report goes on to say:

There is growing interest in determining whether "low" position samples (~1.5-2 meters) can provide equal or greater correlation with bat fatalities than "high" position samples because this would substantially lower cost of this work. Developers could then install a greater number of detectors at lower cost resulting in improved estimates of bat activity and, potentially, improved qualitative estimates of risk to bats.

Because the applicant sampled at a variety of sites and elevations within the project area, follow-up monitoring could contribute to the body of knowledge regarding the ability of various approaches to pre-implementation sampling to predict post-project mortality.

The Townsend's discussion states "[t]here are no known roosting structures or maternity colonies occurring in the vicinity of the project area. Consequently, the likelihood of occurrence on the site is considered to be low." The absence of evidence should not be assumed to be evidence of absence, especially in light of the caveat disclosed about inability to distinguish species during the bat surveys. This species (and many other bats) will roost singly in tree cavities or behind loose bark, so it is impossible to completely dismiss their presence at the site.

3.4.1.6 Other Wildlife Species

¹² Wind Turbine Guidelines Advisory Committee. 2010. Wind Turbine Guidelines Advisory Committee Recommendations. US Fish and Wildlife Service Wind Turbine Guidelines Advisory Committee. Draft report to the Secretary of the Interior. March 4.

August 27, 2010

Page 14

Birds, p.3-63: The DEIS states that “[m]ean overall bird use in the study area was low compared to these other wind resource areas studied; ranking 19th compared to 24 other wind resource areas . . .” This section should explain that comparisons to other wind resource areas in Washington and Oregon may be of little value as these other areas occupy different habitat types—primarily shrub-steppe and agricultural lands. Comparisons to sites located in Eastern deciduous forests are also questionable because of the different suite of bird species, different structural components to the surrounding forests, and dissimilar migration behavior.

Fall Migration Surveys (2004), p.3-64:

Eight species of raptors were observed during the survey. Those with the highest use of the site were sharp-shinned hawk, Cooper’s hawk, and red-tailed hawk. The highest raptor use observed at the site during 2004 surveys occurred between September 11 and October 12, 2004.

This observation is consistent with annual observations made at the Chelan Ridge Raptor Observation Project site in northern Washington, also on the east side of the Cascades. Raptors throughout the West migrate along ridge lines. Some ranges are located at geographic restrictions or at the confluence of ranges that funnel concentrations of raptors. Data do not indicate this is such a site, but do support the idea of a weak raptor migration through the area. Based on the number of raptors encountered during fall surveys, a rough estimate of the number of birds migrating through the site each fall should be made and included as part of the FEIS.

3.4.2.1 Proposed Action

Western Gray Squirrel, p. 3-75: This section suggests that the lack of oak trees in the project area indicates that the area has poor habitat quality for this species. In the northern part of the species’ range, however, oaks are completely lacking. Accordingly, the absence of oak trees should not be used to conclude that the squirrels are absent from a site.

Special Status Wildlife Species, p.3-77: This section introduces the collision risk model (or “bird exposure index” as it is called in the avian reports) from the avian survey reports. As discussed above, this model is highly suspect. The avian survey reports present numerous caveats when using this model or index: “This index is only based on initial flight height observations and relative abundance (defined as the use estimate) and does not account for other possible collision risk factors such as foraging or courtship behavior.”

Reliance upon the Index is subject to criticism on several grounds. Intuitively, the model makes little sense.¹³ The model also fails to account for the disproportionate impact of mortality on rare

¹³ In the model, A = mean use for species is averaged across all surveys. Many species, especially raptors, demonstrate distinct seasonal use of the site. For example, a large influx of bald eagles into the Columbia River

August 27, 2010

Page 15

populations.¹⁴ The model also fails to account for many of the other variables that influence strike risk. These include size of the bird, speed of flight, and direction of flight, or weather conditions which could obscure blades or towers.

Ultimately, there is no indication that this model has any predictive value. Neither the DEIS nor the avian surveys indicate that this model has ever been tested in the field or been utilized prior to the construction of a wind energy facility, followed by post-construction surveys to verify its usefulness.

Given these limitations, any use of numbers from the index should be reported judiciously, sparingly, and with all the caveats identified in Appendix C and the DEIS, otherwise unqualified validity and strength are implied for these indices.

Other Wildlife Species, *Birds*, p. 3-79. The final paragraph in the bird impacts lists a host of caveats, which are cause for concern.¹⁵ Although there is no geographic feature suggesting this

Gorge occurs in the winter, and the DEIS does report that the bald eagle was more likely to occur on the project site during winter. However, the species' weight in the model would be greatly reduced by the number of data collection efforts made at other times of year. During most times of the year, the risk of collision for a species with strong seasonal occurrences would be zero—it just isn't at the site. On the other hand, at the peak of its occurrence at the site the risk could be far greater. Distributing the exposure risk across multiple seasons thereby presents a deceptive index of exposure risk.

The model contains two additional parameters: P_f = proportion of all observations of species i where activity was recorded as flying (an index to the approximate percentage of time species i spends flying during the daylight period), and P_t = proportion of all flight height observations of species i within the rotor-swept height. Both of these parameters are based on information captured at the moment of observation during field data collection. Data derived from the literature regarding each species' natural history and behavior could provide a more accurate picture of long-term behavior. As discussed earlier, almost all birds fly at some point during the day (one of the caveats in the DEIS for the model states “[i]f a species was recorded on the site, but never flying at all, then the exposure index would not be applicable”) and at some point flight heights are likely to enter elevations swept by rotors. Both of these parameters likely suffer from small sample sizes of the total number of observations, meaning that statistically there would be little ability to accurately describe behavior based on the small sample size.

¹⁴ Models such as this suggest that strike risk is reduced specifically because a species is rare at the site. To illustrate the point, the loss of one bird from a local population of two hundred (200) has little biological meaning. The loss of one bird from a local population of two (2) means 50 percent of the population is gone. Yet in each example, only one bird was killed.

¹⁵ These caveats include:

... the level of night migration for species associated with the project site is also not known.

... risk analyses ... provide some insight into which species are most vulnerable to turbine collision; however, estimates are based on abundance, proportion of daily activity budget spent flying, and flight height of each species. Observations were made during daylight hours, and do not take into consideration flight behavior or abundance of nocturnal migrants.

... the analysis does not account for varying ability among species to detect and avoid turbines, habitat selection, or other factors that may influence exposure to turbine collision.

August 27, 2010

Page 16

site constitutes a migratory bottleneck or should host a concentration of migrants, no effort was made to assess passerine migration, particularly at night (when most of these species migrate). In the absence of such an effort and in light of the long list of caveats associated with the collision index, post-construction monitoring and appropriate mitigation (should significant mortality occur) is warranted. Long term impacts should be assessed over a 5 – 10 year period because of our lack of experience with siting wind projects in Western forested ecosystems, and because of the inter-annual variability in migrating bird numbers.

Other Wildlife Species, Bats, p. 3-79: Bats are difficult to study. Nonetheless, the fact that of all the bats detected and all the species that could be present at the site, only the hoary bat was identified to species, leaves much information for the site lacking. The DEIS concludes (based on Appendix C reports) that relatively little bat activity was recorded at elevated heights, and two seasons of monitoring did not detect significant migrations. While these are good signs, the DEIS concludes “variable levels of recorded use by bats across years, habitats and recording height above ground indicate that the extent of impacts is difficult to predict at this time.” This conclusion demands years of follow-up monitoring to assess actual impacts. As one of the first sites placed in a forested setting, such monitoring is particularly critical to understanding the environmental impacts of wind energy sites in forests.

3.4.3 Mitigation Measures

Post-Construction Avian [and Bat] Mortality Study: Given the large number of unknowns discussed above regarding both bats and birds, the avian mortality monitoring mitigation measure should be expanded to include bats and its duration should be expanded from 2 years to a 5-10 year horizon.

Research-oriented Studies: As one of the first wind power projects proposed for construction within a forested habitat in the Pacific Northwest, this project offers a unique opportunity to conduct research-oriented studies regarding the wind energy/wildlife interactions like the research studies identified in the WDFW Wind Power Guidelines (2009) and the USFWS Wind Turbine Guidelines (2010).

Adoption of USFWS BMPs: The proponent should adopt the Best Management Practices set forth by the USFWS Wind Turbine Guidelines Advisory Committee. Most of the BMPs suggested by the committee are already in the DEIS, but a good faith effort should be made to meet all of these guidelines to minimize project impacts. One BMP not presented in the DEIS includes appropriate lighting of on-site facilities (in addition to the towers themselves) to control light pollution and maintain the dark skies needed by bats and migrating birds.

August 27, 2010

Page 17

The Technical Advisory Committee (TAC): As mentioned earlier, membership in the Technical Advisory Committee should include representatives from Audubon Washington or one of its member chapters, as well as representatives from local, federal and tribal federal and local environmental groups. The TAC should be convened for the life of the project, unless EFSEC determines otherwise.

Procedures for Responding to Avian and Bat Mortality Events: The mitigation measures should include the adoption of procedures specifying how the project will respond to large scale avian or bat mortality events or a take of a Bald Eagle or other species subject to protection under Federal or State law. These procedures should include timeframes for notifying relevant authorities (EFSEC, the TAC, and appropriate local, state and federal authorities) and measures to be taken to ensure no additional environmental harm occurs pending investigation of such an event, including curtailment of operations. Consistent with WDFW Wind Power Guidelines, the Applicant should contact the USFWS to determine appropriate measures to resolve unauthorized take of Endangered Species Act listed species or other species covered by other federal regulations.

Construction Monitoring: Mitigation measures during construction should include retaining an independent environmental monitor to ensure that all Best Management Practices and other mitigation measures are fully observed during the course of construction.

Mitigation for Lost Habitat: Arrangement should be made to mitigate for the permanent and temporary habitat losses caused by the project. Mitigation for permanent loss of habitat should be made on a one to one basis as provided for under the WDFW Wind Power Guidelines and should be developed in conjunction with WDFW and EFSEC.

3.4.4 Unavoidable Adverse Impacts

This section concludes with the statement “[t]he potential for ongoing occurrence of either golden or bald eagles is considered extremely rare.” This statement is misleading. While both of these species appear to be rare at the site, surveys have documented their presence at the site. Moreover, both of these species are known to range widely in search of food, and bald eagles have been appearing in increasing numbers during the winter in a location that is only two miles away. Under these circumstances, the DEIS should state that periodic occurrences (in low numbers) of these species at the project site are predictable and are to be expected.

3.6 PUBLIC HEALTH AND SAFETY

3.6.2.1 Proposed Action

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 18

Construction, Fire and Explosion, p. 3-97: The wind turbine nacelles will be at a height of 262 feet. This section should discuss the technical challenges that are posed by responding to a fire, explosion or medical emergency at such a height, the types of emergency equipment necessary to respond to emergency events, and who (local fire departments, DNR or the Applicant) will be responsible for supplying and operating this equipment.

Operation, Fire and Explosion, p. 3-99: This section acknowledges that turbine malfunctions resulting in fires have been known to occur. Given that the turbines nacelle are located hundreds of feet in the air in a windy area surrounded by land being managed for timber production, it would appear that a fire could pose a serious threat to the project site and surrounding property. This section should be expanded to discuss the potential environmental impacts that may arise from a turbine fire and the actions that would be taken to minimize those impacts. This section should discuss whether equipping the turbines with fire suppression equipment is advisable.

3.6.3 Mitigation

Equipping the turbines with fire suppression equipment should be considered as a possible mitigation measure.

3.7 NOISE

3.7.1.3 Affected Environment

The Applicant intends to harvest trees in the vicinity of the project site prior to construction. This section should discuss whether the harvest of trees will affect the validity of the pre-construction sound study with a specific focus on the residential sites identified in the first paragraph of Section 3.7.1.3.

3.7.2 Impacts

This section should discuss on-site alternatives regarding the placement of wind turbine towers and potential noise impacts.

3.7.3 Mitigation

If warranted, mitigation measures should include removal or reconfiguration of turbines to minimize impacts on residential receptors.

If warranted, mitigation measures should include maintenance of vegetative buffers between the project and residential receptors to minimize sound impacts.

3.8 LAND USE AND RECREATION

August 27, 2010

Page 19

3.8.1.2 Recreation

The Mark O. Hatfield Wilderness Area is within a 25 mile radius of the proposed project. Environmental impacts to this wilderness area should be identified and discussed in this section.

3.8.3.1 Proposed Action

Changes to Existing Land Use Patterns and Recreation, *Project Operation*, p. 3-151:

In this section, the authors suggest that the project will not impact local agricultural tourism because wineries located in southeastern Washington are “thriving” despite the fact that there are four wind power facilities located between Walla Walla and Kennewick. This paragraph should be redacted. Correlation does not establish causation. Without more detailed analysis, the fact that wineries and wind power operations co-exist in Walla Walla County should not be used to predict the environmental impact of this project in Skamania County.

Consistency with Applicable Land Use Regulations, Columbia River Gorge National Scenic Area Management Plan, p. 3-154: Under the bullet point entitled “Scenic Appreciation and Scenic Travel Corridors,” strike “only” from the discussion so that the sentence reads: “The project would have minor to moderate impacts on visual quality as viewed from travel corridors inside the Scenic Area.”

Trails and Pathways. The discussion in this section needs to be clarified. The project will have low to moderate visual impacts on viewpoints from some trails and pathways in the CRGNSA. The statement that “[t]he project would not affect any trails or pathways in the Scenic Area” is incorrect.

3.8.3.2 No Action Alternative

If a No Action Alternative is pursued, there will be no impact on visual resources.

3.8.4 Mitigation Measures

This section should discuss reconfiguration or removal of turbines to minimize visual impact on scenic area as a mitigation measure.

3.8.5 Unavoidable Adverse Impacts

If the applicant is unwilling or unable to reconfigure turbines to minimize visual impacts, then this section should identify minor to moderate impacts on visual resources within the CRGNSA as an unavoidable adverse impact.

August 27, 2010

Page 20

3.9 VISUAL RESOURCES

3.9.1 Methodology

The methodology applied should be expanded to include the Visual Resource Management system employed by the Bureau of Land Management. The CRGNSA has established visual resource objectives for a large and specific area within the Columbia River Gorge. Although the project is located just outside the scenic area boundaries, it will be clearly visible from within the scenic area and will impact the area's scenic values. That the project is located just outside the scenic area boundary should not exclude it from an analysis that fully identifies and discusses the project's visual impact on this nationally-recognized, high value regional view shed.

3.9.1.3 Preparation of Visual Simulations

The photographs underlying the visual simulations are problematic. Visual simulation photographs should be taken with a 50 mm lens, as this focal length most closely captures human visual perception. *See Environmental Impacts of Wind-Energy Projects*, National Research Council (2007) at 247. The use of other focal lengths distorts the image and makes it difficult to compare impacts between different photographs. *Id.* If a digital camera is used, it should be set at the highest resolution possible. *Id.* The visual simulations should also be re-sized to a 10 x 12 inch format, at a minimum, for comfortable arm's length viewing. *Id.* at 250.

Most of the simulations produced in the DEIS appear to be taken from viewpoints along roads and highways. Additional simulation should be provided with views from the Columbia River, hiking trails, and wilderness areas. *See Id.* at 251-52.

The DEIS states that simulations were not prepared for night time conditions. An inventory of current night time lighting conditions would be helpful in assessing the extent to which FAA mandated turbine lighting will impact the night sky.

3.9.2.3 Viewpoints

See comments under sections 3.91 and 3.9.1.3.

Columbia River Gorge National Scenic Area – p.3-194

Visual impacts are among the issues to be addressed in NEPA and SEPA analysis. Although Congress has expressed reluctance to apply Scenic Area restrictions to lands lying outside the scenic area boundary, land uses outside the scenic area will impact the visual quality within the scenic area and should be subject to visual analysis consistent with the values encompassed by the CRGNSA.

August 27, 2010

Page 21

3.9.3.2 No Action Alternative

There is no evidence in the record that construction of project will result in an appreciable decrease in this region's development or reliance on fossil fuels or prevent the construction of such plants in the future. The assertion that failure to build the project will result in continued impairment of air quality and visual resources is not well-founded and should be removed from the discussion.

3.9.4 Mitigation Measures

In addition to painting the turbines an unobtrusive, non-reflective color and following FAA lighting guidelines, the following additional mitigation should be included:

- Either reducing or reconfiguring the turbine locations to minimize visual impacts.
- Explore whether vegetative buffers can be grown or maintained to minimize visual impacts.
- To the extent visual impacts are unavoidable, mitigation should include the preservation of off-site visual resources.

3.10 HISTORICAL AND CULTURAL RESOURCES

3.10 .2.2 Cultural Resources Overview

The FEIS should incorporate the results of archaeological field inventory conducted by Yakama Nation's Cultural Resources Department.

3.11 TRANSPORTATION

3.11.2 Impacts

This section should identify likely haul routes for concrete that will be used for the wind turbine foundations and discuss any associated environmental impacts.

3.14.3 CUMULATIVE IMPACT ANALYSIS

3.14.3.5 Habitat and Wildlife

Bird and Bat Species, p. 3-274: This section provides: "Erickson et. al. (2005) concluded that these sources of mortality [i.e., other anthropogenic sources] are likely much larger than the

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 22

potential impacts of wind power development.” This statement of relativism is misleading and is not consistent with the intent of a cumulative impacts analysis. While on its face the statement is likely true, the question is whether wind energy, by adding incrementally to mortality, would be enough to negatively impact bird or bat species.

Discussion of West Cumulative Impact Study, pp. 3-275-76: The cumulative impact study prepared by West, Inc. for the Klickitat County Planning Department has contextual issues that need to be addressed. As the DEIS points out, habitat assessed by West for Klickitat County is significantly different from that at the project site. The DEIS states that “none of the estimated fatalities were anticipated to cause a significant loss in population, and no cumulative impacts were anticipated.” Since the completion of the West report, however, the number of occupied Ferruginous Hawk nests in Washington has dropped precipitously.¹⁶ The West report does disclose that this species could be at risk from wind energy facilities, and suggests that exclusion zones around core habitats might be warranted. In light of the current plight of this species, the “no impact” conclusion needs to be re-evaluated.

Another problem with the West report is that it focuses solely on impacts from the full build out of all anticipated wind development projects in the Columbia Plateau Ecoregion. While informative, this analysis misses the point of a cumulative impacts analysis, which is to evaluate the impact of the current project (in the West report, all anticipated wind energy development) in conjunction with all other reasonably foreseeable stresses on the resource – the analysis should have been wider ranging and not restricted to wind energy development.

Cumulative effects result from spatial (geographic) and temporal (time) crowding of environmental perturbations. The effects of human activities will accumulate when a second perturbation occurs at a site before the ecosystem can fully rebound from the effect of the first perturbation.¹⁷ Fragmentation and habitat degradation are two of the major problems in the shrub-steppe. Development, land conversion, fire, incompatible grazing practices, and weed invasion are all driving mechanisms. The question of whether wind energy development in the Columbia Plateau Ecoregion could add synergistically to these sources of stress is not addressed in the West report.

The DEIS mentions that climate change is not evaluated as a source of stress. Climate change projections for Washington and the Pacific Northwest suggest dramatic changes in East-slope forests (as well as shrub-steppe), and these changes should be discussed in the context of cumulative impacts.

The cumulative impacts discussion in the DEIS concludes with the following sentence:

¹⁶ McCullen, K. 2010. Eastern Washington sees fewer ferruginous hawks. Tri-city Herald. May 9.

¹⁷ Council on Environmental Quality. 1997. Considering Cumulative Effects Under the National Environmental Policy Act. Council on Environmental Quality.

ATTORNEY GENERAL OF WASHINGTON

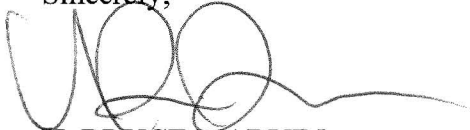

August 27, 2010
Page 23

For example, one study from 2009 estimated that, based on performance in the United States and Europe, wind farms and nuclear power stations are responsible each for between 0.3 and 0.4 bird fatalities per gigawatt-hour (GWh) of electricity while fossil-fueled power stations are responsible for about 5.2 fatalities per GWh (Sovacool 2009).

The Sovacool (2009) paper appears to be fundamentally flawed in its assumptions. Willis et al. (2010)¹⁸ published a rebuttal to this paper that would suggest that its premises are unsound. This line of reasoning should either be removed from the FEIS, or better supporting literature provided to support the point.

Thank you for this opportunity to submit comments on the Whistling Ridge DEIS. Please feel free to contact me if you have any questions or need clarification regarding my comments.

Sincerely,

H. BRUCE MARVIN

Re: Whistling Ridge Energy Project Draft Environmental Impact Statement: Comments

To Whom It May Concern:

Counsel for the Environment (CFE) appreciates this opportunity to comment on the Whistling Ridge Energy Project (Whistling Ridge) Draft Environmental Impact Statement (DEIS). The following comments seek to ensure that the Final Environmental Impact Statement (FEIS) fully captures and analyzes the proposed project's environmental impacts, potential mitigation measures, and reasonable off-site and on-site alternatives so that permitting authorities can make a fully informed decision. CFE takes no position regarding the merits of the project at this time.

1.0 Summary and Purpose of and Need for Action

1.4 ALTERNATIVES ANALYSIS

The Alternatives Analysis is limited to a No Action alternative. While the DEIS states that other locations, project sizes and project configurations were considered, it fails to identify these alternative locations or configurations, or adequately explain why they were not worthy of additional analysis. As described in more detail below, the off-site and on-site alternative analyses should be expanded to include in-depth descriptions of the criteria used to select the proposed site and the proposed project configuration, as well as a focused discussion about why other sites and project configurations were excluded from further review.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 2

1.4.1 Proposed Action

The second bulleted factor in this section indicates that the site must be large enough to accommodate enough wind turbines to produce a minimum of 70 MW of electricity. Because the wind does not blow at a constant rate, wind turbines rarely operate at 100% percent capacity. Accordingly, references to wind generating capacity should be expressed in nameplate generation capacity.

The fourth bulleted factor in this section states: "The site has a long history of commercial logging and associated absence of *native* habitat, reducing or eliminating the need to clear additional forest land." This and similar statements regarding the "absence of native habitat" are made in several places in the document (e.g., 3.4.1.1), and the statement is misleading. With the exception of the weeds identified at the site and disclosed elsewhere in the document, grass, forb, shrub, and tree species at the site are predominantly native. A more accurate statement would be that the site is heavily managed and manipulated and is not in a *natural* state, being maintained in a state of disclimax and with monotypic forest stands. The affected environment description provided in Chapter 3 (3.4.1.1 and 3.4.1.2) is far more accurate.

The final paragraph in this section states that the project would have a total nameplate capacity of "up to 75 MW." The second bulleted factor in this section states that project's minimum nameplate capacity is 70 MW. It is unclear how these two figures relate to one another. The project's maximum and minimum nameplate generating capacity levels should be clearly identified and described in a single location.

1.4.1.1 Wind Turbines

The generating capacity should be referenced as nameplate capacity. This section should also clarify whether the size of the turbines will be consistent throughout the project or whether the size will vary from tower to tower.

1.4.2 No Action Alternative

This section states that the only circumstance the project will not be built is if the responsible agencies (BPA or EFSEC) withhold their authorization. There are a multitude of reasons why a proposed project may not be built. This statement is not accurate and should be removed from the FEIS.

1.4.3 Alternatives Considered But Eliminated From Detailed Study

This section explains why the no action alternative was the only alternative analyzed. In doing so, it references a set of technical and economic requirements that purportedly eliminated all other potential project sites from consideration. None of the eliminated off-site locations,

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 3

however, are identified, and the DEIS does not contain the underlying technical and economic data the Applicant used to eliminate the undisclosed sites from further consideration. At a minimum, the FEIS should include detailed information regarding the economic and technical data underlying the site selection criteria, as well as the locations of all potential alternative sites considered so that the decision to limit review to the No Action alternative can be independently verified.

1.4.3.1 Alternative Project Locations

The DEIS states that the Applicant applied the following criteria to determine whether alternative project locations were available for EIS review: adequate wind supply, applicant ownership of land, ability to operate wind turbines without impacting commercial timber operations, and proximity to high voltage transmission lines. The DEIS analysis and discussion of the alternative location selection process is set forth in a single sentence:

No other sites were identified that are under the ownership of the Applicant or as close to transmission infrastructure facilities.

DEIS at p. 1-14. This summary analysis should be expanded to include a detailed description of the criteria used to select the project site, the location of the alternative sites that were considered, and discussion regarding why these alternative sites were ultimately eliminated from further consideration.¹ The FEIS should also be expanded to consider the Middle Mountain Project, which is only 12 miles from the proposed project site, as an alternative wind generation site.

1.4.3.2 Larger or Smaller Generation Facility Size

The FEIS should be expanded to address on-site alternatives that reduce the number of turbines and/or reconfigure the turbine strings. The purpose of the alternatives analysis is to explore whether the needs of the project can be accomplished through less environmentally impactful means. During the scoping hearings, the public and National Parks Service raised concerns regarding the project's visual impacts, particularly regarding the location of Turbine String A.²

¹ Ideally, this discussion would include information sufficient to independently verify the decision to eliminate these alternative sites from further consideration. This would include the location of SDS holdings in Southern Washington and Northern Oregon, wind resources available in those areas, the location of transmission lines, economic parameters for the project, as well as economic information regarding the project's interrelationship with timber harvesting activities.

² Turbine String A is also unique in that it contains the turbines in closest proximity to residential dwellings and is located on a parcel of land that is zoned FOR/AG 20, which would require issuance of a conditional use permit under Skamania County's land use laws. See DEIS at p. 3-153.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 4

This section asserts that the project must be reviewed as an “integrated whole” from which no piece may be eliminated and that if turbines are removed from the project design, “other locations must be found to replace those turbines to maintain the minimum necessary capacity.” These assertions are unsupported by analysis and appear to be inconsistent with the project description in both the Site Certification Application (SCA) and the DEIS. Both the SCA and the DEIS state that the project will have a total nameplate generating capacity of approximately 75 MW and will be comprised of up to 50 towers equipped with turbines with nameplate generating capacities ranging from 1.2 to 2.5 MW.³ Assuming that a 2 MW turbine is selected, the maximum generating capacity of 75 MW could be satisfied with the installation of 38 turbines (resulting in a reduction of 12 turbines).⁴ If a 2.5 MW turbine is selected, the number of towers could be reduced to 30.

Reducing the number of turbines without sacrificing nameplate generating capacity is not merely hypothetical. The Kittitas Valley Wind Power Project recently reduced its total number of turbines from a maximum of 65 to a maximum of 52 turbines without any change in nameplate generating capacity. The FEIS should include a discussion regarding how the project may be reconfigured through the use of turbines with larger generating capacities.

The FEIS should include information regarding the strength and viability of wind resources found throughout the site. This would include information gathered from the on-site meteorological tower regarding the strength, quality, direction and location of on-site wind resources.

1.4.3.4 Alternative Project Configurations

See comments under § 1.4.3.2, Larger or Smaller Generation Facility Size.

1.4.3.6 Alternative Access Roads

Private logging road CG 2930 should be subject to detailed review as an alternative access road. The original Site Certification Application proposed accessing the site using this route. On October 12, 2009, the Applicant submitted an amended application that abandoned the CG 2930

³ The SCA at Section 2.3.3.1, for example, states that “[t]he project would consist of up to 50 wind turbines” and that each turbine would have a nameplate generating power of somewhere between 1.2- to 2.5 MW. (Emphasis added). The DEIS contains an identical description.³ See DEIS at §1.4.1.1. Both the SCA and DEIS also state that the project must have a generating capacity of “up to 75 MW.” See SCA at §2.3.2 (Project Overview – “up to 75 MW”); DEIS at §1.4.1 (“minimum of 70 MW;” “up to 75 MW”).

⁴ Recently permitted projects appear to be installing turbines with nameplate generation capacities of 2.0 MW or larger. The Desert Claim Wind Power Project, for example, will be installing 2 MW turbines. See Desert Claim Wind Power Project Final Supplemental EIS at 2-13. The recent expansion to the Wild Horse Wind Power Project also used 2.0 MW turbines.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 5

route in favor of the West Pit Road with the stated purpose of removing the entire project outside the CRGNSA boundary. *See* October 12, 2009 Letter from Whistling Ridge Energy Project to EFSEC re: Submittal of Amended Application 2009-01. Although removing this route from the project plan may dispose of certain regulatory hurdles, the West Pit Road is a longer route that traverses steeper terrain and will likely have a higher environmental impact than the CG 2930.⁵ Accordingly, this CG 2930 should be evaluated as an alternative.

1.6 SUMMARY OF POTENTIAL PROJECT IMPACTS AND MITIGATION MEASURES

Earth – p. 1-22 – Impact of Proposed Project: Much of the West Pit Road is located in a Class II Landslide Hazard Area. This section should summarize and address anticipated impacts, if any, related to Class II Landslide Hazard Areas.

Air Quality – p. 1-22 – Impact of No Action Alternative: This section identifies impacts from construction of fossil fuel power plants as a potential impact under the no action alternative. There is nothing in the record establishing that proposed project is being built in lieu of fossil fuel powered plant or that its construction will reduce the number of fossil fuel powered generation facilities in the future. Indeed, intermittent nature of wind generated power may require the construction of fossil fuel facilities to provide a back up power source.⁶

Biological Resources – p. 1-23 – Impact of No Action Alternative: *See* comments regarding Air Quality – p. 1-22 – Impact of No Action Alternative *infra*.

Biological Resources – p. 1-24 – Impact of Proposed Project: This section states that there “would likely be some mortality to birds and bats due to turbine collision and displacement.” This should be revised to state that operation of project “will result in mortality to some birds and bats . . .”

Biological Resources – p. 1-24 – Design and Mitigation Measures: Remove qualifier “extensive” from pre-project assessment of wildlife habitat conducted under WDFW Wind Power Guidelines.

⁵ Long sections of West Pit Road crosses land designated as a Class II landslide hazard area. *See* DEIS Figures 3.1-1, 3.1-4 and 3.11-2

⁶ The No Action Alternative analysis appearing on p. 3-92 and in other section of the DEIS contains a more accurate description of the possible impacts if no action is taken:

It is likely that the region’s power needs would be met through energy efficiency and conservation measures, existing power generation, or the development of new power generation. Base load demands would likely be filled through expansion of existing, or development of new thermal generation such as gas-fired combustion turbine technology. The impacts would depend on the type, location, and size of the facility proposed.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010
Page 6

Biological Resources - p. 1-24 – Design and Mitigation Measures: A Technical Advisory Committee (TAC) is described, including a description of the stakeholders comprising this group. Because the overarching concern for biological resources is bird and bat mortality, a representative of the Audubon Society should be specified and included in the TAC.⁷

Biological Resources - p. 1-25 – Design and Mitigation Measures: The post construction avian mortality monitoring should include bat mortality monitoring as so little is known about bat species' composition and mortality risk at the site. The monitoring program should also analyze the accuracy of the pre-construction risk and mortality predictions. Because the project is being proposed in a new habitat type (forested) for Washington wind energy projects, and because so little is known about bat use of the site, bird and bat monitoring should be conducted for five (5) years, rather than the proposed two (2) years.

Visual Resources – p. 1-28 – Impact of Proposed Project: This section should clearly state that as proposed the project will have low to moderate visual impacts from key viewpoints, including key viewpoints within the CRGNSA.

1.7 SUMMARY OF UNAVOIDABLE ADVERSE IMPACTS

This section should plainly identify and summarize unavoidable adverse impacts. References to beneficial impacts should be removed. The description of unavoidable visual impacts (Table 1-2, p. 1-35) should be re-drafted to read as follows:

This project will have unavoidable adverse visual impacts on the surrounding area. Visual impact analysis establishes that the project will have low to moderate visual impacts from key viewpoints, including viewpoints within the CRGNSA.

1.8 CUMULATIVE IMPACTS

The discussions of existing development in section 1.8.1.1 and reasonably foreseeable future development in section 1.8.1.2 appear to be inconsistent. In section 1.8.1.1, the authors considered wind projects located 35 to 70 miles from the proposed project in their cumulative analysis. In section 1.8.1.2, however, the authors chose to disregard two proposed wind power projects (Juniper Canyon and Summit Ridge) because they are “too far away (generally more than 20 miles) from the Whistling Ridge Energy Project site to result in cumulative impacts.” Given that the cumulative analysis of existing impacts considered projects that were located 70 miles away, the analysis of cumulative impacts relating to reasonably foreseeable future

⁷ The TAC should also be expanded to include representatives from local public interest groups, including interveners Friends of the Columbia Gorge and Save Our Scenic Area.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 7

development should apply similar criteria or include an explanation as to why different criteria were applied.

1.8.1 Projects Considered

The cumulative impact section should discuss the intermittent nature of wind energy generation and the need for easily dispatchable hydro-electric or fossil fuel generating plants to meet demand when the wind is not blowing.

2.0 Proposed Action and Alternatives

2.1 PROPOSED ACTION

2.1.2 Project Overview

Table 2-1 – Permanent disturbance areas should include the permanent parking areas adjacent to each turbine that will be necessary to conduct turbine repairs and maintenance. Also there appears to be some inconsistency in the road width used to determine the impact area outside the project.

2.1.3.7 Access Roads

Neither the Application nor the DEIS include a description of parking areas that will have to be maintained adjacent to each turbine for construction and maintenance purposes. The space consumed by these parking areas should also be included in the calculations for permanently disturbed environment.

2.1.4.1 Construction

The size and location of proposed laydown areas should be disclosed and evaluated in the FEIS.

The size and location of permanent parking lots next to each turbine should be included and evaluated in the FEIS.

This section should include a discussion regarding how concrete will be transported to the construction site. If a concrete batch plant is going to be used, its size and location should be disclosed in the FEIS. If concrete is going to be transported to the site, information regarding the trucking route and potential environmental impacts (air pollution, traffic, etc.) should be disclosed and evaluated in the FEIS.

2.1.6 Forest Harvest During Project Construction and Operation

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 8

Mitigation measures for construction of the project should include off-site mitigation for permanently disturbed or cleared areas that would constitute "forest conversions." This would include turbine parking areas and any permanent laydown area at the site.

2.1.7 Project Decommissioning

The Applicant has indicated that the life of the project is expected to be 30 years, at which time the project will either be upgraded ("re-powered") or decommissioned. If the current project receives EFSEC approval, any proposal to "re-power" the project or extend operation of the project beyond its anticipated life span should be reviewed by EFSEC as an amendment to the Site Certification Agreement. Such review should require an updated evaluation and assessment of the environmental impacts posed by the upgrade or extended life of the project.

2.3. NO ACTION ALTERNATIVE

See comments in response to Section 1.4.3 Summary of No Action Alternative.

2.3.6 Alternative Access Roads

See comments in response to Section 1.4.3.6 Alternative Access Roads.

2.4 BENEFITS AND DISADVANTAGES OF DELAYING PROJECT IMPLEMENTATION

This section summarizes the benefits and disadvantages that will result from delaying the project. It is drafted, however, in a way that minimizes the benefits and over-exaggerates the disadvantages of delay. For example, statements to the effect that a delay will prevent the creation of new construction jobs are simply not accurate. A delay in constructing the project will result in a delay in the creation of new construction jobs, just as a delay in constructing the project will delay visual impacts from the project.

2.5 COMPARISON OF ALTERNATIVES

Government action or inaction is not the only possible reason that the project will not be built. For the reasons discussed earlier, assertions that the No Action Alternative will only arise if EFSEC or BPA deny approval of the project should be redacted.

As discussed above, the DEIS should be expanded to include off site and on site alternatives. Without these additional alternatives, the comparison of the limited alternatives set forth in Table 2-5 is of questionable value for purposes of conducting meaningful environmental impact analysis under NEPA and SEPA.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010
Page 9

3.0 Affected Environment, Impacts and Mitigation

Generally, discussions in this section should be expanded to include off site and on site alternatives.

3.1 EARTH

3.1.1.4 Geologic Hazards

This section should be expanded to address geologic hazard issues related to the proposed access road (West Pit Road). That this road traverses lands identified as Class II Landslide Hazards is of particular concern. See Table 3.1-4.⁸

The DEIS should also be revised to include a discussion regarding the extent to which Skamania County has assessed whether the project site or the area traversed by the proposed access road contains Class I landslide hazards (Severe).⁹ If such an assessment has not been done, the discussion regarding landslide hazards should be expanded to determine whether there are affected areas that would otherwise meet the criteria for a Class I landslide hazards, even though they have not been formally designated as such by the County.

3.1.2.1 Proposed Actions

Access Road. This section should be expanded to include a discussion of geologic hazards and their impact on the access road during both the construction and operation of the proposed project, including the environmental impacts that may arise from locating the access road in a Class II landslide area.

Soil Contamination. The discussion regarding soils does not address possible presence of contaminants along the access road right of way or at the project site. The FEIS should include the results of a Phase I Environmental Site Assessment to determine if and where contaminated soils may exist.

Volcanic Activity. This section should discuss how ash from a volcanic eruption may impact the operation of wind turbines, transmission lines, and other elements of the project.

3.1.2.2 Mitigation Measures

⁸ Table 3.1-4 should be revised so that the locations of the proposed access road, as well as other access road alternatives, are easily discernable.

⁹ To qualify as a Class I landslide hazard, the location must be designated as such by the local legislative body, in this case Skamania County. See DEIS at § 3.1.1.4 *Landslides*.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 10

This section should describe containment and remediation measures that will be taken in the event contaminated soils are found during construction.

The scope of the mitigation measures should be expanded to address geologic hazards associated with the access road and address how the project will be accessed if the proposed access road is damaged or destroyed by a catastrophic geologic event.

The project is located in the vicinity of several volcanoes and the access road traverses land designated as a Class II landslide hazard. This section should describe and discuss mitigation measures designed to protect the environment and human health and safety in the event of a catastrophic geologic event.

3.4 BIOLOGICAL RESOURCES

3.4.1.2 Habitats

Conifer Forests – p.3-37. The second to the last sentence in this section states that “[t]he majority of coniferous forests within the project site is managed for commercial timber production, and is replanted following harvest.” “Majority” could mean anywhere from 51 percent to 100 percent. A more quantitative disclosure is needed here.

Conclusion - p. 3-39. The final sentence in this section states that “[t]he project site is not located within any known wildlife corridor, flyway, foraging area, or migratory route.” This statement is problematic as the site lies within the landscape-scale Pacific Flyway, which is adjacent to the Columbia River gorge (which, in turn, is a significant migratory flyway, particularly for water birds), and all north-south cordilleras in the state support at least a weak raptor migration. Elsewhere in the document (*e.g.*, p. 46), raptor activity at the site is ascribed to migratory behavior. Also, some of the bat behavior observed at the site is assumed to be foraging behavior, and birds and other wildlife are known to forage in the project area. Use of the term “known” is also problematic and suggests the need for additional study. For example, no data was collected to assess bird or bat migration activity at the site.

3.4.1.5 Special Status Wildlife Species

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 11

General Comments, Strike Risk Modeling: The avian surveys for the project use a very crude index to rank relative strike risk among the various species of birds recorded at the site. One of the three variables in the strike risk model relies on where in the vertical air column (in or out of the rotor swept zone) birds were initially detected when they were first seen.¹⁰ No observations of bird behavior were made over any extended period of time. The behavior was apparently not even recorded for all observations, as in some years the metric is absent. Furthermore, as highly mobile species, almost any bird will at some point cross the rotor-swept area.

Some very sophisticated strike risk models have been developed around wind energy towers. The validity of at least some of these models is still in question. Nonetheless, they attempt to quantify the amount of time a species spends in the rotor strike zone, and assign risk based in part on the size, speed, and flight paths of birds crossing the rotor swept area. While implementation of such complex models may not be necessary (at this point) for this project, reliance on the simplistic model used for this project is misleading and the results should be removed from the DEIS, or at the very least the model's limitations (which are discussed in some detail in avian survey reports) should be fully disclosed in the body of the DEIS to ensure that the reader is not misled.

The avian survey report (Appendix C-4) indicates that the index is formulated to help rank the relative risk each species might face in the presence of wind towers. At best, the index may give some insight among the species at this site, but comparison to other sites, particularly in different habitat types from the proposed project, is highly suspect and appears to be untested. Appendix C-4 also states "...no relationships have been observed between overall use by bird types other than raptors, and fatality rates of those bird types at wind-energy facility. Such a lack of predictive ability also speaks for a need for long-term follow up monitoring to assess the true impacts of the project on birds.

General Comment, Species Abundance: Discussion regarding the abundance of species at the site lack context. For example, the DEIS reports that fifteen (15) swifts were seen in fall 2004, four (4) in summer 2006, and eleven (11) in summer 2009. The DEIS, however, fails to place these types of figures into a context. Do these observations constitute "a lot"? "Very few"? Compared to the next watershed west, or the core of the species range? In the case of the swifts, and indeed most species recorded in the project area, subjectively it seems that few of any given species are represented. However, in the case of migrating birds (such as the 15 swifts observed in fall 2004), this could represent a rate. In other words, there could be 15 swifts per day, or per hour trying to migrate across the project site. There is simply no contextual information to put

¹⁰ Glancing at a bird and assigning it to "in" or "out" of the rotor swept area is an exceptionally poor predictor of mortality risk. For example, the avian survey report indicates that Horned Larks are often the most commonly found birds killed at wind tower sites. Horned Larks spend a significant amount of time on the ground. Accordingly, it is likely that an index of this species' strike risk formulated based on this project's model would forecast a low mortality risk and be a very poor predictor.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 12

these numbers into a wider perspective. Similar information subject to this same criticism is provided for other species of concern.

Introduction, p. 3-45: The introductory paragraph states that “[t]wo additional special status species, Keen’s myotis (*Myotis keenii*) and Townsend’s big-eared bat (*Corynorhinus townsendii*), may occur but have not been identified in prior surveys.” A more accurate statement would be that these two species could occur at the site, but surveys conducted at the site were incapable of identifying these or any other bats, except the hoary bat, to the species level.¹¹

Northern Spotted Owl, *Historical Activity Centers*, p. 3-52: This section should be revised to discuss and analyze a May 2010 record of a Spotted Owl in one of the owl circles north of the site. The remaining section addressing Spotted Owl issues should be updated to reflect this finding.

Northern Spotted Owl, *Conservation Support Area*, p. 3-54: Although managed forest is not optimal for spotted owls, it is likely better than wind towers which pose greater mortality risk than young even-aged stands of trees. To that end, the project can only be contrary to the purpose of the CSA. It may be just 0.27% of the area, but it is still a loss that should be disclosed in the discussion (including cumulative impacts).

Northern Spotted Owl, *Spotted Owl Special Emphasis Centers*, p. 3-56: The discussion on this point is obtuse and would benefit from illustration on a map.

The footnote to this discussion indicates that DNR reports that the Mill Creek site has 48 percent of the recommended 40 percent minimum suitable habitat for a spotted owl special emphasis center. The discussion in this section should be expanded to identify what fraction of that suitable habitat occurs where the 1.4 mile circle overlaps with the northwest corner of the project site.

Olive-sided flycatcher, p. 3-56: This section should be expanded to address the following issues. According to Breeding Bird Survey data, this species declined at the rate of 3.3 percent per year between 1966 and 2001. Loss of winter habitat is thought to be one causal mechanism. Another is that managed forests, which superficially replicate the fire-altered forests the birds depend on, may not offer all that the birds need to meet life history requirements.

The last sentence in this paragraph states “none were recorded during the fall of 2004 or the winter of 2008–2009.” The Olive-sided Flycatcher is a late spring arrival and departs in late

¹¹ On page 3-59 states: “Bat surveys conducted during 2007, 2008, and 2009 (Appendices C-8, C-9, and C-10) did not have the ability to detect individual species of bats. Instead, bats were grouped into species with either “high frequency” calls or “low frequency” calls.”

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 13

summer. Recording the species at the site in fall or winter would be most unusual.

Vaux's Swift, p. 3-57. *See General Comment*, Species Abundance above.

Keen's Myotis and Townsend's Big-eared Bat, pp. 59-60: The bat survey, and consequently the distilled discussion in the DEIS, are lacking in detail. The Keen's Myotis discussion discloses "[b]at surveys conducted during 2007, 2008, and 2009 . . . did not have the ability to detect individual species of bats." That species composition at the site could not be determined serves to emphasize that too little is known about the bat fauna. At a minimum, this lack of knowledge demands that there be post-construction studies to evaluate bat mortality and species composition of fatalities. Also, as (potentially) the first wind energy site to be built in a forest setting in the Pacific Northwest, this project should be used to study the impacts of such development on bats and birds. The U.S. Fish and Wildlife Service Wind Turbine Guidelines Advisory Committee draft report of March, 2010 states, "[o]ur current state of knowledge about bat-wind turbine interactions . . . does not allow a quantitative link between pre-construction acoustic assessments of bat activity and operations fatalities."¹² The report goes on to say:

There is growing interest in determining whether "low" position samples (~1.5-2 meters) can provide equal or greater correlation with bat fatalities than "high" position samples because this would substantially lower cost of this work. Developers could then install a greater number of detectors at lower cost resulting in improved estimates of bat activity and, potentially, improved qualitative estimates of risk to bats.

Because the applicant sampled at a variety of sites and elevations within the project area, follow-up monitoring could contribute to the body of knowledge regarding the ability of various approaches to pre-implementation sampling to predict post-project mortality.

The Townsend's discussion states "[t]here are no known roosting structures or maternity colonies occurring in the vicinity of the project area. Consequently, the likelihood of occurrence on the site is considered to be low." The absence of evidence should not be assumed to be evidence of absence, especially in light of the caveat disclosed about inability to distinguish species during the bat surveys. This species (and many other bats) will roost singly in tree cavities or behind loose bark, so it is impossible to completely dismiss their presence at the site.

3.4.1.6 Other Wildlife Species

¹² Wind Turbine Guidelines Advisory Committee. 2010. Wind Turbine Guidelines Advisory Committee Recommendations. US Fish and Wildlife Service Wind Turbine Guidelines Advisory Committee. Draft report to the Secretary of the Interior. March 4.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 14

Birds, p.3-63: The DEIS states that “[m]ean overall bird use in the study area was low compared to these other wind resource areas studied; ranking 19th compared to 24 other wind resource areas . . .” This section should explain that comparisons to other wind resource areas in Washington and Oregon may be of little value as these other areas occupy different habitat types—primarily shrub-steppe and agricultural lands. Comparisons to sites located in Eastern deciduous forests are also questionable because of the different suite of bird species, different structural components to the surrounding forests, and dissimilar migration behavior.

Fall Migration Surveys (2004), p.3-64:

Eight species of raptors were observed during the survey. Those with the highest use of the site were sharp-shinned hawk, Cooper’s hawk, and red-tailed hawk. The highest raptor use observed at the site during 2004 surveys occurred between September 11 and October 12, 2004.

This observation is consistent with annual observations made at the Chelan Ridge Raptor Observation Project site in northern Washington, also on the east side of the Cascades. Raptors throughout the West migrate along ridge lines. Some ranges are located at geographic restrictions or at the confluence of ranges that funnel concentrations of raptors. Data do not indicate this is such a site, but do support the idea of a weak raptor migration through the area. Based on the number of raptors encountered during fall surveys, a rough estimate of the number of birds migrating through the site each fall should be made and included as part of the FEIS.

3.4.2.1 Proposed Action

Western Gray Squirrel, p. 3-75: This section suggests that the lack of oak trees in the project area indicates that the area has poor habitat quality for this species. In the northern part of the species’ range, however, oaks are completely lacking. Accordingly, the absence of oak trees should not be used to conclude that the squirrels are absent from a site.

Special Status Wildlife Species, p.3-77: This section introduces the collision risk model (or “bird exposure index” as it is called in the avian reports) from the avian survey reports. As discussed above, this model is highly suspect. The avian survey reports present numerous caveats when using this model or index: “This index is only based on initial flight height observations and relative abundance (defined as the use estimate) and does not account for other possible collision risk factors such as foraging or courtship behavior.”

Reliance upon the Index is subject to criticism on several grounds. Intuitively, the model makes little sense.¹³ The model also fails to account for the disproportionate impact of mortality on rare

¹³ In the model, A = mean use for species is averaged across all surveys. Many species, especially raptors, demonstrate distinct seasonal use of the site. For example, a large influx of bald eagles into the Columbia River

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 15

populations.¹⁴ The model also fails to account for many of the other variables that influence strike risk. These include size of the bird, speed of flight, and direction of flight, or weather conditions which could obscure blades or towers.

Ultimately, there is no indication that this model has any predictive value. Neither the DEIS nor the avian surveys indicate that this model has ever been tested in the field or been utilized prior to the construction of a wind energy facility, followed by post-construction surveys to verify its usefulness.

Given these limitations, any use of numbers from the index should be reported judiciously, sparingly, and with all the caveats identified in Appendix C and the DEIS, otherwise unqualified validity and strength are implied for these indices.

Other Wildlife Species, *Birds*, p. 3-79. The final paragraph in the bird impacts lists a host of caveats, which are cause for concern.¹⁵ Although there is no geographic feature suggesting this

Gorge occurs in the winter, and the DEIS does report that the bald eagle was more likely to occur on the project site during winter. However, the species' weight in the model would be greatly reduced by the number of data collection efforts made at other times of year. During most times of the year, the risk of collision for a species with strong seasonal occurrences would be zero—it just isn't at the site. On the other hand, at the peak of its occurrence at the site the risk could be far greater. Distributing the exposure risk across multiple seasons thereby presents a deceptive index of exposure risk.

The model contains two additional parameters: Pf = proportion of all observations of species *i* where activity was recorded as flying (an index to the approximate percentage of time species *i* spends flying during the daylight period), and Pt = proportion of all flight height observations of species *i* within the rotor-swept height. Both of these parameters are based on information captured at the moment of observation during field data collection. Data derived from the literature regarding each species' natural history and behavior could provide a more accurate picture of long-term behavior. As discussed earlier, almost all birds fly at some point during the day (one of the caveats in the DEIS for the model states "[i]f a species was recorded on the site, but never flying at all, then the exposure index would not be applicable") and at some point flight heights are likely to enter elevations swept by rotors. Both of these parameters likely suffer from small sample sizes of the total number of observations, meaning that statistically there would be little ability to accurately describe behavior based on the small sample size.

¹⁴ Models such as this suggest that strike risk is reduced specifically because a species is rare at the site. To illustrate the point, the loss of one bird from a local population of two hundred (200) has little biological meaning. The loss of one bird from a local population of two (2) means 50 percent of the population is gone. Yet in each example, only one bird was killed.

¹⁵ These caveats include:

... the level of night migration for species associated with the project site is also not known.

... risk analyses ... provide some insight into which species are most vulnerable to turbine collision; however, estimates are based on abundance, proportion of daily activity budget spent flying, and flight height of each species. Observations were made during daylight hours, and do not take into consideration flight behavior or abundance of nocturnal migrants.

... the analysis does not account for varying ability among species to detect and avoid turbines, habitat selection, or other factors that may influence exposure to turbine collision.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 16

site constitutes a migratory bottleneck or should host a concentration of migrants, no effort was made to assess passerine migration, particularly at night (when most of these species migrate). In the absence of such an effort and in light of the long list of caveats associated with the collision index, post-construction monitoring and appropriate mitigation (should significant mortality occur) is warranted. Long term impacts should be assessed over a 5 – 10 year period because of our lack of experience with siting wind projects in Western forested ecosystems, and because of the inter-annual variability in migrating bird numbers.

Other Wildlife Species, Bats, p. 3-79: Bats are difficult to study. Nonetheless, the fact that of all the bats detected and all the species that could be present at the site, only the hoary bat was identified to species, leaves much information for the site lacking. The DEIS concludes (based on Appendix C reports) that relatively little bat activity was recorded at elevated heights, and two seasons of monitoring did not detect significant migrations. While these are good signs, the DEIS concludes “variable levels of recorded use by bats across years, habitats and recording height above ground indicate that the extent of impacts is difficult to predict at this time.” This conclusion demands years of follow-up monitoring to assess actual impacts. As one of the first sites placed in a forested setting, such monitoring is particularly critical to understanding the environmental impacts of wind energy sites in forests.

3.4.3 Mitigation Measures

Post-Construction Avian [and Bat] Mortality Study: Given the large number of unknowns discussed above regarding both bats and birds, the avian mortality monitoring mitigation measure should be expanded to include bats and its duration should be expanded from 2 years to a 5-10 year horizon.

Research-oriented Studies: As one of the first wind power projects proposed for construction within a forested habitat in the Pacific Northwest, this project offers a unique opportunity to conduct research-oriented studies regarding the wind energy/wildlife interactions like the research studies identified in the WDFW Wind Power Guidelines (2009) and the USFWS Wind Turbine Guidelines (2010).

Adoption of USFWS BMPs: The proponent should adopt the Best Management Practices set forth by the USFWS Wind Turbine Guidelines Advisory Committee. Most of the BMPs suggested by the committee are already in the DEIS, but a good faith effort should be made to meet all of these guidelines to minimize project impacts. One BMP not presented in the DEIS includes appropriate lighting of on-site facilities (in addition to the towers themselves) to control light pollution and maintain the dark skies needed by bats and migrating birds.

As a result, actual risk may be lower or higher than indicated by these estimates[.]

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 17

The Technical Advisory Committee (TAC): As mentioned earlier, membership in the Technical Advisory Committee should include representatives from Audubon Washington or one of its member chapters, as well as representatives from local, federal and tribal federal and local environmental groups. The TAC should be convened for the life of the project, unless EFSEC determines otherwise.

Procedures for Responding to Avian and Bat Mortality Events: The mitigation measures should include the adoption of procedures specifying how the project will respond to large scale avian or bat mortality events or a take of a Bald Eagle or other species subject to protection under Federal or State law. These procedures should include timeframes for notifying relevant authorities (EFSEC, the TAC, and appropriate local, state and federal authorities) and measures to be taken to ensure no additional environmental harm occurs pending investigation of such an event, including curtailment of operations. Consistent with WDFW Wind Power Guidelines, the Applicant should contact the USFWS to determine appropriate measures to resolve unauthorized take of Endangered Species Act listed species or other species covered by other federal regulations.

Construction Monitoring: Mitigation measures during construction should include retaining an independent environmental monitor to ensure that all Best Management Practices and other mitigation measures are fully observed during the course of construction.

Mitigation for Lost Habitat: Arrangement should be made to mitigate for the permanent and temporary habitat losses caused by the project. Mitigation for permanent loss of habitat should be made on a one to one basis as provided for under the WDFW Wind Power Guidelines and should be developed in conjunction with WDFW and EFSEC.

3.4.4 Unavoidable Adverse Impacts

This section concludes with the statement “[t]he potential for ongoing occurrence of either golden or bald eagles is considered extremely rare.” This statement is misleading. While both of these species appear to be rare at the site, surveys have documented their presence at the site. Moreover, both of these species are known to range widely in search of food, and bald eagles have been appearing in increasing numbers during the winter in a location that is only two miles away. Under these circumstances, the DEIS should state that periodic occurrences (in low numbers) of these species at the project site are predictable and are to be expected.

3.6 PUBLIC HEALTH AND SAFETY

3.6.2.1 Proposed Action

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 18

Construction, Fire and Explosion, p. 3-97: The wind turbine nacelles will be at a height of 262 feet. This section should discuss the technical challenges that are posed by responding to a fire, explosion or medical emergency at such a height, the types of emergency equipment necessary to respond to emergency events, and who (local fire departments, DNR or the Applicant) will be responsible for supplying and operating this equipment.

Operation, Fire and Explosion, p. 3-99: This section acknowledges that turbine malfunctions resulting in fires have been known to occur. Given that the turbines nacelle are located hundreds of feet in the air in a windy area surrounded by land being managed for timber production, it would appear that a fire could pose a serious threat to the project site and surrounding property. This section should be expanded to discuss the potential environmental impacts that may arise from a turbine fire and the actions that would be taken to minimize those impacts. This section should discuss whether equipping the turbines with fire suppression equipment is advisable.

3.6.3 Mitigation

Equipping the turbines with fire suppression equipment should be considered as a possible mitigation measure.

3.7 NOISE

3.7.1.3 Affected Environment

The Applicant intends to harvest trees in the vicinity of the project site prior to construction. This section should discuss whether the harvest of trees will affect the validity of the pre-construction sound study with a specific focus on the residential sites identified in the first paragraph of Section 3.7.1.3.

3.7.2 Impacts

This section should discuss on-site alternatives regarding the placement of wind turbine towers and potential noise impacts.

3.7.3 Mitigation

If warranted, mitigation measures should include removal or reconfiguration of turbines to minimize impacts on residential receptors.

If warranted, mitigation measures should include maintenance of vegetative buffers between the project and residential receptors to minimize sound impacts.

3.8 LAND USE AND RECREATION

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 19

3.8.1.2 Recreation

The Mark O. Hatfield Wilderness Area is within a 25 mile radius of the proposed project. Environmental impacts to this wilderness area should be identified and discussed in this section.

3.8.3.1 Proposed Action

Changes to Existing Land Use Patterns and Recreation, *Project Operation*, p. 3-151:
In this section, the authors suggest that the project will not impact local agricultural tourism because wineries located in southeastern Washington are “thriving” despite the fact that there are four wind power facilities located between Walla Walla and Kennewick. This paragraph should be redacted. Correlation does not establish causation. Without more detailed analysis, the fact that wineries and wind power operations co-exist in Walla Walla County should not be used to predict the environmental impact of this project in Skamania County.

Consistency with Applicable Land Use Regulations, Columbia River Gorge National Scenic Area Management Plan, p. 3-154: Under the bullet point entitled “Scenic Appreciation and Scenic Travel Corridors,” strike “only” from the discussion so that the sentence reads: “The project would have minor to moderate impacts on visual quality as viewed from travel corridors inside the Scenic Area.”

Trails and Pathways. The discussion in this section needs to be clarified. The project will have low to moderate visual impacts on viewpoints from some trails and pathways in the CRGNSA. The statement that “[t]he project would not affect any trails or pathways in the Scenic Area” is incorrect.

3.8.3.2 No Action Alternative

If a No Action Alternative is pursued, there will be no impact on visual resources.

3.8.4 Mitigation Measures

This section should discuss reconfiguration or removal of turbines to minimize visual impact on scenic area as a mitigation measure.

3.8.5 Unavoidable Adverse Impacts

If the applicant is unwilling or unable to reconfigure turbines to minimize visual impacts, then this section should identify minor to moderate impacts on visual resources within the CRGNSA as an unavoidable adverse impact.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 20

3.9 VISUAL RESOURCES

3.9.1 Methodology

The methodology applied should be expanded to include the Visual Resource Management system employed by the Bureau of Land Management. The CRGNSA has established visual resource objectives for a large and specific area within the Columbia River Gorge. Although the project is located just outside the scenic area boundaries, it will be clearly visible from within the scenic area and will impact the area's scenic values. That the project is located just outside the scenic area boundary should not exclude it from an analysis that fully identifies and discusses the project's visual impact on this nationally-recognized, high value regional view shed.

3.9.1.3 Preparation of Visual Simulations

The photographs underlying the visual simulations are problematic. Visual simulation photographs should be taken with a 50 mm lens, as this focal length most closely captures human visual perception. *See Environmental Impacts of Wind-Energy Projects*, National Research Council (2007) at 247. The use of other focal lengths distorts the image and makes it difficult to compare impacts between different photographs. *Id.* If a digital camera is used, it should be set at the highest resolution possible. *Id.* The visual simulations should also be re-sized to a 10 x 12 inch format, at a minimum, for comfortable arm's length viewing. *Id.* at 250.

Most of the simulations produced in the DEIS appear to be taken from viewpoints along roads and highways. Additional simulation should be provided with views from the Columbia River, hiking trails, and wilderness areas. *See Id.* at 251-52.

The DEIS states that simulations were not prepared for night time conditions. An inventory of current night time lighting conditions would be helpful in assessing the extent to which FAA mandated turbine lighting will impact the night sky.

3.9.2.3 Viewpoints

See comments under sections 3.91 and 3.9.1.3.

Columbia River Gorge National Scenic Area – p.3-194

Visual impacts are among the issues to be addressed in NEPA and SEPA analysis. Although Congress has expressed reluctance to apply Scenic Area restrictions to lands lying outside the scenic area boundary, land uses outside the scenic area will impact the visual quality within the scenic area and should be subject to visual analysis consistent with the values encompassed by the CRGNSA.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 21

3.9.3.2 No Action Alternative

There is no evidence in the record that construction of project will result in an appreciable decrease in this region's development or reliance on fossil fuels or prevent the construction of such plants in the future. The assertion that failure to build the project will result in continued impairment of air quality and visual resources is not well-founded and should be removed from the discussion.

3.9.4 Mitigation Measures

In addition to painting the turbines an unobtrusive, non-reflective color and following FAA lighting guidelines, the following additional mitigation should be included:

- Either reducing or reconfiguring the turbine locations to minimize visual impacts.
- Explore whether vegetative buffers can be grown or maintained to minimize visual impacts.
- To the extent visual impacts are unavoidable, mitigation should include the preservation of off-site visual resources.

3.10 HISTORICAL AND CULTURAL RESOURCES

3.10 .2.2 Cultural Resources Overview

The FEIS should incorporate the results of archaeological field inventory conducted by Yakama Nation's Cultural Resources Department.

3.11 TRANSPORTATION

3.11.2 Impacts

This section should identify likely haul routes for concrete that will be used for the wind turbine foundations and discuss any associated environmental impacts.

3.14.3 CUMULATIVE IMPACT ANALYSIS

3.14.3.5 Habitat and Wildlife

Bird and Bat Species, p. 3-274: This section provides: "Erickson et. al. (2005) concluded that these sources of mortality [i.e., other anthropogenic sources] are likely much larger than the

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010
Page 22

potential impacts of wind power development.” This statement of relativism is misleading and is not consistent with the intent of a cumulative impacts analysis. While on its face the statement is likely true, the question is whether wind energy, by adding incrementally to mortality, would be enough to negatively impact bird or bat species.

Discussion of West Cumulative Impact Study, pp. 3-275-76: The cumulative impact study prepared by West, Inc. for the Klickitat County Planning Department has contextual issues that need to be addressed. As the DEIS points out, habitat assessed by West for Klickitat County is significantly different from that at the project site. The DEIS states that “none of the estimated fatalities were anticipated to cause a significant loss in population, and no cumulative impacts were anticipated.” Since the completion of the West report, however, the number of occupied Ferruginous Hawk nests in Washington has dropped precipitously.¹⁶ The West report does disclose that this species could be at risk from wind energy facilities, and suggests that exclusion zones around core habitats might be warranted. In light of the current plight of this species, the “no impact” conclusion needs to be re-evaluated.

Another problem with the West report is that it focuses solely on impacts from the full build out of all anticipated wind development projects in the Columbia Plateau Ecoregion. While informative, this analysis misses the point of a cumulative impacts analysis, which is to evaluate the impact of the current project (in the West report, all anticipated wind energy development) in conjunction with all other reasonably foreseeable stresses on the resource – the analysis should have been wider ranging and not restricted to wind energy development.

Cumulative effects result from spatial (geographic) and temporal (time) crowding of environmental perturbations. The effects of human activities will accumulate when a second perturbation occurs at a site before the ecosystem can fully rebound from the effect of the first perturbation.¹⁷ Fragmentation and habitat degradation are two of the major problems in the shrub-steppe. Development, land conversion, fire, incompatible grazing practices, and weed invasion are all driving mechanisms. The question of whether wind energy development in the Columbia Plateau Ecoregion could add synergistically to these sources of stress is not addressed in the West report.

The DEIS mentions that climate change is not evaluated as a source of stress. Climate change projections for Washington and the Pacific Northwest suggest dramatic changes in East-slope forests (as well as shrub-steppe), and these changes should be discussed in the context of cumulative impacts.

The cumulative impacts discussion in the DEIS concludes with the following sentence:

¹⁶ McCullen, K. 2010. Eastern Washington sees fewer ferruginous hawks. Tri-city Herald. May 9.

¹⁷ Council on Environmental Quality. 1997. Considering Cumulative Effects Under the National Environmental Policy Act. Council on Environmental Quality.

ATTORNEY GENERAL OF WASHINGTON

August 27, 2010

Page 23

For example, one study from 2009 estimated that, based on performance in the United States and Europe, wind farms and nuclear power stations are responsible each for between 0.3 and 0.4 bird fatalities per gigawatt-hour (GWh) of electricity while fossil-fueled power stations are responsible for about 5.2 fatalities per GWh (Sovacool 2009).

The Sovacool (2009) paper appears to be fundamentally flawed in its assumptions. Willis et al. (2010)¹⁸ published a rebuttal to this paper that would suggest that its premises are unsound. This line of reasoning should either be removed from the FEIS, or better supporting literature provided to support the point.

Thank you for this opportunity to submit comments on the Whistling Ridge DEIS. Please feel free to contact me if you have any questions or need clarification regarding my comments.

Sincerely,

Comment on Whistling Ridge Energy Project

Draft Environmental Impact Statement (DEIS)

Comments on Bat Studies

August 27, 2010

Stephen Posner
Energy Facility Site Manager
Washington EFSEC
905 Plum Street SE, 3rd Floor
PO Box 43712
Olympia, WA 98504-3712

Andrew M. Montaño
Environmental Protection Specialist
Bonneville Power Administration
PO Box 3621 KEC-4
905 NE 11th Avenue
Portland, OR 97208-3621

Dear Messrs. Posner and Montaño:

Save Our Scenic Area (SOSA) is involved with the Whistling Ridge Energy (WRE) project application as an Intervener. SOSA is a non-profit corporation formed by concerned local Gorge citizens. Its primary mission is to help preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. I am writing today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

SOSA is submitting several different comment letters, covering a variety of subject matter within the DEIS. We have also reviewed the comments submitted by the Friends of Columbia Gorge, agree with them and incorporate them by reference. There are multiple environmental issues involved in the consideration of this project and it is important that each be given through consideration in the EIS process. We find that, in many areas, the present DEIS is completely insufficient and we urge that the NEPA/SEPA responsible officials prepare a supplemental DEIS.

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

The following pages of written and charted comments, plus Exhibits, are intended to address some, but not all, of the deficiencies noted in the particular sections within the WRE DEIS that address Bats. In all cases, the deficiencies are explained. In most cases, particular remedies are suggested. Because no remedy is proposed by SOSA does not mean there should not be one implemented by the NEPA/SEPA responsible officials.

Prepared for Save Our Scenic Area
by Loreley Drach, M.S.

I am commenting on the methods, results and conclusions resulting within the Acoustic Bat Surveys and the text of the Whistling Ridge DEIS.

METHODS

Whistling Ridge Energy (WRE) hired the consultant WEST, Inc to perform bat surveys in 2007, 2008, and 2009. The bat survey consisted only of Anabat recordings at selected locations. This method has the ability to detect and record the ultrasonic calls allowing bat species to be identified and enumerated within the spatial range of the Anabat equipment. Use of the Anabat recorder however has limitations. Anabat recorders are used to determine activity. What specific activity is occurring, such as migration or feeding cannot be determined from the calls themselves. The limitations of the survey methods must be addressed and conclusions need to remain within the methodology limitations and not go beyond. WRE makes assertions that do not have any empirical basis in an attempt to lead reviewers to believe it has fulfilled the requirements of the DEIS.

To begin with, WEST, Inc. did not consistently achieve their own stated goals: “(1) characterize the local bat populations in a variety of habitats, (2) identify areas of high usage by bats, and (3) characterize the frequency of bat usage areas representative of where turbine strings would be located” if they were achieved at all.

- (1) Local bat populations were not characterized in a variety of habitats. Implied in characterizing the bat populations is the identification of species and providing their composition of the calls in each habitat. Only one bat, the hoary bat, was identified. This bat in general only made up approximately 5-6% of the calls. Out of the 15 species of bats that may be present in the WRE area, six have status, and two are candidates for listing. Over 90% of the bat calls remains unidentified. WEST, Inc. states that they did not have the ability to detect individual species of bats. Perhaps WEST, Inc. does not have the ability to do so in house, but they could have sent out the recordings for analysis

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

by a qualified expert. WEST, Inc. provided text in a report for another wind development company Acciona demonstrating they have sent tapes out for expert analysis (Exhibit 1).

- (2) During 2008, four locations closely representing the diversity of habitats and the turbine corridors in the WRE project area were monitored with the Anabat II recorders. These general habitat types included a wetland between two strings, a road corridor, and two clear cut locations.
- (3) The 2007 survey did not state habitat type monitored and 2009 did not monitor a similar variety of habitats in the WRE area as in 2008. In 2009, WEST, Inc. only monitored areas similar to the one identified in 2008 as having the lowest activity. WEST, Inc. did not indicate whether they surveyed locations that would represent tree stands of 10, 20, and 30 years of growth. These tree ages would be present as the project area becomes reforested. WEST, Inc. surveyed highly disturbed locations only, worst case scenario from a species use standpoint. The results in 2009 therefore only represents the lowest probably use by surveying what appears to be the least desirable bat habitats, and in conditions only present for the first few years following completion of construction. Yet, only the 2009 activity data was used as the basis of comparison to other wind facilities with bat mortality data.

Bat activity numbers should be normalized by a fixed time period, like day, week, or month. In the case of WRE, they normalized by study period, when each year's study duration was different, as well as start and stop dates. The longer study period, lasting past normal activity periods for bats will indicate lower average values for the whole year's study.

The bat survey did not cover any of the bat activity during spring. The longest survey period covered June thru October. Bats have been seen adjacent to the WRE area as early as March. Wind in the PNW is most frequent during the winter and spring as frontal systems move in from the Pacific Ocean. Bats, with high springtime metabolic requirement would be vulnerable as they forage to recover lost fat from hibernation or migrate through the WRE site.

The WRE surveys discarded single calls. These single calls could belong to species that range on the quiet or non vocal side of the bat world. A table needs to be created showing which NW bats vocalize with two or more calls and which ones often use single calls.

Very significantly, the WRE bat survey failed to assess the prevalence of migrating bats through the project area. The DEIS makes statements that appear intended to demonstrate WRE does not believe they pose a significant risk to migrating bats, but these statements are not supported by any study or facts. Anabat recordings do not differentiate between bats feeding, migrating, or engaged in other activities. Simply noting what time of year activity was higher or lower does

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

not even suggest migration. Migration can only be elucidated from carefully designed and executed surveys.

Kunz et al. (2007) outlines some of the different technology and methods available for assessing nocturnal bats. Equipment such as tracking radar and thermal infrared imaging cameras can be used in conjunction with ultrasound microphones for bats and audio microphones for birds to obtain a greater picture of bat and bird migration and behavior in and through the WRE area. Because, bird migration was also not assessed, a bird and a bat could be hit with the nearly same proverbial stone should a migration survey be required.

Bat experts with specialized knowledge were not consulted for information on location of hibernacula and maternity colonies, the only person consulted was a generalist WDFW habitat biologist, Bill Weiler (pg 3-80).

These deficiencies in the methods makes it difficult to truly assess what bat species may be at greatest risk both from a numbers issue a population perspective.

RESULTS and CONCLUSIONS

The acoustic bat surveys during 2008 better covered the diverse habitats currently available on or near the WRE site than either 2007 or 2009. The WRE project site contains wetlands, streams, ridges, low lying areas, clear cuts, varying ages of forest, and forest fringe areas. Not all these areas were monitored, but in 2008 several of them were. In 2008 three upland sampling locations, two clear cuts and a road corridor (July 3 to Oct 7) were monitored over 97 nights recording 39,326 bat passes and one additional sampling station next to a wetland (located between two rows of turbine strings) was monitored over 97 nights and recorded a whopping 17,269 bat passes (mean of **178.0** bat passes per detector night). The three upland locations had means of **14.3**, **73.8**, and **397.3** bat passes per detector night. *These results appear to be some of the highest bat pass detections reported (and in three locations, the highest detections) of any wind turbine site in the U.S* Compare to the numbers in the Activity column in Table 4 in appendix C-10, page 18. The highest activity on the table is 38.3 bat detections/detector night.

WRE suggests that bat use of the site is not high and states that the “extent of impacts is difficult to predict at this time (pg. 3-81).” The absolute extent cannot be precisely predicted, but a general ballpark statement can be made upon closer examination of the numbers. WRE agrees: “a) bat mortality shows a rough correlation with bat activity as measured by Anabat units (Table 4).” The WRE Anabat monitors more than suggest high bat activity, it has been clearly demonstrated. It is reasonable to expect that bat mortality could be very high at the WRE location if turbines are installed.

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

It is common knowledge that bats have been killed in far greater numbers than birds, particularly along the mountain ridges of the Eastern US. No information exists in the Pacific Northwest on bat mortality associated on the forested ridges of the Pacific Northwest, simply because no industrial wind projects have been built in this location to date. Whether resident or local populations are more at risk is completely unknown. In absence of information, a conservative approach would be best, especially in light of six status species of which two are candidates for listing, possibly inhabiting or migrating through the WRE area.

Bats do not have to be struck by wind turbines, but simply being in the proximity to a rotating blade may cause fatalities from barotrauma (Baerwald et al. 2008). Whether bats are killed as a result of a random event or by some selective mechanism is not fully known. However, it appears that bats may be attracted to wind turbines (Horn et al. 2008).

Bats are long-lived and have low reproductive rates, making populations susceptible to localized extinction (Barclay and Harder 2003). Bat populations may not be able to withstand the existing rate of wind turbine fatalities (Kunz et al. 2007; Arnett et al. 2008). As the number of wind turbine facilities increase across the continent, even greater numbers of fatalities will occur. One serious bat problem looming on the horizon is the possibility that White Nose Syndrome may infect western bats. The cumulative effect of wind turbines and this devastating infection on bats has not been addressed in cumulative impacts. This information needs to be added, especially in light of the high bat activity at the WRE location.

Society needs to take great care protecting these small flying mammals. Bats are significant consumers of human and agricultural pests. Without them life could be different.

comment #'s continued from previous Specific Comments submitted earlier								
108					nonexistent	Science based studies require a statement of all assumptions made to design a study and collect, analyze, and interpret data. This is completely nonexistent in the DEIS and Appendices.		
109	3	65	3.4.1.6	4	Bat acoustic studies conducted from 2007 through 2009 were implemented at various locations on the project site. The goal of the studies were to: (1) characterize the local bat populations in a variety of habitats, (2) identify areas of high usage by bats, and (3) characterize the frequency of bat usage areas representative of where turbine strings would be located. Studies were done across several seasons to estimate annual variation during breeding and periods of migration.	Goal (1) was not met. One cannot characterize the local bat populations (note plural) if one does not know what different populations of bats exist at the site. The Anabat recordings were only used to differentiate between high and low frequency calls, and only the call of the hoary bat (approximately 6% of the calls) was identified to species. Goal (3) only addressed one of a number of "representative" habitats, and this one habitat selected had the lowest activity of all monitored habitats. Only goal (2) was accomplished. Periods of migration were not identified by the study, only an assumption that migrating bats would migrate during the same period as bats on the East Coast of the US. Because migration by bats from or through the area were not studied, WRE cannot make any conclusions about migration. Not all bats migrate, some are residents, so unless one knows what migratory species are in or moving through the area nothing other than counts of presence can be made.		Identify all common and unique bat calls by Genus and Genus species and report along with location, date, time, wind speeds, and other meteorological information. Provide all information in a supplemental DEIS. Characterize the local bat populations in a variety of habitats. Design study to specifically address MIGRATION according to established best practices.
110	3	65	3.4.1.6	5	For all studies, passive Anabat II echolocation detectors coupled with Zero Crossing Analysis Interface Modules (ZCAIM; Titly Electronics Pty Ltd., NSW, Australia) were used in all survey years. Bat species are generally grouped into those that emit low frequency (<35 kHz) or high frequency (≥35 kHz) calls.	Bats need to be identified to species, particularly in light of a number of species with an elevated status. The Applicant's consultant, WEST INC, has demonstrated capability to provide this service and needs to perform this analysis. Bats should be grouped by Genus, and Genus Species in addition to low and high frequency calls.	Condensed excerpts from WEST, Inc. bat study for Acciona: Analysis of bat calls was conducted using Analook software (DOS version). Species identification was aided by the Preliminary Key to the Qualitative Identification of Calls within the AnaBat System (Amelon 2005, unpublished data) All Myotis-like calls were identified to genus only and submitted to biologist, Eric Britzke, for identification to species.	Identify all common and unique bat calls by Genus and Genus species and report along with location, date, time, wind speeds, and other meteorological information.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
112	3	67	3.4.1.6		In 2009, the bat survey efforts were further refined to focus specifically on the types of locations where turbines would be sited.	This statement is patently false and misleading. The study design in 2008 represented the turbine locations by including areas near water sources. There are two water sources bats can use. One is the wetland just outside of 150 feet from some of southern the C string of turbines. The second, although mentioned a number of times during scoping, is from a creek below the southern A-array. This creek flows into an old reservoir located on the east side under the southern A string. It too provides a water source for bats. The 2009 survey selected locations far from water sources and as far from any size of trees that could be attained and is not representative of the diverse environment typical of a mountainous coniferous environment.		
113					General	No comparison to environmental conditions during the time Anabat equipment was operating,		
114					General	No mention of how bat use will increase in clearcuts as trees regrow.		
116					General	Bats data cannot be compared to other PNW use and mortality surveys. A those surveys occurred in the open, dry, unforested farmlands and grasslands and not in the damp coniferous forests and ridgelines of the Cascade Mountains. Patterns in use and activity are highly likely given differences in species and therefore behavior patterns of each individual species. Timing of reproduction and migration or hibernation is very likely to be different in the hot and dry environments than than in the forests of the Cascade Mountains for those species that inhabit both areas.		An expanded, in depth independent study needs to be performed over multiple years prior to any conclusions about seasonal and temporal use patterns and predicted mortality.
117	3	66	3.4.1.6	table 3.4-6	Table	Need to identify also what species are high and low frequency. A count shows that two high frequency and four low frequency bats have status. Of the low frequency bats one has been identified but only makes up 5.9% of the total calls. This means that over 94% of the bat calls are unidentified. Of particular interest, in the low frequency group, one species had been identified as being in the area, leaving six not identified. Out of those six, four have status. In the high frequency group, two of the 8 have status. Overall, there is a very good chance that a number, if not all of these status species use this area, given the number of unidentified calls.		Have expert biologists identify calls and present results along with detailed life history and overall abundance.

DEIS Comments on BATS from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
118	3	79	3.4.1.7	6	It is likely that some bat mortality would occur during operation; however, mortality estimates are difficult due to our lack of understanding of why bats collide with wind turbines....	It is common knowledge that it is not necessary to know why things happen to be able to assign a number to how often it may happen. It may be necessary to know why things happen to develop an effective solution. For example: Survival studies (mortality) in salmon are able to calculate the estimated number in a species population surviving through each dam, and the number surviving to the ocean based on the survival passage at each dam. Those numbers can be used to develop models of survival based on flow, temperature, size of fish, species, and timing of migration. It is not necessary to determine what exact or behavioral factor is involved. Same with bats. Scientists may not know what behavior exposes bats to be killed by wind turbines, but it IS known that bats are killed based on exposure (activity) to turbines. Significantly more than some are likely to be killed, especially if WRE is along a migration pathway. Population effect could result for a number of the bat species and particularly for Townsend's big eared bat.		
119	3	80	3.4.1.7	3	The timing of peak bat activity on the proposed project site (portions of July and August) does not coincide with when the highest levels of bat mortality have been documented at other wind projects in the US. Fatality studies have shown a peak in mortality in August and September and generally lower mortality earlier in the summer (citations)..... Rest of paragraph.	This section tries to suggest that because more bat calls were recorded in the summer months that mortality in migrating bats will be low. This does not correlate with other projects in the PNW. These other projects are in the eastern part of the state not having all the same species, a warmer drier environment with moderate fall weather where bat activity will remain higher longer into the fall. Second, bat mortality IS correlated with bat call recordings that indicate activity. Bat activity occurs until late September and early November with a peak in September. Because bat migration was not studied, no conclusions about bat migration can be made.		
120	3	80	3.4.1.7	4	After August 31, activity for all bats was very low relative to earlier dates, indicating that most bats had left the area for winter hibernacula or warmer climates.	This statement is not supported by an analysis of the numbers. Because species of bat calls are not identified and each species of bat has behavioral/physiological differences with response to oncoming winter, it cannot even be suggested that the bats left the area for hibernacula or warmer climates. For example: The Townsend's big eared bat's annual cycle includes an approximate 7 to 8 month period of peak activity in spring and summer when insects are most available and reproduction occurs. The life history and behavior of each bat species that may use the area needs to be incorporated into the timing of bat survey results and discussion. And the results need to include the identification of bat calls by the bat experts that specialize in studying each species of bats, especially the uncommon ones.	http://www.yoloconservationplan.org/yolo_pdfs/speciesaccounts/mammals/townsend-big-eared-bat.pdf	Identify bat call to species. Conduct a full bat migration study. Use accepted statistical analysis to compare bat abundance and movement in and through the WRE project area.
121	3	80	3.4.1.7	5	The project site does not contain topographic features, such as canyons, that may funnel migrating bats toward corridors where turbines would be placed.	Unfounded statements. There is no Pacific NW study on topographic effects on migrating bats to substantiate this. If so, cite the supporting document and do so for bat species that may migrate from or through the Pacific NW.		

DEIS Comments on BATS from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
122	3	80	3.4.1.7	5	No turbines would be constructed near wetlands or ponds, and cleared areas surrounding turbine strings would closely mimic clearcuts or young reforested areas, where to date, recorded bat activity levels on the project site were the lowest.	Absolutely incorrect assertion. Cedar swamp, a wetland discussed in the DEIS, is only a little over 150 feet from the C string of turbines to the east and a little further to the E string. The SB2 Anabat placed near the wetland recorded 178.0 bat passes per detector-night. The A string sits above an old reservoir that holds water the entire year. The Anabat placed in the A string corridor recorded 73.8 bats per detector-night even though it was sitting out in the middle of a clearcut as were the detectors in 2009. By no stretch of the imagination is this a low number, only relatively lower than the extremely high numbers at two other locations in 2008. The numbers are so high, the developer did not want to compare them in the Table 4, page 18 appendix C-10. If 2008 numbers had been placed in the table, it would have reset the bar for all time high numbers of bats recorded per detector-night at wind turbine facilities.	DEIS Text.	Repair the deficiencies in the map and show the OLD RESERVOIR at the base of the southern A-Array. Provide actual measures in FEET or METERS for each turbine within 2000 ft of a body of water.
123	3	59	3.4.1.5		Bat surveys conducted during did not have the ability to detect individual species of bats. Based on the lack of detailed information of this species life history and habitat requirements and nature of the bat surveys conducted it is difficult to conclude with certainty with the likelihood of Keen's bats occurring on the project site. However, Due to the lack of old growth or mature forest types within the project area and the predominant commercial forestry use of the property, the likelihood of occurrence on the site is considered to be low.	Anabat II technology exists to identify, by call, individual bat species. This technology has existed for over 10 years. West has authored a paper where the Anabat technology was used to identify to species the majority of calls. Papers, abstracts, and excerpts are attached. The tapes need to be further analysed by a highly qualified INDEPENDENT expert to identify bat calls with special emphasis to identify rare species. If WEST failed to set up the Anabat II correctly so that calls can be identified, then additional bat data collection needs to occur. Additionally, cumulative impacts should assess the possible future infection of bats by white nose syndrome. Increased mortality of ANY type, may directly affect these species future viability.		
124	3	75	3.4.2	4	Keen's Myotis and Townsend's Big Eared Bat. Surveys for bats were not able to identify <i>all</i> bats to species level.	Bats currently identified by the surveys, to Genus and Genus species, must be listed in a table form at the minimum. It is unconditionable to withhold such information, especially in light of this statement verifying the existence of bat species data.		Provide supplemental DEIS identifying how many Keen's Myotis and Townsend's Big Eared bat calls were detected by the Anabat II and locations, time of year, wind speeds, and other meteorological information.
125	3	66	3.4.1.6	1	Two additional special status species, Keen's bat (<i>Myotis keenii</i>) and Townsend's big-eared bat (<i>Corynorhinus townsendii</i>), may occur but have not been identified in <i>prior</i> surveys.	The reason for doing the WRE survey is to perform a survey and determine what species are identified to use the area.		State whether either of these two species have been identified in the current DEIS study. This can only be achieved by reporting species calls identified on the Anabat II recording. What PRIOR surveys are being referred to here? Explain why it matters whether something was identified prior? What is the purpose of a current survey that can identify species if it only matters what is identified PRIOR?

DEIS Comments on BATS from Save Our Scenic Area (SOSA)

August 27, 2010

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
126		78	3.4.1.7	3	Special Status Species	Not discussed under 'special status species': Fringed myotis, Long-legged bat, pallid bat, and Western pipistrelle. These four other bats each have some status as detailed on Table 3.4-6.		Discuss undre special status species or state why their status on the table not qualify them for special status
127	3	80	3.4.1.7	5	The nearest know hibernaculum is located near the town of Trout Lake, nearly 20 miles north of the proposed project (B.Wieler, personal communication).	Townsend's big eared bat hibernaculum near Trout Lake is known and is one of the largest in Washington. However, other as of yet identified hibernaculum, may exist nearby. A vast lava flow begin just a few miles west of the project site and it could contain hibernaculum. The project site is an area of old volcanic activity. Given that the Townsends big eared bat is difficult to identify through recordings, it is hard to find maternity colonies, and later in the season they may travel as much as 50 km, extra effort needs to be expended to determine if this at risk species is near to or using areas of the WRE project.		
128	3	60	3.4.1.5		There are no known roosting structures or maternity colonies occurring in the vicinity of the project area.	See comments on Keen's Myotis. Townsend's Big Eared Bat, a species of concern and a candidate for listing, is present in the region. One of the largest colonies at is located in lava cave nearer to Trout Lake to the north (400 bats?). Colonies are small compared to many other bat species and not many colonies are known to exist. The southern end of the old lava flow (can be seen from Google Earth) that may contain additional colonies is approximately three miles from the project .		
129	3	59	3.4.1.5		Bat surveys conducted during 2007, 2008, and 2009 (Appendices C-8, C-9, and C-10) did not have the ability to detect individual species of bats.	Completely inaccurate statement at the best. Hoary Bats were identified. It IS ACCEPTED THROUGHOUT THE BAT WORLD THAT THE ANABAT IS A PRODUCT TO COLLECT BAT CALLS AND TO IDENTIFY BAT CALLS TO SPECIES. TITLEY INC, AUSTRALIA (the company that makes this product) PROMOTES THE ANABAT AS A GREAT PRODUCT BECAUSE OF THIS CAPABILITY! The DEIS text make this assertion a number of times and and is just a false the first time stated as every other time stated in the DEIS!		
130	C-8	3			Hoary bats comprised 5.7% of the total passes detected within the SWRA (20 of 348 bat passes: Table 1).	So, it is possible to identify bat species, so why not the remaining 94.3% of the calls? It is clear these tapes need to be reviewed by qualified experts.

3.4 Nocturnal AnaBat Surveys

The objective of the nocturnal AnaBat surveys was to record the relative abundance of echolocating bats flying through the sampling area during summer breeding season and the spring and fall migration seasons.

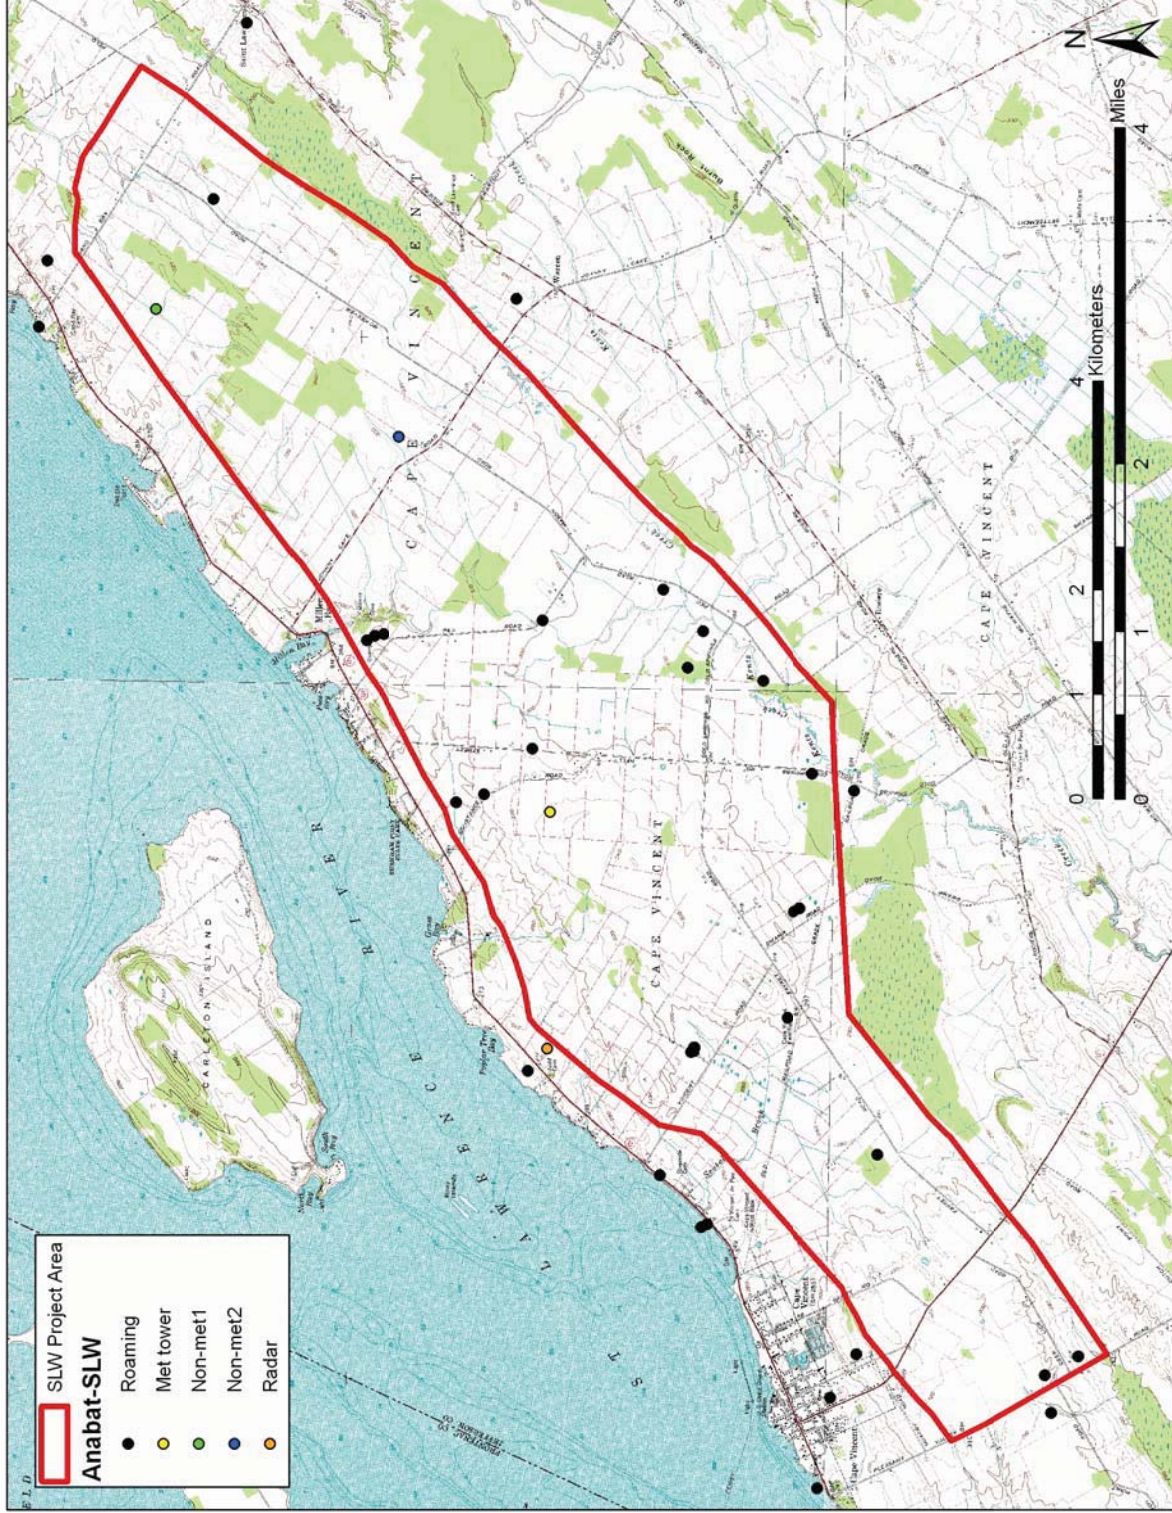

3.4.1 Methods

Bat activity at the project area was recorded using an AnaBat II ultrasonic bat detector attached to a zero-crossing analysis interface module (ZCAIM) which houses a compact flash memory card for temporary download of ultrasonic activity files. To sample continuously on remote mode (automatic data collection), the detector and ZCAIM were powered by an external 12V battery. Each AnaBat unit (detector, ZCAIM, and 12V battery) was enclosed inside a plastic box or dry bag with the detector microphone positioned against a PVC tube protruding from the box/bag. This design prevented water from damaging the AnaBat units without compromising the ability of the unit to detect ultrasonic noise in the environment. To limit variation among AnaBats, sensitivity settings were calibrated for each unit prior to data collection. Most AnaBat units were set at or near setting 7 on the sensitivity dial. Each passive AnaBat unit was positioned so that the microphone faced the same cardinal direction for each sampling period. Calls were recorded for passive sampling from approximately sunset to sunrise (1900 – 0700). AnaBat units were removed from the field approximately once per week to download files, recharge batteries, and troubleshoot technical problems. Data gathered from the passive AnaBat units at the met tower were used to calculate bat activity (designated as number of calls/night) present at the site during the sampling periods. Nights that experienced any number of technical difficulties were not included in the final analyses.

During the spring sampling season (April 13 – May 29), two AnaBat sampling locations were established. One unit was placed at ground level in the open grassy field at the base of the project met tower and another unit was deployed near a wooded edge (Non-met 1) to increase likelihood of detecting additional species (Figure 15). Access issues and technical difficulties with the AnaBat unit at the Non-met 1 location caused the unit to be relocated to a small farm pond near a wooded edge (Non-met 2) within the project boundary after a week of sampling. Acoustic sampling at these two locations (Met tower and Non-met 2) continued through spring and these locations were maintained through the summer sampling season (June 28 – August 8). During the fall season (August 13 – October 9), AnaBat sampling continued at ground level at the met tower. A second AnaBat unit was deployed from August 15 – October 16 in a tree approximately 10 m above ground near the radar survey station (Radar; Figure 15).

In addition to the stationary passive units, a “roaming” or mobile AnaBat unit was deployed during the summer to assess resident/breeding bat species present within the project area. Roaming sampling was conducted using a handheld AnaBat unit for 9 nights (3 sampling periods of 3 consecutive nights each) at habitats likely to have high numbers of resident bats. To select locations for active sampling, reconnaissance visits were made to the project area during the day time to select sampling locations based on the presence of travel corridors (trails and roads), linear landscape features (forest edges), and access to water; habitat features known to be important for bats. Active sampling was conducted from sunset until approximately 4-5 hours after sunset (2100 – 0100).

Figure 15. AnaBat survey locations for the project area.

Analysis of bat calls was conducted using Analook software (DOS version). Analook displays ultrasonic activity in a format similar to a sonogram used for analysis of bird vocalizations (e.g., frequency versus time). Species identification was aided by the Preliminary Key to the Qualitative Identification of Calls within the AnaBat System (Amelon 2005, unpublished data) where characteristics such as slope, frequency, minimum frequency, consistency of minimum frequency, and shape of pulse assist in the identification of bat vocalizations. Due to similarity of call characteristics, two species (big brown and silver-haired bat) were lumped into one species category. All *Myotis*-like calls were identified to genus only and submitted to NYSDEC-recommended biologist, Eric Britzke, for identification to species. To obtain species identifications, an ID filter (Britzke and Murray 2001) was loaded into Analook to determine calls sequences of sufficient quality and length for species identification to be attempted. Once separated, echolocation calls of sufficient quality and length were also identified using quantitative techniques (Britzke 2003). Quantitative analyses are conducted by a cross-validated classification model based on 10 extracted call parameters [duration (Dur), maximum frequency (Fmax), minimum frequency (Fmin), mean frequency (Fmean), duration to the knee (Tk), frequency of the knee (Fk), duration of the body (Tc), frequency of the body (Fc), initial slope (S1), and slope of the body (Sc)] collected from 1,846 sequences (35,979 calls) of 12 eastern U.S. bat species (Britzke 2003). Average accuracy rates for species identification using this statistical method ranges from 56.9% (*L. borealis*) to 98.5 % (*M. grisescens*), with accuracy rates for *Myotis sodalis* ranging from 81.4% to 88.6%.

3.4.2 Results

Passage Rates

The total number of calls and number of calls per night, recorded by each AnaBat unit varied by location and season (Table 4). The met tower AnaBat unit detected 769 bat calls total (19.72 calls/night) during the 39 days of spring sampling. Sampling at the two non-met locations during spring resulted in higher bat activity (29-33 calls/night) than at the met tower, despite changing in sampling location for the non-met unit. Summer sampling occurred at the met tower on 9 nights and recorded a total of 198 calls (22.0 calls/night). Approximately 2.5 times as many calls (55.56 calls/night) were recorded at the non-met 2 location during summer, likely indicating a nearby roosting colony of species and/or better habitat for foraging bats. During fall, the AnaBat unit positioned at ground level at the met tower recorded the lowest number of bat vocalizations per night (9.26 calls/night). Despite a similar number of sampling days, the AnaBat unit located at the radar sampling station recorded more bat calls/night (32.58). Approximately 93% of calls (n=1519) at the radar location were recorded between August 15 and August 21. Only 25% of the calls recorded at the met tower (n=117) were recorded during the same sampling period.

Table 4. Number of sampling days, total number of calls recorded, and calls/night recorded by each AnaBat unit for spring, summer, and fall sampling periods.

Season	Location	# of sampling days used in analysis	Total # of calls	# calls/night
Spring	Met tower low	39	769	19.72
	Non-met 1	11	320	29.09
	Non-met 2	24	782	32.58
Summer	Met tower low	9	198	22.0
	Non-met 2	9	500	55.56
Fall	Met tower low	50	463	9.26
	Radar	50	1629	32.58

Species Identification

Using qualitative analysis of search calls, 5 species groups of bats were positively identified at the met tower location (Table 5). As is typical with AnaBat sampling, the majority of vocalizations were unable to be identified due to the few number of pulses per call (<5 pulses/call sequence). Relative call frequency was calculated by dividing the number of calls recorded for each species by the total number of calls recorded at the met tower for each season. Of those calls that were able to be identified to species, *Lasiurus borealis* calls accounted for the majority of the vocalizations during all seasons at the met tower.

Summer sampling with the mobile AnaBat unit occurred on nine nights and recorded 464 bat calls (Table 6). The objective of the mobile sampling was to identify to the extent possible the species of bats using the St. Lawrence Windpower project area during the summer breeding season. As with the fixed station sampling, many calls could not be identified to species. One individual of an additional species, eastern pipistrelle (*Pipistrellus subflavus*), was recorded during the roaming surveys and not recorded during sampling at the passive monitoring stations. The highest number of recorded calls was of hoary bat (Table 6); however, 95% of those calls occurred on one night at one location and may have been from only one or a few individuals echolocating repeatedly near the AnaBat microphone.

Following the qualitative screening, 208 call files with characteristics resembling *Myotis* species were submitted to Eric Britzke for further analysis. Of those files, 76 calls (36.5%) did not contain sufficient enough information to be processed quantitatively. The remaining calls were analyzed quantitatively on a nightly basis by site (Britzke 2003). Calls meeting the quantitative criteria for the following species were identified: eastern red bat (22 calls), little brown bat (50 calls), northern myotis (44 calls), and Indiana bat (16 calls).

Overview

Anabat is a system designed to help users identify and survey bats by detecting and analysing their echolocation calls. It carries a strong emphasis on passive detection, in which the detector is used as a logging device to monitor bat activity in the absence of human intervention. But it is also very well suited to active monitoring, where the user watches bats in much the same ways as a birder watches birds. In that case, a bat detector is substituted for binoculars as the main enabling technology.

For passive monitoring, there are three main components to the system, a Bat Detector, a ZCAIM and software. In the newer SD1 model, the detector and ZCAIM are combined into one housing. The detector and ZCAIM can be placed in the field and protected from the weather, so they can monitor bats all night long, every night for months or even years at a time, while saving their data to a Compact Flash memory card (like those used in cameras). The card is typically swapped out in the field with an empty card, and then downloaded to extract the stored data, which can be viewed and managed in the AnalookW software.

For active monitoring, the ideal setup is an SD1 with an attached PDA, which allows in-the-hand monitoring of bat calls in real time. This arrangement gives the user maximum freedom of movement to follow bats on foot. Surveys can easily be conducted on foot or from a moving vehicle. The ability to see bat calls in real time has many benefits, making it much easier to associate different bat call types with the bats and their behaviour. See [here](#) for more details.

The Bat Detector is used to produce audible output from the ultrasonic (and therefore generally inaudible) sounds which bats generate in order to echolocate. While there are many types of bat detectors available commercially, those used in the Anabat system are the ANABAT II and SD1 detectors. The SD1 is a more recent model which combines a detector and ZCAIM (see below). These are frequency dividing (FD) detectors which provide a broadband frequency down-conversion, which generates audio signals with frequencies directly related to those the bat is producing. Many authors have treated Frequency Division detectors as poor cousins of the more complex detector types, because they provide less complete detail of the recorded bat calls. However, there are many tradeoffs in bat detector design, and the Anabat detectors provide a number of very important facilities which are not possible with other detectors. Anabat detectors make it very fast and easy to see the output which is of most value for species identification (the frequency-

time characteristics of bat calls), and they provide this in a manner which is extremely efficient in terms of data storage requirements and power consumption. Furthermore, the nature of the data generated by Anabat detectors is ideally suited to analysis using Zero-Crossings Analysis (ZCA), which provides very clear depictions of the important call details without the blurriness inherent in displays made using FFT (which is necessary for other forms of call analysis, and is also much slower and requires relatively huge amounts of data). FD and ZCA are used in combination to allow Anabat detectors to provide realtime displays of bat calls, and to facilitate long term passive monitoring. Other techniques, such as time-expansion, may give more complete depictions of call detail, but these extra details have little if any value for species identification and they impose other costs (such as not being able to record all the time, not being able to provide realtime displays and demanding vastly greater storage space) which limit their use in other ways.

The ZCAIM (Zero-Crossings Analysis Interface Module) is a piece of hardware which interfaces the audio-frequency signal from the Bat Detector to a computer, such as a PC, laptop or PDA. At this stage, only computers running the Windows operating system are supported. The ZCAIM is necessary to efficiently provide the fine temporal resolution required for ZCA. It is NOT true that normal computer sound cards can be used effectively for this purpose. The ZCAIM is included inside the SD1 detector, which provides the functionality of both the detector and ZCAIM in the one box. The older CF Storage ZCAIM is a separate piece of hardware intended for use with an Anabat II bat detector.

The software consists of two main programs:

[CFCread](#) which allows management of the ZCAIM for passive recording and downloading of data from CF cards.
[AnalookW](#) which allows viewing and manipulation (such as call parameter extraction) from saved Anabat data and has many facilities for data management.

two utility programs:

[PicLoad](#) which allows upgrading of the firmware in CF Storage ZCAIMs and SD1 detectors
[AnaSun](#) which provides computations of sun and moon rises and sets and twilight times.

and PIC [firmware](#) for the SD1 and CF Storage ZCAIM.

Latest AnaPocket software

AnaPocket version 2.5b dated 24 July 2007

Download [ANAPOCKET.ZIP](#) (163k)

Latest Storage ZCAIM and SD1 Software / Firmware

CFCread

Software required to read a CF card used in a storage ZCAIM, and also to set the time in the ZCAIM.

The version of CFCread which you use must be appropriate to the version of PIC firmware in use. The current version is Version 4.2a dated 31 Oct 2006. It should be paired with the latest PIC firmware for all the functionality to operate correctly. Always update CFCread and the PIC firmware together, if both are new. The most common problem with using incompatible firmware and software is that a new firmware version might store new codes onto the CF card which cannot be read by an earlier version of CFCread.

Version 4.2a, dated 31 Oct 2006

(to check version number, click on system menu at left of CFCread dialog title and open the ABOUT box)

Download [CFCREAD.ZIP](#) (196k)

PIC Loader

Software required to upload storage ZCAIM internal firmware via serial port.

PICLOAD version 3.7b dated 18 July 2007

(to check version number, click on system menu at left of PICload dialog title and open the ABOUT box)

Download [PICLOAD.ZIP](#) (164k)

PIC firmware

Storage ZCAIM and SD1 internal firmware, which can be upgraded via the serial port using PICLOAD. You MUST use the latest version of PICLOAD when updating the firmware.

Always make sure you upgrade to the latest CFCread version when you update the PIC firmware.

(to check version loaded into the storage ZCAIM, connect ZCAIM to laptop via serial cable and run CFCread, open port and read Version.)

Download [SZ2.ZIP](#) (13k - version 237g3) for earlier model Storage ZCAIMs using the PIC16F877 chip and with version numbers V2xxg3

Download [SZ3.ZIP](#) (14k - version 3019g) for later model Storage ZCAIMs using the PIC18F452 chip and with version numbers V3xxxg

Download [SD1.ZIP](#) (14k - version 4019g) for SD1 Storage Detectors with version numbers V4xxxg

Other Utility Software

ANASUN Version 1.0a

A utility which generates tables of Moonrise, Moonset, Sunrise, Sunset and Twilight times for either a whole year or a single month. Enter your position in degrees and decimals for latitude and longitude, and your time zone in hours relative to GMT (west of Greenwich is negative). Output is a text file, tab delimited for easy access by spreadsheet programs. Requires Windows 9x, NT or 2000.

Comment on Whistling Ridge Energy Project

Draft Environmental Impact Statement (DEIS)

Specific and General Comments of Sections 1 thru 3

August 27, 2010

Stephen Posner
Energy Facility Site Manager
Washington EFSEC
905 Plum Street SE, 3rd Floor
PO Box 43712
Olympia, WA 98504-3712

Andrew M. Montaño
Environmental Protection Specialist
Bonneville Power Administration
PO Box 3621 KEC-4
905 NE 11th Avenue
Portland, OR 97208-3621

Dear Messrs. Posner and Montaño:

Save Our Scenic Area (SOSA) is involved with the Whistling Ridge Energy (WRE) project application as an Intervener. SOSA is a non-profit corporation formed by concerned local Gorge citizens. Its primary mission is to help preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. I am writing today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

SOSA is submitting several different comment letters, covering a variety of subject matter within the DEIS. We have also reviewed the comments submitted by the Friends of Columbia Gorge, agree with them and incorporate them by reference. There are multiple environmental issues involved in the consideration of this project and it is important that each be given through consideration in the EIS process. We find that, in many areas, the present DEIS is completely insufficient and we urge that the NEPA/SEPA responsible officials prepare a supplemental DEIS.

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

The following 24 pages of charted comments, plus Exhibits, are intended to address some, but not all, of the deficiencies noted in the WRE DEIS. In all cases, the deficiencies are explained. In most cases, particular remedies are suggested. Because no remedy is proposed by SOSA does not mean there should not be one implemented by the NEPA/SEPA responsible officials. Two of the larger sized Exhibits will be included as separate PDF files: exhibit 2E and exhibit 2F. All other exhibits appear at the end of this charted comment letter/file.

Thank you for this opportunity to comment on the DEIS. SOSA trusts that the DFEIS and FEIS will provide facts and analysis on the issues raised herein.

Regards,

Thomas Drach, PE
Board Member

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
1	1	1	1.1	1	...and there is a proven wind resource at the site.	The use of the word "proven" should require substantiation. A review of government websites, like the National Renewable Energy Labs (NREL), found at windpowermaps.org, shows a wind rating for the WRE site as Marginal to Fair. They should provide met tower data, and the location of such. The only currently observed tower, from a public vantage point, is located on the highest predicted wind power location within the site, so additional met tower data should be provided at the lowest predicted locations as well. Given the Federal Investment Tax Credit, it is imperative that the public grants are used up on the best potential wind resources first, which this site is NOT. (according to government predicted models) The Applicant should justify with supportably detail data to demonstrate otherwise. see also comment at 1-9 (1.4.1)	Exhibit 2B Exhibit 2C	Wind Resource must be quantified by met tower data in multiple locations, and with wind direction in all THREE axes. Then these data must be compared to the alternative of wind resources in the Eastern portion of WA State. Wind power versus wind speeds must be discussed and compared.
2	1	7	1.3.1	2	BPA must consider the environmental consequences of its proposed actions—in this case, the proposed interconnection of the project to the FCRTS—under NEPA...	BPA must consider under NEPA, not only the environmental impacts of the substation, but also the environment impacts of the WRE project as a whole, when issuing it's Record of Decision		BPA must consider under NEPA, not only the environmental impacts of the substation, but also the environment impacts of the WRE project as a whole, when issuing it's Record of Decision
3	1	8	1.3.2	4	Those agencies may use this EIS in order to fulfill their NEPA or SEPA responsibilities.	Providing that the final EIS is a fair, accurate, clear, and truthful document of the issues.		Issue a complete and accurate final EIS as the document used by Decision-makers in the Adjudicative process.
4	1	9	1.4	1	Two alternatives are evaluated in this EIS: the Proposed Action (authorizing construction and operation of the proposed Whistling Ridge Energy Project and associated components) and the No Action alternative ...	Proposed Action and No Action alone does not satisfy SEPA or NEPA requirements. The extent of available lands in the analysis should be determined by partnerships or contracts between Applicant and other parties/investors.		Reference SOSA comment letter addressing the topic specifically, in detail
5	1	9	1.4.1	2	<ul style="list-style-type: none"> The site has a proven, robust wind resource 	<ul style="list-style-type: none"> - No legal data exists for A1-7, South of South BPA line, due to no conditional use permits issued by Skamania County, confirmed by Public Information Request, Drach to Skamania County Planning Dept. July 2010 - Any Met tower Data in the Appendicies? - NREL wind power maps show the WRE site ranging from Marginal to Fair, as compared to typical Eastern WA projects listed as Fair to Good (www.windpowermaps.org) see also comment at 1-7 (1.3.1) 	Exhibit 2G	Wind Resource must be quantified by met tower data in multiple locations, and with wind direction in all THREE axes. Then these data must be compared to the alternative of wind resources in the Eastern portion of WA State. Wind power versus wind speeds must be discussed and compared.
6	1	11	1.4.1.3	3	. The Underwood Tap to Bonneville Powerhouse 1-North Camas 115-kV line adjacent to North Bonneville-Midway 230-kV transmission line would require a new steel lattice structure to raise the conductors such that the 230-kV line can cross underneath for this interconnection.	The explanation of this requirement is unclear.		Provide a graphic of the substation site and locations of extra towers required. Identify if this is related to both potential substation locations.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
7	1	12	1.4.1.5	4	Less than 5,000 gallons per day is anticipated for kitchen and bathroom use.	No mention of quantity of water used to wash/clean Wind Turbine Blades and Towers. No mention of detergents involved in cleaning operation, nor potential release of chemicals into ground water from Turbine cleaning operations.		All uses of water at the site must be discussed, and the impacts of ALL water releases into the environment must be identified and addressed. i.e. washing the exterior of the Industrial Equipment.
8	1	12	1.4.2	1	This [No Action]alternative would not help the state of Washington in achieving the renewable energy goals mandated by the state's RPS.	This is true for the ALL ALternatives, Action or No Action. There is no control over which state gets credit for the Renewable Energy from WRE, the power is sold to the highest bidder. EFSEC would need to condition WRE's permit to sell its power only to Washington State entities, resulting in possible legal complications.		The EIS can not claim that WA RPS are benefitted as a result of this Project as proposed. This must be removed as a discussed Benefit of the Project, unless an approved permit conditions the sale of WRE power ONLY to Washington State CONSUMERS, via utility contracts.
9	1	13	1.4.3.1	2	<ul style="list-style-type: none"> Applicant-owned land that contained high ridges on which to place wind turbines with little impact to the continued underlying use of the land for commercial forestry 	<p>Applicant states in DEIS that commercial forestry would cease for the life of the Project. Plus, why are high ridges mutually exclusive for wind, this is not true for most all Projects in Eastern WA and OR.</p> <p>Note: this citation is one of 3 KEY criteria for establishing a site. It is flawed in logic, and will bias the conclusion that only the proposed site is feasible.</p>		The Alternatives analysis must be redone with the criteria removing the requirement of placement on a high ridge, as this artificially excludes viable lands. Remove the limitation of placement only in areas used for commercial forestry.
10	1	13	1.4.3.1	2	<ul style="list-style-type: none"> Land in proximity to existing high voltage transmission lines 	Proximity simply translates to a financial impact, which would be covered as a potential negative in a proposed alternative. Simply not including an alternative due to cost is not complying with SEPA and NEPA. It is up to the decision-makers to determine if those potential extra costs outweigh any potential benefits of the alternate location.		The DEIS should identify viable Alternatives by including projects in lower impact areas. In the case of a location distant from the GRID, presumably a larger MW capacity would be contemplated to justify the extra cost, and these analyses should be made available to all to understand.
11	1	14	1.4.3.2	3	These objectives include providing a minimum level of generation to be attractive to utilities seeking to fulfill their RPS requirements, ...	Documentation should support these claims as to the minimum level power generation, as well as the Entities (presumed Buyers) which have conditioned future potential agreements upon said minimum level of power generation, and the service area of said Entities. (ie. WA, CA, AZ, etc.)		The EIS should include written statements from prospective Utilities which might purchase power from WRE, stating whatever conditions should exist for a Purchase Agreement to be negotiated at some future date.
12	1	14	1.4.3.2	3	In order to provide this return, the Applicant has determined that the project must be capable of producing a minimum of 70 MW.	Unsubstantiated claim, this is a private project operated for the public good, therefore financial analysis and justification is NOT exempt from review. (ie for WA RPS mandates)		The EIS should include written statements from prospective Utilities which might purchase power from WRE, stating whatever conditions should exist for a Purchase Agreement to be negotiated at some future date.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
13	1	15	1.4.3.5	1	Alternative Project Configurations As discussed above, the proposed project site contains a series of ridge lines that are conducive to locating wind turbines but at the same time are limiting as to where those turbines can be placed. This means that there are limited options for locating wind turbines within the site.	With the restricted area cited in the DEIS for Turbine micro-siting, the minimum 70MW economic viability number, and the marginal wind conditions cited by NREL, any ersatz assumptions about Project performance could lead to economic failure. With such a tight margin for error, as claimed by the Applicant, the overall Project risks appear to surpass the proposed benefits. This must be considered by the Council in contrast to the same circumstances of Kittitas, Big Horse, etc. Economic viability, with the Federal PTC, and without the Federal ITC of 30%, should be validated by the SEPA Responsible Official.		WRE, touted as a project to help WA society to meet its RPS goals, is a project for the Public welfare, and must include financial viability. The project's decision-makers must have the financial date, so potential Environmental COSTS to the public can be weighed relative to potential private PROFITS.
14	1	16	1.4.3.6	2	<p style="text-align: center;">Alternative Access Roads</p> <ul style="list-style-type: none"> Route 1: Ausplund Road to a private logging road vacated by Skamania County in 1987, which crosses private property (not owned by the Applicant) that is currently used for residential, agricultural orchards, and commercial timber production and harvest 	There is at least a 500' portion of the old Ausplund Road that does not exist, it is overgrown with trees. (Picture attached) The portions of Ausplund Road Private are not available to the Applicant. Road building and improvements within the CRGNSA have been acknowledged by the Applicant as not allowed. This is simply NOT a viable Alternative, and therefore does not satisfy the SEPA requirements. Applicant failed to include viable alternatives, like Little Buck Creek Road , which publicly connects with their land, and would reduce traffic congestion on Cook-Underwood Road, since it turns off early in the proposed route.	Exhibit 2A	The EIS must remove Ausplund Road from consideration, and replace it with a known viable alternative - namely Little Buck Creek Road, or other real, existing route.
15	2	22	2.3.6	2				
16								
17	1	16	1.4.3.6	2	<p style="text-align: center;">Alternative Access Roads</p> <ul style="list-style-type: none"> Route 2: Kollack-Knapp Road to Scoggins Road to a private logging road called the CG2930 road on County Assessor's maps, which crosses property owned by the Applicant that is currently used for commercial timber production and harvest 	Kollack-Knapp Road was officially retracted by the Applicant in its Amended Application submitted around October 2009. By the Applicants own statements, it is NOT a viable Alternative, and therefore does not satisfy the SEPA requirements. Applicant failed to include viable alternatives, like Lacock-Kelchner Road , via Little Buck Creek Road, which publicly connects with their land, and would also reduce traffic congestion on Cook-Underwood Road, since it turns off early in the proposed route.	Exhibit 2A	The EIS must remove Kollack-Knapp Road from consideration, and replace it with a known viable alternative - namely Lacock-Kelchner Road, or other real, existing route.
18	2	22	2.3.6	2				
19								
20	1	22	1.6	Table 1-1	Table 1.1 Row 1: Earth - Construction: A detailed geotechnical invesetigation would be performed to identify any sub-surface conditions	This is yet another example of a deficiency in the DEIS - no-one can assess the environmental impact of massive recontouring, excavating and roadbuilding on steep slopes, until the geotechnical assessment is completed and included in the DEIS. This Study must be done, and included in the FEIS. Moderate to Severe changes to topography are likely, given the steep terrain and soil types. Prevailing winds would place the Turbines on the steepest Western slopes of the Ridge, and/or risk loss of critical performance if set too far to the leeward side of the Ridge. Economic viability could be at risk if geotechnical report finds problems. Please note that the economics appear marginal, so the risk level could be high.	Exhibit 2D	The steep ridges of the proposed WRE project present significant geotechnical challenges that do not exist for projects placed in farming area. The EIS must include real and likely ground-displacing activities, the volumes of material to be moved, the locations of displaced material, the depths needed to secure foundations, etc. if for no other reason than to ensure the Applicant that realistic construction costs do not render the project economically unviable.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
21	1	23	1.6	Table 1-1	Table 1.1 Row 2: Biological Resources, Column 4: Impact of No Action Alternative: Potential Impacts from construction of fossil fuel power plants.	Please clarify the language, as SOSA's interpretation is that the Applicant would thus potentially pursue a fossil fuel (natural gas) plant at this site, if No Action on the Wind Plant was followed. One may already be being planned even if the Wind plant is permitted.		Clarify the statement by indicating if this is a general statement, or specific to the vicinity of the proposed WRE project. (i.e. within 10 mile radius)
22	1	23	1.6	Table 1-1	Table 1.1 Row 2: Construction, Column 5: Micrositing of turbines and associated facilities would allow sensitive resources discovered during construction to be avoided.	Applicant states in DEIS that the micrositing corridor is very narrow along the ridge line due to steep slopes on both sides. Any discovery of sensitive resources, or even geologic hazards, could disrupt or preclude a major portion of the entire Project, thus placing it in financial jeopardy. Compared to Facilities cited in farm lands and grass/shrub/steppe topography, this site has almost no flexibility to adjust to problems discovered during construction.		No concrete remedy to suggest, and no pun intended.
23	1	24	1.6	Table 1-1	Table 1.1 Row 1: Operation, Column 2: There would likely be some mortality to birds and bats....., though not in sufficient quantities to affect population viability.	This is a sweeping and dangerous generalization. PLUS, what constitutes a given species' viability has NOT been defined anywhere in this DEIS. Such a subjective assertion does injustice to the scientific principles and integrity required in any EIS. The data is sufficient to clearly show greatly elevated bird and bat numbers compared to recent wind projects in Klickitat County, WA. And the actual mortalities far exceeded predicted mortalities at those sites. One should assume a similar trend for these Projects in close proximity. It is a great leap to go from predicting mortality to predicting a species viability. In this Project site, how many Goshawks can society loose? How many Townsend Big Eared Bats can society loose before they are non-viable? It really depends on who you ask. Rather than forcing the issue, society should first choose and deplete the sites for Wind Turbines where man has already developed - meaning - use up the nation's farmland for wind energy before clear cutting the forest to do so.		The EIS should remand the Bat studies for completion again, using the mature technology of the Anabat 2 hardware, and Analook software, which is capable of identifying species of Bats, not just a threshold 35KHz between big and small bats. A significant discrepancy between the WEST 2008 and 2009 studies is the duplicative sensors and the filtered noise percentages, confirming the underlying assumptions between the two studies changed dramatically, but were not discussed.
24	1	24	1.6	Table 1-1	Table 1.1 Column 5: Convene a Technical Advisory Committee to evaluate the mitigation and monitoring program....	If created, this Committee should be much more than just Advisory. If just advisory, then it must answer to some entity other than the Applicant, that can rule and enforce mitigation actions. The composition of such a Committee and Authority should be composed of the Applicant, government agencies, and identified stake-holders in the interest of the environment. As such, organizations like the state and regional Audobon societies, The Friends of the Columbia Gorge, and others should be ongoing participants in the review and development of appropriate mitigation measures. Furthermore, a Committee or Authority without jurisdictional authority to limit operating hours is useless, and does not further the dynamic balance between human and environmental needs which will occur over the life of this Project (and beyond..).		The EIS should include fine details, outlining the structure and authority of a Committee that is not just advisory, but one that could implement any level of mitigation and operation restrictions if deemed appropriate. EFSEC Decision-makers should have a clear idea of the likely protections which could be applied during Project Operations, in the event actual impacts and deaths exceed estimated impacts and deaths.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
25	1	26	1.6	Table 1-1	Table 1.1 Column 2: Operation: Turbine fires are possible, howeverare extremely rare.	This issue is serious , because even if the potential occurrence is low, the risk to ALL residents of Underwood's lives and properties is extremely high. Any standardized risk assessment model uses the product of "occurrence" and "severity of occurrence" to assess risk. (for example - FMEA -Failure Modes Effects Analysis) It appears the Applicant wants to oversimplify this issue by not considering the issue in a proper manner. This Project is proposed in a Forest environment: an ignitable fuel source in close proximity to the Turbines. There are areas in the Project site that cannot be clearcut to reduce the fire risk - namely the western slopes where identified slide hazards exist, and there are unlogged lands on the western slopes owned by Washington state DNR. (between North BPA line and South BPA line ~1 mile?) The statement about being extremely rare is based upon typical wind farm topography and elevation. The steep terrain, and unconfirmed meteorological data, combined with elevated fuel loads compared to the norm, may likely result in a catastrophic wildfire event. Without comparable scenarios, existing data should not be relied on. In the alternative, the Applicant could continue its current site condition by maintaining the massive clearcutting already undertaken throughout most of the Project area. This, however, would result in the effective "permanent" removal of the "forest" ecosystem, and those environmental impacts would then need to be addressed, and presumably mitigated. Again, cost is a major part of the equation, and this Applicant has already said they are on the edge of viability. One can insure property, but not lives.		The DEIS should consider the Environmental Impacts of the project, as if the entire site were removed from Forestry altogether, and the ground maintained with minimal fuel loads.
26	1	26	1.6	Table 1-1	Table 1.1 Column 2: Operation: At a distance beyond 2500 feet, shadow flicker is considered..... Even if shadow flicker were a proven impact, none of the planned turbines are within 2500 feet of existing residences.	The statement fails to identify a permitted residential structure, applied well prior to WRE's Application, that is within 2000 feet of the proposed Facility.		Consider adding the following language to the end of the existing sentence: ", and the permitted residence at 2000 feet could be mitigated by appropriate vegetative screening placed by the Applicant on its land, adjacent to the affected residence." Since this 80 acres of land, in the Project Site, was just logged in June/July 2010, new vegetation will need to be planted if this measure is deemed appropriate.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
27	1	26	1.6	Table 1-1	Table 1.1 Column 2: Operation: EMF from the project will be lower than those of many common household appliances and would have no health or safety impacts.	Please provide/include data to support this assertion. Not only Electromagnetic Fields (EMF) should be included, but also stray electrical voltage produced during normal operations, during lightning storms, and especially power must be dumped into the ground during temporary grid overload conditions. One of SOSA's members, Tom Drach, and his family live at a residence roughly 2500 feet from proposed Turbines. There is strong evidence to suggest such stray electricity would pose a safety impact, due to potential failure of Electrical services and systems dependent upon such. For example, Ground-Fault Electrical Devices required by WA Code. The geology of this area is known to contain faults and fractures, which would tend to carry electrical energy much, much further than in an homogenous isotropic type soils, which is likely assumed in the Applicant's analysis.		Any proposed permit should include provisions for nearby residents to fully remedy issues related to stray voltage and stray electro-magnetic energy, with the entire cost burden placed on the Applicant.
28	1	28	1.6	Table 1-1	Table 1.1 Visual Resources, Column 2: Operation: The turbines would be visible from some viewpoints, including some within the CRGNSA. This project has the potential to create low to moderate levels of visual impact at key viewpoints.	The statements made here should be quantified, or terminology defined more precisely. The wording tends to minimize the issue, and "low to moderate" should have some reference scale for decision-makers to know how to gage severity on a commonly understood basis. Such subjectivity, especially in a summary, can lead to erroneous interpretations. (decision-makers with limited time to review may rely on the Summary to inform them as to the critical issues involved)		Quantify the visual impacts in table format for each Key Viewing Area within the CRGNSA, as well as other noteworthy points in view of the proposed project. Remove subjectivity by implementing an intuitive, commonly understood reference scheme.
29	1	31 AND 33	1.6	Table 1-1 AND Table 1-1	Table 1.1 Public Services and Utilities, Column 2: Operation: The project's assessed value could be as much as \$87.5 million, and this would generate approximately \$800,000 per year in tax distributions..... AND Table 1.1 Socioeconomics, Column 2: Operation: The proposed project would have an estimated value of \$87.5 million, which would represent an increase of 6.5% in assessed value in the County. At current tax rates, the increase in property tax revenue to the County would be \$731,500 annually.	The statement in Table 1.1 must accurately reflect the likely financial benefit, rather than the theoretical maximum, so the decision makers can weigh the true benefit appropriately. WRE's number grossly exaggerates the tax benefit to municipal, County, and local jurisdictions. The SEPA responsible official should contact Mr. Gabe Spencer, Skamania County Assessor, to confirm these numbers are not accurate. A member of SOSA had a conversation with Mr. Spencer on June 24, 2010, and left with the following understanding: Scenario 1 - Project remains privately owned during operation - then Assessed Value will be a negotiated 10 year average value which will remain constant for the first 10 years - to offer more uniform cash flow for the County Budget versus Straight Line or MACRS depreciation methods. (ref Klickitat County model) Furthermore, by complex Budget laws, residents in the Underwood District would otherwise be potentially subject to the shortfall in revenue as depreciation mounted from the Project. (Surely this would be a strong negative for Underwood Community) So- under the 10 year average scenario - WRE's tax payments would be closer to \$350,000 per year, NOT \$800,000. Scenario 2 - The Project is acquired by a WA state recognized public utility, like PSE. The tax for this is not determined by local real tax law, but by a complex formula within the State Dept. of Revenue (WDOR). According to Ms. Chris Miller, Columbia County, WA Assessor, their Projects which have fallen under WDOR jurisdiction have only provided thier County with approximately one-third (33%) of the revenue claimed by the Applicant using the same assumptions as WRE has here. So this value would be ~\$266,000, NOT \$800,000 per year.	Mr. Gabe Spencer Skamania County, WA Assessor 509-427-3720 Ms. Chris Miller Columbia County, WA Assessor 509-382-2131 Mr. Van Vandenberg Klickitat County, WA Assessor 509-773-3715	The SEPA Responsible Official should consult with the Skamania County Assessor to determine the potential financial outcomes, and report as such in the EIS. The only data provided in the EIS is clearly based on the Applicants information to the SEPA responsible official, and does not reflect the two MOST likely scenarios. If the present DEIS scenario is maintained, it should reflect a declining tax payment based on equipment depreciation, and the real, long-term burden on the Underwood residents thru increased levy rates.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
30	1	31	1.6	Table 1-1	Table 1.1 Public Services and Utilities, Column 5: Operation: Fire Protection: [list of 9 bulleted items]	For the Operation phase of the project, nowhere is there listed an intent to construct and maintain a water reservoir or storage capacity for on-site fire suppression of the Project site if a Turbine fire failed to be contained. Given the fuel loads present, and lack of water, any Fire Protection and Prevention Plan should be required to include a storage reservoir suitable for use by both land-based equipment and fire-suppression helicopters. Due to steep terrain, the turbulent updrafts present along the ridgeline would limit the ability of fixed-wing aircraft to assist in fire suppression at key areas of the Project site. Simply complying with existing DNR regulations, as the Applicant suggests, does not suffice, for the DNR statues could not have contemplated the operation of Industrial-grade mechanical and electrical equipment of this magnitude operating in a forested environment, and 24 hours a day, a good portion of which without human observation.		Include the requirement for, and analyze the impacts of, establishing a fire suppression reservoir, or holding tanks to combat runaway fires.
31	1	33	1.6	Table 1-1	Table 1.1 Socioeconomics, Column 2: Operation: The project would employ eight to nine employees; most would be hired from the local area.	Please also include the number of Full-Time Equivalences (FTE's) that these eight to nine employees would provide. This is the best way to clarify for the decision-makers how much benefit is realized thru Project operation.		Include Full-Time Equivalents (FTE's) as part of the description of Operations Personnel.
32	1	33	1.6	Table 1-1	Table 1.1 Socioeconomics, Column 2: Operation: Based on a review of available studies, operation of the project is not expected to create adverse impact to property values.	Data on this subject is limited for a number of reasons. Significant differences in underlying assumptions hold for the WRE project. As such, "... a Property Value Guarantee (PVG) should be required of the developer. A State-controlled fund or developer bond should be required to guarantee no undue delay in PVG payment(s) to legitimately affected homeowners, and/or to buy out homeowners located within 2-miles of any turbines if they elect to relocate away from the turbine project(s) and cannot sell for the pre-project market value of their properties. Such a guarantee is nominal in cost, relative to total project costs, and are used to condition high impact land use approvals such as landfills and even limestone quarries, as well as other wind energy developments." *	Exhibit 2F, attached as separate PDF file due to size. * - Citation from McCann Appraisal LLC Property Value Report to Adams County Board, IL, June 8, 2010, copy included in Appedix This report includes several other recommendations, appropriate for conditioning the WRE Application, to protect residents if Developer claims are later determined to be incorrect.	The EIS should include, in the Appendix, a reference Template on a Property Value Guarantee, which generally outlines the structure and authority of such a Guaranteed by the Applicant. Decision-makers should have a clear idea of the likely protections which would be result, in the event they choose to implement such, as part of any conditioning of a project permit.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
33	1	34	1.7	Table 1-2	Table 1-2 Row 4: Biological Resources, Column 2: This level is not expected to be high enough to impact species viability.	See our response for text on page 1-24, Table 1-1, Row 1, Column 2		The EIS should remand the Bat studies for completion again, using the mature technology of the Anabat 2 hardware, and Analook software, which is capable of identifying species of Bats, not just a threshold 35KHz between big and small bats. A significant discrepancy between the WEST 2008 and 2009 studies is the duplicative sensors and the filtered noise percentages, confirming the underlying assumptions between the two studies changed dramatically, but were not disclosed or discussed.
34	1	34	1.7	Table 1-2	Table 1-2 Row 6: Public Health and Safety , Column 2: Unavoidable adverse impacts to environmental health are anticipated to be minimal.	Please amend or clarify this statement, as it OMITS any reference to Public Safety . (The Element of the Environment heading is: Public Health and Safety) Plus, should one assume that the word "environmental" used in the DEIS is synonymous with "Public"? Also, please refer to our comments above about the serious issue of Fire Safety, Public life, and public property damage resulting from a failed Fire Management scenario. (Ref comment at Page 1-26: Table 1.1 Column 2: Operation: Turbine fires are possible, howeverare extremely rare.)		Please correct the wording to address Public Health and Safety, rather than environmental health.
35	1	35	1.7	Table 1-2	Table 1-2 Row 1 (on page 1-35) column 2: Noise : ...and operation noise is predicted to be less than the nighttime threshold of 50 dbA Leq, per Washington State and Skamania County regulations.	Even though Oregon has much more progressive laws on noise and setbacks, the minimum legal standard in WA is the (woefully inadequate) Washington Administrative Code (WAC 173-60).WA noise standards. The public welfare is better served by, and EFSEC is encouraged to so condition, the Environmental Protection Agency Guidelines: In April 1973, the local EPA Region X office published a document titled, "Environmental Impact Statement Guidelines." This document discusses potential impacts from noise increases in terms of expected community response to the introduced noise source. This regional EPA guideline document suggests the following potential community responses to ranges of noise increases:	Kittitas Desert Claim 2004 FEIS at 3-192 : Environmental Protection Agency Guidelines	Consider requiring the Applicant to follow the document titled, "Environmental Impact Statement Guidelines," which would limit noise to 10 dBA over typical background levels (25 dBA nighttime, 35 dBA daytime, typ. for rural areas) Thus making the condition for noise not to exceed 35 dBA at night, and 45 dBA during the day.
36	3	289	3.18	-	<ul style="list-style-type: none"> Short-term noise impacts during construction is exempt so long as it occurs during daytime hours, and operation noise is predicted to be less than the nighttime threshold of 50 dbA Leq per Washington State and Skamania County regulations. 	<ul style="list-style-type: none"> Up to 5 dBA increase – few complaints if gradual increase 5 to 10 dBA increase – more complaints, especially if conflict with sleeping hours Over 10-dBA increase – substantial number of complaints According to the EPA Region X document, generally no mitigation is required if the increase is less than 5 dBA. Some mitigation should be considered for increases of 5 to 10 dBA. Increases greater than 10 dBA would be considered serious and would warrant close attention.	All Verbal and Written comments submitted by Keith Brown and/or Teresa Robbins for the WRE DEIS, are incorporated by reference here by SOSA.	The WAC code did not contemplate noise sources from Wind Turbines, and their proximity to residential use. Furthermore, SOSA incorporates the recommendations of Keith Brown and Teresa Robbins by reference, regarding all the aspects of the noise subject.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
37	2	14	2.1.5	Table 2-4	Operations and Maintenance Staff: Table describing number of personnel.	This table should include the number of Full-Time Equivalences (FTE's) that these eight to nine employees would provide. This is the best way to clarify for the decision-makers the extent of "jobs" created by this Project. Median salary ranges for each type of position would also be informative.		Include Full-Time Equivalents (FTE's) as part of the description of Operations Personnel.
38	2	19	2.3	-	<ul style="list-style-type: none"> The project must be located in an area with a steady supply of robust wind power, and on a site on which construction can reasonably occur (no significant geotechnical constraints) 	Both terms "steady" and "robust" have not been substantiated with independent data, or data from the Applicant. (i.e. met tower data in velocity, durations, 3-Dimensional directions) The DEIS does not even demonstrate that the "preferred" alternative meets these criteria.		<ol style="list-style-type: none"> 1) Quantify the terms "steady" and "robust." 2) Support the "preferred" alternative with data compared to item 1 above. 3) Evaluate other alternatives against the standards established in item 1 above.
39	2	19	2.3	-	<ul style="list-style-type: none"> The project must be located in an area with a steady supply of robust wind power, and on a site on which construction can reasonably occur (no significant geotechnical constraints) 	The "preferred" alternative has not had a final Geotechnical Assessment done. DEIS at Appendix B. This preliminary assessment does not include subsurface core sampling below ~10 feet. Foundation concrete depth expected to be 30 feet. In this report, URS already anticipates using rock anchors to resist the overturning moment of the Turbine, since soil conditions are not suitable for traditional mat-slab gravity-held foundations.		
40	2	19	2.3	-	<ul style="list-style-type: none"> The project must be located in an area with a steady supply of robust wind power, and on a site on which construction can reasonably occur (no significant geotechnical constraints) 	The micro-siting corridor for proposed Turbines A1-7 averages ONLY 170 feet wide, before entering into Landslide Hazard Area (LHA) Class II. The URS report (DEIS at Appendix B) states no Turbines will be sited on LHA Class II (or I, implied) soils. With a Foundation diameter of 60 feet (typ.) there is very limited ability to site these machines. The Applicant's "preferred" alternative does not even qualify for consideration, according to their own standards.		Since no other alternatives have been offered, other than the No Action alternative, one or two other Alternatives must be added to compare the reasonableness of construction from a geotechnical perspective.
41	2	19	2.3	-	<ul style="list-style-type: none"> To reduce startup costs, the project must be located on land the Applicant owns and controls, and land that can serve a dual purpose of commercial forestry and power production 	Generally speaking, most Land Lease agreements are based more on output, than on fixed rates, and they may or may not include up front costs. These are an insignificantly low percentage of the construction costs (read "startup costs") that this argument can only speak to the marginal economic viability of this project. As for land that can serve a dual purpose of revenue generation over the life of the project, similar to wheat farming, this has NOTHING to do with STARTUP COSTS. These are self serving, self-imposed constraints, designed to artificially restrict consideration of any other alternative.		Disclose financial justification of how these particular startup costs materially effects project viability, or remove that as a "constraint" in evaluating Alternatives.
42	2	19	2.3	-	<ul style="list-style-type: none"> To enable the power to reach urban markets and eliminate the cost and time required to construct new transmission lines, the project must be located in proximity to existing high-voltage transmission lines 	Proximity to existing high-voltage transmission lines is PURELY a matter of economics, and has nothing to do with power reaching urban markets.		Restate the "constraint" to incorporate the additional costs, due to this factor, into the potential viability of other alternatives. Such that the economic viability of WRE has a certain savings over Alternative B, C, and D, for example.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
43	3	130	3.7.2.2	2	Low Frequency Sound	This is an phenomenon that is still being studied, and as such needs to be treated with caution and concern, relating to the impacts to nearby residents. There is ample material to garner sufficient doubt to the claims made in the DEIS. Time to comment is not sufficient, so SOSA must incorporate by reference the comments by Keith Brown and Teresa Robbins.	Exhibit 2E - Tuning and Sensitivity of the human vestibular system to low-frequency vibration," Todd, Rosengren, Colebatch: Nueroscience Letters 444 (2008) pgs 36-41	Impose a C-Scale (dBC) requirement for noise emmissions from EFSEC permitted projects, in addition to the proposed 35 max total dBA nighttime, and 45 max. total dBA daytime levels mentioned above.
44	3	160	3.9.1.3	3	Simulations were prepared assuming a conservative scenario of 50 turbines. This approach to creating simulations most likely overstates the visual impacts. This is because the Applicant has applied for EFSEC certification for a maximum of 75 MW. If 2.5 MW turbines were to be used, only 30 turbines could be built, and overall visual impact would be less. ...	Because the DEIS contemplates the use of 2.5MW turbines to reduce the visual impact of the proposed project, this needs to be one of the Alternatives to consider under Section 1.4 of this EIS.		Add to the Alternatives in Section 1.4, a proposed project configuration of 30 Turbines of 2.5MW capacity.
45	3	164 to 172	3.9.2.3	All	3.9.2.3 Viewpoints (entire section)	The assignment of Scenic Quality and Viewer Sensitivity to the Viewpoints are fundamentally bias towards the Applicant's interests. Even if the author wrote this from a desk in the middle of Yosemite or any world class visual destination, one would be challenged to rate most locations in and around the CRGNSA anything but a 5 or 6, based on Table 3.9-1 DEIS at 3-158. The assignment of Viewer Sensitivity are based on a focus of facts only to justify the lowest ratings.	Exhibit 2H	As opposed to inserting such important analyses in the body text of the DEIS, a truly quantitative analysis needs to be performed by a qualified independent landscape architect.
46	3	164 to 172	3.9.1	All	3.9.1 METHODOLOGY (basis for whole section)	The Visual Analysis is NOT complete or meaningful. As presented with only "Scenic Quality" and "Viewer Sensitivity" as separate factors, there has been no coupling of factors in a scientific or statistical basis for decision-makers to relate the visual impacts to a defined standard, or to a relative reference frame. No accurate conclusions could reasonably be made about Visual Impact of the project, given the format existing in this DEIS.		Professionals in this field would be able to offer guidance on how to identify and quantify the common variables, and to combine them in such a way as to numerically demonstrate a given Viewpoint's potential degradation relative to some tangible reference point. The work done on this subject must by a credential expert. The Visual resource Management System used by the BLM seems more relevant for this EFSEC Application, due to its visual objectives for lands with multiple managment objectives.
47	3	164 to 172	3.9.2.3	All	3.9.2.3 Viewpoints (entire section)	There are a number of important Viewpoints that were omitted, for example - Panorama Point in Hood River County, Oregon.		The majorly significant viewpoint of Panorama Point, OR must be included in this analysis. It is a KVA within the CRGNSA, one of the most visited.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
48	3	172	3.9.2.3	3	Viewpoint 23: Ausplund Road End Scenic Quality. This viewpoint represents the view from local area roadways at specific intersections where local area travelers might converge. These roads are old logging roads that have been upgraded to meet the local residential use. However, they are still used for logging and would be used in the construction portion of this project. This would include upgrading and in some instances widening the roads, which can affect visual quality. This view is from the end of the Ausplund Road, which would be used to access the area for construction and maintenance. Very few viewers beyond those associated with the project would see this viewshed. Without the vehicles in the foreground, the scenic quality rating assigned to this view is moderate. Viewer Sensitivity. When considering the distance of the project from this viewpoint (less than 1 mile), the portion of the project that is visible from the viewpoint, the viewer types (local area workers and residence), and the scenic quality rating, the level of sensitivity was rated as low to moderate.	1) This Viewpoint (23) is near the end of Ausplund Road, looking to the NNW direction. This intersection represents a viewpoint central to 4 separate legal parcels, 3 of which have homes on them with active residential use. This site is roughly 1/2 mile from the proposed project. Each of these agriculturally-zoned parcels have about one acre each established for residential use. Submitted for your review is a picture taken from the home at the "end" of Ausplund Road, which is a typical view from most all the homes on Ausplund Road, and many, many homes in Underwood as a whole. This is not a Scenic Quality of 3, but rather a very substantial 6. (ref AusRdEndSouthView.pdf)	SOSA Comment letter of Aug. 27, 2010 - titled Visual Analysis Section 3.9	This viewpoint, as with ALL the others in this DEIS, cannot be judged for Scenic Quality SOLELY on its view of the proposed project. The starkly contradictory photo introduced here should establish that most of the Viewpoint analyses are faulty and bias, and must be remanded for reevaluation, or utilize a more appropriate Methodology (3.9.1) and objective consultant.
49	3	10	3.1.2.1		The changes to topography would be minor to moderate depending on location	"Changes in topography" denotes significant earth moving. Need detailed maps and grading/excavating plans to able to assess the extent of the topographical changes.		The extent of topographical changes should be identified in the DEIS test, as well as the photomontages.
50	3	11	3.1.2.1		Landslide evaluation....without danger...to surrounding environment. No obvious recent mass wasting features were observed in the aerial photos or during sight reconnaissance. Class III LHAs were delineated adjacent to proposed wind turbines along the southern Tower Line A and along Tower Line C.	Fails to show detailed topography, detailed topographical changes, and how it affects landslide danger. Attempts to depict turbines outside of slide area, but common knowledge dictates the pad and activities will be in the unstable slopes.		
51	3	17	3.2.1		Like hydropower production of electricity from wind produces no direct emissions of greenhouse gases or other pollutants. The generation of wind also displaces generation from individual fossil fuel fired power plants or units thereby reducing fuel consumption and the resulting air emissions that would have otherwise occurred.	Patently false, and rebutt by adding papers that actually state that greenhouse gas emissions will increase that we are displacing clean hydropower because most dams used water from run-of-the-river and storage as a result is limited, both in capacity and for fish. Include articles that demonstrate as more wind is integrated into the system, the more difficult it is for BPA to balance without harming fish. Include paper that shows that BPA desire that wind energy operators acquire its own balancing reserves and that means NG generation and increasing emissions.		
52	3	20	3.2.2	there would be no emissions from the operation of the turbines	True, but backup would release emissions therefore the operation of the farm would result to increased emissions in the region.		Include impacts due to firm power backup, and idling gas plants during wind power operations.
53					Entire document	This DEIS divides and splits information in a way that makes it difficult for the reviewers to assess any aspect of concern without reading the entire document word for word and placing wording into a spreadsheet for organization as is done here.	Too many to put in here and not time effective	Redo the entire DEIS and organize into a coherent and comprehensible document.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
54	3	3	3.1.1.2		Above the basalts are a variety of younger volcanic rocks and sedimentary materials that range from.....	These are materials that contribute to instability on slopes. Need clear topo maps that show where turbines are to be placed so the interaction between loose layers and steep slope can be identified.		
55	3	11	3.1.2.1		entire section	No information is given as to how cite decommissioning will occur so impacts cannot be assessed.		
56	3	12	3.1.3		entire section	no mitigation measures can be identified because of the above deficiency		
57	3	18	3.2.1		The Skamania Fish Hatchery.....	Average temps taken from fish hatchery that cannot be googled for address? Precipitation is higher and snowfall is significantly lower as elevation decreases and one proceeds west. Underwood receive approx 40 inches of rainfall a year and snowfall is measured in feet. WRE location can expect 4-5 feet of snow on the ground during winter and over 10 feet annual snowfall.		
58	3	34	3.4.1.1		The project site contains a network of roads ranging in width from approximately 8 to 20 feet.	The 20 ft rd was built specifically for hauling WRE equipment. Roads to support logging activities are 8-10 ft.		
59	3	35	3.4.1.1		As a result, the project area includes no native habitat and is permanently committed to use by commercial forestry operations and utility infrastructure.	The area contains "no unaffected habitat" but under a normal logging regime that does not include an expedited process for turbines, habitat that can support many of the native species would exist.		
60	3	35	3.4.1.2		Five vegetation communities.....	Two of the first five vegetation communities do not naturally occur in the area and are only present following logging and only for a few years. This is not an accurate representation.		
61	3	45-46	3.4.1.5		One bald eagle was recorded on the project site in 2009 during surveys for northern goshawk. In addition, three bald eagles were observed during the winter of 2008-2009 during baseline avian surveys. Two were observed flying within the rotor-swept area, and one below.	Bald eagles use the Columbia River, Little White Salmon and White Salmon Rivers as overwintering and nesting habitat. As the bald eagle population recovers further, more eagles will reside in the area. WRE spans a saddle between Underwood Mtn and Nestor Peak between the Little White and the White Salmon River. It is not unexpected that bald eagles would hunt the WRE area and use it as a shortcut between the two river basins. WRE, if permitted, may likely be the first project to kill bald eagles in the Pacific Northwest.		There must be a discussion of the long-term risks and impacts to Bald Eagles. Nesting and over-wintering are not addressed.
62	3	46	3.4.1.5		In Washington State, goshawks occur year-round and in some areas only during the non-breeding seasons. The project site is located in an area where either may occur, and the eastern slope of the Cascades is considered the most common place to find this "uncommon" species (Bird Web 2009).	Should state that "The Northern Goshawk occur year round in breeding areas and in some areas only during the non breeding season." "The project site lies in an area that either may occur."		
63	3	46	3.4.1.5		Northern goshawks were recorded during avian surveys during the fall of 2004 and the summer of 2006. A total of five individuals were sighted; two during the fall and three during the summer. They were observed flying both within and above the rotor-swept height during surveys.	Demonstrates that breeding populations exist and WRE if permitted may be the first project to kill this "uncommon" species and breeding population impacted.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
64	3	47	3.4.1.5	4	Northern goshawk surveys were conducted during the spring and summer seasons in 2004, 2008, and 2009..... (No northern goshawk responses were recorded in 2004, 2008, 2008.)	No northern goshawk responses were recorded, but yet they were noted during avian surveys. A basic rule of all survey work is that presence affirms presence; absence does not affirm the subject not present, just that it was not detected by some established measure. In the case of the northern goshawk survey, none were detected but yet, goshawks were affirmed as being present during the avian survey. The only message to take home is that the goshawk survey was not successful at detecting northern goshawks. The surveyers need to re-evaluate survey methods and determine why they were not successful at stimulating northern goshawks to respond in a manner that could be recorded. This is a serious issue when one considers that the other other bird-of-prey surveys are dependent on a response as well. It throws into doubt all the bird-of-prey response-dependent surveys.		
65	3	46	3.4.1.5		Two golden eagles were recorded during the fall of 2004. One was observed flying at a height within the rotor-swept area, and one was observed flying above the rotor-swept area.	Golden eagles are documented to fly through the WRE project area and are, like the other raptors, at high risk of being killed.		
66	3	49	3.4.1.5		The Applicant conducted surveys and analysis to confirm the absence of northern spotted owls.	This statement demonstrates a bias by looking for a specific outcome. It is extremely difficult to definitively "confirm" absence, but reasonable to provide some probability of use at any given time. Spotted owls historically have, with high probability, been present in the area of the project. Vast clearcutting has reduced the modern small chance to a very small chance that spotted owls would be present in the WRE area at any given point in time for the near future. Surveys were conducted for northern goshawks and none were "detected" in a common place to find an uncommon species either.		
67	3	56	3.4.1.5		Forest practices within a SOSEA are therefore allowed to proceed so long as they do not affect the 40 percent suitable habitat threshold.	Forest practices will not continue in the area as outlined in..... because the forest may never be allowed to grow trees of a marketable size. This represents a forest conversion in a SOSEA. This permanently and effectively reduces the SOSEA size and creates more fringe area relative to the SOSEA area.		Don't allow Turbines anywhere near, established SOSEA's, regardless of whether recent Spotted Owl activity has not been "observed."
68	3	45	3.4.1.5			Fails to state that the Little White Salmon is approximately 1 mile west of the project area. Ignores the potential flight corridor between the Little White Salmon River and the White Salmon rivers over the saddle formed by Nestor Peak and Underwood Mtn where WRE is located.

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
69	3	56	3.4.1.5		There were 21 birds observed during summer 2006 avian surveys, and six recorded during the spring of 2009. All 21 observed in 2006 were within the rotor-swept area; it is not reported in 2009 how many were in the rotor swept area. None were recorded during the fall of 2004 or the winter of 2008-2009.	The WRE area is highly used by this species. Reporting absence in the fall and winter is misleading as this bird leaves begins its migration to S. America in August. Because 100% of the birds recorded in 2006 were in the rotor swept area, it is reasonable to assume that 100% of those recorded in spring 2009 would be in the rotor-swept area. Even though fewer numbers were observed in the spring, this is a particularly bad time to lose any member of the species. For each female lost, future recruitment is reduced. If three of the six are females and each female produces 3-4 offspring, then a lost of three females could represent a recruitment of 9-12 additional birds. The bird counts represent a minimum. There is no extrapolation over area. No method for comparing counts to scientific studies of local population levels. There is no mention of how loss of forest habitat from extensive clearcuts affects reproduction. For a species on the decline, it is important to consider all actions of direct and indirect losses to the population. This has not been done for a migratory species.		
70	3	57	3.4.1.5		In Washington, pileated woodpeckers occur year round but are uncommon in the vicinity of the project site. ... During avian surveys in the project area, six pileated woodpeckers were recorded in the fall, two during the winter, seven during the the spring, and none in the summer.	Doing the math, six plus two, plus seven equals 15 pileated woodpeckers observed. According to the Applicants own study numbers, pileated woodpeckers are anything but uncommon in the vicinity of the project site. Fifteen pileated woodpecker sightings is especially significant. These birds are fiercely territorial and the observation of such high numbers in periods seperated by many years in some instances, is telling of the perserverance and number of territories in the vicinity of the project. Lack of sighting in the summer months, does not indicate absence, only lack of detection. The DEIS must be changed to reflect the significant use of the project vicinity by pileated woodpeckers. It is important to note here that pileated woodpeckers prefer habitats with large trees. Contrary to the Applicants claim, extensive logging in the area has not completely removed use by species that prefer habitats with older tree areas. Pileated woodpeckers demonstrate the resilience of some species to changing habitats. Therefore it should not be assumed that just because extensive logging has occurred in the project are that species will leave and therefore not be at risk. Pileated woodpeckers will fly at height that puts them into the rotor swept		
71	3	57	3.4.1.5		During fall 2004 avian surveys, 15 Vaux's swifts were recorded in three groups, 87 percnt of which occurred within the rotor-swept area. Four were recorded in two groups during the summer of 2006, all of which occurered within the rotor-swept area.	Doing the math, a total of 17 out of 19 Vaux's swifts were observed in the rotor-swept area for a number of almost 90% in the rotor swept area. This percentage applied to the 11 birds observed in the 2009 period would place a total of 10 swifts in the rotor-swept area. In total, 28 of the 31 of the observed swifts (in that short period alone) were at risk of being killed. It is even more reasonable to assume that all the swifts have the potential to use the rotor-swept area and all members of the population are at risk. Again, this is a conservative number due to the very limited nature of the survey. Because original data was not supplied, the temporal seperation in years, and lack of overlap between fixed points it is reasonable to assume that most if not all swifts were not counted more than once.		

Specific DEIS Comments from Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
72	3	59	3.4.1.5		Bat surveys conducted during did not have the ability to detect individual species of bats. Based on the lack of detailed information of this species life history and habitat requirements and nature of the bat surveys conducted it is difficult to conclude with certainty with the likelihood of Keen's bats occurring on the project site. However, Due to the lack of old growth or mature forest types within the project area and the predominant commercial forestry use of the property, the likelihood of occurrence on the site is considered to be low.	Anabat II technology exists to identify, by call, individual bat species. This technology has existed for over 10 years. West has authored a paper where the Anabat technology was used to identify to species the majority of calls. Papers, abstracts, and excerpts are attached. The tapes need to be further analysed by a highly qualified INDEPENDENT expert to identify bat calls with special emphasis to identify rare species. If WEST failed to set up the Anabat II correctly so that calls can be identified, then additional bat data collection needs to occur. Additionally, cumulative impacts should assess the possible future infection of bats by white nose syndrome. Increased mortality of ANY type, may directly affect these species future viability.		
73	3	60	3.4.1.5		There are no known roosting structures or maternity colonies occurring in the vicinity of the project area.	See comments on Keen's Myotis. Townsend's Big Eared Bat, a species of concern and a candidate for listing, is present in the region. One of the largest colonies at 400 bats is located in lava cave nearer to Trout Lake to the north. Colonies are small compared to many other bat species and not many colonies are known to exist. The southern end of the old lava flow (can be seen from Google Earth) that may contain additional colonies is approximately three miles from the project .		
74	3	62	3.4.1.6		Table 3.4-5	One year round bird, the northern pygmy owl was not observed during ANY study, yet is common in the area. This speaks again to the basic rule, absence does not absence does not affirm the subject not present. Northern Pygmy owl and any other species that are likely to exist should be added to the list and represented as is the Northern saw-whet owl.		
75	3	63-64	3.4.1.6		This annual rate is low relative to raptor use at 36 other wind-energy facilities that implemented similar protocols and had three or four season surveys.	It is very important to note that a number of raptor species use the WRE area and rotor-swept area are sensitive, candidates for listing, or formerly listed recovering species. This number needs to be compared relative to other wind energy facilities as well. Appendix C4 page 9 states: American kestrels...,red tailed hawks..., and golden eagles...were killed more often than predicted based on abundance. ... It is likely that many factors, in addition to abundance, are important in predicting raptor mortality.		
76	3	65	3.4.1.6	2	The WDFW Priority Habitats and Species database was searched for known occurrences of raptor nests. The only recorded nest was for an osprey, more than one mile east of the project site.	This database is not complete nor comprehensive and cannot be used as an authority. Just as the goshawk survey was not able to generate a response, any attempts, if one had been attempted, would likely not have found nests. WDFW is not allowed to enter SDS property unless permission is obtained and escorted by an SDS representative. It is highly unlikely any nests would be known.		
77	3	64	3.4.1.6		Fall migration surveys (2004)	The DEIS fails to assess bird migration through the project area. This DEIS ONLY makes daytime observational counts of birds during four seasonal time periods, fall, winter, spring, and summer. Nothing in this section or study assesses fall migration, the regular seasonal journey of species from one one location to another. This is a serious deficiency because migrating birds are at significant risk when flying through the rotor-swept area. Birds migrate at varying heights by species and weather conditions. Conditions with poor visibility such as clouds, mist, fog can lower the migration paths of higher flying species so they too are exposed to the rotor swept area. These weather conditions are common in the spring, winter, and fall along the ridges of the Cascade Mountains. Include studies that describe methods of detecting bird movement at night for migration studies.		

Specific DEIS Comments from Save Our Scenic Area (SOSA)

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
83	3	72	3.4.1.7	1	From 150 feet to 500 feet from the base of the turbine towers, tree height would be limited to 50 feet above the turbine base within an area formed by a 90 degree arc centered on the ordinary downwind direction (figure 2-4 in Chapter 2).	DEIS fails to state exactly what locations and affected acres will be within an area formed by a 90 degree arc..... DEIS fails to reveal how many turbines are proposed in a topographical area that does not meet the 90 degree arc requirement. The DEIS fails to provide an analysis of acres will affected and to what degree in topographical areas that do not meet the area formed by a 90 degree arc requirement. This significant deficiency does not allow agencies or the public to assess what the impacts to forestry and forest habitat from siting wind turbines in forested areas will be. During scoping, a comment requesting this information was submitted.	Topographical maps show little, if any, areas meet the condition of "an area formed by a 90 degree arc centered on the ordinary downwind direction."	Rewrite section of DEIS with a complete analysis, in light of the expanded information. A map of the project area and the all area around it that could be impacted to create and maintain airflow needs to be included. Include a table of the affected habitat types and display the expected length of time for the forest to be fully renewed for viable timber harvest. If harvest will not be allowed to renewed to an age of 50-80 years for any reason, then show age it will attain. Any sections on forest, animals, and habitats that would be affected in light of this information needs to be updated and resubmitted for public comment through a completely updated DEIS or a supplemental DEIS.
84	3	74	3.4.1.7	1	No wetlands or wetland buffers are located within the project footprint.	Misleading statement. A wetland is included in the project footprint, as it is within the project area borders. This wetland has been and will continue to be impacted if the project is permitted. SDS obtained a permit to harvest timber in the WMZ from DNR. This disturbing activity may have, like most logging operations, damaged the WMZ that could remove silt in runoff from construction activities.	DNR Maps and FPA's	Update and correct this section with the most recent forestry actions that are planned or have occurred. Correct and place this information in DEIS and resubmit for comments.
85	3	77	3.4.1.7	1	No wetlands or wetland buffers are located within the project operation area.	Misleading statement. A wetland is included in the project operation area, as it is within the project area borders and a possible wind impediment. This wetland has been and will continue to be impacted if the project is permitted. SDS obtained a permit to harvest trees in the RMZ of the wetland (or is it called a WMZ?) from DNR (FPA #2704045 and #2704443). Because this wetland is along a road accessing project area from the east, it raises the question of whether the logging occurred to improve the road for WRE access or for logging operations or in the words of a long time local "to remove an environmental problem" (sensitive species).	DNR Maps and FPA's	Update and correct this section with the most recent forestry actions that are planned or have occurred. Correct and place this information in DEIS and resubmit to public for comments.
86	3	74	3.4.1.7	2	Roadway improvements to the County or private logging roads are not expected to affect wetlands. This information was confirmed through field investigations performed in May and July 2009.	This Report is not cited as existing in Appendix	DEIS	Include this report in DEIS and resubmit to public for comments.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
87	3	74	3.4.1.7	7	Construction of the proposed project would result in the permanent loss of 21.86 acres of managed coniferous or mixed deciduous-coniferous forest.	Here it state that the loss of forest will be permanent, yet prior arguments stated "for the life of the project estimated to be 30 years."	DEIS	Show actual permanent loss of forest from construction and operation of the project. Rewrite this section of DEIS with a complete analysis, in light of the expanded information. Include a map of the entire forest area that could be impacted to improve airflow. Include a table of the affected habitat types and display the expected length of time for the forest to be fully renewed for viable timber harvest. If harvest will not be allowed to renewed to an age of 50-80 years for any reason, then show age it will be allowed to attain and the differetial in board feet at harvest. Any sections on forest, animals, and habitats that would be affected in light of this information needs to be updated and resubmitted for public comment through a completely updated DEIS or a supplemental DEIS.
88	3	77	3.4.1.7	1	Operation of the project would result in no further impacts to habitats on the project site.	Operation of the project would result in the LONG TERM and perhaps permanent removal of functional forest in the airflow area. Trees in the airflow area may never be allowed to regrow to a size that could prove needed habitat.	DEIS	Remore this statement and others like it.
89	3	76	3.4.1.7	4	In order to determine which species (including special status species)....are most at risk for turbine fatalities a relative collision risk....	This analysis is not appropriate for determining risk because it is dependent on observational counts. Uncommon species would never have a high risk.	Basic statistical knowledge.	Use percent of species observed in rotor swept area. Put in suplmental DEIS or rewritten DEIS.
90	3	50	3.4.1.5	2	Surveys were conducted in 2003, 2004, 2008, and 2009	NSO surveys were conducted in 2007 as well. During one of the visits in particular, slash burning on Chemawa Hill above this area could have affected obtaining a result. Survey was known to occur in the fall, which according to Bill Weiler, WDFW Biologist, was not the correct time of the year to be conducting owl surveys. Although the design was flawed, those data sheets need to be made available to the public for review.		Make available to public in supplemental DEIS or rewritten DEIS.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
91	3	77	3.4.1.7	7	Bald eagles, although fairly common in Washington State, are likely uncommon visitors to the project site. The potential for ongoing occurrence of bald eagle on the project site is very low. The potential for bald eagle fatalities as a result of turbine strike is also considered to be extremely low.	DEIS has failed to analyse increasing Bald Eagle presence in the Columbia River Gorge mainstem and tributaries. The central gorge with an overwintering population from other parts of the U.S./Canada and a growing resident nesting population, has become much more common in the area and the numbers in the area is expected to increase as the overall recovering bald eagle population increases. DEIS has failed to address the potential use of the area by bald eagles to shortcut across the saddleback through WRE project area between the White Salmon River and the Little White Salmon River. The potential for use of the area and a turbine strike is increasing with increasing populations, particularly in light of the use of airspace in the rotor-swept area.		Include USFWS data on producing and overwintering populations. Include the likelihood of a fatality should an eagle pass through two strings of turbines as is present on the site. (Survival as calculated in fish, only in this case estimated from available science) If not calculated, use the number generated from percent of observations in rotor swept area relative to the population in the White Salmon to Little White Salmon Rivers and Columbia River between those two rivers. Extrapolate for an increasing population.
92	3	77	3.4.1.7	8	Two golden eagles were recorded on the project site considered to be at a relatively low risk for collision with turbines at this site.	Every golden eagle that enters the WRE area, like bald eagles, are at risk of being killed by the turbine blades. Golden eagles are quite possibly using the site more than rarely, perhaps a better word to use is infrequently. Because of the timing and nature of this study, little can be said about the frequency of visits, other than, golden eagles were observed during the limited bird surveys.		
93	3	78	3.4.1.7	3	This includes the occurrence of five individuals, four of which were flying within the rotor swept area. Similar to the golden eagle, this species may be at risk of increased foraging activity in open areas around turbines because they hunt for prey that occurs on the ground in cleared areas. However given their rare occurrence on the project site, the potential for turbine related fatalities for this species is extremely low.	First, northern goshawks are not "rare" in the WRE area. Northern Goshawks have been observed flying southeast from the WRE project area into the farmland south of the project area, presumably to hunt. During logging under DNR FPA# 2704293 in June-July 2010 on a unit (named Fern) just below Chemawa Hill (southern A-array), a northern goshawk was observed flying and repeatedly crying for two days just south of where the logging activities were taking place. Quite possibly, a nesting tree may have been removed from the riparian zone with reportedly 100+ year old trees (the riparian zone repeatedly not mentioned by the Applicant) being logged. A request was lodged by an adjacent landowner with the Southeast Regional Office in Ellensburg to have a DNR employee enter the area and check for eggs or chicks that might have survived. The request was refused by DNR stating that they have no rules on the books and are not responsible for regulating any wildlife.		Change text to acknowledge prevalence of this uncommon bird in the WRE area. Change text to state that the potential for turbine related fatalities is high based on the presence of northern goshawk in the area AND the high percent of observed northern goshawks flying in the rotor swept area. Reissue the DEIS with corrections or a supplemental DEIS for public comment.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
94		78	3.4.1.7	3	General	Relative index using all bird species is not applicable.		If a relative index is to be used it should be divided into general class of birds, ie: raptors. This will give the public a better understanding of which raptor is at greatest risk of turbine caused fatality based on total number of raptors, number of each species observed, and flying in the rotor-swept area. Although a qualifer must be stated that ALL raptors are at significant risk for turbine caused fatality because of their size and hunting behavior.
95	3	79	3.4.1.7	1	Based on this analysis and surveys on the project site, the estimated raptor/vulture fatality rate is zero per MW/year, which is an extremely low estimate compared to many wind projects.	The so called analysis does not in any way reflect the risk of raptors/vultures to turbine caused fatality . This distorts and falsely implies that a relative index predicts mortality. The relative risk index only provides an indication of how many of a species were in the rotor-swept area relative to other species. In fact, larger birds, because of their larger wing spans and body size, are more likely to be struck than a small bird occupying only a small space in the rotor swept area. Birds spending more time in the rotor-swept area are more likely to be killed. Environmental conditions when birds are in the rotor-swept area can affect fatality, and so forth. The lack of assumptions to account for shortcomings is a fatal flaw in any "study" and certainly is for this one.		This Study's list of assumptions must be reevaluated and independently confirmed. Remove this and other incorrect statements of non-fact.
96					nonexistent	Science based studies require a statement of all assumptions made to design a study and collect, analyze, and interpret data. This is completely nonexistent in the DEIS and Appendices.		
97	3	79	3.4.1.7	1	Further, data collected from the project site indicate that the area is not within a major migratory pathway, at least during fall migration.	No migration data on any species was collected, only observational counts of animals on different days/seasons. Because migration requires some movement, and movement was not demonstrated in any "study" whatsoever, migration conclusions cannot be made.		Remove references to "migration" from existing DEIS language until such time actual migration studies are completed and documented.
98	3	79	3.4.1.7	2	Pileated woodpeckers were recorded on the site, but not flying.	Pileated woodpeckers do fly at rotor-swept height. They do not take the bus.		A more accurate conclusion is suggested here: "Because pileated woodpeckers were not observed flying, the relative index was zero. Pileated woodpeckers may fly at rotor-swept height through the WRE project area and may be killed as a result."

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010

www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
99	3	79	3.4.1.7	1	Vaux's swifts.....were commonly observed flying at rotor-swept heights	More than SOME deaths should be expected based on the percentages of birds in the rotor swept area.		Change to "Vaux's swifts....were commonly observed flying at rotor-swept heights, and SIGNIFICANT turbine related mortality may occur.
100	3	79	3.4.1.7	1	Olive-sided flycatchers.....were commonly observed flying at rotor-swept heights	More than SOME deaths should be expected based on the percentages of birds in the rotor swept area.		Change to "Olive-sided flycatchers....were commonly observed flying at rotor-swept heights, and SIGNIFICANT turbine related mortality may occur."
101	3	79	3.4.1.7	1	Western bluebird.....were commonly observed flying at rotor-swept heights	More than SOME deaths should be expected based on the percentages of birds in the rotor swept area.		Change wording to "Western bluebirds....were commonly observed flying at rotor-swept heights, and SIGNIFICANT turbine related mortality may occur."
102					Waterfowl, waterbirds, and shorebirds were not observed using lands within the project site during this study, and mortality involving this group is expected to be rare.	These species area migratory birds and would not be expected to be seen USING LAND within the project site as there is no large body of water, but the AIRSPACE would be used during migration. Migratory birds, including water using species have been killed during migration by wind turbines at many different projects throughout the U.S. and world. Migratory birds of ALL species are at risk. Migration has NOT been assessed in any study within this DEIS.		Remove all reference to "migration" from any study and DEIS text. Require a full study on spring and fall migration be conducted according to best experimental design and current research protocols. Included in any assessment of migration by mammal (including bats) and avian species, needs to cover 24 hour time periods when environmental and seasonal conditions are favorable for every species (particularly status species) and for 3 years to account for annual variation.
103	3	79	3.4.1.7	1	Turkey vultures are known to have very low susceptibility to turbine collisions (Orloff and Flannery 1992).	Old Citation based on older, smaller turbines. Provide updated current information to support any assertion.		Base conclusions on more recent information to reflect the latest generation of industrial wind turbines. Review Canadian and European white and grey papers on turkey vulture and cousin fatalities at wind turbine facilities.
104	3	79	3.4.1.7		General	The DEIS is deficient because the studies have failed identify the underlying assumptions used in design, data collection, and analysis that could affect extent and validity of conclusions. The assumptions must be qualified by the authors as to the appropriateness of the study. Because of this lack of assumptions, independent reviewers are unable to confirm the integrity of the methodology and conclusions.		The reports and the conclusions must be reissued with this information in a SEIS or a replacement DEIS.

Specific DEIS Comments from Save Our Scenic Area (SOSA)

August 27, 2010 [REDACTED] www.saveourscenicarea.org

Comment #	Section Number	Page Number	Heading Number	Paragraph Number	DEIS Text	Declared Deficiency	References	Remedy
105	3	79	3.4.1.7	3	These collisions would likely be rare and it is unlikely that the Project would have any negative impacts on population levels on and near the project site.	Acutally, the opposite is true. Collisions are very likely to occur. The sheer number of turbines and their configuration along a ridge poses a very high risk to special status and uncommon species, as well as migrating birds and bats of all kinds.		Compare to other forested ridgetop wind turbine projects in Eastern USA, with the statement that because no turbines have been place in conifer forests of the NW, it cannot accurately reflect numbers only provide general basis of comparison. It MUST be stated that placement of wind turbines along ridges is likely to rusult in extremely high mortality of resident and migratory birds and bats as has occurred in the Eastern US when placed along forested ridges.
106	3	79	3.4.1.7	4	...in Washington and Oregon indicate that less correlation between pre-construction surveys and turbine-related mortality is observed in non-raptor species. The lack of correlation may be because most fatalities are among nocturnal migrants that are not accounted for during surveys.	This statement admits there is a lack of a migration study. Most fatalities are among nocturnal migrants, and most species migrate at night. At no point, during day or night, was any study of bird or bat migration through the project area.		Require a three year study on bird and bat migration by qualified researchers using scientifically accepted methods and design protocols. Provide results for review by public and governmental entities.
107	3	9	3.1.2.1		The primary impacts during construction would be potential for erosion, landslides, soil compaction and changes to topography	Where these impacts will occur needs to be disclosed fully, particularly where changes to topography will occur.		Provide a supplemental DEIS that fully discloses where the topographical changes will occur and provide before and after contour maps for all locations.

Comment #	General Comment from SOSA for the Whistling Ridge Energy DEIS	Remedy
GC-1	<p>Need Met Tower data at proposed location on the Western (prevailing windward) slope. This data must include 3-dimensional wind direction, as well as wind speeds. At least one should be located South of the South BPA line, along the A1-7 string. This area topographically should result in the worst case scenario for turbulence and off-axis wind direction.</p> <p>Turbine efficiency is based on laminar flow in the direction of the Turbine Axis. Turbines placed on a steep slope will suffer significantly reduced performance, which must be quantified in the EIS to ensure economic viability for the Applicant.</p>	<p>Applicant should demonstrate to EFSEC Council that the "wind power" resources at this proposed site meet or exceed that of existing or permitted WA Wind Turbine Facilities. "Wind Power" is defined as the aggregated product of wind speed with time. The purpose would be to provide some basis to justify and offset the increased environmental impacts of this project, relative to those existing WA Wind Turbine Facilities.</p>
GC-2	<p>BPA yard size of 4+ acres invites and encourages future growth, which must be evaluated now.</p>	<p>BPA must, or the DEIS must, identify the minimum size of land needed to house a 75 Megawatt Substation, and only permit, purchase, and develop such a BPA Facility, if the proposed WRE project is approved. Any larger size of land or power capacity would trigger additional review requirements for WRE Application in the BPA NEPA process.</p>
GC-3	<p>It appears that BPA may have initiated agreements with the landowner for specific parcels of land, which would be premature prior to the completion of an FEIS, perhaps even a ROD.</p>	<p>BPA must not enter into contractual agreements or commitments until the lawfully allowable time.</p>
GC-4	<p>Certain claims by the Applicant can neither be substantiated with certainty or refuted with certainty. In these cases, the Council should neither consider a claim to be a benefit or a detriment to the proposed Project. For example, Global warming, reduction in CO2 emissions, as supported by several scientific papers concluding that the "jury is still out" on some of these issues.</p>	<p>The EFSEC Council should consider these types of claims as neither a significant benefit or a significant detriment to the proposed Project.</p>
GC-5	<p>The State of Oregon has on their books very good scenic protections, not only for the National Scenic Area, but a huge number of State public lands which are deemed appropriate to save from visual intrusion of Wind Turbines. Washington State should prepare and release an analogous document. EFSEC should consider the spirit of Oregon's protections, and apply similar standards when considering the overall benefits to society and the public welfare.</p>	<p>EFSEC should consider the spirit of Oregon's scenic protections relating to Energy Facility Siting, and apply similar standards when considering the overall benefits to society and the public welfare. Longer term, EFSEC is urged to pass some guidelines similar in spirit to the Oregon statutes, either within the Department, or at the State legislative level.</p>
GC-6	<p>The layout of information within the DEIS makes it difficult to understand and assess the true nature of the Project.</p>	<p>No obvious remedy to suggest.</p>
GC-7	<p>Incorporate others' testimony by reference</p>	<p>SOSA hereby incorporates by reference, the comments of:</p> <p>Keith Brown and Teresa Robbins, Skamania County Residents (SCR)</p> <p>Mike and Joyce Eastwick, SCR</p> <p>Mary Repar, SCR</p> <p>Friends of the Columbia Gorge</p> <p>Dawn Stover, Klickitat County Resident</p> <p>Sally Newell, SCR</p> <p>Paul Smith, SCR</p>

GC-8	<p>Applicant must provide met data and "wind power" analysis (confidentially if needed) to EFSEC Council to justify why this site is sooooo much better than others, that it could justify or warrant consideration in light of all the issues against.</p> <p>Wind Power is defined as the integral of wind "energy" with time. This is commonly approximated as a function of average wind speed spanned out over a long time period. and timeOne must note that the calculated wind speeds(or power) just north of the north BPA line are a maximum for the project site, and the average for the site, as a whole, would be considerably less.</p>	<p>Financial justification for the Project needs to be disclosed and verified.</p>
GC-9	<p>It appears that many general and specific issues raised in the Scoping Report are not addressed, or not adequately addressed. To ensure the integrity of the Scoping Process, SOSA recommends the DEIS or "FDEIS" include a "Response Matrix" - which would indicate the location(s) within the DEIS where the response, rebuttal, or otherwise answer to EACH scoping comment can be found.</p>	<p>Close the loop with the public comments by indicating responses in a "Response Matrix" as described to the left.</p>
GC-10	<p>Issues raised in the Scoping Process, under the Category of "Documents" (Issue Code "DX"), are not broken down in any detail. Lack of categorization of the individual documents, and subjects within, could have led to an important issue not being addressed. As part of the "Results Matrix" comment above, any matter raised in the "DX" issue code should be re-categorized separately into the other Categories, and likewise noted where these issues are addressed in the DEIS. Furthermore, a supplementary DEIS or a new DEIS should be issued and public comment provided.</p>	<p>see above and left</p>
GC-11	<p>Speculation here, but such efforts could be explained by the future "relative" ease of proposing a Natural Gas Energy Plant on adjoining lands, given a number of factors, the least of which is the NG pipeline running thru the currently proposed Wind project.</p>	<p>If any knowledge of plans for additional development at or near the proposed site of WRE, the impacts from such must be addressed at this time.</p>

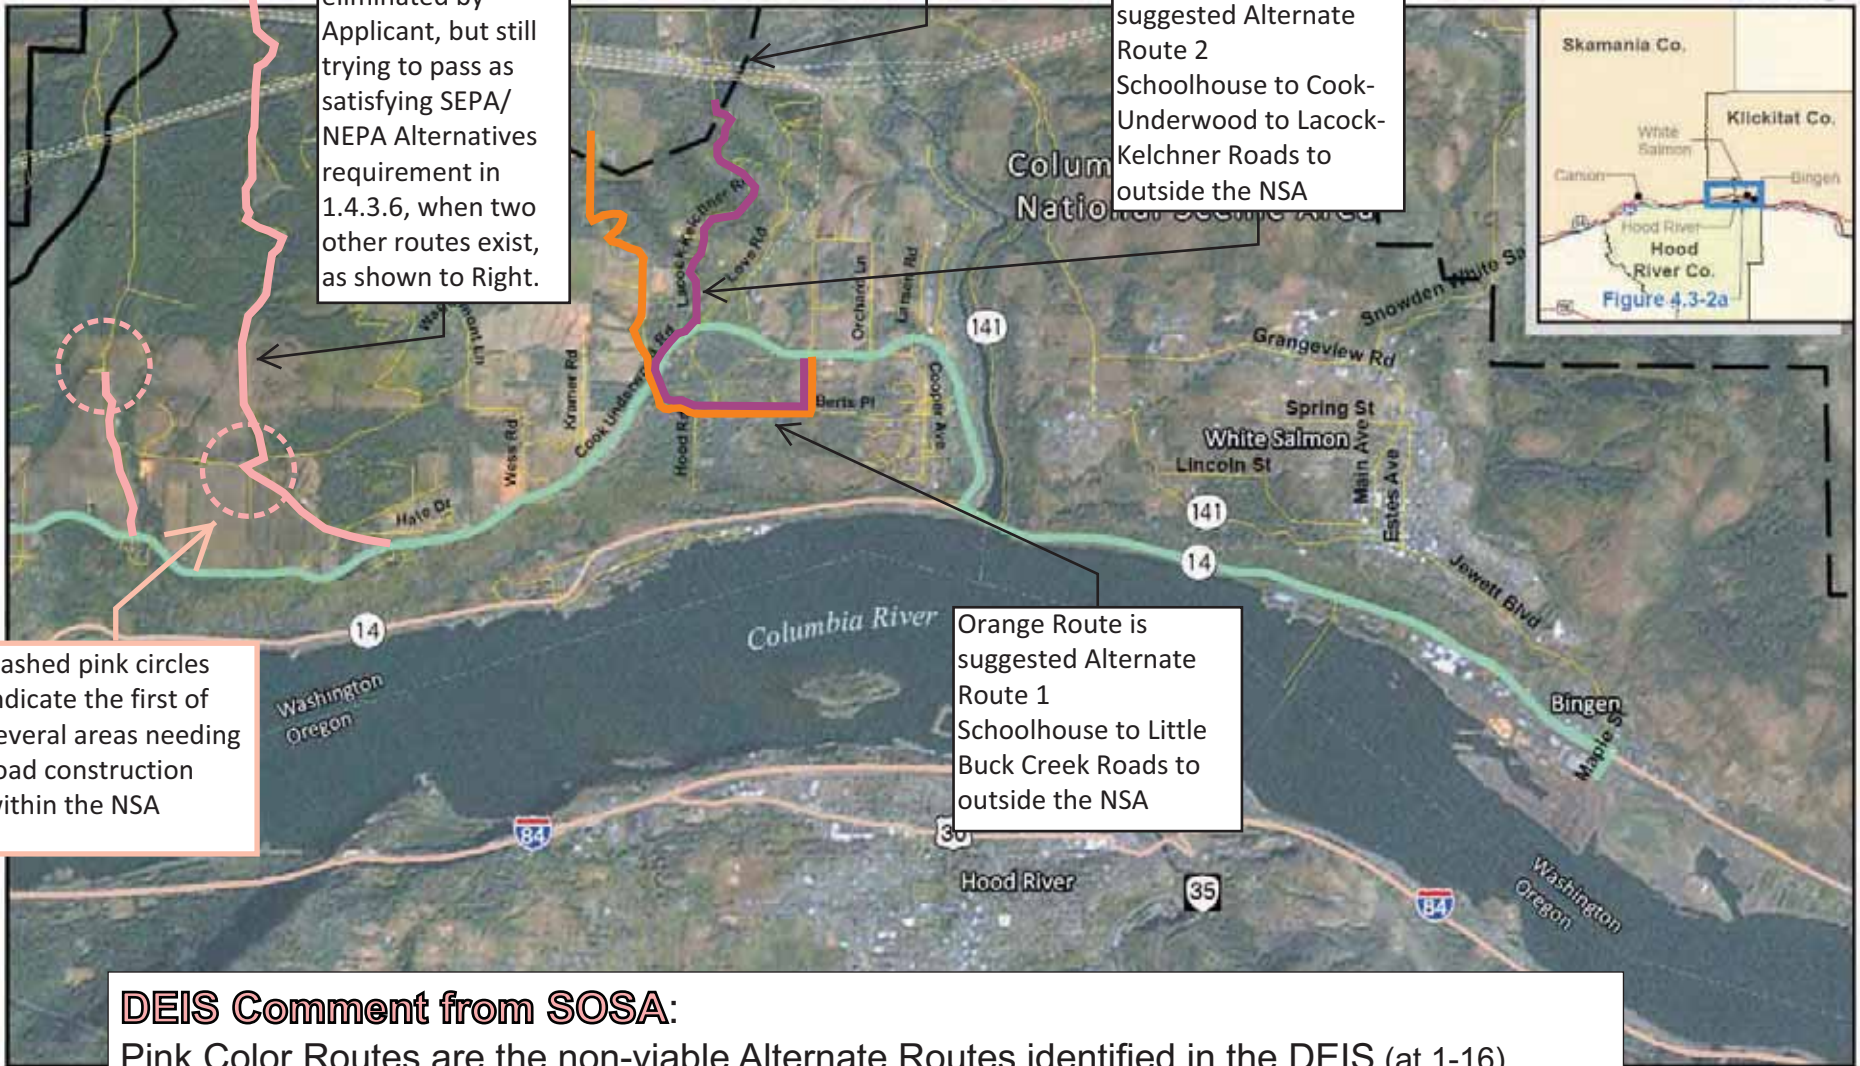

Pink Routes eliminated by Applicant, but still trying to pass as satisfying SEPA/NEPA Alternatives requirement in 1.4.3.6, when two other routes exist, as shown to Right.

NSA Boundry

Purple Route is suggested Alternate Route 2 Schoolhouse to Cook-Underwood to Lacock-Kelchner Roads to outside the NSA

Dashed pink circles indicate the first of several areas needing road construction within the NSA

Orange Route is suggested Alternate Route 1 Schoolhouse to Little Buck Creek Roads to outside the NSA

DEIS Comment from SOSA:

Pink Color Routes are the non-viable Alternate Routes identified in the DEIS.(at 1-16)

Ausplund Road is NOT a possible alternative, given new road building within the NSA would be required, which the Applicant has acknowledged is not allowed for this use within the NSA. Pictures of the now-overgrown portion of Ausplund road is shown on following pages.

DEIS states in 1.4.3.6 (at 1-16) that both Alternatives have been eliminated as an alternative due to road construction requirements within the NSA.

As such, the DEIS is deficient in that no Construction Roadway alternatives are identified or considered. SOSA has identified two alternatives - namely Schoolhouse to Little Buck Creek Road, and Lacock-Kelchner Roads, both of which will take traffic out of the NSA and allow the Applicant to build roads on property which it ALREADY owns, all the way to the proposed Project site.

Tom & Loreley Drach
[REDACTED]

RE: Request for Public Information dated July 6, 2010

Dear Mr. & Mrs. Drach,

This letter is in response to your Request for Public Information for any Skamania County Community Development issued permits, allowed administrative uses, or allowed outright uses, within the Forest Agriculture 20 zone in Township-Range-Section 03-10-18 and 03-09-13, between the years 2002 – 2010.

Our department has searched our paper records, electronic records, and emails as per your request. We have not received any applications or permitted any uses within the geographic area described, including records or correspondence related to meteorological towers. There is one Boundary Line Adjustment review, file number BLA-04-09, that was completed in 2004 that falls within the described area however it was not related to meteorological towers as far as any of our record show. Copies of this Boundary Line Adjustment (BLA) file are available to you by confirmation.

Sincerely,

A handwritten signature in black ink, appearing to read "Bonnie L. Anderson", with a long horizontal flourish extending to the right.

Bonnie L. Anderson
Administrative Assistant

OAR 345-022-0040(1)(g) prohibits energy projects that are “likely to result in significant adverse impact” to the Columbia River Gorge National Scenic Area.

Protected Areas

(1) Except as provided in sections (2) and (3), the Council shall not issue a site certificate for a proposed facility located in the areas listed below. To **issue a site certificate for a proposed facility located outside the areas listed below, the Council must find that, taking into account mitigation, the design, construction and operation of the facility are not likely to result in significant adverse impact to the areas listed below.** References in this rule to protected areas designated under federal or state statutes or regulations are to the designations in effect as of May 11, 2007:

(a) National parks, including but not limited to Crater Lake National Park and Fort Clatsop National Memorial;

(b) National monuments, including but not limited to John Day Fossil Bed National Monument, Newberry National Volcanic Monument and Oregon Caves National Monument;

(c) Wilderness areas established pursuant to The Wilderness Act, 16 U.S.C. 1131 et seq. and areas recommended for designation as wilderness areas pursuant to 43 U.S.C. 1782;

(d) National and state wildlife refuges, including but not limited to Ankeny, Bandon Marsh, Baskett Slough, Bear Valley, Cape Meares, Cold Springs, Deer Flat, Hart Mountain, Julia Butler Hansen, Klamath Forest, Lewis and Clark, Lower Klamath, Malheur, McKay Creek, Oregon Islands, Sheldon, Three Arch Rocks, Umatilla, Upper Klamath, and William L. Finley;

(e) National coordination areas, including but not limited to Government Island, Ochoco and Summer Lake;

(f) National and state fish hatcheries, including but not limited to Eagle Creek and Warm Springs;

(g) National recreation and scenic areas, including but not limited to Oregon Dunes National Recreation Area, Hell's Canyon National Recreation Area, and the Oregon Cascades Recreation Area, and **Columbia River Gorge National Scenic Area;**

(h) State parks and waysides as listed by the Oregon Department of Parks and Recreation and the Willamette River Greenway;

(i) State natural heritage areas listed in the Oregon Register of Natural Heritage Areas pursuant to ORS 273.581;

(j) State estuarine sanctuaries, including but not limited to South Slough Estuarine Sanctuary, OAR chapter 142;

(k) Scenic waterways designated pursuant to ORS 390.826, wild or scenic rivers designated pursuant to 16 U.S.C. 1271 et seq., and those waterways and rivers listed as potentials for designation;

(L) Experimental areas established by the Rangeland Resources Program, College of Agriculture, Oregon State University: the Prineville site, the Burns (Squaw Butte) site, the Starkey site and the Union site;

(m) Agricultural experimental stations established by the College of Agriculture, Oregon State University, including but not limited to:

Coastal Oregon Marine Experiment Station, Astoria

Mid-Columbia Agriculture Research and Extension Center, Hood River

Agriculture Research and Extension Center, Hermiston

Columbia Basin Agriculture Research Center, Pendleton

Columbia Basin Agriculture Research Center, Moro

Comment on Whistling Ridge Energy Project

Draft Environmental Impact Statement (DEIS)

Section 3.9 Visual Resources

August 26, 2010

Stephen Posner
Energy Facility Site Manager
Washington EFSEC
905 Plum Street SE, 3rd Floor
PO Box 43712
Olympia, WA 98504-3712

Andrew M. Montaño
Environmental Protection Specialist
Bonneville Power Administration
PO Box 3621 KEC-4
905 NE 11th Avenue
Portland, OR 97208-3621

Dear Messrs. Posner and Montaño:

Save Our Scenic Area (SOSA) is involved with the Whistling Ridge Energy (WRE) project application as an Intervener. SOSA is a non-profit corporation formed by concerned local Gorge citizens. Its primary mission is to help preserve the Columbia River Gorge National Scenic Area view-shed; to further maintain the existing rural and scenic character of Underwood, Washington, and surrounding communities in Washington and Oregon; and work to preserve the intent of the Columbia River Gorge National Scenic Area Act. I am writing today to provide comments on the recently issued draft environmental impact statement (DEIS) for the WRE proposal.

SOSA is submitting several different comment letters, covering a variety of subject matter within the DEIS. We have also reviewed the comments submitted by the Friends of Columbia Gorge, agree with them and incorporate them by reference. There are multiple environmental issues involved in the consideration of this project and it is important that each be given through consideration in the EIS process. We find that, in many areas, the present DEIS is completely insufficient and we urge that the NEPA/SEPA responsible officials prepare a supplemental DEIS.

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

Topic: Visual Resources Section 3.9 DEIS at 3-155 - 3-196

The Federal Highway Administration process (FHWA) used by the Applicant should be replaced with the BLM methods referred to in the DEIS. If the FHWA methods are retained, then many parts of this methodology must increase in complexity and quantitative analysis, to ensure useful information for EFSEC decision makers. The deficiencies and proposed remedies outlined below serve only as a partial list of issues to address in correcting the DEIS Visual analysis to a level suitable for use as an unbiased, objective decision making "Tool." To this end, SOSA furthermore incorporates by reference, the Friends of the Gorge DEIS comments by Dean Apostle.

As the phrase goes - "a picture is worth a thousand words," I am focusing my comments on the problems associated with the photomontages. The visual photomontage's size, resolution, contrast ratio, and background sky conditions all serve to completely under-represent the likely visual impact created by the proposed Project. In fact they fail to provide any useful measure of the degradation in scenic value.

Deficiencies with the DEIS Section 3.9:

- 1) There is only one lighting scenario provided in the DEIS. The (daytime) conditions provided in the DEIS do not depict other illuminated conditions which will occur - namely, sunrise, sunset, and night time. (Reference Exhibit B)
- 2) There is only one contrast ratio provided in the DEIS - hazy. The four that should be used are clear, hazy, front lit and back lit. A Cloudy condition should result in minimal degradation, and should not need to be formally analyzed. (Reference Exhibit A and B)
- 3) The Landscape Scenic Quality Scale (Table 3.9-1, DEIS at 3-158) uses a numeric scale, but its application to the Viewpoints appear non-objective and bias towards minimizing the appearance of scenic degradation. Imagine not even one "postcard view" rating from the USA's only National Scenic Area (NSA).
- 4) The three levels of Visual Sensitivity (DEIS at 3-158 and 3-159) provide too coarse a resolution for true numeric analysis, especially given it's a combined parameter. As stated at DEIS 3-158, Visual Sensitivity is defined as a combined parameter of: number of viewers, type of viewers, viewing conditions, and quality of the view. It would be far more appropriate to evaluate each parameter separately. To each parameter apply a 6-level scale, then multiplying

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

them by appropriate weighting factors, then summing to a final numeric output. (not "Low, Moderate, High")

5) The Summary Table (Table 3.9-2, DEIS at 3-177) provides the "Level of Visual Impact" in qualitative terms. This is not a useful output for proper assessment or decision-making. Classifying the final output of this "qualitative" process with its 3-step scale underreports Scenic Degradation. It's kind of like asking a person that needs corrective vision to take off their eyeglasses to drive their car. The EFSEC Council, at the least, needs statistical, refined numbers to use in various "what-if" scenarios, to probe the effects of various mitigation concepts. Evaluating the effect of removal of various turbines or turbine strings, as an example. A finer resolution, numeric basis will provide a clearer consensus for decision makers.

6) The "Scenic Quality" value of "3" assigned to Viewpoint 23 is flawed. (Reference Exhibit C) Further, other viewpoint "scenic quality" values are likely under-valued or under-scored.

7) This summer 2010, SDS logged the 80 acres sloping south beneath the proposed A-string turbines, from the ridgeline down. (Ref. DNR FPA# 2704293) (Reference Exhibit E primary, and A and B secondary) There is now a huge 80 acre brown patch on the south facing slopes by Chemawa Hill, contrasting with adjacent green forest for the foreseeable future. Furthermore, and more importantly, it removes about 100 feet of vertical distance between the rotor-swept area and the now visible ridgeline, thereby aggravating the disparity between the each "A" Turbine and the natural land forms around them. The DEIS's existing visual photomontage's do not account for this recent and dramatic scenic landscape "modification," and thereby understate even further the magnitude of visual impact to viewpoints to the South and to the East. Affected Viewpoints are: 4, 15, and 23. The FPA 2704293 was approved in October 2008, so the Applicant had ample time and knowledge to advise their URS consultants as to the visual site conditions which should have applied to the Photomontages, to have them prepared appropriately.

Discussion

Even the most accurate picture cannot replicate the true image in real life. To this end, there must be a more quantitative approach to reaching an "accurate measurable difference", as proposed in paragraph 1 above. There are analogous quantitative tools, which Engineers like myself, use in their profession. For example - FMEA (Failure Modes Effects Analysis). These tools put tangible numbers to normally qualitative phenomena, allowing decision makers to make accurate comparative decisions. Objectively applied, I would predict that most all the viewpoints reported in this DEIS would show significantly higher scenic degradation than other

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

Wind Turbine Projects in Washington state. I propose that EFSEC, as the EIS responsible official, incorporate a process similar to the above referenced FMEA process, to the existing WRE template and to future EFSEC Applications, as well.

Further refinement of visual impact could be achieved by classifying the percent of time a particular viewer will see the Turbines with a given contrast ratio. Meaning from a given location, say 35% of the time, a viewer will see flashing red lights, 16% of the time they will see only cloud cover, 40% of the time clear deep blue sky, 5% sunrise/sunset, etc. Then sensitivity and view value for each situation can be quantified for each location.

This author lives adjacent to Viewpoint 23 (DEIS at 3-190), and has produced scaled photomontages to illustrate the dramatic visual difference that lighting direction, and clear blue skies will affect the contrast ratio, and hence visual impact. All of the assumptions are clearly stated on the photomontages, and information is on each for independent confirmation as to scale. These are intended to serve as scaled representations, not photo-realistic images, and not dissimilar from the URS-supplied image.

REMEDIES - proposed actions by DEIS responsible official to correct Deficiencies

- 1) All photomontages should accurately depict the four viewing conditions of: a) clear, bright blue sky, b) hazy, c) back lit(i.e. sunset) and d) night time.
- 2) The contrast ratios should be adjusted higher to closely simulate how the Turbines would be seen in "real life" resolution. ("real life" resolution is clearly articulated in Dean Apostle comments)
- 3) The "Level of Visual Impact" in Table 3.9-2 must be a numeric product of a multi-variable analysis, each variable with a numeric scale of at least 6 levels of distinction. The variables identified previously, along with the additional variable discussed above will provide a quantifiable output with clear relative importance being attributed to each viewpoint.
- 4) The analysis "output" for Table 3.9-2, "Level of Visual Impact" needs to be a finer resolution, numeric basis to provide a clear consensus for decision makers to enter into "what-if" scenarios when contemplating various mitigation opportunities.
- 5) For current and future EFSEC Applications, consider evaluating Scenic Degradation compared to a standardized reference view shed - say an expansive desert shrub-steppe/wheat field environment where most Turbines are effectively located. (One could also consider this same approach for wildlife habitat and mortality impacts...)

Save Our Scenic Area (SOSA)

www.saveourscenicarea.org

6) Due to clear-cutting of the A-Turbine String Ridgeline this summer 2010, the visuals from sites 4, 15, and 23 sorely under-represent reality, and must be re-created using new photographs and properly scaled Turbines, and on a worst case contrast ratio. "Changes to topography," as (vaguely) mentioned in DEIS at 3-9, must also be included.

7) These slopes of the proposed A1-7 string, if not others, will have permanent land scarring activity. Depending on the geologically allowable locations of Turbines, land scarring may be in full view of, and facing the National Scenic Area. The visual impact of these landform disturbances must be including in the Visual analysis. As a reference to the magnitude and scale of "changes to topography" (DEIS at 3-9) a photograph of construction activity on a ridge top in Maine is included as Exhibit G. The slope in Exhibit G appears not as steep as the Northwestern and Western slopes of the proposed Project, which are the windward side of the prevailing wind direction. In particular to the A1-A7 proposed Turbines, this is also true, but furthermore, the opposite slope of the A1-A7 string is similar in slope to Exhibit G. This supports our claim that significant and permanent land scarring activity is likely, especially true for the A1-A7 proposed Turbines.

Thank you for this opportunity to comment on the DEIS. SOSA trusts that the DFEIS and FEIS will provide facts and analysis on the issues raised herein.

Regards,

Thomas Drach, PE
Board Member

Scaled Photomontage

Exhibit A : Clear Day

Viewpoint 23 - Ausplund Road End
compare to Figure 3.9-15 at DEIS
pg. 3-190 Note this area was
clear-cut since DEIS release

Photomontage: Source Tom Drach using ProEngineer CADsoftware and CorelDraw software to overlay scale rendering of Vestas V82 (Exhibit H).
Hub Height - 80m (262 ft) from top of ridgeline, Rotor Diameter - 82m (270 ft) Bottom of swept diameter from the ground = 262 ft - 135 ft = 127 ft. Note: Douglas Fir trees at ridgeline at left are assumed fully mature at 110-120 feet, to be conservative. If trees are actually shorter, turbines would need to be scaled LARGER in relation to the photo. Dashed circle for rotor diameter on left included for independent confirmation of scale.

Proposed turbines to the North, reference Viewpoint 23, Figure 3.9-15 at DEIS pg. 3-190

DEIS rates this location as: (Table 3.9-2 at 3-177)

Scenic Quality = Moderate (3 on a scale 1 to 6, 6 being postcard quality) (REALLY ??? should be a 6)

Viewer Sensitivity = Moderate, hence overall rating of Visual Impact = Moderate

Authors Note: How many other Viewpoints "analyzed" in the DEIS suffer from this same disparity in "Scenic Quality" rating?

- Unity is the degree to which the visual resources of the landscape join together to form a coherent and harmonious visual pattern

Each viewpoint was assigned a final rating based on the rating scale shown in Table 3.9-1. This rating scale incorporates the landscape assessment concepts developed in the USFS and FHWA methodologies.

**Table 3.9-1
Landscape Scenic Quality Scale**

Visual Quality Rating	Explanation
Outstanding 6	A rating reserved for landscapes with exceptionally high visual quality. These landscapes are significant nationally or regionally. They usually contain exceptional natural or cultural features that contribute to this rating. They are what we think of as "picture postcard" landscapes. People are attracted to these landscapes to view them.
High 5	Landscapes that have high quality scenic value. This may be due to cultural or natural features contained in the landscape or to the arrangement of spaces contained in the landscape that causes the landscape to be visually interesting or a particularly comfortable place for people. These landscapes have high levels of vividness, unity, and intactness.
Moderately High 4	Landscapes that have above average scenic value but are not of high scenic value. The scenic value of these landscapes may be due to human or natural features contained within the landscape, to the arrangement of spaces in the landscape, or to the two-dimensional attributes of the landscape. Levels of vividness, unity, and intactness are moderate to high.
Moderate 3	Landscapes that are common or typical landscapes with average scenic value. They usually lack significant human or natural features. Their scenic value primarily results from the arrangement of spaces contained in the landscape and the two-dimensional visual attributes of the landscape. Levels of vividness, unity, and intactness are average.
Moderately Low 2	Landscapes that have below average scenic value but not low scenic value. They may contain visually discordant human alterations, but these features do not dominate the landscape. They often lack spaces that people perceive as inviting and provide little interest in terms of two-dimensional visual attributes of the landscape.
Low 1	Landscapes that have below average scenic value. They may contain visually discordant human alterations, and often provide little interest in terms of two-dimensional visual attributes of the landscape. Levels of vividness, unity, and intactness are below average.

Source: Buhyoff et al. (1994), FHWA (1988), and USFS (1995)

3.9.1.2 Visual Sensitivity Assessment

The analysis also assessed visual sensitivity, which involves predicting the general impact on the quality of views from a given viewpoint. A combination of three factors determines how sensitive a landscape scene is:

- The number and type of viewers
- The viewing conditions
- The quality of the view

Residential areas with unobstructed views of a regionally important and memorable scene would be very sensitive to objects or structures that would impede views. A view from a seldom-

Comment by SOSA:

Due to clear-cutting of the A-Turbine String Ridgeline this summer 2010, the visuals boxed in RED above, must be re-created using new photographs and properly scaled Turbines on a worst case contrast ratio. Topographic changes must also be included, per

This summer, SDS logged the 80 acres sloping to the south-east of the proposed A-string turbines, from the ridgeline down.

This now leaves a dramatic brown patch contrasted with the green forest for at least 5 years, and land scarring activity of the turbine foundations and roads, all of which must be included in the applicable photomontages.

Furthermore and more importantly, it removes about 100 feet of vertical distance between the rotor-swept area and the closest ground features.

The existing visual photomontage's do not account for this recent and dramatic scenic landscape "modification," and thereby understate even further the magnitude of visual impact to viewpoints to the South and East.

V82-1.65 MW

Creating more from less

Vestas

Optimized for low and medium winds

With its large rotor and powerful generator, the V82 outperforms any turbine in its megawatt class for sites with low and medium wind conditions. Our hydraulic Active-Stall® technology ensures that the rotor gathers the maximum power from the prevailing wind, while minimizing loads and controlling output. Active-Stall® provides fail-safe protection in all conditions and, at and above its rated wind speed, maintains a steady output of 1.65 MW. With the V82, we have designed a wind turbine that offers unparalleled performance at a cost-effective price.

Low sound level

Vestas has made a concerted effort to reduce the sound level of the V82 dramatically – with audible results. The operating sound levels are among the lowest on the market, regardless of wind speed.

Excellent grid compatibility

As wind turbines capture more of the electricity market each year, they have an increasingly significant role to play in grid management. Fortunately, the V82 meets even the most stringent grid demands, and with the installation of our advanced grid compliance system, the V82 will actually help stabilize a weak grid. VestasGridSupport™ features full load and dynamic phase compensation to enhance reactive power regulation and thus keep the power factor in range. It has an uninterrupted backup power supply, too, so that auxiliary systems run at full capacity during grid disturbances. Moreover, our grid support provides continuous active and reactive power regulation to maintain voltage balance in the grid, as well as fault ride-through in the event of disturbances.

High reliability

Det Norske Veritas (DNV) has certified the V82 as meeting the strictest standards in the wind industry. It has the capacity to tune up its own generator, which helps to give it a particularly high degree of operational availability. In addition, the nacelle is based on the thoroughly tested design of previous models. To date, more than 700 wind turbines featuring this platform design have been installed on sites with conditions ranging from arctic to tropical.

Proven performance

Wind power plants require substantial investments, and the process can be very complex. To assist in the evaluation and purchasing process, Vestas has identified four factors that are critical to wind turbine quality: energy production, operational availability, power quality and sound level.

We spend months testing and documenting these performance areas for all Vestas turbines. When we are finally satisfied, we ask an independent testing organisation to verify the results – a practice we call Proven Performance. At Vestas we do not just talk about quality. We prove it.

Creating more from less

Ideally, it makes sense to generate electricity close to where it will be consumed so as to keep transmission, infrastructure and service costs low. However, since populous areas tend to have low winds and stringent requirements on sound levels, the wind industry often concentrates on coastal areas, deserted interiors and the open sea, where the wind is plentiful and sound restrictions are few.

With the V82 wind turbine, Vestas has made it easier to produce electricity close to where people live. Not only is the

V82 extremely efficient in areas with low and medium winds, but it also provides lower sound levels to suit local requirements. This means that a large number of previously marginal sites can now be exploited profitably – and quietly.

The V82 is an extremely competitive turbine in its class in areas with low and medium winds. An impressive capacity factor of 41 percent at 7.5 m/s at hub height speaks for itself and enables the V82 to create more power from less

INTRODUCTION

These comments regarding the Draft Environmental Impact Statement for the Whistling Ridge Energy Project are submitted by Friends of the Columbia Gorge.¹ Friends is a nonprofit organization with approximately 4,700 members dedicated to protecting and enhancing the resources of the Columbia River Gorge.

Of all the wind energy projects that EFSEC and BPA have reviewed to date, the Whistling Ridge Energy Project is easily the most controversial and problematic, as well as the project most likely to cause significant environmental impacts. This is the only project proposed to be located within forested habitat. This is the only project proposed within a designated Special Emphasis Area for the federally listed Northern Spotted Owl. This is the only project proposed within three miles of the Lewis and Clark National Historic Trail, the Oregon Pioneer National Historic Trail, the Historic Columbia River Highway (designated as a National Historic District on the National Register of Historic Places, as well as a National Historic Landmark), and the Ice Age Floods National Geological Trail. This is the only project for which multiple other agencies, including the United States Forest Service and the National Park Service, have recommended substantial modifications to the project. This is the only project proposed adjacent to a National Forest. This is the only project that would cause significant adverse impacts in two states (not just Washington). This is the only proposed project surrounded by recreational and cultural resources. And last but certainly not least, this is the only proposed project that would cause significant adverse impacts to a National Scenic Area.

¹ Friends hereby incorporates by reference all of its previous written and oral comments to the agencies, as well as its submissions to EFSEC through that agency's adjudicative proceeding and land use consistency process. The DEIS does not adequately address many of Friends' previous comments. Friends also incorporates all comments of Save Our Scenic Area.

Because of these unique factors, the agencies must take a special, close look at the impacts. Unfortunately, this Draft Environmental Impact Statement fails to take the hard look required by NEPA and SEPA. The DEIS is fundamentally flawed because it improperly narrows the scope of study, ignores and trivializes the impacts of the project, ignores or summarily dismisses detailed comments from the public and expert agencies, and was largely drafted and/or influenced by the applicant and the applicant's consultants behind closed doors and is therefore extremely biased in favor of the project. The DEIS is so deficient that it cannot be used as the basis for a decision on the project. The proposed project should be denied outright, but if it is to be given further consideration, a supplemental or revised DEIS is required.

BACKGROUND

I. The Columbia River Gorge and the Affected Communities

The Whistling Ridge project would be sited in the heart of the Columbia River Gorge. Many of the proposed turbines would be sited immediately adjacent to and/or highly visible from the Columbia River Gorge National Scenic Area. In addition, portions of the proposed "haul route," along which construction materials and turbine components would be transported, are located within the National Scenic Area.

Established by Congress in 1986, the National Scenic Area is an extraordinary national treasure, an area protected under federal law for its aesthetic, biological, ecological, historic, and recreational values. *See* Columbia River Gorge National Scenic Area Act ("Scenic Area Act"), 16 U.S.C. §§ 544–544p.

The Gorge, under the protection of the Scenic Area Act, offers unfettered scenic and historic views along the Columbia River, site of the final portion of Lewis and Clark's journey across the West. Additionally, the Gorge offers unique recreational opportunities with its many

side-river canyons, ridgetops, and the Columbia River itself. Hiking, bicycling, river rafting, kayaking, skiing, boating, fishing, camping, kiteboarding, windsurfing, birdwatching, and wildflower viewing are all pursued actively by the public throughout the Gorge. The overall character of the surrounding region highly scenic, ranging from wilderness to rural areas with quaint towns and spectacular vistas, rather than industrial or commercial.

In its November/December 2009 issue, *National Geographic Traveler* ranked the Columbia Gorge region #6 internationally, and second in the nation, among “iconic destinations.” The Gorge was ranked higher than all of the county’s national parks that were surveyed, and higher than Tuscany, Italy; the Serengeti Plains; and Mount Kilimanjaro. A primary reason given by *National Geographic* for the Gorge’s high ranking was the Gorge’s international reputation for “an incredible job of protecting the views.” Another stated reason was the Gorge’s “[g]reat potential for ‘agritourism and geotourism.’”

The Gorge has long been considered a special area. In 1915, the U.S. Forest Service (“USFS” or “Forest Service”) established Eagle Creek as the first Forest Service Recreation Area in the nation. The following year, the Gorge was proposed as a National Park. Continuing development pressures led to the establishment of the National Scenic Area in 1986. Today the Gorge contains hundreds of miles of hiking and bike trails through locales as diverse as misty river canyons and arid grassland plateaus. The Gorge also contains dozens of lakes, parks, campgrounds, and other recreational areas.

The proposed energy project would be highly visible from several urban areas and unincorporated communities in or near the National Scenic Area. These include Underwood, Hood River, Mosier, Mill A, Willard, and White Salmon. Hundreds of residents of these and

other communities are strongly opposed to the project and have expressed their opposition and concerns in comments to the reviewing agencies and to Skamania County.

II. The National Environmental Policy Act

A major purpose of the National Environmental Policy Act (“NEPA”) is to ensure that federal agencies conduct fully informed environmental decision-making. NEPA promotes its sweeping commitment to “prevent or eliminate damage to the environment and biosphere” by focusing the attention of federal decision makers and the public on the environmental and other impacts of proposed agency action. 42 U.S.C. § 4321. By focusing agency attention on the environmental and socioeconomic impacts of a proposed action, NEPA ensures that the agency will not act on incomplete information, only to regret its decision once finalized. *See Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349 (1989).

To that end, “[t]he sweep of NEPA is extraordinarily broad, compelling consideration of any and all types of environmental impacts of federal action.” *Calvert Cliffs’ Coordinating Comm. v. U.S. Atomic Energy Comm’n*, 449 F.2d 1109, 1122 (D.C. Cir. 1971). An agency must “take the initiative of considering environmental values at every distinctive and comprehensive stage of the process.” *Id.* at 1111.

III. The State Environmental Policy Act

The Washington State Environmental Policy Act (“SEPA”) applies to state and local governmental actions and decisions. SEPA’s general purpose is to require consideration of environmental factors at the earliest possible stage in order to allow decisions to be based on a complete disclosure of environmental consequences. *See Stempel v. Dept. of Water Resources v. City of Kirkland*, 82 Wn. 2d. 109, 118 (1973). Agencies are required to engage in an open and public study of environmental impacts at the earliest possible time. RCW § 43.21C.030(b); *see*

also WAC § 197-11-300.

Agencies must assess the likely cumulative, direct, indirect, short-term, and long-term impacts to the environment. WAC 197-11-030(2)(b), (2)(g); *see also* State Environmental Policy Act Handbook (SEPA Handbook) at 2 (2003). Agencies must also evaluate alternatives and mitigation measures. WAC 197-11-055(2)(c); *see also* SEPA Handbook at 2. Agencies “shall not limit” consideration only to impacts within the boundaries of the agencies’ jurisdiction. WAC 197-11-060(4).

For projects with likely significant impacts, environmental impact statements are required to ensure that government agencies and interested citizens have an opportunity to thoroughly review environmental impacts of proposed actions at the earliest possible stage; the agency must use the EIS in planning actions and making decisions. WAC 197-11-400(4). “The primary purpose of an environmental impact statement is to ensure that SEPA’s policies are an integral part of the ongoing programs and actions of state and local government.” WAC 197-11-400(1).

The EIS must be *impartial* and must inform decision makers of alternatives and mitigation measures that avoid or minimize impacts of a proposed action. WAC 197-11-400(2). The EIS must not merely rationalize a predetermined outcome. WAC 197-11-402(10). (“EISs shall serve as the means of assessing the environmental impact of proposed agency action, rather than justifying decisions already made.”) Rather, the EIS must include sufficient objective analysis to actually inform the agency’s decision making process.

The EIS must be completed early enough to serve as a practical contribution to the decision making process. WAC 197-11-406 (“The statement shall be prepared early enough so it can serve practically as an important contribution to the decision making process and will not be used to rationalize or justify decisions already made.”); *see also King County v. Boundary*

Review Board, 122 Wn.2d 648, 666, 860 P.2d 1024 (1993); *Barrie v. Kitsap County*, 93 Wn.2d 843, 854, 613 P.2d 1148 (1980); *Mentor v. Kitsap County*, 22 Wn.App. 285, 291, 588 P.2d 1226 (1978).

For projects with potentially significant or serious impacts, SEPA requires the same hard look that NEPA does. “The level of detail shall be commensurate with the importance of the impact,” and in the face of any scientific uncertainty, the EIS must disclose the uncertainty and analyze the worst case scenario and the likelihood of its occurrence. WAC 197-11-402(2) and 197-11-080(2), (3).

DISCUSSION

I. The DEIS is Improperly Designed so that the Applicant’s Private Economic Interests Unlawfully Dictate the Purpose, Need, Alternatives, and Eventual Outcome for the Proposed Action.

A. The Purpose and Need Statement in the DEIS is Being Improperly Driven by the Applicant’s Private Economic Interests.

NEPA requires federal agencies to “rigorously explore and objectively evaluate all reasonable alternatives” to a proposed action. 40 C.F.R. § 1502.14(a). In order to do so, the agency must first reasonably and objectively define the purpose and need of a proposed action. *See Simmons v. United States Army Corps of Eng’rs*, 120 F.3d 664, 666 (7th Cir. 1997) (citing *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 195–96 (D.C. Cir. 1991)). The chosen statement of purpose and need effectively dictates the range of alternatives evaluate in an EIS. *Id.*

“[A]n agency cannot define its objectives in unreasonably narrow terms.” *City of Carmel-By-The-Sea v. United States Dep’t of Transp.*, 123 F. 3d 1142, 155 (9th Cir. 1997). “An agency may not define the objectives of its action in terms so unreasonably narrow that only one alternative . . . would accomplish the goals of the agency’s action, and the EIS would become a

foreordained formality. *Nat'l Parks & Conservation Ass'n v. Bureau of Land Mgmt.*, 606 F.3d 1058, 1070 (9th Cir. 2010). Moreover, an agency may not allow the economic needs and goals of a private applicant to define the purpose and need, and hence the inevitable outcome, of an EIS. *Id.*

Unfortunately, that is exactly what is happening with this EIS. The DEIS lists the applicant's "needs," including the "business needs of the applicant" (such as "diversifying the holdings" of the Applicant) as stated needs for the project, and lists no agency-defined objectives or needs other than complying with applicable laws. The DEIS fails to even acknowledge that the agencies have no obligation or responsibility whatsoever to meet the applicant's needs or desires. As a result, the Applicant-identified needs are defining and driving the characteristics of this project and the alternatives thereto. This approach is inappropriate and unlawful.

Interestingly, some of the Applicant-identified needs are suspect. For instance, the Applicant identifies a need for utilities in Washington State to provide more alternative energy to their customers. DEIS at 1-4-1-6. But nowhere has the Applicant specified or publicly committed to sell the electricity from this project within Washington State. As it stands, well over half of all the wind energy produced in Washington and Oregon is currently being sent to California. If a similar fate occurs with the electricity from the Whistling Ridge project, then the Washington state requirements for alternative energy are wholly irrelevant to the project. The applicant cannot have it both ways. It cannot assert that meeting Washington state renewable portfolio standards is a need for the project, and yet refuse to commit energy from this project to remain in Washington state.

The DEIS repeatedly states or implies that the project would reliably produce between 70 MW and 75 MW of energy. *See, e.g.*, DEIS at I-9, 3-90, 3-271. The DEIS significantly

overvalues the generating potential of the project. Wind energy facilities cannot continually generate energy at their rated capacity. Generally, wind energy facilities generate energy at 30% of capacity. So for this project, the actual energy output would be only 21 MW. Every assertion or implication in the DEIS that the Whistling Ridge project would produce 70 or 75 MW of energy must be corrected to reflect the likely actual production of the facility. This correction must also be reflected in the purported need to produce at least 70 MW of energy for the project to be marketable. In any event, the facility would likely deliver 21 MW of energy to the grid.

Further, the Applicant's purpose and need statement appears to be defined only in terms of conveying power from a wind energy generation facility. This purpose and need is too narrowly limited, and avoids the question of whether there truly is a need for a wind energy project. As a result, the purpose and need statement improperly limits the alternatives considered by the agencies.

As in the *National Parks & Conservation Association* case, the private economic interests of the Applicant are the driving force behind the purpose and need statement, and thus behind the entire DEIS. The narrowly drawn statement unreasonably constrains the possible range of alternatives, because it excludes alternatives that fail to meet the Applicant's specific private objectives, which are to build a wind energy project. The result of such a narrowly driven statement led to only two alternatives to be considered: the proposed action (authorizing construction and operation of the proposed Whistling Ridge Energy Project and associated components) and the No Action Alternative (not authorizing construction and operation of the proposed project). This extremely narrow range of alternatives is unreasonable, and thus, violates NEPA.

////

B. The Stated Purposes Fail to Acknowledge EFSEC’s Duty to Protect State or Local Governmental or Community Interests.

One of EFSEC’s mandates is to “protect state or local governmental or community interests affected by the construction or operation of the energy facility.” WAC 463-64-020. Any site certification agreement must contain conditions to meet this mandate. *Id.*

The DEIS fails to even mention this mandate, let alone apply it. This mandate should be expressly included in the stated purpose and need for action on page 1-3 of the EIS, and should be applied and reflected throughout the DEIS.

C. The Range of Alternatives Considered is Inadequate.

The DEIS discusses only the Proposed Action Alternative (the proposed project) and the No Action Alternative. Such a truncated alternatives analysis violates the agencies’ duties under NEPA and SEPA to fully review all reasonable alternatives.

“The purpose of NEPA is to require disclosure of relevant environmental considerations that were given a ‘hard look’ by the agency, and thereby to permit informed public comment on proposed action and any choices or alternatives that might be pursued with less environmental harm.” *Te-Moak Tribe of Western Shoshone of Nevada v. United States Dep’t of the Interior*, --- F.3d ---, 2010 WL 2431001 (9th Cir. 2010) (quoting *Lands Council v. Powell*, 395 F.3d 1019, 1027 (9th Cir.2005)); *see also* 42 U.S.C. § 4332(E) (requiring agencies to “study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources”). Agencies are required to consider alternatives in an EIS and must give full and meaningful consideration to all reasonable alternatives. *Id.*; *see also* 40 C.F.R. § 1508.9(b). “The existence of a viable but unexamined alternative renders an environmental impact statement inadequate.” *Id.* (citing *Idaho Conservation League v. Mumma*, 956 F.2d 1508, 1519 (9th Cir.1992) (quoting *Citizens for*

a Better Henderson v. Hodel, 768 F.2d 1051, 1057 (9th Cir.1985)).

SEPA also requires an EIS to evaluate alternatives. RCW 43.21C.030(2)(c)(i). The applicable guidelines are found at WAC 197-11-440(5). An alternative considered for purposes of an EIS need not be certain or uncontested, it must only be reasonable. *King County v. Central Puget Sound Growth Management Hearings Bd.* 138 Wn.2d 161, 184-85, 979 P.2d 374, 385 (1999). A reasonable alternative is one that could feasibly attain or approximate a proposal's objectives at a lower cost to the environment. *Id.*; *see also* WAC 197-11-440(5)(b).

According to the applicable federal regulations, an EIS “shall inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment.” 40 C.F.R. § 1502.1. CEQ clarified the meaning of this requirement in its “Forty Most Asked Questions” policy guidance by defining “reasonable alternatives” as including “those that are *practical or feasible* from the technical and economic standpoint and using common sense, rather than simply *desirable* from the standpoint of the applicant.” Forty Most Asked Questions Concerning CEQ’s National Environmental Policy Act Regulations, 46 Fed. Reg. 18,026 (Mar. 23, 1981) (emphasis in original).

When selecting alternatives, an agency may *consider* an applicant’s desires, but is not by any means bound or limited by them. It is not appropriate for an agency to rely on the “self-serving statements of the project applicants.” *Southern Utah Wilderness Alliance v. Norton*, 237 F. Supp. 2d 48, 53 (D.D.C. 2002). Instead, the action agency must “to the fullest extent possible . . . study, develop and describe appropriate alternatives to recommended courses of action in any proposal which includes unresolved conflicts concerning alternative uses of available resources.” *Id.* at 54 (citing 42 U.S.C. § 4332(2)(E)). Moreover, “[o]ther factors [other than the applicant’s desires] to be developed during the scoping process—comments received from the public, other

government agencies and institutions, and development of the agency's own environmental data—should certainly be incorporated into the decision of which alternatives to seriously evaluate in the EIS.” CEQ, Guidance Regarding NEPA Regulations, 48 Fed. Reg. 34,263, 34,267 (July 28, 1983).

Again, the DEIS analyzes the impacts of only two alternatives: 1) the proposed project, and 2) the no action alternative. These options advance the Applicant's goals, rather than the agencies' goals, to the exclusion of other reasonable alternatives. The DEIS is fatally flawed in its failure to consider an adequate range of reasonable alternatives. *See Muckleshoot Indian Tribe v. USFS*, 177 F.3d 800, 913 (9th Cir. 1999) (agency failed to consider an adequate range of alternatives when an EIS considered only a no action alternative along with two “virtually identical” action alternatives).

Various other alternatives should have been considered. First, at page 1-13 of the DEIS, the BPA did not consider any alternate locations for the wind turbine project other than those owned by the Applicant. Likewise, alternatives for interconnecting the wind project with transmission lines off of the project site were eliminated.

Indeed, under NEPA, the EIS may even have to look at alternatives over which the applicant has no control. *NRDC v. Morton*, 458 F.2d 827, 835 (D.C. Cir. 1972); *NWF v. NMFS*, 235 F. Supp.2d 1143 (W.D. Wash. 2002). Further, it is irrelevant whether an applicant already owns alternative sites for the purposes of NEPA review: “The fact that this applicant does not now own an alternative site is only marginally relevant (if it is relevant at all) to whether feasible alternatives exist to the applicant's proposal.” *Van Abbema v. Fornell*, 807 F.2d 633, 638 (7th Cir. 1986).

As stated in the *Van Abbema* case, other alternatives for a project cannot be eliminated as non-feasible simply because the Applicant does not now own the site where an alternative location may exist. Here, SDS and Broughton Lumber own tens of thousands of acres of land in Oregon and Washington that could potentially be available for energy production purposes. The EIS fails to consider those lands, and fails to consider the possibility of applicant purchasing lands in other locations, such as east of the National Scenic Area, for an energy facility.

Similarly, SEPA also requires a discussion of alternate development sites for a proposed project in order to have an adequate discussion of reasonable alternatives. *See Barrie v. Kitsap County*, 93 Wn.2d 843, 855, 613 P.2d 11481155 (1980) (EIS was inadequate because it looked only at the use of the applicant's private property for siting a shopping center, and failed to discuss alternative development sites).

Here, alternate locations could provide comparable energy output. This approach would be consistent with the BPA stated goals of acting consistently with its environmental and social responsibilities and providing for cost and administrative efficiency. Surely other sites with far less impacts could easily be located. Not far to the east of this project site, thousands of wind turbines have been constructed recently, the vast majority of which pose far less resource impacts than the Whistling Ridge site.

Another potential site is immediately north of the proposed project site, on DNR lands. In fact, this property has been designated by WRE as "Phase 2" of the Whistling Ridge project. Although DNR has indefinitely placed on hold consideration of WRE's request for a wind power lease of this property, that does not mean use of the property is forever out of the question. In fact, recent emails by WRE representatives, obtained by Skamania County residents Keith Brown and Teresa Robbins in response to a public records request, indicate that WRE still

wishes to use the DNR property for wind energy. The DEIS fails to analyze the possibility of siting wind turbines on this property rather than on the SDS and Broughton Lumber land.

Second, the BPA did not consider alternate configurations (with fewer wind turbines and/or in different locations) for the project. On page 1-14, the DEIS states that “the project must be capable of producing a minimum of 70 MW” and that the project size “was selected to *optimize* . . . economic feasibility” (emphasis added). There are no financial data or projections provided to support this claim. Moreover, the agencies eliminated any alternatives that would have considered a smaller generation facility, for instance in order to address potential environmental impacts, solely in an effort to “optimize”² the applicant’s economic wishes. Nor did the agency consider alternative locations for individual turbines that would reduce their impacts. This approach is unlawful and violates the agencies’ legal mandates.

Third, the BPA did not consider other potential renewable energy sources in the DEIS. A dismissal of renewable energy sources other than wind energy, such as distributed generation, does not comport with the agencies’ stated goal of acting consistently with their environmental and social responsibilities.

Fourth, no conservation alternatives were considered to eliminate the stated “need” for this 70 MW of installed capacity. Conservation alternatives, such as demand response technologies, also should have been included in order to meet the agencies’ goals of promoting their environmental and social responsibilities.

Fifth, another reasonable alternative is one that analyzes and considers the future development of the proposal. WAC 197-11-440(5)(c) states that the EIS shall:

(vii) Discuss the benefits and disadvantages of reserving for some future time the implementation of the proposal, as compared with possible approval at this time. The

² The *Webster’s Dictionary* definition of “optimize” is “to make as effective, perfect, or useful as possible.”

agency perspective should be that each generation is, in effect, a trustee of the environment for succeeding generations. Particular attention should be given to the possibility of foreclosing future options by implementing the proposal.

The DEIS fails to comply with this requirement, because it fails to consider the possibility of delaying the development of wind energy until a later date, perhaps at a time when the energy grid will be more equipped to handle the addition of new wind energy sources.

The above alternatives were either eliminated from the study, or not considered at all, because the Applicant's economic needs, rather than the stated goals of the agencies, dictated the results of this DEIS. In effect, the agencies are violating their duties to consider all reasonable alternatives.

D. The Applicant and its Consultants Appear to Have Played an Improper Role in the Drafting of the DEIS, Leading to a Biased and Result-Oriented Document.

The agencies' ability to prepare an EIS that would provide a balanced and objective analysis, leading to a decision that addresses the interests of the general community and not just the Applicant, have become further compromised by an apparent decision to allow the same consultants who prepared the application on behalf of the Applicant to also prepare analytical content in the DEIS.³

Originally, the agencies stated that the Applicant and its consultants would be preparing the EIS. However, because the public objected to this arrangement and pointed out that it would violate NEPA, the agencies made the following announcement in the DEIS May 21, 2010 cover letter:

While EFSEC and BPA are the entities that have prepared the Draft EIS, these agencies have worked collaboratively with Whistling Ridge Energy LLC to

³ These consultants include employees of URS Corporation, West Inc., and others. Although several consultants who prepared the application also are listed in section 6 of the DEIS as "preparers" of the DEIS, none of them noted their role in preparing the application on their disclosure statements in Appendix F.

obtain necessary information about the project and its potential impacts for the EIS. Initially, EFSEC had intended to allow Whistling Ridge Energy LLC to prepare the EIS, as allowed by SEPA; however, after public concern was raised, EFSEC and BPA decided that the lead agencies would be directly responsible for preparing the EIS. Accordingly, we have used environmental information provided by Whistling Ridge Energy LLC and its consultants in the EIS as appropriate. All such information has been independently evaluated and reviewed for accuracy by the lead agencies, as well as by an independent, third party consultant retained by EFSEC.

This statement invites more questions than it answers. What was the exact nature and extent of the involvement of WRE and its consultants in the preparation the DEIS? Did they simply supply environmental “information,” as stated in the cover letter, or did they supply analysis, findings, and/or conclusions for the DEIS? Why does the DEIS adopt lengthy passages from the application verbatim or practically verbatim? If WRE and/or its consultants were allowed to write portions of the DEIS, will the agencies identify which portions? Were the applicant and/or its consultant allowed to review any portions of the EIS before it was made final, and if so, did they make any changes to it?

There is a major difference between the applicant’s consultants supplying the agencies with information and data (such as species survey data, photographs, coordinates for turbine locations, etc.) and the applicant’s consultants drafting analysis and conclusions to be inserted into the DEIS document. Unfortunately, the DEIS cover letter does not satisfactorily explain which scenario occurred, but the extremely biased nature of the DEIS in favor of the project strongly implies an active role by the Applicant’s consultants in its preparation.

An attached May 28, 2010 email string further calls into question whether EFSEC and BPA staff actually wrote the content of the EIS, or allowed the applicant’s consultants to write it. The emails show that a landscape architect with the U.S. Forest Service telephoned the EFSEC Site Manager “express[ing] concerns about the quality of the [visual resource] analysis.” The

Forest Service employee asked EFSEC “who did the analysis,” “what their qualifications were,” and “whether or not a Landscape Architect was consulted during development of this section.” Apparently not knowing the answer to these questions, the EFSEC Site Manager appears to have referred the questions to the Project Manager with URS Corporation, the Applicant’s lead consultants.

As with the agencies’ DEIS cover letter, this email string poses a number of questions. If EFSEC and BPA prepared the DEIS, why does it appear that EFSEC had to ask the Applicant’s consultants who wrote it? If the agencies were directly responsible for the content of the EIS, why did they not know whether a landscape architect participated in its drafting? And as the Forest Service asked, who in fact “did the analysis,” and what were their qualifications?

On the face of the email and the DEIS itself, it certainly appears as if the same people who wrote the application (*i.e.*, the Applicant’s consultants) were also allowed to prepare the analysis reviewing the application. In fact, it appears that the entire scenic resources analysis section of the application, including all analysis, findings, and conclusions, was simply lifted from the application and inserted verbatim into the DEIS. Although the agencies claim to have “prepared” the content of the DEIS and independently reviewed and verified any information from the applicant, by all outward appearances this did not occur—at least with major sections of the DEIS. Rather, it appears that the Applicant’s consultants were allowed to write major portions of the DEIS. If so, then the Applicant has been allowed to exert undue influence over the content of the DEIS. The predictable outcome is a DEIS that, in effect, serves as an extremely biased and result-oriented prospectus for the proposed project exactly as proposed by the Applicant, instead of the searching and balanced decision-making document required by NEPA and SEPA.

NEPA case law and guidance are clear that an applicant, such as Whistling Ridge Energy, should not be allowed to influence the analytical content of an EIS. *See, e.g., Sierra Club v. Sigler*, 695 F.2d 957, 962 n.3 (5th Cir. 1983) (expressing serious concern over role of private firm in preparation of EIS). An EIS must be an entirely objective analysis intended to aid the decision maker and the public in understanding the consequences of an agency decision. Thus, it is standard practice for action agencies to ensure that applicants for federal action are insulated from all aspects of EIS preparation other than providing information.

Any arrangement that allows the very same consultants who drafted the application to also draft analytical content for the DEIS is improper and cannot be allowed to continue. If in fact the agencies have been relying on the Applicant's consultants (rather than agency employees) to draft analytical content for the DEIS, then the agencies should immediately withdraw the DEIS, and should either retain new consultants unaffiliated with the applicants to prepare a revised DEIS or should ensure that a revised DEIS is drafted by disinterested agency employees. The Applicant and its consultants must not be allowed to continue to play a direct and significant role in the preparation of factual and legal conclusions in the EIS. Such a role is improper and invalidates the DEIS as the basis for further decision-making.

The agencies also state that they have hired a third-party consultant who has been charged with independently verifying the content of the DEIS. However, it is ultimately the agencies' responsibility, and not that of any consultants, to independently verify the DEIS's content. The agencies are "responsible for the independent verification and use of the data, evaluation of the environmental issues, and . . . the scope and content of the environmental assessment." *Save Our Wetlands v. Sands*, 711 F.2d 634, 642 (5th Cir. 1983). Given the

extremely biased nature of this document, Friends questions whether the agencies are meeting this responsibility.

II. The DEIS Does not Demonstrate that EFSEC and BPA Consulted with Agencies with Expertise in the Resources that Would be Affected by the Whistling Ridge Energy Project.

EFSEC must consult with agencies with expertise in the resources that may be impacted by the proposed development. RCW 43.21C.030(2)(d); WAC 197-11-408(2)(a). SEPA requires that the agency “utilize a systematic, interdisciplinary approach” to environmental review. RCW 43.21C030(2)(A). EFSEC’s SEPA regulations also require that EFSEC works with interested agencies throughout the preparation of the DEIS. WAC 463-47-140(5).
