Level of Service Criteria for Two-Way-Stop-Control Intersections

Level of Service Expected Traffic Delay

- A < 10 seconds
- B > 10 - 15 seconds
- C > 15 - 25 seconds
- D > 25 - 35 seconds
- E > 35 - 50 seconds
- F > 50 seconds

Source: TRB (2000)

Existing LOS was estimated for SR 14 and Cook-Underwood Road, using estimated 2009 traffic volumes and the software package Highway Capacity Software Plus, which uses algorithms based on the Highway Capacity Manual (TRB 2000). Based on this analysis, the longest delays occur at Cook-Underwood Road during the PM peak hour; however, these delays are relatively short (see Table 3.11-4). Up to approximately 10 seconds of delay is experienced by some vehicles at the west junction of Cook-Underwood Road with SR 14 during the PM peak hour. Slightly more than 10 seconds of delay is experienced by some vehicles at the east junction of Cook-Underwood Road with SR 14 during the PM peak hour. These delays translate to LOS A conditions at the west junction and LOS B at the east junction. Delays during the AM peak hour at Cook-Underwood Road and during both peak hours at SR 14 are all less than 10 seconds, which translates to LOS A.

Delay = Average per vehicle

Existing Traffic Safety

Traffic safety was analyzed along SR 14 between the towns of Stevenson and Bingen for 2006 to 2008. Collision Data Summaries were obtained from WSDOT. SR 14 is functionally classified as a rural collector roadway. SR 14 between Stevenson and Bingen is located within the Southwest Region of the state of Washington. During this three-year period, a total of 158 collisions occurred between the west city limits of Stevenson at MP 43.91, and the east city limits of Bingen at MP 66.88.

3-219

Between 2006 and 2008, a total of 17 collisions occurred within the Stevenson city limits, and another 17 occurred within the Bingen city limits. Only one collision occurred at the west junction of Cook-Underwood Road and SR 14 (MP 56.28), and three collisions occurred at the east junction of Cook-Underwood Road and SR 14 (MP 63.32). Four collisions occurred at the intersection of Maple Street and SR 14 within the city of Bingen (MP 66.47). The majority of collisions occurred within Skamania County between MP 44.66 and MP 63.48. Several collisions also occurred within Klickitat County between MP 63.48 and MP 64.71, and within the White Salmon city limits between MP 64.71 and MP 65.50.

The number of collisions that occur along a given roadway is generally expressed in terms of a rate, where collision occurrence is indexed to the number of vehicles traveling on a particular length of the given roadway. The collision rate is based on the number of collisions per millionvehicle-miles (MVM) traveled. Table 3.11-5 shows collision rates for each year as well as multi-year rates for the three year period for SR 14 between Stevenson and Bingen, in addition to collision rates for the city of Bingen.

The multi-year collision rate along SR 14 between Stevenson and Bingen is 1.43 collisions per MVM. The 2007 average collision rate for all Washington state rural collector roadways was

1.65 collisions per MVM and for 2008, 1.63 collisions per MVM. The average collision rate for all Washington rural collector roadways within the Southwest Region during 2007 was 1.72 collisions per MVM, and during 2008, 1.87 collisions per MVM. The multi-year collision rate on SR 14 between Stevenson and Bingen is lower than both the 2007 and 2008 average Washington State and Southwest Region collision rates.

The multi-year collision rate for the city of Bingen is 1.63 collisions per MVM. The multi-year collision rate for the city of Bingen is equal to or close to both the 2007 and 2008 Washington State collision rates and is lower than both the 2007 and 2008 average Southwest Region collision rates. No average collision rate data is available for year 2006.

3-220

Transportation Plans and Programmed Transportation Improvements

Skamania County. The Transportation Element of the Comprehensive Plan represents the County's policy plan for the next 20 years and specifically considers the location and condition of the existing traffic circulation system, the projected transportation needs, and plans to address future transportation needs while maintaining established LOS standards. This plan is implemented through the Six-Year Transportation Improvement Program and Annual Construction Program. The most recent Six Year Transportation Improvement Program was approved in April 2009, and lists one improvement to Cook-Underwood Road: a resurfacing project between MP 0 and MP 3. This improvement is listed for years 4–6 of the program, or between 2012 and 2014.

Washington State Department of Transportation Statewide Transportation Improvement Program. This is a list of funded transportation improvement projects. The Transportation Improvement Program for 2009–2012 presents a list of regionally significant projects for the upcoming three years (WSDOT 2009a). A search of the project database for Clark, Skamania and Klickitat Counties showed no projects scheduled for any of the roads in the immediate project vicinity. The only planned transportation improvement project near the project site is resurfacing 1.0 mile of Wind River Road.

WSDOT also is planning to improve SR 14 between Camas and Washougal, east of Vancouver. The project will widen SR 14 from two lanes to four lanes from the end of the West Camas Slough Bridge to Union Street (SR 500). Included in the project will be construction of a new

bridge parallel to the existing bridge on the east end of Lady Island, and construction of a split-diamond interchange at Union Street and 2nd Street. The project is planned to go to bid in 2010, and construction is scheduled to be completed in 2012 (WSDOT 2009b).

Skamania County and Klickitat County Regional Transportation Plans. These Regional Transportation Plans were developed by the Southwest Washington Regional Transportation Council, in coordination with other jurisdictions and WSDOT (SWRTC 2009a and 2009b). Regional transportation plans are intended to develop regional solutions to transportation needs. Both plans emphasize maintenance and preservation as priorities. Improvements are recommended to address identified deficiencies. Recommended improvements in these plans include several projects to upgrade portions of SR 14. However, funding is not provided through this planning process and these projects are not currently included in the Statewide Transportation Improvement Program.

3.11.1.2 Rail Transportation

The Burlington Northern Santa Fe Railway operates a rail mainline that runs parallel to SR 14 to the south of the project site. This line is a major link that ties the important industrial areas of Vancouver, BC; Portland, Oregon; and Seattle/Tacoma, Washington to the north-central states of the United States and eastern railroads via Chicago. In the project vicinity, SDS currently has two rail spurs from the Burlington Northern Santa Fe mainline to an existing SDS facility located along the Columbia River in Bingen, Washington. One spur terminates near Maple Street and is approximately 800 feet long. The second spur terminates at a plywood facility in the area and is approximately 2,000 feet long.

3-221

3.11.1.3 River Transportation

River transportation in the project vicinity includes barge and boat shipping transport on the Columbia River, which is located about two miles south of the project site and runs predominantly east to west towards the Pacific Ocean. The Columbia River is a major thoroughway used for transporting commodities such as grain, wheat, and lumber down river from the interior Pacific Northwest to ports such as the Ports of Longview and Vancouver for shipping to various U.S. and international destinations. The Columbia River also is used to ship goods upriver to destinations in the interior Pacific Northwest. Although there are many hydroelectric dams and associated lockage facilities along the Columbia River, the only such facility between the Pacific Ocean and the project site is Bonneville Dam, at about river mile 146 on the Columbia River.

Barges moving upriver from the Ports of Longview or Vancouver are transported to the Bonneville Dam using tug boats. The barges and tugs bypass the Bonneville Dam via the lockage facility at the Dam. The Bonneville lockage facility accommodates commercial, government, and recreational vessels. The heaviest lockage traffic on average occurs during the month of August. Vessel traffic is typically heaviest on Thursdays, Fridays, Saturdays, and Sundays. River vessels then continue upriver past the SDS facility in Bingen. At this SDS facility, there is a dock and crane suitable for unloading heavy materials and other equipment.

3.11.1.4 Air Transportation

Air transportation in the regional area includes the Portland International Airport approximately 60 miles southwest of the proposed project site, and several other smaller public and private local airports within a 10-mile radius.

3.11.2 IMPACTS

To determine potential transportation impacts, the Skamania County Public Works Department Manager, the County Engineer, and the Maintenance Superintendent were consulted. Potential impacts to potential project access routes were considered, and levels of service were estimated for the construction and operation periods. Impacts were considered high if they would result in a decrease in LOS to below the Skamania County standard of LOS C at a given intersection after mitigation. Impacts would be moderate if the project would result in a modest change to traffic volumes, patterns, or LOS. Impacts would be low if the project would result in no noticeable change to traffic volumes, patterns, or LOS. Potential impacts to rail, river, and air transportation also were evaluated to determine whether there would be significant increases in uses or interference with their operations.

3.11.2.1 Proposed Action Construction

Impacts to Project Vicinity Roadways

During project construction, various types of construction vehicles would access the project site. Most project construction vehicles would be expected to travel to the general project vicinity via

3-222

SR 14 since it is the most convenient major highway leading to the area. From SR 14, the construction access route would follow Cook-Underwood Road to Willard Road, and then use a short segment of newly-constructed roadway to access West Pit Road (see Figure 3.11-2). From West Pit Road, construction vehicles would use a network of existing, improved, and new private logging roads at the site to access areas where project facilities would be built (see Figure 3.11-3).

Project construction would last for approximately one year, and would involve transport of large wind energy components, such as the tower sections, the nacelle and turbines, and blades, to the project site during a two to three month period. All wind energy components initially would be delivered from their manufacturing points to one of two ports in Washington state – either the Port of Longview or the Port of Vancouver. From these Ports, the project components would be transported to the project site. Potential methods for transporting these materials to the project site include:

- Using specialized trucks that would use existing State, County, City, and private

roadways to deliver the components directly to the project site;

- By train via the existing Burlington Northern Santa Fe rail lines that run parallel to SR 14 to deliver the components to an existing SDS facility in Bingen, Washington, and then using specialized trucks to deliver these components to the project site; and
- By barge and tug boat up the Columbia River and through the lockage facility at the Bonneville Dam to SDS's existing facility in Bingen and then via specialized trucks to the project site.

Potential impacts associated with specialized trucks are discussed in this subsection of the analysis; the rail and river transport options are discussed later in this section. The specialized trucks used for transporting wind energy components could have loads as high as 17.5 feet tall measured from the ground to the highest point of the load, as wide as 14.5 feet, and/or as long as 150 feet. While most of these trucks would not exceed the WSDOT legal load limit, some trucks could have a gross vehicle weight in excess of 105,500 pounds. Trucks with loads in excess of the legal load limit could degrade the condition of the existing roadways along the proposed haul route, and may require additional axles in order to distribute the weight of the load. Permits would be required for all oversized and overweight vehicles.

Most specialized trucks delivering components directly from either of the Ports to the project site would be expected to use SR 14 to the west junction of Cook-Underwood Road with SR 14 at MP 56.28 (see Figure 3.11-2). These trucks would encounter restrictions on SR 14 that are summarized in Table 3.11-6, and could require additional traffic control measures. However, SR 14 would not require improvements to accommodate the trucks the transport of wind energy components.

Comments: These "specialized trucks" would be traveling in the National Scenic Area, on two lane roads that are used by a lot of tourists. Of course there would be impacts to local, tourist, and other truck traffic! What we don't know from this DEIS is how horrible these impacts would actually be. And, we don't know how they would degrade the roads and who would be responsible for fixing these roads.

3-223

33758687_123.cdr

Figure 3.11-3

Source: GeoDataScape. Project Site Roadway Network

Due to the road constraints discussed in Section 3.11.1.1 and identified in Table 3.11-6, the use of specialized trucks on SR 14 may not be physically possible for some extremely large or wide loads. An alternate route would be for trucks to use I-84 through Oregon to the Boardman junction, then along SR 730 to the junction of I-82 with SR 395, across the Columbia River back into Washington State and then to SR 14. Trucks traveling on SR 14 in this direction, between the junction of I-82/SR 395 and Cook-Underwood Road, would be constrained by one very narrow tunnel with a height restriction of 13 feet 3 inches measured vertically from the edge of the roadway. There also are several additional Columbia River crossings west of the I-82/SR

395 crossing, but each has weight restrictions that would prohibit the transport of wind energy components. These crossings include the Bridge of the Gods, the Hood River Bridge, SR 197, and SR 97.

Table 3.11-6 Road and Bridge Restrictions for Oversize Motor Vehicles on SR 14 (all restrictions apply in both directions)

Milepost	Height	Width	Length
18.89 to 34.68			
(west of project)			
Loads over 10' wide require 1 front and 1 rear pilot cars			
19 to 56			
(west of project)			
Loads over 14' wide require 2 front and 1 rear pilot cars			
19 to 83.53			
(west and east of project)			
Loads over 125' – trailer/load length prohibited			
56.28 to 63.25			
(west of project)			
All over-height (14') loads must contact WSDOT Goldendale Office			
Detour via Cook-Underwood Road must be approved by Skamania County			
No loads over 12' wide allowed			
Loads between 8.5 and 10' wide require 2 front and 1 rear pilot cars			
65 to 65	Hood River		
Bridge Crossing			
(east of project)			
No over-width loads allowed			
76.77 to 76.91			
(east of project)			
All over-height (14') loads must contact WSDOT Goldendale Office			
Loads over 10' wide require 2 front and 1 rear pilot cars			

a. Heights are measured from the ground to the highest point on the load. For wind energy components transported either by rail or barge as discussed below, these

components would be delivered from either of the Ports to the existing SDS facility in Bingen, Washington, and then loaded onto specialized trucks at this facility. The trucks would then transport the components to the project site. The route for these trucks would include approximately 0.25 mile of Maple Street in Bingen, Washington. Maple Street was recently constructed and is in good condition. Maple Street has two 12-foot lanes, a wide concrete sidewalk on the east side, and a paved shoulder on the west side. There are currently no oversize or overweight restrictions for this road.

Specialized trucks leaving the SDS facility would then follow SR 14 to the east junction of SR 14 and Cook-Underwood Road at MP 63.32. This portion of SR 14 has a restriction on loads over 125 feet in length. Special provisions and/or permitting may be required to transport the turbine blades (the longest components) to the junction of SR 14 and Cook-Underwood Road at MP 63.32 from the junction of SR 197 (MP 83.50).

3-225

Improvements to County and private roads between SR 14 and the project site would be necessary to support the long and heavy loads that would be required for the delivery of the wind energy components. These improvements would include widening and rebuilding sections of the existing roadway network, as well as placing asphalt on some roads that would be used for hauling equipment and project components to the project site. All existing county roadways requiring improvements prior to hauling would be designed and constructed in accordance with the WSDOT Design Manual (WSDOT 2007) and A Policy on Geometric Design of Highways and Streets (AASHTO 2004).

Cook-Underwood Road contains a bridge that crosses the Little White Salmon River near its northernmost point at approximate MP 5.5. Specialized trucks would be required to meet Skamania County provisions for oversized and overweight loads. Cook-Underwood Road would require no improvements to accommodate the transport of wind energy components. However, specialized trucks transporting wind energy blades, the longest single wind energy component, eastbound on SR 14 onto Cook-Underwood Road at MP 56.28 or westbound onto Cook-Underwood Road at MP 63.32 would require a 135-foot inside turning radius, and a 20-foot allowance for “tip swing.”

In addition, temporary widening of the intersection of Cook-Underwood Road and Willard Road would be required to accommodate the required truck turning radii for westbound trucks transporting wind energy blades to the project site. Widening could include removal of some trees and vegetation, and engineered fill sections and embankment cut sections. The engineered fill and embankment cut sections would not require paving, but would require an all-weather driving surface. The exact amount of right of way or easement that might be required from adjacent property owners would depend on the turbines chosen, and would be determined during final design. Following construction, the area would be re-vegetated. No other improvements would be required along Willard Road to accommodate the transport of wind energy components

A new direct connection across property owned by SDS would be required between Willard Road and West Pit Road for transport of larger project components to the project site. The

intersection of Willard Road and West Pit Road would be designed to accommodate the required truck turning radii. In addition, West Pit Road would require additional permanent widening to accommodate transport of wind energy components to the project site. West Pit Road would be improved to provide a minimum drivable section width of 25 feet (width of finished road), with an additional 5 feet of shoulder on either side, with allowance for side slope and drainage. The one existing culvert, which was upgraded during the summer of 2009, may need some additional lengthening if the roadway is widened over the culvert. Widening could include removal of trees and vegetation, and engineered fill sections and embankment cut sections. The engineered fill and embankment cut sections would not require paving, but would require an all-weather driving surface.

Roadway Construction at the Project Site

To provide access to all of the proposed wind tower locations, approximately 7.9 miles of existing roads would be improved and about 2.4 miles of new private access roads would be constructed at the project site (see Figure 3.11-3). All roadway improvements and new construction at the proposed project site would be designed and constructed in accordance with

3-226

the standards for the applicable road classifications as set forth in the Skamania County Private Road Guidelines and Development Assistance Manual, as adopted by the County Resolution in 2008.

New gravel roadways would extend toward and run along the turbine strings. Roads extending towards the turbine strings would be designed for a minimum drivable section width of 25 feet with allowance for side slope and drainage. Roads running along or between the turbine strings would be designed for a minimum drivable section width of 25 feet with an additional 5-foot section on both sides to accommodate drainage and clearance for the project crane that would be on site to assemble the tower sections, the nacelles, and blades. All newly constructed roads would be constructed with an all-weather driving surface.

During construction, parking would be located at the construction staging area and along the proposed project site access roads. Parking along turbine string roads would be primarily for those employees working on foundations, electrical infrastructure, and turbines. Vehicles would park in areas that would be already temporarily or permanently disturbed from other construction activities. No additional ground disturbance would occur solely for construction parking requirements.

Impacts to Traffic Volumes and LOS

During project construction, there would be an increase in traffic activity in and around the project site due to the construction workforce, equipment deliveries, and empty trucks returning to SR 14. Traffic delays could occur on project area roads due to the maneuvering of large vehicles carrying heavy and/or long loads. In addition, it is expected that approximately 265 personnel would be on site at the same time while multiple construction disciplines conduct work

concurrently. Between 65 and 75 percent of the construction labor force would most likely be hired from the cities of Portland and Vancouver; of these, most are expected to commute daily to and from the project site. The remaining 25 to 35 percent of the work force would most likely be residents of Skamania, Klickitat, and Hood River counties.

Traffic volumes during construction were estimated for the west and east junctions of Cook-Underwood Road with SR 14. The estimated traffic volumes assume that all construction vehicles related to project construction would travel through either the east or the west junction Cook-Underwood Road with SR 14; if other routes were used, the actual impacts to these junctions would be less.

Table 3.11-7 compares estimated traffic volumes without the proposed project to estimated traffic volumes with the proposed project during the peak construction period. As shown in this table, it is expected that at the peak of construction (a period of three to five months) during the AM peak hour, approximately 210 construction vehicles would travel through either junction of SR 14 and Cook-Underwood Road. During the PM peak hour, approximately 10 construction vehicles would be expected to travel through this same junction. Also during this construction peak, an increase of up to 275 vehicles total would be southbound on Cook-Underwood Road from the project site during the PM peak hour.

3-227

Table 3.11-7
Estimated 2011 Traffic Volumes
during Peak Construction Period

Location	2011 Without Project	2011 With Project	2011 Without Project	2011 With Project
	AM Peak	PM Peak	AM Peak	PM Peak
West Junction of Cook-Underwood Road with SR 14	160	100	370	105
East Junction of Cook-Underwood Road with SR 14	180	110	390	115
Eastbound	160	100	370	105
Westbound	180	110	390	115
Southbound	70	230	160	240
Cook-Underwood Road	10	10	20	285
	10	10	20	285

AM Peak Hour is 7:00 AM to 8:00 AM

PM Peak Hour is 4:00 PM to 5:00 PM

Peak-hour LOS analyses were completed for both the west and east junctions of SR 14 and Cook-Underwood Road using estimated 2011 traffic volumes, including non-project traffic and traffic related to construction. The analysis assumed that 65 to 75 percent of construction traffic trips would travel to and from west of the project site on SR 14, and 25 to 35 percent of construction traffic trips would travel to and from east of the project site on SR 14. Many of these trips would occur outside of the peak periods, depending on their origin location and start time. Analyses results are presented in Table 3.11-8.

Table 3.11-8
Level of Service during Construction

Location	Peak Hour	Estimated 2009 LOS	Estimated 2011 LOS Without Project	With Project Delay (sec/veh)	LOS
West Junction of Cook-Underwood Road SR 14	Eastbound Left Turn	AM 7.6	A 7.6	A 8.4	A
		PM 7.9	A 8.0	A 8.0	A
	Southbound Left/Right Turn	AM 9.4	A 9.4	A 14.7	B
		PM 10.0	A 10.1	B 14.1	B
East Junction of Cook-Underwood Road SR 14	Eastbound Left Turn	AM 7.6	A 7.6	A 8.4	A
		PM 8.0	A 8.0	A 8.1	A
	Southbound Left/Right Turn	AM 9.4	A 9.5	A 15.1	B
		PM 10.2	B 10.3	B 14.7	B

Delay = Average per vehicle

Based on this analysis, estimated 2011 traffic volumes, including construction vehicles, would have minimal impact on the LOS at either junction of SR 14, which would maintain LOS A. For vehicles turning left or right from Cook-Underwood Road at either the west or the east junctions

of Cook-Underwood Road with SR 14, delays would increase up to approximately six seconds per vehicle over estimated 2011 conditions. The southbound approach on Cook-Underwood

3-228

Road at the west junction with SR 14 would experience degradation in LOS from A to B during the AM hour over estimated 2011 operations. The southbound approach on Cook-Underwood Road at the east junction with SR 14 would experience degradation in LOS from A to B during the AM peak hour over estimated 2011 operations. LOS B operations would be maintained at both the west and east junctions of Cook-Underwood Road with SR 14 during the PM peak hour with no change in LOS over year 2011.

Traffic Hazards

Traffic hazards associated with construction projects generally relate to accidents. Construction of the project would require that many construction vehicles, including trucks with oversized and overweight loads, share the existing roadway network with the general public. As a result, some accidents could occur that would be directly attributable to construction traffic. This increase is expected to be temporary and minimal. Prior to project construction, coordination would be required between the owner, contractor, the Cities of Bingen and White Salmon, Skamania County, and WSDOT to ensure the highest level of safety possible for both the traveling public and the construction vehicles. This coordination would be particularly important during the summer months when the cities of Bingen and White Salmon experience an increase in traffic volume from recreational activities in the surrounding area.

SR 14 in the vicinity of the proposed project site is a two-lane undivided rural highway with limited access. Access points in the proposed project vicinity do not include roadway channelization for turning movements. PM peak traffic volumes at both the east and west intersections of SR 14 with Cook-Underwood Road would increase from an estimated 10 vehicles without the project to an estimated 285 vehicles with the project (see Table 3.11-7). While traffic delay would increase by approximately four seconds (see Table 3.11-8), LOS at both intersections in the PM peak would remain at LOS B. Construction worker traffic (workers travelling to and from the job site) is anticipated to have minor effects on traffic safety. Potential moderate impacts to travel safety could occur due to the turning movements of oversized and overweight trucks onto and off of Cook-Underwood Road during the peak construction period.

Impacts to Railroad Transportation

Some wind energy components also may be transported from either the Port of Longview or Port of Vancouver by rail to the existing SDS facility in Bingen, Washington. Wind energy components on rail cars can be up to 14.5 feet in width, up to approximately 15 feet in height, and as long as 150 feet. The wind energy components likely would be transported on standard or heavy-duty 89-foot long flat rail cars. These components would be off-loaded at the SDS facility to a staging location to be determined and loaded onto specialized trucks for transport to the project site.

Although the Burlington Northern Santa Fe rail line between Vancouver, Washington and the SDS facility could accommodate most wind energy components, this rail line may not be able to accommodate loads with widths in excess of 14 feet. This may preclude transport by rail of the wide bottom sections of the wind turbine towers; however, the nacelles, turbines, blades, and upper sections of the wind turbine towers still could be transported by rail. Because rail transport would only be used for components that could safely be transported by rail and would

3-229

be accomplished within existing railroad schedules, impacts to rail transportation are expected to be minimal to low.

Impacts to River Transportation

Potential impacts to river transportation would occur only if wind energy components were transported by barge from either the Port of Longview or Port of Vancouver to the SDS facility in Bingen, Washington. The wind energy components would be transported from the Ports upriver to the Bonneville Dam using by barges and tugboats. The barges and tugboats would bypass the Bonneville Dam via the lockage facility, and continue upriver to the existing SDS facility in Bingen, Washington. The wind energy components would be off-loaded at the SDS facility to a staging location to be determined and loaded onto specialized trucks for transport to the proposed project site.

Comment: What types of “specialized trucks” are we talking about here? How much do they weigh? What is this “staging location” and where is it located? Surely SDS knows where they can or cannot off-load any barged equipment!

There would be no oversized or overweight restrictions using barges at either of the Ports, on the Columbia River, or at the lockage facility at the Bonneville Dam. Coordination with the Bonneville Dam Project Office would be required to determine optimal times for lockage use. Because there would be no interference with river operations and shipping of project materials would be accomplished within existing lockage schedules, construction impacts to river transportation are expected to be minimal to low.

Impacts to Air Transportation

Temporary construction equipment such as cranes and derricks that would be used for the construction of the proposed towers could pose a hazard to aviation safety during the construction period, depending on their height. A “Determination of No Hazard to Air Navigation” likely would need to be obtained for certain taller wind energy components, such as the wind turbines, that would be constructed at the project site. It is not expected that local or regional airports would be used for transporting construction equipment or material, and no air transportation impacts would be anticipated.

Operation

Project operation would generate small volumes of additional traffic associated with workers commuting to the project and occasional service delivery trips. Project operation workers would generate approximately 30 daily trips, with service delivery trips ranging from zero to usually no more than four daily trips. Although the project will operate 24 hours a day, seven days a week, using an automated system, the operations crew would typically work eight-hour days Monday through Friday. The distribution of operational traffic trips is expected to be the same as for construction trips.

Impacts to Project Vicinity Roadways

Vehicles trips generated during project operation would consist primarily of employees commuting to and from the site in their personal vehicles. The number of additional trips, and the types of vehicles used, are not expected to exceed State or County roadway legal load limits. These vehicles would not contribute to roadway degradation.

3-230

Impacts to Traffic Volumes and LOS

Peak-hour traffic volumes were estimated for operations at both the west and east junctions of SR 14 and Cook-Underwood Road. These estimates include 2012 baseline traffic volumes and the project-generated traffic volumes. Like the analysis of traffic volumes during construction, the estimated traffic volumes assume that all vehicles during project operation would travel through either the east or the west junction Cook-Underwood Road with SR 14; if other routes were used, the actual impacts to these junctions would be less. Table 3.11-9 compares estimated traffic volumes without the proposed project to estimated traffic volumes with the proposed project during full operation of the project.

Table 3.11-9
Estimated 2012 Traffic Volumes during Operation
at Junctions of Cook-Underwood Road and SR 14

Location		2012 Without Project		2012 With Project		2012 Without Project		2012 With Project	
		AM Peak	PM Peak	AM Peak	PM Peak	AM Peak	PM Peak	AM Peak	PM Peak
Eastbound									
SR 14		170	100	180	100	180	110	190	110
Westbound									
SR 14		70	240	75	240	80	260	85	260
Southbound									
Cook-Underwood									

Road

10 10 10 25 10 10 10 25

AM Peak Hour is 7:00 AM to 8:00 AM

PM Peak Hour is 4:00 PM to 5:00 PM

Peak-hour LOS analyses were completed for both the west and east junctions of SR 14 and Cook-Underwood Road, based on the estimated 2012 traffic volumes. The results indicate that operations would have a minimal impact on the LOS for either the west or the east junctions of Cook-Underwood Road with SR 14. Delays would increase slightly—less than one second per vehicle—for vehicles turning left or right from Cook-Underwood Road at either the west or the east junctions of Cook-Underwood Road with SR 14 over estimated 2012 operations. LOS A and B operations would be maintained during the AM and PM peak hours at both the west and east junctions of Cook-Underwood Road with SR 14 with no change in LOS over year 2012. Analyses results are presented in Table 3.11-10.

Delay = Average per vehicle

During operations, employees would park at the Operations and Maintenance facility parking lot. There would be approximately 10 vehicles each day, including employee and delivery vehicles. A maximum of approximately 20 vehicles are expected to be parked in the Operations and Maintenance facility parking lot at any one time. A visitor kiosk is also planned at the Operations and Maintenance facility that would provide tourists with a safe place to view and learn about wind turbines. The parking lot would be sized to accommodate these uses.

Traffic Hazards

Because of the low volumes and infrequent trips, project operation is not expected to increase traffic hazards or accident occurrences.

Impacts to Railroad and River Transportation

Once construction is complete and the project is operational, it is expected that there would not be any use of railroad or river transportation for the proposed project. Because there thus would be no interference with railroad or river operations, there would be no expected impacts to railroad and river transportation during project operation.

Impacts to Air Transportation

The proposed wind turbines would not be expected to conflict with arriving or departing aircraft from either the public or private airports within the project vicinity. All towers would meet Federal Aviation Administration regulations regarding lighting. A "Determination of No Hazard to Air Navigation" would be obtained for the proposed project. The Federal Aviation Administration would need to be notified of any alterations to the wind turbine towers that could affect air space.

Project Decommissioning

In compliance with WAC 463-72, Site Restoration and Preservation, the Applicant will provide EFSEC with an initial site restoration plan at least ninety days prior to the beginning of site

3-232

preparation. The plan will address site restoration that would occur at the conclusion of the project's operating life (estimated to be 30 years), and restoration in the event the project is suspended or terminated during construction or before it has completed its useful operating life. The plan will include or parallel a decommissioning plan for the project.

The initial site restoration plan will be prepared in sufficient detail to identify, evaluate, and

resolve all major transportation issues presently anticipated, including impacts to traffic volumes and LOS standards. If impacts to transportation are anticipated to occur as a result of site restoration and project decommissioning, mitigation measures will be proposed as part of the plan.

3.11.2.2 No Action Alternative

Under the No Action Alternative, the project would not be constructed and therefore no additional auto or truck trips would be added due to the project. No impacts upon any type of transportation (road, rail, air, or river) would occur.

3.11.3 MITIGATION MEASURES

The following mitigation measures are identified to avoid, reduce, or compensate for potential project impacts to transportation.

- Prepare and implement a Transportation Management Plan to direct and obligate the contractor to implement procedures to minimize traffic impacts in consultation with both WSDOT and Skamania County. The plan should be submitted to EFSEC for approval and include requirements for coordination of project-related construction traffic and WSDOT planned construction projects, along with requirements for coordination of project-related construction traffic and Skamania County, City of Bingen, and City of White Salmon summer recreational traffic.
- Comply with State and County permitting requirements for over-size and over-weight vehicles.
- Notify land owners in the project vicinity prior to construction of transportation routes that would be used for construction equipment and labor.
- Place approved State and/or County advanced warning construction signs prior to and during construction.
- Use certified flaggers when necessary to direct traffic when over-size and over-weight trucks either enter or exit public roads, to minimize risk of accidents.
- Avoid restricting traffic flow for more than 20 minutes during the construction phase.
- Use pilot cars both in front of and behind all trucks transporting over-size or over-weight loads on all public roadways. For all loads over 10 feet wide traveling on SR 14 from east of the proposed project site between MP 76.77 and MP 76.91, use three pilot cars, two in

3-233

front and one in the rear. The two front pilot cars would be required to maintain a minimum 500 feet of separation. The lead pilot car would warn oncoming traffic of the over-size load, and the pilot car immediately in front of the over-size load would be responsible for stopping all oncoming traffic.

- Design and build all access road improvements or new construction according to WSDOT and Washington State access management standards.
- Conduct pre- and post-haul construction visual assessments of roadway surface conditions to identify weak or deteriorated areas along the haul route that may require repair as a result of

project-related traffic. Following the end of construction, repair all pavement sections affected by project-related traffic as needed to pre-construction conditions or better.

- Perform all snow removal from project access roads in a safe manner that does not degrade roadway conditions.

3.11.4 UNAVOIDABLE ADVERSE IMPACTS

No major unavoidable adverse impacts to traffic and transportation have been identified. Construction of the project is anticipated to have very minor impacts to LOS standards, and to have a potential very minor impact on traffic safety. Operation of the project is anticipated to have little to no impact to transportation.

3.12 PUBLIC SERVICES AND UTILITIES

This section describes impacts to public services and utilities. The project area and site are served by a variety of public services and utilities. Public services discussed include fire

protection, law enforcement, emergency medical services and schools. Utilities discussed include telephone, electric, sewer, water and solid waste disposal.

3.12.1 AFFECTED ENVIRONMENT

3.12.1.1 Public Services

Fire Protection

As discussed in Section 3.6.1.2, Public Health and Safety, fire protection services are provided by two city fire departments (North Bonneville and Stevenson) and seven Skamania County fire districts provide fire protection to Skamania County residents. DNR also provides fire suppression services to forested areas in Skamania County, and would be the first responder to a fire emergency at the project site (J. Weeks, personal communication).

Law Enforcement

As discussed in Section 3.6.1.3, Public Health and Safety, the Skamania County Sheriff's Office would provide law enforcement services to the project. Sheriff's Office headquarters are located in Stevenson, approximately 15 miles southwest of the project site. The response time from Sheriff's Office headquarters to the project site is approximately 20 minutes.

Additionally, the Washington State Patrol patrols SR 14, which is south of the site. Construction and equipment delivery vehicles would travel on SR 14. Roads extending north of SR 14 are county roads, and are patrolled by the Sheriff's Office.

Emergency Medical Services

As discussed in Section 3.6.1.4, Public Health and Safety, two ambulance companies would respond to an emergency at the Project site: Skamania County Emergency Medical Service and Skyline Ambulance. Skamania County Emergency Medical Services is the functioning entity of Skamania County Hospital District No. 1, which provides ambulance service to the residents of Skamania County. Skyline Ambulance is based at Skyline Hospital in White Salmon, and is equipped with three ambulance vehicles.

The two hospitals closest to the project are Skyline Hospital in White Salmon (7 miles southeast of the project) and Providence Hood River Memorial Hospital in the City of Hood River (8 miles southeast of the project).

3-235

Schools

The public school closest to the project site is the Mill A School, which is approximately 2 miles southwest of the site. The next closest public schools are in the community of Carson, approximately 10 miles west of the site. School buses may drive through neighborhoods near the project site, including Willard and Mill A, which are located approximately 2.25 and 1.5 miles

respectively from the site.

Mill A School District No. 31 provides public educational services to the population in the district (ESD 2008). Mill A School currently enrolls 81 students in grades K through 8 in the southeastern corner of Skamania County adjacent to the project site. High school students living within the boundaries of the Mill A School District attend Stevenson High School in the Stevenson-Carson School District No. 303, which borders Mill A School District No. 31 on the west. Table 3.12-4 shows that over the last few years, enrollment in these five districts has not changed more than five percentage points, on average.

Source: Washington State OSPI (2008).

There are no higher education facilities near the project area. The higher education facilities closest to the site are located in Vancouver, Washington.

3.12.1.2 Utilities

The site area is served by the following utilities:

- Telephone: Embarq
- Electric: Skamania County Public Utility District (PUD)
- Sewer: Individual septic systems
- Water: Individual wells
- Solid Waste Pickup: Skamania County

3-236

Embarq provides telephone service to the area surrounding the site (D. Cox, personal communication). The Skamania County Public Utility District (PUD) is a customer-owned utility that provides electricity service to Skamania County. The PUD's primary source of power is obtained from BPA, which markets power generated by the federal hydroelectric facilities along the Columbia River. The PUD's backup power source is the Condit Dam. The PUD has expressed interest in using the project as a source of backup power when the Condit Dam is removed.

The homes and businesses in Mill A and Willard do not have sewer service or water service, and are served by individual wells and septic systems.

Skamania County provides solid waste pick-up service to residences and businesses in the County, including those near the project site (Skamania County PUD office staff, personal communication). The majority of solid waste from Skamania County is delivered to the Roosevelt Regional Landfill in Klickitat County (WSSWIC 2009). The landfill began operations in 1990, and as of 2000 had in excess of 140 million tons of remaining permitted capacity. The landfill site contains more than 2,000 acres in which additional capacity could likely be permitted (Klickitat County 2000).

3.12.2 IMPACTS

3.12.2.1 Proposed Action

The potential impacts of the proposed project on public services and utilities include those from construction and operation.

Construction

The use of construction workers from outside the immediate area could result in a minor and temporary increase in the demand for public services including police departments, providers of emergency medical services, and local fire departments.

The impact of project construction on local schools would be at most minor and temporary, as few out-of-area construction workers are likely to be accompanied by families for this temporary construction project.

Construction-related impacts to local utilities providing telephone, electric or solid waste pickup are also expected to be minor and temporary. Most workers would not be in the area for long enough to obtain these services; those who stayed in temporary housing in the area would not remain for more than a few months.

The presence of construction vehicles on area roads would not impact the response times for emergency providers. Construction trucks would represent additional volume on area roads, but transportation LOS would remain at LOS A or B (delays of less than 15 seconds), and thus would not cause substantial delays to emergency response vehicles. Construction activities themselves would take place entirely within land managed for commercial forestry by the Applicant, and would not impact local emergency providers.

Fire Protection

The project site is generally forest land. The only structures proposed on the forest lands are the towers, associated transformers and substation, and the Operations and Maintenance facility. Project construction could temporarily increase the risk of fire at the project site and in the broader project area. As the landowner, S.D.S Co., LLC has the ability to respond to fires on their forest land with dozers and water trucks.

Fire response on forest lands is provided by DNR. They have resources in the area and respond to all wildland fires. DNR would likely respond to a structure fire in the woods, as would Underwood Fire District and Mill A Volunteers. Mill A Volunteers is not a recognized fire district with a tax base but a volunteer fire company; the group has joint responder agreements with Underwood and DNR.

Underwood Fire District is the nearest local fire district and has submitted a comment (scoping comment #108) to EFSEC regarding their ability to respond to fires and provide services. The Underwood fire chief commented:

“The area designated for the energy project is outside our district; DNR is the official service provider for these areas. The Project may have a generally positive impact on the ability of our department and DNR to offer fire protection services to the area because new roads, extensions, and improved existing roads will provide better access for all first responders. If necessary, Fire District 3 can provide service coverage to the Project area without any reduction in service capacity to our constituency. We do not have a contract to provide service to the area. The project does not present any challenges or requirements for which we are not already prepared to respond.”

There are two potential locations for the Operations and Maintenance facility site, one on-site next to the substation and the alternative site along West Pit Road near the intersection with Willard Road. The alternative site would have a shorter emergency response time than the on-site option.

Law Enforcement

Construction activities associated with the project would increase traffic volume on roadways surrounding the project site, as a result of both commuting construction workers and the transportation of materials. This increased volume would likely occur in mid-summer to fall when vacationers use the roadways. It is possible that the number of accidents and calls for service along major roadways (e.g., SR 14 and I-84) would increase for approximately six months, after which most of the on-site work would be done.

The demand for traffic enforcement activities would peak when construction employment peaks at approximately 265 employees for approximately one month. Out-of-area workers are not

expected to move their families into the project area because each construction phase requiring workers with specialized skills would be completed within three and one-half months or less. They would likely either commute (from the Portland-Vancouver area) or stay in temporary housing for the period of time needed to complete their tasks. As described in Section 4.4

3-238

Socioeconomics of the Application for Site Certification, this analysis assumes that as many as 40 non-local workers could be employed at the project site during the peak construction month (this includes potential out-of-state workers) and would likely stay in temporary housing. There likely would be additional calls for response during the construction phase, primarily because of increased traffic and accident potential. However, because the construction period is short (approximately one year), the increased service calls are not anticipated to be sufficient in number to require additional law enforcement staff resources in the project area. See Section 3.11, Transportation, for further discussion of traffic safety hazards.

Comment: There is no real, data-based socio-economic analysis in the DEIS. SDS and BPA have failed to do any analysis on the socio-economic cumulative impacts to Skamania County as a result of this proposed project. During the public scoping period, SDS Lumber presented that a total of FIVE permanent jobs (some technical and others as watch personnel) would result from this project. As far as I can determine, pillaging 1000+ acres for five jobs is not a good return on our environmental investment!!

Emergency Medical Services

During project construction, the local demand for emergency medical services could increase slightly due to construction accidents that could occur at the project site or project vicinity. Project construction workers would be exposed to hazards caused by equipment failure, natural disaster, or human mistake that would require the services of local emergency response units to provide initial treatment and transportation to a local medical facility and the services of emergency rooms in the receiving facility. The specific level of demand for emergency medical service response is unknown.

With adequate safety measures in place, and considering the size of the construction workforce (which would temporarily reach a peak of 265 workers for one month) it is expected that project construction would generate few serious injury accidents requiring emergency medical services response. The two local hospitals (Skyline Hospital in White Salmon and Providence Hood River Memorial Hospital in Hood River) have capacity for additional patients and there are ambulances available to service the project site.

It is expected that an average of 31 and a peak of 40 construction workers would temporarily migrate to the local labor market from either outside the immediate tri-county area of Skamania, Klickitat and Hood River region or from out of state. However, because the duration of their stay in the project area would be short (approximately four months), it is unlikely that these temporary workers would create a noticeable increase in demand for emergency medical services during project construction.

Schools

An average of 21 (40 at peak) specialized non-local construction workers from out of the area would work on the project. However, the anticipated maximum duration of employment for each craft is three to three and one-half months, and few workers are anticipated to move their families to the area. Further, much of the construction will take place during the summer months when school is not in session. Consequently, construction is expected to cause little to no additional enrollment. The Mill A and White Salmon School Districts have the capacity to handle any influx. The White Salmon Valley School District commented during scoping:

“Economically this project has the potential to benefit the community and the school district by adding revenues without creating additional demands for services or impacts on the school system.”

3-239

Construction traffic is not expected to lower transportation LOS below LOS A or B (delay less than 15 seconds), and consequently there would be little or no impact on school busses in the area.

Utilities

Water Supply. During the approximately one-year construction period, approximately 1.7 million gallons of water would be consumed for road compaction, dust control, wetting concrete, and other construction purposes. The construction contractor would supply water used during construction. Water would be delivered to the project site via water trucks and obtained from a local source with a valid water right. This impact would be negligible considering the temporary nature of the impact and the availability of adequate water supplies.

Wastewater. No impacts to community wastewater disposal systems are anticipated because the project would not be connected to a sewer system during construction. Sanitary wastes would be collected in portable toilets during construction. Disposal of sanitary wastes would be managed through a contract with a portable toilet vendor. The contractor would incorporate applicable state capacity requirements based on the construction worker population on the project site at any given time. Collected wastes would be managed and disposed of by the contracted vendor.

Solid Waste. During construction, the primary wastes generated would be solid construction debris such as scrap metal, cable, wire, wood pallets, plastic packaging materials and cardboard. The total volume of construction wastes is expected to be less than ten tons. This waste would be accumulated on site in drop boxes until hauled away to a licensed transfer station or landfill by either the construction contractor or the Skamania County Solid Waste Division.

The majority of solid waste from Skamania County is delivered to the Roosevelt Regional Landfill in Klickitat County (WSSWIC 2009). The landfill began operations in 1990, and as of 2000 had in excess of 140 million tons of remaining permitted capacity. The landfill site

contains more than 2,000 acres, in which additional capacity could likely be permitted (Klickitat County 2000).

Operation

Project operation would create a potential positive impact on public services and utilities. The project's assessed value could be as much as \$87.5 million, and this would generate approximately \$731,500 per year in property tax revenue and \$50,000 in sales tax revenue. Assuming that an annual tax revenue of \$731,500 would be distributed in the same manner as current property tax distributions, funds receiving the most revenue would be the State School Fund (\$185,281), School District 405 Maintenance and Operations (\$149,461), the County Road fund (\$115,035), and the Current Expense fund (\$111,086). The sales tax revenue would be split between Washington State (approximately \$46,000) and Washington Counties, primarily Skamania and Klickitat Counties (\$4,000). Section 3.13.2 Impacts provides additional information on revenue. Although impacts are expected to be minimal, a portion of these funds could nevertheless be used to upgrade existing public services and utilities in Klickitat County.

3-240

The project would have eight to nine on-site employees during operation. Given this small number, and considering the use of on-site services and emergency response plans, the project is expected to have minimal adverse impact on local public services and utilities.

Fire Protection

Fire protection would continue to be provided by S.D.S. Co., LLC, DNR, Underwood Fire District and Mill A Volunteers. Potential for fire during operations would be lower than during the construction period, and the remaining fire risk could be mitigated through appropriate operational practices. DNR has stated that resources for fire protection and suppression services are adequate to serve the project during construction and operation (J. Weeks, personal communication).

Wildfires in the project area are relatively rare, and DNR continually monitors fire conditions.

Turbine fires are possible; however, with the types of modern wind turbines proposed for the project, turbine malfunctions leading to fires in the nacelle are extremely rare. The turbine control system detects overheating in turbine machinery, and internal fires would be detected by these sensors, causing the machine to shut down immediately and send an alarm signal to the central supervisory control and data acquisition system, which would notify operators of the alarm by cell phone or pager.

Law Enforcement

The Sheriff's Office resources are generally adequate to serve the project during construction and operation, given that on-site security is provided by a separate party (D. Cox, personal communication). Whistling Ridge Energy LLC would likely contract locally for private security.

Emergency Services

The project would not result in a decrease in response times for area service providers during operation. The project's eight to nine permanent employees would not represent a substantial increase in traffic volumes on area roads that would impact emergency response, nor would project facilities result in additional traffic controls.

Schools

The addition of eight to nine employees, even if all were from outside the local area and had families, would represent a minimal impact to local schools, especially since they would likely live in more than one school district.

Utilities

Upon completion, the project and either of the proposed sites for the Operations and Maintenance Facility would be served by the following utility systems:

- Telephone. Embarq and Sprint. Both providers have adequate capacity to serve the site.
- Electric service. Skamania County PUD/BPA connection. Electricity would be used at the Operations and Maintenance building. The PUD has adequate capacity to serve the site. The impact would be the same at either alternative location for the facility;

3-241

however, the alternative site at West Pit Road would be closer to existing PUD lines. No new BPA infrastructure would be needed for the electrical transmission interconnection system beyond the proposed interconnection and substation.

- Drinking water. Estimated water use during operation would be less than 5,000 gallons per day, primarily for showers, kitchen, and bathroom for Operations and Maintenance staff. Since the staff would work eight-hour shifts Monday through Friday, total water use is likely to be equivalent or less than a single-family home. Water would be supplied by an on-site well. A well using less than 5,000 gallons of water a day would be exempt from permit requirements in RCW 90.44.040. The well would be installed by a well contractor licensed pursuant to Chapter 173-162 WAC, and in compliance with the requirements and standards of Chapter 173-160 WAC. The well would be installed consistent with Skamania County Community Development Department and Ecology requirements for the new wells.
- Wastewater. Sewer service would be provided through an on-site septic system. The Operations and Maintenance facility would use less than 5,000 gallons per day of water, and since sewer flows are determined by indoor water use, total sewer flow is also likely to be equivalent or less than a single-family home. There is adequate space on either the project site or the alternative Operations and Maintenance site for construction of a septic field of sufficient size to serve this demand. The septic system would be built by a septic tank installer licensed by Skamania County, in accordance with all requirements of the

Washington Department of Health and the Skamania County Community Development Department Environmental Health Division.

- Non-hazardous waste. Solid waste pickup would be provided by Skamania County through Allied Waste, which has one of three garbage collection franchises for the County. The Roosevelt Regional Land Fill has adequate space for any routine nonhazardous waste from the project. .

Project Decommissioning

In compliance with WAC 463-72, Site Restoration and Preservation, the Applicant will provide EFSEC with an initial site restoration plan at least ninety days prior to the beginning of site preparation. The plan will address site restoration that would occur at the conclusion of the project's operating life (estimated to be 30 years), and restoration in the event the project is suspended or terminated during construction or before it has completed its useful operating life. The plan will include or parallel a decommissioning plan for the project.

The initial site restoration plan will be prepared in sufficient detail to identify, evaluate, and resolve all major environmental and public health and safety issues presently anticipated, including potential impacts on public services and utilities. If impacts to public services or utilities are anticipated to occur as a result of site restoration and project decommissioning, mitigation measures will be proposed as part of the plan.

3-242

3.12.2.2 No Action Alternative

Under the No Action Alternative the project would not be built. There would be no impacts to public services and utilities.

3.12.3 MITIGATION MEASURES

The following mitigation measures are identified to avoid, reduce, or compensate for potential project impacts to public services and utilities during construction or operation of the proposed project.

- Mitigate potential impacts to public services and utilities by using tax revenues generated by the project.
- Provide all local police, fire, and emergency medical agencies with emergency response information for the project, including employee contact information, procedures for rescue operations to the nacelles, and location of rescue basket. The Applicant would provide applicable emergency response information to local agencies prior to project construction and would review and update employee contact information annually and provide any changes to the appropriate agencies.
- Utilize fire precautions for staying abreast of fire conditions in the project area by contacting DNR. A Fire Protection and Prevention Plan would be developed for EFSEC approval and implemented, in coordination with the Skamania County Fire Marshall and

appropriate agencies. Both the wind turbine generators and the substation would be equipped with lightning protection systems. As seen in Table 3.6-5, Public Health and Safety, sources for potential fire and explosion along with measures to mitigate the risk of either occurring, are outlined.

- Maintain the use of a full-time security plan during project construction to reduce the potential need for increased police services to the project site. These law enforcement mitigation measures are outlined in Section 3.6.3, Public Health and Safety.
- Prepare emergency plans to protect the public health, safety, and environment on and off the project site in the case of a major natural disaster or industrial accident relating to or affecting the project. The construction specifications would require that the contractors prepare and implement a Construction Health and Safety Program that included an emergency plan. The Construction Health and Safety Program would include the following provisions:
 - Construction Injury and Illness Prevention Plan
 - Construction Written Safety Program
 - Construction Personnel Protective Devices
 - Construction On-Site Fire Suppression Prevention

3-243

- Construction Off-Site Fire Suppression Support
- Install the well supplying the Operations and Maintenance facility, at either of the two sites under consideration, by a well contractor licensed pursuant to Chapter 173-162 WAC, and in compliance with the requirements and standards of Chapter 173-160 WAC. The well would be installed consistent with Skamania County Community Development Department and Ecology requirements for the new wells.
- Coordinate and comply with the Skamania County Community Development Department Environmental Health Division, and would comply with all County and State septic tank and subsurface disposal field design, installation, and maintenance requirements

3.12.4 UNAVOIDABLE ADVERSE IMPACTS

The project would have no unavoidable adverse impacts to public services and utilities. The small amount of additional services and utilities that would be needed would be offset by the increased tax revenue.

Comment: When SDS first proposed this project, Mr. Jason Spadaro, SDS's president held a couple of community meetings in the area. I attended one of these meetings and took notes. These are my notes from the Mill-A meeting held on Aug. 11th, 2007: My notes from the SDS August 11th, 2007 presentation on the Mill-A Wind Generation project called "Saddleback": Audience questions are italicized.

Jason Spadaro, SDS president gave the presentation and he had a representative from Puget Sound Energy, Brian Lentz (sp?) their partner in this project.

Jason/Skamania County has too much federal land base so it won't benefit from wind energy as much as other counties. [Why can't wind turbines be on Federal lands? There are cattle, sheep, miners, etc., using Federal lands! Why not wind turbines?]

Some questions that came to my mind as he spoke:

? What about migration routes for animals? Danger from blades? (Wasco just this week, of 27 August, had a fatality from a broken blade.)

? View shed? Visibility?

? Water issues?

? Transmission lines—how will the generated electricity get to market? Power stations?

Jamie Tolfree, Skamania County Commission for District 3, said that the county will get less timber dollars in the next 5 years; down by 30% by 2011.

Jason/We want to keep the power local. But he makes no promises. Jason said that tax rates for Mill-A residents could be lower. Jobs would be produced.

? But, would tax rates actually go down for Mill-A residents only? Or would the tax rate decline (if there is one) be spread out over the whole county and its residents?

? Costs to public?

? Are there any EPA regs for wind turbine noise?

? *Are there tax credits given to start up wind energy companies?*

Jason spoke of "turbine flicker" where sunlight flickers as it the sun shines through the blades. [It can be very annoying as anyone who has ever had outside branches "flickering" in the afternoon sun, can attest to!]

? FAA requirements?

? *Affect on bats, owls, night-flying animals?*

Jason has 4 years of data on sensitive, threatened, or endangered species for the project area. According to him, this is not an area where they would be in great numbers. [I think the Jason's survey may not be accurate!] The turbines are 80 meters tall (approx. 240 feet.)

Jason stated that BPA's transmission lines go through the property and that they would hook up with those lines. There are two types of transmission lines up there, 115 KV and 230 KV. Clyde Leach, one of three Skamania County Public Utility District

Commissioners, said that he would like to see SDS's project connect to the 115 KV line in order to improve PUD's service. [There are, apparently, transmission problems on the 115 KV line and there are power fluctuations.] Leach also said that the demand for turbines for wind energy production has created a backlog of in turbine production. Jason said that they are working on a 2010 timeline.

Roads/Jason—will necessitate year-round roads. Some will have to be upgraded. County roads may require upgrades and “we’ve talked to the county about this.” (Too bad the county hasn’t talked to the rest of us!)

? Who would pay for these upgrades? Environmental reviews? SEPA?

Johanna asked about lightning strikes and possible fires. Jason/The towers are grounded and there is a 50 foot radius gravel area around each tower. [The fire issue is a very big concern for residents in Mill-A.]

Mildred Boucher asked if the view shed from I-84 would be affected. Jason/The turbines could possibly be seen from Mosier.

LeeLynn asked how much would the local schools get. What would be the benefit to the county? Jason/State schools would get \$171,000. We want economic benefit for Willard and Mill-A, but there’s no tax mechanism to benefit these schools directly. The project area is actually in the White Salmon school district.

? *How are utilities taxed? What basis?*

One member of the public suggested that SDS subdivide their land around Mill-A and Underwood so people could build more houses. Lots of loud disagreement from the group!!

Jason/We could help you form a fire district and then we could pay into your fire district. BUT everybody else would also have to pay into the fire district—which they don’t do now. *A fireman in the audience spoke up: Could expand Underwood fire district except that Underwood has hit their levy limit.*

Johanna/What kind of people are you going to need to upkeep the towers? Jason/This is specialized work. A concrete 50 - 60 jobs during construction and 5 – 10 people to keep things going once the project is done. In Dayton, there are 83 towers and it takes 15 people to upkeep them. The technicians have to have knowledge about hydraulics and not be afraid of heights, etc.

? *Can SDS provide scholarships for trainees? Apparently there is a college program in The Dalles specifically geared toward wind power work.*

? What is the guarantee that those 50 – 60 jobs will be local?

? How much of your project is being subsidized? Jason/We would get a production credit of 1.98 cents/kwh for ten years. [This is a pretty good subsidy considering we pay less than 5 cents/kwh!]

Jason/The substation and a maintenance building would be within a fenced area and would not be visible.

Neal/What type of permitting process do you have to do? Jason/We have a pre-application conference with the county at the end of this month and next month. This project may require an EIS. May have to have scoping meetings. We estimate that the talks with the county could last 2 – 3 months. We're looking at 6 – 8 months on the low end and at least two public meetings. There might already be a record of certain environmental studies and we might not need to do a SEPA or NEPA.

Jason is delusional if he thinks that this project would not require a SEPA or an EIS! It is interesting that Jason has been talking to Skamania county but there has been no public record of any meetings and this subject has not been on the commissioners' agendas.

Comment continued: There are no indications in this presentation that Skamania schools would get any benefits from this proposal. The \$171,000 that Jason Spadaro talks about would go to the STATE school system to be distributed to all the school systems; the project area is actually in the White Salmon-Bingen, WA school district. There would not be, apparently, any benefits for the local fire district, either. Also, Jason did not speak to the amount of tax revenue that Skamania County would actually get from this proposal. The county's yearly budget is approximately \$50,000,000, with less than \$3,000,000 coming from property taxes. Since we don't have the data as to how much property tax this proposed wind farm would generate, there can really be no data-based cost-benefit analysis done on this proposal and any assumed benefits to Skamania County.

3.13 SOCIOECONOMICS

This section describes the potential impact of the proposed project on local socioeconomic resources. For the purpose of this analysis, the region is defined as the tri-county area that includes Skamania and Klickitat Counties in Washington State and Hood River County in Oregon State. The project area is defined as the area within approximately three miles of the

project site.

3.13.1 AFFECTED ENVIRONMENT

3.13.1.1 Demographics

Region

Table 3.13-1 shows the April 1, 2009 population for Skamania and Klickitat Counties, and the July 1, 2008 population for Hood River, Oregon. A greater percentage of all three counties live outside of incorporated areas. The incorporated cities closest to the project site are White Salmon, Washington, with 2,200 residents, and Hood River, Oregon, with 6,865 residents. The metropolitan area closest to the project site is the Portland-Vancouver-Beaverton metropolitan area, with a population of 2.2 million people. Table 3.13-1 also shows the population distribution for the region and the surrounding communities.

Minority residents represent 23 percent of the White Salmon population and 31 percent of the Hood River population. The minority population is primarily Hispanic/Latino. The tri-county

3-245

area including Skamania, Klickitat, and Hood River Counties is predominantly white, non-Hispanic. Hood River County has the highest minority percentage (31 percent) of population, followed by Klickitat County (16 percent) and Skamania County (11 percent). The State of Washington population includes 24 percent-minority residents. Oregon's population includes 20 percent minority.

In 2000, 17 percent of the population of White Salmon and Hood River were living below the poverty²² level. This same measure was 13 percent for Skamania County, 17 percent for Klickitat County, and 14 percent for Hood River County the same year. These percentages are higher than statewide averages for Washington and Oregon.

Comment: This information on minority populations shows a need for a full Environmental Justice portion to this DEIS. BPA, as a Federal agency is certainly required to prepare a environmental justice analysis for this DEIS. Why hasn't it been done? Just talking about environmental justice is not doing the research to see how rural communities and residents are being impacted by the proliferation of wind farms in the West; it is not analyzing the cumulative impacts of transmission lines and other energy production facilities on the health and welfare of these rural communities. Environmental justice must also apply to the environment and the flora and fauna that occupy it. What are the environmental cumulative impacts to flora and fauna? This is another fatal flaw of this inadequate DEIS. I will address Environmental Justice in a separate comment memo.

Table 3-13-1 Population Distribution in the Project Vicinity

Jurisdiction Population, April 1, 2000 Population, 2009

Skamania County 9,872 10,800

Unincorporated 8,079 8,465

Incorporated 1,793 2,335
 North Bonneville 593 880
 Stevenson 1,200 1,455
 Klickitat County 19,161 20,200
 Unincorporated 12,536 13,550
 Incorporated 6,625 6,650
 Bingen 672 685
 Goldendale 3,760 3,745
 White Salmon 2,193 2,200
 Hood River County (Oregon) 20,411 21,725
 Unincorporated 13,465 13,745
 Incorporated 6,946 7,980
 Cascade Locks 1,115 1,055
 Hood River 5,831 6,925
 Washington State 5,894,143 6,668,200
 Unincorporated 2,374,593 2,552,500
 Incorporated 3,519,550 4,115,700
 Oregon State 3,421,399 3,823,465
 Unincorporated 1,141,038 1,158,198
 Incorporated 2,280,361 2,665,267

Notes: 2000 estimates are April 1 estimates; 2009 estimates are April 1 for Washington State and counties, and July 1 for Oregon state and Hood River County.
 Sources: WOFM (2009), PSUPRC (2009).

Skamania County's population is expected to grow from 10,800 in 2009 to 11,720 in 2015, an annual average growth rate of 1.4 percent. Klickitat County's population is expected to grow from 20,200 in 2009 to 23,049 in 2015, an annual average growth rate of 2.2 percent. The

22 The Census Bureau uses a set of income thresholds that vary by family size and composition to determine who is in poverty. If a family's total income is less than the family's threshold, then that family and every individual in it is considered in poverty. The official poverty thresholds do not vary geographically, but are updated annually for inflation. The poverty threshold in 2000 for a family of four with two related children under age 18 was \$17,463 (US Census 2009).

3-246

growth rates for both Skamania County and Washington State are expected to slow by 0.3–0.4 percentage points during 2015 to 2025. The population growth rate for Klickitat County is expected to slow from 2.2 to 1.1 percent for 2015 to 2025. Skamania County is expected to have 12,915 residents by 2025 and Klickitat County is expected to have 25,831 residents by 2025. Hood River County is expected to grow 1.3 percent annually on average, during 2009–2015 and 2015–2025.

Project Area

In 2008 the three census block groups within 3 miles of the project site had 3,347 residents. Approximately 12 percent were minority. Nine percent lived below the poverty level in 2000; fewer than for the region generally.

3.13.1.2 Housing Region

In 2008 there were 5,409 housing units in Skamania County, 9,985 housing units in Klickitat County and 3,050 housing units in Hood River County. Occupancy rates in 2008 were 83 percent in Skamania County, 89 percent in Klickitat County and 90 percent in Hood River County, representing 909 vacant units in Skamania County, 1,078 vacant units in Klickitat County and 892 vacant units in Hood River County. In 2000, median gross rents were 13 percent lower in Skamania County and 25 percent lower in Klickitat County than for Washington as a whole. Median gross rent in Hood River County was 13 percent lower than in Oregon as a whole in 2000.

Project Area

The existing residences closest to the project site are approximately 0.48 mile and 0.8 mile from the proposed turbine locations. A new homesite location has been applied for, which would be located approximately 2,000 feet (0.38 mile) from the site's south property line. It is unknown if the applicant for this permit has secured all approvals or has proceeded with construction plans. One of two alternative Operations and Maintenance facility sites is located approximately 0.9 mile west of the project site on West Pit Road. The nearest residence to this potential site is approximately 0.25 mile away. The other alternative Operations and Maintenance facility site is located on the project site adjacent to and north of the substation, farther from residential areas.

The unincorporated community of Willard is located approximately 2.25 miles northwest of the project site. The unincorporated community of Mill A also is located near the project site, approximately 1.5 miles west of the site. The homes near the project site are in a rural setting, primarily single family and between 30 and 50 years old.

Temporary Housing

Over 1,000 hotel rooms and 39 recreational vehicle (RV) or tent campsites exist within 25 miles of the project site (Table 3.13-2). Assuming an average occupancy rates of 70 percent, a minimum of 325 hotels rooms or RV/tent campsites are available at any one time.

3-247

Table 3.13-2 Temporary Lodging Units

Type of Lodging Units within 25 Miles of Project Site
Hotel or Motel 1,043

RV Camping 21
Tent Camping 16
Cabin or RV 2
Total Units 1,082
Units Available Assuming 70% Occupancy 325

Source: Woodall (2008), TravelWashington (2008).

3.13.1.3 Employment Region

In Skamania County, there were approximately 3,254 jobs in 2007 (BEA 2009), representing a gain of 138 jobs over 2006 levels. The principal sources of employment in Skamania County were local government, accommodation and food services, federal government, and manufacturing (Golubcow 2006a and 2006b). “Place of work earnings” (wages, salaries and proprietors’ earnings) accounted for only one-quarter of total personal income in the county, with income from property (dividends, interest and rent) and transfer payments (mainly Social Security) making up the balance. The annual unemployment rate in Skamania County was 6.6 percent in 2007 and 8.4 percent in 2008, higher than for Washington State (4.5 percent in 2007 and 5.5 percent in 2008).

In Klickitat County, there were approximately 9,839 jobs in 2007 (BEA 2009). Of these jobs, SDS and Broughton Lumber Company employ a work force of up to 325 employees during their busiest production times, which is equivalent to three percent of total jobs in Klickitat County.²³ The principal sources of employment were local government, retail trade, and professional and technical services. Place of work earnings accounted for about 46 percent of total personal income in the county, with income from property and transfer payments making up the balance. The unemployment rate in 2007 was 6.7 percent, and in 2008 was 8.2 percent. These unemployment rates were higher than for Washington State as a whole.

There were 15,787 jobs in Hood River County in 2007 (BEA 2009), representing the highest employment of the three counties in the region. Place of work earnings accounted for 59 percent of total personal income in the county, with income from property and transfer payments making up the balance. The principal sources of employment were manufacturing, health care and social assistance, local government, and retail trade. The unemployment rate in Hood River County was 4.6 percent in 2007. In comparison, the annual unemployment rate for Oregon as a whole was 5.1 percent in 2000 and 5.2 percent in 2007.

Table 3.13-3 shows unemployment rates in the region for 2000, 2007 and 2008. Hood River County has the lowest unemployment rate of the three counties in the region. The most recent

²³ Located in Bingen, SDS jobs are reported as part of Klickitat County statistics even though logging operations occur in both Skamania and Klickitat Counties.

3-248

available annual unemployment rate in Hood River County (2007) is roughly two percentage points lower than the same measures for Klickitat and Skamania Counties and 0.6 percentage point lower than for Oregon as a whole.

Table 3.13-3
Unemployment Trends

Geographic Area		Unemployed		2000 Annual		2007 Annual		Annual 2008 (Washington areas) and December 2008 (Oregon Areas)	
No.	Percent	No.	Percent	No.	Percent	No.	Percent	No.	Percent
Skamania County	290	6.0	340	6.6	450	8.4			
Klickitat County	700	7.5	650	6.7	820	8.2			
Hood River County	757	6.6	592	4.6	712	5.7			
Washington State	151,340	5.0	154,720	4.5	192,000	5.5			
Oregon State	93,196	5.1	100,517	5.2	158,369	8.0			

Sources: WESD (2008), OED (2009).

a. The most recent annual statistics for Washington are for 2008 and are shown in this column. The most recent annual statistics for Oregon are for 2007. This column shows (for the Oregon areas) the most recent unemployment rate available for both Oregon and Hood River County, which is the December 2008 monthly unemployment rate. The annual rates, however, do not show the impact of the economic recession, which began to be felt at the end of 2008. These effects can be partially seen by comparing monthly unemployment rates between 2008 and 2009 (through August, the latest month available) which are shown in Table 3.13-4. Table 3.13-4 shows that in August 2009, Skamania County’s unemployment rate was 3.1 percentage points higher than for the same month in 2008. The comparable figures are 2.9 percentage points for Klickitat County and 3.3 percent for Hood River County.

Table 3.13-4 Monthly Unemployment Rates, 2008 and 2009

Month	Skamania County		Klickitat County		Hood River County	
	2008	2009	2008	2009	2008	2009
January	8.9	14.5	9.2	12.7	5.5	8.5
February	9.5	14.2	8.9	12.3	5.2	8.9
March	8.5	15.1	7.0	12.9	5.0	9.6
April	7.8	14.2	7.3	12.1	4.6	9.6
May	7.1	11.9	7.2	9.9	5.1	10.6
June	7.8	12.0	6.5	10.3	5.6	9.2

December 11.7 N/A 9.6 N/A 6.3 N/A

Source: BLS (2009).

3-249

Project Area

The project site is used for long-term timber production. Although the number of jobs in the project area is unknown, approximately 400 homes or businesses exist within three miles of the project site, and approximately one-third of these homes or businesses are located in Willard.

Minority and Low-Income Populations

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, states that each federal agency shall identify and address, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority and low income populations. The Order further stipulates that the agencies conduct their programs and activities in a manner that does not have the effect of excluding persons from participation in, denying persons the benefits of, or subjecting persons to discrimination because of their race, color, or national origin.

As stated above, the 2000 Census indicated that Skamania County had a minority population that consisted primarily of Hispanic/Latino persons which accounted for only 11 percent of the total population in that county. Additionally, of the total population make-up for Skamania County, 13 percent were living below the poverty level as indicated by the 2000 Census.

Comment: So, where is the Environmental Justice analysis for the region and the cumulative impacts to the region from the energy production activities of BPA and SDS Lumber and all the other energy producers in the region? Environmental Justice not only addresses impacts to populations but it addresses environmental impacts. Why are wind farms being located in low population, rural areas when the energy they produce mainly benefits large, urban areas that are not even located in the region? Where is the environmental justice in using and abusing rural areas that produce food, clean water, and other resources for energy production for urban areas? There is no environmental justice in this!

3.13.1.4 Public Finance and Fiscal Conditions

Due to the location of the proposed project within Skamania County and Washington State, these two jurisdictions would be the primary beneficiaries of tax revenues related to project construction and operation. Washington State and Skamania County collect several types of taxes:

- Payroll taxes. Washington State collects payroll taxes for workers' industrial insurance,

unemployment compensation, and other purposes. While Counties do not directly benefit from payroll taxes, these revenues have a direct beneficial impact to Skamania County residents.

- Business and occupation taxes. Business and occupation taxes, which are paid on the gross receipts of business activities, are the second-largest revenue source for Washington State. Skamania County does not levy a business tax, so although it does not benefit directly from Business and occupation taxes paid by businesses within Skamania County, the state as a whole would benefit.
- Retail sales and use tax. In Washington State, the first 0.5 percent of retail sales tax goes to the local county.
- Property tax. Skamania County collects property taxes for taxing districts within the County. The project site is within Taxing District 109, for which the total assessment rate is \$8.026839/\$1,000 assessed value. This revenue is split between the County, Washington State, and the local taxing district.

3-250

In 2008, Skamania County started with a beginning fund balance of \$25.6 million, and accrued revenues of \$13.7 million that year. The largest revenue fund categories were intergovernmental revenues (43 percent), general property taxes (21 percent) and charges and fees for services (10 percent). Expenditures in 2008 were \$19.4 million. The largest expenditure categories were law and justice services (26 percent), general government (20 percent), transportation (19 percent) and natural resource (10 percent) (Table 3.13-5).

Dollars in each of the revenue and expenditure categories are distributed among the General Fund, Special Revenue Fund, Debt Service Fund, Capital Project Fund and Enterprise Fund. Approximately 54 percent of all revenue dollars are in the General Fund, and 39 percent of the revenue dollars are in the Special Revenue Fund. Most of the expenditure dollars were in the General Fund (57 percent) and the Special Revenue Fund (37 percent).

The project site is within Taxing District 109, for which the total millage rate²⁴ is \$8.026839/\$1,000 assessed value. The millage rate is broken down in Table 3.13-6.

Table 3.13-5 Skamania County Revenues and Expenditures, 2008

Category	Amount
General Property Taxes	2,814,374
Sales & Use Taxes	362,938
Other Local Taxes	614,543
Licenses & Permits	182,553
Charges & Fees for Services	1,331,765
Interest & Investment Earnings	1,228,335
Fines & Forfeits	478,440
Rents, Insurance Premium, Internal Contributions, Miscellaneous	840,764
Intergovernmental Revenues	5,855,309
Total Revenues	13,709,021

Beginning Fund Balance 25,623,475

3.13.2 IMPACTS

3.13.2.1 Proposed Action

Impacts of the proposed project are divided between construction and operation.

Construction

Business and Economic Impacts

Design and construction of the proposed project is expected to begin in 2011. Operation is expected to commence by 2012. During the estimated one-year construction period (excluding engineering, design, specifications, and survey), approximately 330 full-time and part-time workers would be employed at some point during construction. Some of these jobs would not last the entire construction period. The on-site construction work force would peak at approximately 265 workers over the construction period and average 143 workers over the 12 months (Table 3.13-7).

Source: A. Barkley (personal communication)

An estimated 65 to 75 percent of the construction labor force would likely be hired from outside the tri-county area, and 25 to 35 percent would be residents of the tri-county area including Skamania, Klickitat, and Hood River counties (A. Barkley, personal communication).²⁵ (This estimate is based on the relative size of the labor force in the tri-county area compared to larger labor forces in metropolitan areas that are farther away.) This would translate to 66 to 93 (peak) and 36 to 50 (average) workers from the tri-county area and 172 to 199 (peak) and 93 to 107

(average) workers from outside the tri-county area, primarily the Portland-Vancouver metropolitan area. At peak, the construction workforce would represent 32 to 45 percent of the estimate size of the construction workforce in Skamania County in 2007 (BEA 2009).

The total cost of construction is \$150 million. Total payroll costs, including fringe benefits and other labor overhead costs, are projected to be approximately \$18 million, of which approximately \$4.5 million (25 percent) is expected to be earned in the tri-county area (A. Barkley, personal communication), based on the assumption by the Applicant that approximately one-quarter of the construction workforce would already live in the tri-county area.

Non-labor costs are estimated to be \$132 million. Construction materials, services and equipment leasing associated with construction are projected to total approximately \$13.2 million (10 percent of total non-labor costs) (A. Barkley, personal communication). The Applicant estimates that most of this spending would take place in the tri-county area.

25 This information, along with estimated average and peak workforce size and number of full-time and part-time jobs related directly to project construction, are project-specific estimates provided by the Applicant.

3-253

Spending by suppliers, local project workers and households would benefit the retail trade and services sector, as well as other sectors of the local economy. To estimate the value of these indirect and induced impacts, assumptions specific to project construction were provided by the proposed project owner (A. Barkley, personal communication), and were used as inputs to the IMPLAN regional input/output model. These assumptions are as follows and were also mentioned above:

- Local non-labor construction expenditures would be approximately \$13.2 million
- Labor income earned by local residents would be approximately \$4.5 million
- Approximately one-quarter of the workforce (36 workers, taken as a percentage of the average workforce size of 143 workers) would be current residents of the local area

Based on these assumptions and using IMPLAN modeling software, indirect and induced value added from construction is estimated to be approximately \$3.9 million.²⁶ Project construction would result in 71 indirect and induced jobs (Table 3.13-8). Total direct, indirect and induced value added would be an estimated \$8.5 million. Total employment (direct, indirect and induced) would be an estimated 107 full-time and part-time jobs. These effects would continue throughout the construction period.

a. Totals may not add due to rounding.
 26 Value added is the difference between the proposed project's total output and the cost of the proposed project's inputs. For the construction industry in the tri-county area, value added is comprised primarily of employee compensation (IMPLAN 2008). Value added is a measure of the contribution to output in the tri-county area made by project construction.

3-254

Economic effects would occur beyond the tri-county area in the form of jobs, income and spending. These effects would occur due to spending (attributable to project construction) that would occur outside the tri-county area. Although these effects were not quantified as part of this analysis, 65 percent to 75 percent of the construction workforce would live in areas outside the tri-county area; therefore, spending would likely increase in the areas where these employees reside. Also, non-labor construction procurements that occur in areas outside the tri-county area (estimated to be approximately \$119 million) would result in economic benefits. Areas that benefit could include the metropolitan area closest to the proposed project (Portland-Vancouver) as well as other areas in the Northwest and the nation as a whole.

Comment: So, Skamania County wouldn't really benefit. It's the metro areas that would get the lions share of benefit. What are these "other areas in the Northwest"? How would the nation benefit from wind turbines scattered along the NSA? SDS cannot make such a blanket statement about the nation benefiting, without a lot of supporting environmental and economic data—data that is not included in the DEIS.

Population and Housing Impacts

Up to an estimated 15 percent of the construction workforce would be specialized craftsmen originating outside of Washington and Oregon (A. Barkley, personal communication). These workers would likely have relatively short assignments, and few would be expected to bring their families to the area. The remaining 85 percent of non-local workers would likely come from the Portland-Vancouver area. Assuming as a worst-case scenario that one-third of the workers from the Portland-Vancouver metropolitan area would stay in temporary lodging near the project site Monday through Friday, and the specialized, temporary staff also would require lodging, the population that would require housing in the tri-county area is expected to range from 75 workers to 85 workers during peak construction. These construction workers would be expected to seek temporary accommodation in the general vicinity of the project site, and to use motels, trailers, campers, and other forms of transient housing. Given that 325 of the approximately 1,082 hotel rooms or RV campsites within 25 miles of the project site would be available at any one time, the out-of-area workers would not cause a substantial impact to the availability of transient accommodation in the project vicinity. The construction phase of the proposed project is not expected to affect median housing values, median gross rents, or new housing construction.

Fiscal Impacts

Overall fiscal impacts of project construction are expected to be positive, based primarily on increased employment and spending in the local economy.

Sales Tax Revenue. The total cost of construction is estimated to be approximately \$150 million. Non-local procurements would include wind power generation equipment purchased from various domestic and foreign suppliers. Depending on legislation currently under consideration in the state legislature, state sales and use tax may be levied only on procurements that are not directly related to electricity generation. Should the state sales tax exemption for wind power be extended, capital equipment such as turbines, transformers, transmission cables, and substation equipment would not be taxable.

Local procurements are estimated to be 10 percent of total procurements (\$13.2 million) (A. Barkley, personal communication). An estimated 90 percent of local procurements would be directly related to electricity generation, and would not be subject to sales tax should the state sales tax exemption for wind power be extended. Taxable sales due to project construction is therefore estimated to be approximately \$1.32 million, resulting in \$92,400 in sales and use tax

3-255

revenue using the sales tax rate (7.0 percent) for the project site, which is located in unincorporated Skamania County.

Most of the sales tax revenue due to project construction would accrue to Skamania County because the project site is located in Skamania County. However, if taxable construction supplies are purchased in another Washington State county (Klickitat County, for example), and not shipped to the project site, the county in which the purchase occurred would receive the county portion of the sales tax revenue on that purchase. Of the total estimated \$92,400 in sales tax revenue, Washington State would receive \$85,800 and Skamania County (or the counties where materials or supplies are purchased and not shipped to the site) would receive \$6,600.

If a portion of taxable construction materials or supplies are purchased in Hood River County, the owner must pay use tax to Washington State, in which case the tax would go to Washington State (6.5 percent) and Skamania County (0.5 percent). Sales tax revenue would not accrue to Hood River County. Klickitat County could receive a portion of the sales tax revenue, but as stated above, the majority of the county portion is expected to go to Skamania County.

In addition to the \$92,400, the proposed project would result in modest increases in sales tax revenues due to local purchases by construction workers.

Property Values and Property Tax Revenue. Construction activities are not likely to adversely affect property values in residential and commercial areas near the project site because the construction period would be relatively short. Construction of the proposed project would not affect property tax revenues.

County Expenditures. Construction of the proposed project would require that many construction vehicles, including trucks with over-size and over-weight loads, share the existing roadway network with the general public. Skamania County could experience a small increase in traffic-related costs due to the need for permitting and control measures related to these vehicles, particularly for the over-size loads. Some accidents could occur that would be directly attributable to construction traffic, but any increase is expected to be minimal.

The County could experience minor to negligible increases in the cost of public services such as fire suppression, law enforcement, governmental services, parks and recreation, and hospital costs during construction due to the additional traffic and the temporary population. These are not expected to be significant in the context of the County as a whole.

Operation

Business and Economic Impacts

Operation of the proposed project would result in a positive economic impact to Skamania County, the tri-county area, and the State of Washington due to increased tax revenues, employment, and local expenditures.

Project operation would require eight to nine full-time or part-time Operations and Maintenance

employees. Approximately 75 percent of employees (7 employees) would originate from the tricounty area (A. Barkley, personal communication). An additional temporary workforce with

3-256

appropriate skills would be utilized during major maintenance or other non-routine operational work. Efforts would be made to hire local individuals to staff the proposed project as much as practicable.

The estimated gross payroll, including fringe benefits and other payroll overhead for the operational workforce would be \$1.5 million, or an average annual labor cost of \$167,000 to \$188,000 per employee. Subtracting approximately 25 percent to estimate benefits and overhead, the implicit wage would be within 10 percentage points of the 2007 standard industrial wage for construction workers in Skamania County (IMPLAN 2009).

In addition to the direct employees, project operation would result in indirect and induced employment, for an estimated total of 12 permanent jobs resulting from the proposed project (Table 3.13-9).

North American Industry Classification System categories that are 0 are not shown.

a. Totals may not add due to rounding

Using IMPLAN regional economic modeling software for the power generation and supply industry in Skamania, Klickitat, and Hood River Counties, a wind power facility employing nine

full-time workers would have a gross annual operating cost valued at approximately \$3.75 million. This would include direct purchases from suppliers (including fuels, maintenance supplies and services, retail goods and professional services).

An alternative methodology for calculating job impacts is used by the Renewable Energy Policy Project, which estimates that every megawatt of installed wind capacity creates about 4.8 job-years of employment, including both direct and indirect jobs (REPP 2009). Using this methodology, the proposed project, which would produce approximately 75 MW of electricity, would result in 360 job-years or 12 jobs per year for the 30 year life of the proposed project.

3-257

As stated in Chapter 1, the purpose of the Project is to help meet the future need for energy resources while at the same time enabling SDS to further diversify its business through a technically and economically feasible project. When SDS started in 1946, there were 26 employees in its original crew. This number grew to a high of 450 employees during the 1970s when logging and lumber production were at a peak. Production has since slowed tremendously, as the supply of timber from national forests has sharply declined due to environmental legislation. For this reason, many of the mills in Skamania County have closed down. SDS was able to survive the crises and changes of the last 30 years and no longer relies on timber from national forests. SDS has scaled back operations, yet today SDS is one of the largest employers in Klickitat County, employing 325 people during busiest production times.

SDS has remained viable during changes in the market through expanding and diversifying its enterprises to include marine in 1984 and power produced in its steam-operated power plant, which creates energy from wood waste, a renewable, organic resource. The the Project is intended to provide another means of diversifying the holdings of SDS to ensure a continuation of a resource-based work force in Skamania County, and to create new construction and operation jobs at a time when jobs in Washington State are being lost. As shown in Table 3.139, the proposed project would create twelve new full-time jobs in Skamania County,

Comment: It is not EFSEC's job to "provide another means of diversifying the holdings of SDS" by condoning or approving this proposed wind farm! Throughout this DEIS, SDS has inserted the economic benefits to itself and its business model. There is very short shrift given to the environmental impacts and cumulative impacts from this proposal and all the other energy production actions that are ongoing in the region. This does not make for an adequate DEIS!

Population and Housing Effects

Of the nine permanent employees for the proposed project, seven are assumed to originate from the tri-county area, and two would be assumed to migrate to the area from other locations. Assuming an average household size of 2.6 persons, the population in the area could increase by approximately five people, and two households. At the most recent average housing vacancy rate available for Skamania County (16.8 percent), more than 900 housing units would be available in Skamania County alone. Thus operation of the proposed project would not impact

housing availability or cost.

The proposed project would not displace any minority or low-income populations. The proposed project would be constructed on private land currently used for forest production, and no residents would be displaced.

Fiscal Impacts

Property Values. Local communities near proposed wind turbine locations have expressed concern that constructing wind turbines would detract from views, which would in turn decrease their property values. A number of studies have been performed to determine the impact of wind power projects on property values. These include the following:

- The Lawrence Berkeley National Laboratory prepared *The Impact of Wind Power Projects on Residential Property Values in the United States: A Multi-Site Hedonic Analysis* in December 2009 (Hoen et al. 2009). Researchers collected data on almost 7,500 sales of single-family homes within 10 miles of 24 existing wind facilities in nine different US states. None of the models uncovered conclusive evidence of the existence of any widespread property value effects that might be present in communities surrounding wind energy facilities. Neither the view of the wind facilities nor the

3-258

distance of homes to those facilities was found to have any consistent, measurable, and

significant effect on the selling prices of those homes (Hoen et al. 2009).

- In 2006, ECONorthwest prepared *Economic Impacts of the Kittitas Valley Wind Project* (the Kittitas Study) for the Economic Development Group of Kittitas County, Washington. This report involved a survey of tax assessors in counties (other than Kittitas County) with wind projects to determine the potential effects of wind farms on property values. The Kittitas Study also conducted a review of the available academic literature for additional information on property value effects. The finding was that views of wind turbines will not negatively impact property values (ECONorthwest 2006).

- The Renewable Energy Policy Project prepared *The Effect of Wind Development on Local Properties* (REPP 2003). For this study, the project compiled a database that included every wind development that came on-line after 1998 with 10 MW installed capacity or greater. For all projects for which sufficient data was available, REPP conducted a statistical analysis to determine how property values changed over time in the viewshed and in the comparable community. The statistical analysis provided no evidence that wind development has harmed property values within the viewshed (REPP 2003).

- Responses to comments published as part of the 2009 Desert Claim Wind Power Project Final Supplemental Environmental Impact Statement state “the Final EIS referenced a 2003 report published by Kittitas County that summarized the existing literature on the effect of wind power projects on property values.” The response states that the study, which was prepared by Huckell/Weinman Associates, concluded that wind power facilities have not diminished the value of surrounding properties (EFSEC 2009).

- A literature review to assess the question of whether wind turbines in rural communities have the potential to affect residential property values was completed as part of the Lower Snake River Wind Energy Project Draft EIS (Ecology & Environment 2009). The Draft EIS reported that in 2008 Hoen and Wiser found (1) no statistical evidence that homes near wind facilities are stigmatized by those facilities, (2) no statistical evidence that homes with a view of wind turbines have different values than homes without such views, and (3) no statistical evidence that homes within 0.25, 0.5 and 1 mile of the turbines sell for different values than those located further away. In 2006, while assessing the impacts of a 20 turbine, 30 MW windfarm's visibility on residential property values in Madison County, New York, Hoen found no statistically significant relationship between either proximity to or visibility of the windfarm and the sale price of homes (Ecology & Environment 2009, Hoen 2006).

In summary, the results of these studies and literature reviews are that no statistical evidence exists that wind development has a harmful effect on property values within the viewshed. Therefore, property value impacts are not expected as a result of the proposed project.

Sales Tax Revenues. Sales, use and other indirect business taxes to state and local governments attributable to project operation are estimated at approximately \$50,000 per year. This estimate

3-259

is the sum of the estimated sales and use tax revenue from (1) the procurement of supplies and materials for the purpose of project operations, and (2) new employee spending in the area. The sales tax revenue would be split between Washington State (approximately \$46,000) and Washington counties, primarily Skamania and Klickitat counties (\$4,000).

The portion of non-labor annual operating cost that is not directly related to electricity production (10 percent of \$2.3 million, or approximately \$230,000) would be taxable (A. Barkley, personal communication). Applying the Skamania County sales and use tax rate (7.0 percent) to this amount results in an estimated \$15,800 in tax revenue.

New employee spending is estimating by taking the total labor income (direct, indirect and induced) from the IMPLAN operations model (approximately \$977,000 per year) and assuming that 70 percent of this amount is disposable income and 70 percent of disposable income is spent in local Washington counties. Based on these assumptions, related sales and use tax revenue would be approximately \$34,000.

With the proposed project, the project site would continue to be managed as commercial forest, excluding the area containing the turbine strings and roads. The project site covers 1,152 acres. Table 1-1 shows that the maximum area developed for the wind turbine foundations, connecting roadways and transmission lines would be 384 acres (approximately 33 percent of the 1,152-acre site). As specific locations are determined for turbines and other project components, the 384-acre area would be reduced. The areas that would experience permanent impacts and temporary construction impacts of the proposed project total approximately 108 acres (approximately nine percent of the 1,152-acre site). The 56-acre area that would be removed from timber production for the life of the proposed project is approximately five percent of the total project site. The

opportunity cost of taking this land out of timber production would include tax revenues for Skamania County and Washington State, and would be countered by the sales tax revenues resulting from wind energy sales.

Property Tax Revenue. The proposed project would have an estimated value of \$87.5 million, which would represent an increase of 6.5 percent in assessed value in the County. Using the average 2008 property tax rate for Skamania County of \$8.36/\$1,000 assessed value (WDOR 2009), the increase in property tax revenue to the County would be \$731,500. This would represent an annual revenue increase of 7.6 percent compared to the \$9.6 million in property tax collected in calendar year 2007. Although Washington State limits property tax increases to one percent of the previous year's levy, new construction does not apply, and would be added on after the one percent is added, using the previous year's property tax rate (V. Torres, personal communication). The increase in property tax revenue would begin one year after construction is complete, and continue for the life of the proposed project. However, to the extent the wind turbines depreciate over time, the assessed value of the turbines and therefore the property tax revenue also would decrease.

Comment: Skamania County collects less than \$3,000,000 per year in property tax. What does the \$9.6 million in property tax, above, refer to? What is the turbine depreciation over time? How much would the property tax revenue decrease over the 30 year predicted lifespan of the turbines and the project?

Additional property tax revenue would be distributed to a variety of County departments. Assuming that annual tax revenues of \$731,500 would be distributed in the same manner as current property tax distributions, funds receiving the most revenue would be the State School Fund (\$185,281), School District 405 Maintenance and Operations (\$149,461), the County Road

3-260

Comment: Skamania County's school districts are #2 and 303. Whose district are they talking about when they talk about School District 405? Is that White Salmon and Binger, in Klickitat?

fund (\$115,035), and the Current Expense fund (\$111,086). A portion of the State School Fund would be returned to Skamania County for Skamania County schools.

Property tax revenues would be higher to the extent that increased wages and economic activity in the County resulted in higher valued properties.

A different methodology was used by the National Wind Coordinating Committee, which estimates an increase of \$10 to \$14 in property taxes for each \$1,000 investment (NWCC 2009). Using this approach, the \$17.7 million dollars spent locally (labor and non-labor cost) would result in approximately \$177,000 to \$250,000 in additional property taxes. This estimate is lower than the forecast given above; however, the NWCC estimate is based on industry averages, while the first estimate is based on project-specific data.

County Services. The addition of five residents would cause a negligible increase in demand for and cost of public services. These would also be outweighed by the substantial economic benefits of the proposed project to the County.

Comment: Although a previous table purports to show 12 permanent jobs resulting from this proposed wind farm, in the statement above “the addition of five residents” would appear to support the number of permanent jobs as just FIVE, as stated by Mr. Spadaro, SDS’s president and chief proponent for this project, in several meetings. Which number is correct? Why the discrepancy?

Minority and Low-Income Populations. Environmental justice addresses whether the Proposed Action would disproportionately impact disadvantaged populations such as low-income and minority residents. The population in the study area (Skamania and Klickitat Counties, Washington; and Hood River County, Oregon) is predominantly white (non-Hispanic/Latino) and a review of data from the 2000 Census did not identify any specific geographic concentrations of minority groups. The Proposed Action would not be expected to disproportionately affect any low-income populations, based on per capita income information at the Census Tract level. Therefore, there would be no disproportionately high or adverse effects to minority or low income groups.

Project Decommissioning

In compliance with WAC 463-72, Site Restoration and Preservation, the Applicant will provide EFSEC with an initial site restoration plan at least ninety days prior to the beginning of site preparation. The plan will address site restoration that would occur at the conclusion of the proposed project’s operating life (estimated to be 30 years), and restoration in the event the proposed project is suspended or terminated during construction or before it has completed its useful operating life. The plan will include or parallel a decommissioning plan for the proposed project.

The initial site restoration plan will be prepared in sufficient detail to identify, evaluate, and resolve all major socioeconomic issues presently anticipated, including potential impacts to population, housing and employment. If socioeconomic impacts are anticipated to occur as a result of site restoration and project decommissioning, mitigation measures will be proposed as part of the plan.

3.13.2.2 No Action Alternative

Under the No Action Alternative, the wind power project would not be built. Socioeconomic conditions in the area would continue in their present condition.

3-261

3.13.3 MITIGATION MEASURES

The following mitigation measures are identified to avoid, reduce, or compensate for potential project impacts to any socioeconomic factors during construction or operation of the proposed

project.

- Impact to the local economy and social structure of the proposed project is expected to be beneficial, in the form of additional jobs, increased sales, and increased tax revenues. Temporary increases in population during construction are likely to be minor in view of the availability of housing, transient accommodations, and other public services in the region.
- Ensure that the applicant uses the local labor pool to the greatest extent possible; construction contractors would be required to advertise positions locally and to employ local workers to the greatest extent possible.

3.13.4 UNAVOIDABLE ADVERSE IMPACTS

The proposed project would result in beneficial impacts, primarily from employment during construction and operation. Minimal adverse impacts are expected.

3.14 CUMULATIVE IMPACT ANALYSIS

“Cumulative impacts” are the impacts on the environment which result from the incremental impact of an action, such as this Proposed Action, when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time (40 C.F.R. 1508.7).

This section describes existing development in the vicinity of the proposed project, as well as current and reasonably foreseeable future development planned for the area, and analyzes and describes potential cumulative impacts. The past, present, and reasonably foreseeable future actions provide the context to assess the cumulative impacts of these actions in combination with the Proposed Action.

Comment: Cumulative impacts analyses are not done on a project by project basis. They are done on a regional basis, especially when there are regional impacts from these types of proposals! BPA is a regional provider of energy and therefore must do a regional cumulative impacts report detailing the cumulative environmental impacts of all its activities! Certainly SDS Lumber is also obliged to do a cumulative impacts and effects analysis of ALL its regional activities, too. SDS has a quarry in White Bingen that recently had some environmental issues. SDS is proposing a huge condo development on the shores of the

Columbia River, in the National Scenic Area, that would result, if it comes to pass, in a large increase in population and a commensurate increase in local resources depletion. SDS has stated that it wants to also build a resort in Cascade Locks, OR, in the heart of the NSA. Another impact on local resources such as water and air quality, the Columbia River, quality of life, transportation, etc. SDS and BPA have failed to follow the CEQ's Considering Cumulative Effects : Under the National Environmental Policy Act Handbook in analyzing cumulative regional impacts and this is a very disastrous fatal flaw in this increasingly inadequate DEIS.

3.14.1 EXISTING DEVELOPMENT

The nature and extent of existing development in the vicinity of the proposed project is largely described earlier in this chapter in the sections for each environmental resource. The general project area is characterized by agriculture, commercial forestry, rural residential development, and a small number of commercial enterprises.

The proposed project site is located approximately two miles north of the Columbia River and directly north of the Columbia River Gorge National Scenic Area. The National Scenic Area extends along the Columbia River for about 85 miles and includes 292,500 acres in parts of three Oregon and three Washington counties. Although both the project site and the proposed access road are located completely outside the Scenic Area, the proposed project area does extend south

3-264

to the northern boundary of the Scenic Area. The Gifford Pinchot National Forest is located north of the project site.

On the Washington side of the Columbia River, land use is predominantly commercial forestry and residential in numerous small, unincorporated communities. There are approximately 400 residences and businesses within three miles of the project site (Figure 3.8-1). There is some limited agriculture, mostly pear and apple orchards recently augmented with some wine grape vineyards, located within the Columbia River Gorge National Scenic Area. On the Oregon side of the Columbia River, land use within the Scenic Area is predominantly commercial timber production and residential. South of the Scenic Area, land uses include commercial forestry, agriculture, and some residential. The primary Oregon orchard crops are pears, apples, and cherries.

Portions of the Project would be visible to drivers along I-84, which is located on the Oregon side of the Columbia River. For the purpose of assessing cumulative impacts to visual resources, views of other wind projects from I-84 were considered. I-84 extends for a distance of approximately 127 miles from Cascade Locks, Oregon (southwest of the project site on the Oregon side of the Columbia River) to the intersection with I-82, which leads north to the Tri-Cities. There are ten existing wind projects along this segment, all located within a distance of approximately 70 miles east of the Project site (to approximately Arlington, Oregon).²⁷ These ten projects could potentially be viewed by drivers along I-84 within a driving time of approximately one to 1.5 hours.

From Arlington, I-84 continues on in an easterly and the southeasterly direction, terminating at Pendleton, Oregon. There are no existing wind energy projects in this area. Farther east, there are wind energy generation projects southeast of the Tri-Cities, and west and southwest of Walla Walla (in both Washington and Oregon), more than 80 additional miles east-northeast. These were considered too remote for this analysis.

All of the ten existing wind energy projects are located east of the Columbia River Gorge National Scenic Area (Figure 3.14-1). Four are located north of the Columbia River in Washington, and six are located south of the river in Oregon. In contrast to the steep terrain and forested vegetation of the Project site, the ten operating wind projects located to the east are on lands with rolling hills, open vistas, and little or no vegetation. The projects that were considered include:

- Windy Point, 137 MW wind project west of Maryhill, Washington
 - Biglow Canyon I, 125 MW wind project in Sherman County, Oregon
 - Klondike (I – IIIA), 499-MW wind project in Sherman County, Oregon
 - Hay Canyon, 101-MW wind project in Sherman County, Oregon
- 27 See map at <http://www.nwcouncil.org/maps/power/Default.asp>.

3-265

- Goodnoe Hills, 94-MW wind project north of the Columbia River between Goldendale and Roosevelt, Washington
- Big Horn, 199-MW wind project in Klickitat County, Washington
- White Creek, 205-MW wind project near Roosevelt, Washington
- Leaning Juniper, 101-MW wind project near Arlington, Oregon
- Rattlesnake Road, 103-MW wind project near Arlington, Oregon
- Wheat Field, 97-MW wind project near Arlington, Oregon

3.14.2 REASONABLY FORSEEABLE FUTURE DEVELOPMENT

Reasonably foreseeable future development generally includes those actions currently underway, formally proposed or planned, or highly likely to occur based on available information. Various sources, including searches in the fall of 2009 of the web sites of the surrounding Skamania, Klickitat and Hood River Counties, Columbia River Gorge Commission, WSDOT, Oregon Department of Transportation, EFSEC, the Oregon Department of Energy, and the Ports of Skamania County, Klickitat County, The Dalles, and Cascade Locks, were made to obtain information about any current and potential future development in the project vicinity. Reasonably foreseeable development that may occur in the vicinity of the Proposed Action could include both other wind projects and roadway projects. (See Figure 3.14-1 for the general locations of this potential development.)

3-266

Columbia River Gorge National Scenic Area
Figure 3.14-1
Job No. 33758687 Existing and Proposed Development

In addition to the potential for cumulative visual impacts, two proposed projects in the project vicinity were identified as having a potential for other cumulative impacts with the Project. These projects are:

- Middle Mountain Wind Project. Hood River County is proposing this 9-MW project, which would be located approximately 10 miles south of Hood River²⁸. Six wind turbines are proposed in a single line on Middle Mountain. The project would be located approximately 15 miles south of the Project. The County has completed visual simulations, and a project informational meeting is scheduled for January 12, 2010. The County plans to continue its feasibility analysis in the coming months. Studies of impacts to biological resources have not been conducted.
- I-84 Bridge Replacements. Oregon Department of Transportation is repairing or replacing 21 bridges on I-84 through the Columbia River Gorge with new bridges²⁹. Several of these projects are located near Hood River and these improvements are grouped as follows:
 - I-84 Cascade Locks to Hood River. The bridges in this bundle span the junction of the Hood and Columbia rivers. Construction began in July 2008 and will be completed in fall 2010³⁰.
 - I-84 Exit 64 (Hood River). This bundle includes replacing the overpass bridge on Interstate 84 at exit 64 in Hood River and improving the interchange and Button Bridge Road beneath the overpass. Design work started in fall 2008 and will be completed by fall 2009. Construction is scheduled from early 2010 to late 2011³¹.
 - I-84 Hood River to The Dalles. These five bridges are located at the east end of the Columbia River Gorge. Construction on the Mosier Creek bridge replacement began in August 2008 and will be completed in fall 2010³². Design work on the remaining bridges is complete and construction is scheduled from spring 2009 until early 2012. Repairs to the I-84 bridges at Hostetler Way in The Dalles and over Rock Creek in Mosier were completed in summer 2007.

3.14.3 CUMULATIVE IMPACTS

The following subsections describe the cumulative effects that the Proposed Action, in combination with the past, present, and reasonably foreseeable future actions identified above, would have on the various environmental resources discussed in this EIS. Cumulative impacts from the combination of these actions could occur for each of the environmental resources. However, the contribution of the Proposed Action to these cumulative impacts would vary, with the greatest contribution occurring in cumulative impacts on visual resources as constructing and operating the Project would add a view of an additional wind power project to travelers in the Gorge. In addition to the existing projects east of the project area, long-distance travelers in either direction along I-84 could see some elements of the Project, for approximately 12.5 miles traveling west and 6.5 miles traveling east. Travelers along SR 14 would not see the Proposed Action, which would be blocked by the bluff to the north of the road. As discussed in more depth below in Section 3.14.3.10, the visual impact of the Project along I-84 would be variable, with the number of turbine strings visible changing with topography. In many places only a few turbines would be visible, and the area where the most turbines would be visible (directly across the Columbia River from White Salmon and Bingen) would also be the area where the viewer would be the farthest from the project area (Figure 3.9-1). This would constitute a small cumulative impact when considered in combination with views of other wind projects located from 35 to 70 miles to the east.

Low levels of adverse cumulative impacts have been identified for energy and natural resources from the use of steel, concrete and vehicle fuel for construction, and for transportation (traffic safety and increased risk of accidents during construction periods of the Project and the I-84 bridge replacement projects, if they should overlap). Simultaneous construction projects may create a beneficial cumulative socioeconomic impact to local communities. Finally, by introducing up to 75 MW of clean renewable energy into the regional electrical grid, the project will positively contribute to efforts to combat the cumulative impacts of climate change, and also contribute to efforts to improve air quality in the Columbia River Gorge vicinity.

Comments: This is not cumulative impacts analysis, folks. Table 5-3, Primary and special methods for analyzing cumulative impacts, in the CEQ NEPA Considering Cumulative Impacts Handbook (and I have provided EFSEC with a copy of this handbook in my previous testimony), lists these primary methods as follows: Questionnaires, interviews, and panels; checklists; matrices; networks and system diagrams; modeling; trends analysis [my comment: this is a very important part of any cumulative impacts analysis]; overlay mapping and GIS; carrying capacity analysis [my comment: this is a crucial and extremely important analysis and SDS and BPA have failed to do this analysis and it is a FATAL FLAW of the DEIS]; ecosystem analysis [my comment: VERY IMPORTANT and has not been done in this DEIS]; economic impact analysis [my comment: this has not been done. It involves establishing the region of influence, modeling the economic effects, and determining the

significance of the effects.]; social impact analysis [my comment: Social impact analysis addresses cumulative effects related to the sustainability of human communities by (1) focusing on key social variables such as population characteristics, community and institutional structures, political and social resources, individual and family changes, and community resources, and (2) projecting future effects using social analysis techniques such as linear trend projections, population multiplier methods, scenarios, expert testimony, and simulation modeling. SDS and BPA have not done these analyses for this proposal and this is yet another instance of a fatal flaw in this DEIS. BPA at least should know better than to try to avoid these types of analyses!

All potential cumulative impacts are discussed below.

3.14.3.1 Earth

Past and present commercial logging of the site and surrounding area, agriculture, and construction of rural residences have resulted in cumulative impacts to geology and soils, primarily through increased erosion and soil disturbance and compaction. As the reasonably foreseeable future actions are developed, these actions likely would contribute to cumulative impacts. Reasonably foreseeable use of the Project site for both the proposed the Project and for a continuation of commercial forestry could increase the potential for soil erosion, and contribute to these cumulative impacts for the life of the project.

3.14.3.2 Air Quality

While past and present development and activities have resulted in some deterioration of air quality in the project vicinity, the cumulative effect of these activities on air quality has been fairly negligible. Overall, the air quality in the region is considered good, as evidenced by

3-269

Oregon Department of Environmental Quality (ODEQ) reports on air quality for The Dalles, Oregon, the closest city with an air monitoring station. ODEQ reports air quality data using an air quality index based on particulate matter 2.5 micrometers diameter and smaller (PM2.5). ODEQ's 2008 report for The Dalles shows 339 days with good air quality, 25 days with moderate air quality, and no days with unhealthy air quality (ODEQ 2009).

While air quality in the project area is generally good, haze is a well-documented problem in the Columbia Gorge and the causes are being studied by the Southwest Clean Air Agency. In a 2008 Report, the agency found that haze was largely caused by winter stagnations that trap pollutants and fog (SWCAA 2008). In the summer, winds flow predominantly from the west, transporting emissions from the Portland metropolitan area into the Gorge. Wildfires also contribute to the haze when smoke is blown into the Gorge. There is no single source that is primarily responsible for haze; however, man-made sources are important contributors (ODEQ 2008). The most significant man-made sources contributing to haze in the Gorge include: power plant emissions; woodstoves; motor vehicles; non-road emissions (e.g. ships, trains, trucks); and agricultural sources of ammonia.

Construction of reasonably foreseeable future actions would be expected to generate dust and emissions during construction activities that could cumulatively contribute to air quality degradation. Construction of the terrestrial portions of the Proposed Action also would generate dust and emissions that likely would incrementally contribute, though slightly and only for a short time, to cumulative air quality impacts in the general project vicinity.

Climate Change. Past and present actions in the project vicinity, the region and across the globe have contributed to climate change and global warming. The past and present actions include, without limitation, the post-settlement conversion of native landscapes to residential, commercial and forestry uses, the introduction of carbon dioxide and other greenhouse gases from fossil fuel emission sources, particularly from automobiles and fossil fuel electrical generation sources, and in general, post-industrial manufacturing processes and land uses. Locally, residential, agricultural and commercial development is expected to continue a trend that permanently removes forests and replaces them with land uses that contribute to climate change.

“Climate change” refers to changes in the Earth’s global climate, including the rise in average surface temperature known as global warming. At this time, while there is nearly complete scientific consensus concerning the anthropogenic causes of global climate change, and also consensus on its deleterious impacts on the natural and human environment, there is uncertainty regarding the specific, localized effects of projected global warming upon regional temperature, precipitation and ocean conditions. The Federal Environmental Protection Agency (EPA) recently acknowledged that due to its impacts on climate change and related human health effects, carbon dioxide is considered an air quality pollutant requiring a regulatory response.³³

Footnote 33: In December, 2009, Environmental Protection Agency (EPA) Administrator Lisa Jackson announced that the agency had finalized its finding that greenhouse gases, including carbon dioxide, pose a threat to human health and welfare. The ruling allows the EPA to begin regulating greenhouse-gas emissions from power plants, factories and major industrial polluters, although the precise details of that regulation have yet to be worked out. “The threat is real,” said Jackson. “If we don’t act to reduce greenhouse-gas emissions, the planet we will leave to the future will be very different than the one we know today.”

3-270

The effects of global warming on the overall hydrology of the Columbia River Basin are difficult to separate from the natural variability resulting from cycles such as El Niño and the Pacific Decadal Oscillation. Further, forecasted changes to water supply or runoff volumes for the key Columbia River Basin drainages are more susceptible to shorter climatic cycles, such as El Niño and the Pacific Decadal Oscillation, than longer-term trends attributable to global warming. The variability seen in the Columbia River Basin over the last 80 years is greater than the variability experienced in the last 10–15 years. Therefore, even though the precise effects of global warming on the Columbia River Basin cannot be accurately determined at this time, estimated changes are within historic variations. Although precise forecasting of the future effects of global warming on the Columbia River Basin may not be possible at this time, it is possible to consider how the development of the Project will affect emissions of greenhouse gases such as

carbon dioxide.

Comment: The U.S. Forest Service's Pacific NW Experimental Station, located in our own Skamania County, at the old Wind River Nursery site (the oldest nursery in the Pacific NW, dating back to 1909), has put together a CD set on global climate change and its effects on the Pacific NW. One of their conclusions is that we will get more rain and less snow pack, something which will definitely affect BPA's energy production and local quality of life. There will be impacts on fish and other wildlife. One of the things that their research did not address was any changes in wind patterns resulting from global climate change. This is the FUTURE part of cumulative impacts analysis and should be done for this DEIS!

Reasonably foreseeable future actions, including continued use of fossil-fuel-burning automobiles, industrial processes, and electrical power generation are likely to continue, with cumulative impacts to air quality and acceleration of climate change through the continuing introduction of greenhouse gas emissions into the atmosphere. Power generated from wind displaces power generated by carbon dioxide emitting sources. In addition to wind energy generation being a non-emitting source, wind energy also is integrated into the hydropower system to reduce reliance on other thermal energy sources (i.e., coal, natural gas, or nuclear). Because the current mix of power sources in the Northwest relies heavily on thermal sources, electricity sourced from the wholesale market would likely have a significant greenhouse gas component, with attendant deleterious cumulative impacts. Integrating power generated by wind turbines into the hydropower system reduces reliance on other energy alternatives and avoids the need to procure 75 MW of electric power with a significant greenhouse gas component. Consequently, the Proposed Action will have a positive cumulative impact on efforts to combat air quality deterioration and climate change.

Comment: Although BPA states that it does not own any gas plants, it will need to rely on backups, perhaps even natural gas-powered plants, to back up its energy production. The more energy BPA is asked to produce the more power plants (or other types of machinery that will produce on-demand, quick backup) will have to be online to ensure flexibility and capability in the power grid. This is NOT a "positive cumulative impact" that would "combat air quality deterioration and climate change"! Cumulative impacts are not done on a project by project basis. They must be on a regional basis, especially when there is a regional energy producer, BPA, involved. Also, BPA is in the process of trying to build bigger and bigger transmission lines in order to produce and carry more energy production. These transmission lines have environmental effects and cumulative effects. There is nothing in the DEIS that addresses the environmental impacts and effects of past, present, and future transmission lines.

3.14.3.3 Water Resources Creeks and Streams

Past and present development and activities have cumulatively caused various adverse impacts to creeks and streams in the general project vicinity. Portions of some of these water bodies have been channelized or filled. Others have been affected by pollutants from stormwater runoff, wastewater discharges, and other sources. Reasonably foreseeable future actions, including

continued commercial forestry practices and the additional development of rural residences could also contribute to these cumulative impacts.

Roadway construction and maintenance in the project area and vicinity could increase stormwater runoff, and increase sedimentation and turbidity if construction equipment crosses drainage ways. The Proposed Action would incrementally contribute to adverse cumulative impacts to creeks and streams in the general project vicinity. In particular, the Proposed Action

3-271

would potentially add to cumulative impacts to Little Buck Creek on the east side of the project and possibly to Lapham Creek near the proposed site of the Operations and Maintenance Facility during project construction from construction site stormwater runoff that would result in temporarily increased sedimentation and turbidity. The Proposed Action and other cumulative projects also would have a longer-term adverse cumulative impact to these creeks through the addition of increased impervious areas, which would increase the amount of stormwater runoff to these creeks, however the increase in impervious surfaces for the Proposed Action are expected to be minimal and largely limited to the wind turbine foundations and the Operations and Maintenance building. Lapham Creek drains into the Little White Salmon River, which drains into the Columbia River. Implementation of stormwater detention and other stormwater management practices for the Proposed Action would serve to minimize and possibly avoid project contributions to these cumulative impacts, including contributions to cumulative impacts to other water bodies in the area, such as the Columbia River.

Groundwater Resources

Cumulative impacts to groundwater from past and present development and activities in the general project vicinity have included groundwater withdrawals for wells. The reasonably foreseeable future actions would cumulatively affect groundwater for additional wells, including the proposed groundwater use of up to 5,000 gallons per day for the Operations and Maintenance Facility. The Proposed Action could contribute to the cumulative effect of potential groundwater contamination; however the potential for spills or contamination would be no larger than existing commercial forestry or agricultural operations.

3.14.3.4 Vegetation and Wetlands

Vegetation and Habitat

Past and present land development, timber harvest, and agricultural uses have resulted in a cumulatively significant change in the composition of vegetation and habitat types in the project vicinity. In general, land development and agricultural uses have resulted in conversion of forested areas to non-forested areas, and timber harvests have resulted in a mosaic of forest ages, with average stand age declining over time from relatively short stand rotations. Changes in stand structure and complexity, patch size, and species distribution also have occurred. Few large, old-growth conifers or late-successional stands exist in the general project vicinity. Accordingly, past and present uses have resulted in cumulative habitat conversion and an

ongoing pattern of habitat fragmentation. Reasonably foreseeable future actions, such as ongoing land development and timber harvests, would continue this trend.

Project construction would take place in the context of the existing use of the project vicinity generally for commercial forestry, which includes regular cycles of clearcutting and reforestation. Nonetheless, by removing trees and other vegetation in the wind project area for the life of the project, development of the Proposed Action would contribute incrementally, though in a relatively minor way, to these cumulative impacts.

3-272

Special-Status Plant Species

Plant species listed as threatened or endangered and other special-status plant species have been cumulatively affected by past and present development and activities through habitat loss and direct effects to individual species. This trend will likely continue as future development occurs in areas where these species are present. However, the Proposed Action would not contribute to this adverse cumulative impact because, as described in Section 3.4.1.4, the Proposed Action would not affect any threatened or endangered or other special-status plant species.

Comment: I feel like I'm banging my head against a brick wall... One more time: Cumulative impacts are not analyzed on a project by project basis, especially when cumulative impacts are regional. And, just because "threatened or endangered and other special-status species have been cumulatively impacted by past and present development" does not mean that we should continue practices that will impact them in the FUTURE! Cumulative impacts analyses measure past, present, and future direct and indirect impacts and their CUMULATIVE IMPACTS.

Wetlands

Incremental losses and degradation of wetlands over time have cumulatively depleted wetland resources in the United States. In the project vicinity, wetlands likely were previously impacted by construction of a variety of activities, including development of roads and railroads, agricultural activities, and past timber harvests. Reasonably foreseeable future actions may also affect wetlands in the project vicinity, but it is expected that these future projects would be required to avoid, minimize, and compensate for any potential impacts to wetlands from filling or other activities as part of project Section 404 permitting requirements. Regardless, because construction and operation of the proposed wind project would not impact wetlands, implementation of the Proposed Action would not contribute to cumulative impacts to wetlands.

Noxious Weeds

Past and present activities in the project vicinity have led to a cumulatively significant spread of noxious weeds in the vicinity, and noxious weed spread could continue with reasonably foreseeable future actions. Although mitigation measures have been identified to minimize the spread of noxious weeds by the Proposed Action, it is likely that noxious weed impacts would

nonetheless still occur under the Proposed Action. The Proposed Action thus would contribute incrementally, though in a relatively minor way, to this cumulative impact.

3.14.3.5 Habitat and Wildlife Terrestrial Wildlife Species

Past and present development and other activities have had a cumulative adverse impact on terrestrial wildlife species and their habitat in the general project vicinity. The clearing and conversion of land for home sites, utility infrastructure, and other uses since approximately the 19th century has resulted in the cumulative loss of wildlife habitat. Wildlife habitat also has been cumulatively modified through activities such as logging and other silvicultural activities, which have altered and fragmented habitat. This habitat loss and modification has resulted in the displacement of wildlife species. While these changes to existing habitat have been cumulatively detrimental to some species of wildlife, some changes that have resulted in conversion from one habitat type to another (as opposed to conversion to human uses) have been cumulatively beneficial to other wildlife species. Wildlife species also have been directly affected by hunting and trapping activities, as well as incidental harm and killing from other human activities in the area. Reasonably foreseeable future actions involving highway improvements, residential,

3-273

commercial, agricultural and other development and logging would be expected to incrementally add to these cumulative impacts.

The Proposed Action would impact terrestrial wildlife habitat through permanent improvement of approximately 56 acres now in grass/forb, field/shrub, managed coniferous or mixed deciduous-coniferous forest from within the wind project area (See Table 1-3 and Section 3.3). Some terrestrial wildlife species may also be disturbed by project construction activities or avoid the project area temporarily during construction. The Proposed Action thus would contribute incrementally, though in a relatively minor way, to the cumulative impact on terrestrial wildlife species and their habitat.

Comment: What does “permanent improvement mean, exactly?!? What is the factual basis for this statement? Where is the cumulative impact analysis supporting the statement that “The proposed actions thus would contribute INCREMENTALLY, THOUGH IN A RELATIVELY MINOR WAY, to the cumulative impact on terrestrial wildlife species and their habitat”?!? Again, cumulative analysis is NOT done on a project by project basis when there are regional impacts to be considered. It is these types of statements that litter this very inadequate DEIS throughout its many pages. There is no cumulative data or cumulative impacts effects analyses that have been done to support these flagrantly unfounded statements yet they are included in this data-deficient, weak, meager DEIS as if they are factual statements. FATAL FLAW.

Bird and Bat Species

Past and present development and other activities have had a cumulative adverse impact on

wildlife species, including birds and bats, with permanent alteration and loss of their habitat in the general project vicinity. The clearing and conversion of land for home sites, utility infrastructure, and other uses since approximately the 19th century has resulted in the cumulative loss of habitat for birds and bats. Habitat for birds and bats has also been cumulatively modified through activities such as logging and other silvicultural activities, which have altered and fragmented habitat. This habitat loss and modification has resulted in the displacement and mortality of these wildlife species. Further, as discussed below, past and present residential and other development has a continuing impact on these species, through building, window, transmission line and telecommunication facility strikes, vehicular strikes, and the predation of these species by domestic cats. Reasonably foreseeable future actions, including non-wind energy generation uses, are expected to have a continuing negative impact on these species.

As documented elsewhere in this DEIS in Section 3.4 Biology, the Proposed Action would impact bird and bat species. Because of the variability in species, habitat, and flight patterns on a regional basis, it is difficult to assess potential cumulative impacts of “full build-out” development of wind power on birds and bats over a large geographic area. However, the National Academy of Sciences National Research Council estimated the best and worse case fatality estimates for birds and bats based on a regional “full-build” scenario in 2020 for the Mid-Atlantic Highlands (NRC 2007). This study is considered the most thorough, objective and “best available science” on the topic of cumulative impacts from wind energy projects, and made use of a real world example (although from a different region of the country from Whistling Ridge). This study concluded that it is unlikely that the predicted level of fatalities would result in measurable impacts to migratory populations of most species, although for rare and local populations, the cumulative impacts when combined with all other man-made sources of mortality could affect population viability.

The reference in this study to “all other man-made sources of mortality” in the National Research Council study highlights one of the numerous caveats and difficulties inherent to such a study: collisions with turbines are only one element of man-made cumulative effects on bird and bat populations in a given region. Examples of other man-made impacts include collisions with buildings, transmission lines and vehicles, habitat loss, and predation by domestic cats. Erickson et. al. (2005) concluded that these sources of mortality are likely much larger than the potential impacts of wind power development. Other uncertainties included:

Comment: There comes a point when the carrying capacity of a region is met and the cumulative impacts threshold is met. When that time comes, and it should be determined through thorough cumulative impacts and effects analyses, then it is time to say “NO” to further cumulative impacts on the region. When all the cumulative impacts are taken into account there might come a point when no further development can take place because the cumulative impact threshold has been reached and further development would detrimentally and permanently affect the environment.

3-274

- While estimation of bird fatalities caused by wind energy projects is possible, data on bat fatalities is currently sparse, and typically is not species-specific.

- Estimates of turbine fatalities from past projects, especially those from the 1980s through the 1990s, are based on a variety of methodologies and do not include corrections for observer bias and potential removal of carcasses by scavengers.
- Factors such as the turbine height and design, rotor velocity, number and dispersion of turbines, location of turbines in the landscape, and operational schedule of turbines may influence fatalities. Turbine technology is continually changing and it cannot be predicted what technology will be available in the future.

A similar cumulative impact study on avian and bats was performed by West, Inc. for the Klickitat County Planning Department (West, Inc. 2008). West's study reviewed 17 wind-energy facilities totaling 2,464 MW that were in operation in the CPE of Eastern Washington and Oregon, and an additional 30 potential wind-energy facilities that were planned or being constructed within the CPE as of mid-2008. At the time of their study, West found that there was approximately 6,665 MW of existing or proposed wind-energy facilities in the CPE. For the purpose of their analysis, West assumed that 6,700 MW of wind power would be present in the CPE. However, past experience indicates that not all permitted projects are built, so these figures likely overestimate what will actually be constructed. Klickitat County added this study to the Klickitat County energy Overlay Zone Environmental Impact Statement originally issued in September 2004. This study is included in this EIS as Appendix C-11.34

Like the National Research Council study, for the purpose of their cumulative analysis, West assumed that for cumulative impacts to occur, there must be a potential for a long-term reduction in the size of a population of birds or bats.

West's general approach to the cumulative effects analysis was to summarize results of fatality monitoring studies at operational wind-energy facilities within the CPE, and then use those results to estimate impacts for all constructed and proposed wind-energy facilities within the same ecoregion. At the time of the West study, most wind energy development in northern Oregon and southern Washington had been within an area historically characterized by open, arid shrub-steppe and grassland-steppe habitats. West found that the current predominant land use of the CPE is dryland agriculture and rangeland, with low precipitation (6 to 12 inches per year). Habitat and land use throughout the entire CPE are similar.

West's cumulative effects analysis relies heavily on data from 11 wind-energy facilities in the CPE where fatality monitoring has occurred. Most of the operating facilities have had or will have some sort of avian and bat post-construction casualty monitoring associated with them, and post-construction fatality monitoring data are available from 11 operational wind energy facilities in the CPE. For each of the individual study areas from which fatality results are

34 A similar, but somewhat more limited cumulative impact study was prepared for the Shepherd's Flat Wind Energy Facility in 2007. (Included in this EIS as Appendix C-12)

3-275

available, the predominant land use was a mosaic of agriculture (mainly dryland wheat farming)

and grassland or shrub-steppe rangeland used for livestock grazing.

West estimated the population losses for birds (excluding raptors), raptors, upland game birds, waterfowl, waterbirds, and shorebirds, passerines, sensitive bird species, and bats. Their study estimated 69.5 percent of losses would be to passerines, of which horned lark fatalities made up nearly half. Fatalities to other avian and bat populations were estimated to be substantially less. None of the estimated fatalities were anticipated to cause a significant loss in population, and no cumulative impacts were anticipated.

In comparison to the CPE, the site proposed for the Project is more mountainous, receives more precipitation (an average of 84.06 inches per year as measured at the Skamania fish Hatchery), and is more forested than the CPE. Due to the difference in habitat types between the Project site and the CPE, the results of the direct impact analysis for the Project cannot be directly applied to the results of West's cumulative effects analysis for the CPE. However, West's cumulative effects analysis is relevant in considering the added impacts of the Proposed Action to the overall cumulative biological impacts of all wind energy projects in the region.

As described in Section 3.4 Biological Resources, operation of the Project would result in unavoidable mortality to birds and bats through turbine collisions, but there likely would not be enough mortality to negatively affect the population viability of any single species. Operation of the Middle Mountain wind project also would presumably cause some mortality to birds and bats. Raptors, including bald eagles, golden eagles, northern goshawks and others could travel the 12 air miles between the two wind projects, and the two projects would be considered part of the same regional population of raptors. The Proposed Action thus would contribute incrementally, though in a relatively minor way, to the cumulative impact on bird and bat species in the region.

Finally, the evaluation of cumulative impacts for wind energy generation facilities should be considered in the context of other mortality threats to these species, which have been estimated in recent research as many times larger than those from wind energy generation (Erickson et al. 2005; 2008). Moreover, the cumulative impacts analysis for wind energy generation facilities does not account for potential mortality to birds and bats caused by climate change, and the beneficial biological impact of renewable energy in avoiding these impacts. For example, one study from 2009 estimated that, based on performance in the United States and Europe, wind farms and nuclear power stations are responsible each for between 0.3 and 0.4 bird fatalities per gigawatt-hour (GWh) of electricity while fossil-fueled power stations are responsible for about 5.2 fatalities per GWh (Sovacool 2009).

Comment: Ok. So, cumulatively, all of these activities actually kill how many birds in total? What is the cumulative impact of all this killing on bird populations? Many birds are pollinators. Eighty percent of our agriculture (FOOD!) is dependent on pollinators, birds and bees, etc. What effects do wind farms have on pollinator mortality? How does any killing of pollinators by wind farms affect agriculture and our food supply? The cumulative effects of any pollinator mortalities are not addressed in the DEIS and should be.

Fish Species

Past and present development and other activities have had an adverse impact on fish species, including the alteration and loss of their habitat in the general project vicinity. Negative impacts to fish and other aquatic resources from past and present, as well as reasonably foreseeable future development in the region include the alteration of streams and rivers by the introduction of hydroelectric generation dams, loss of riparian habitat, increased sediment loading, increased stream temperatures, pollution from herbicide and insecticide use, changes in peak and low

3-276

stream flows, fragmentation of fish habitat, decreases in streambank stability, altered nutrient supply, and stormwater runoff from roads and bridges. The proposed work on the I-84 bridges may cause temporary increases in impacts from construction activities. These impacts are anticipated to continue into the foreseeable future.

Typically, wind energy generation projects in the region tend to be located in upland areas and generally well away from fish habitat, which is also true of the proposed project. Therefore, wind energy projects in the region in general, and the proposed project in particular, would not contribute to direct cumulative impacts to fish species.

Comment: This statement “wind energy projects in the region in general, and the proposed project in particular, would not contribute to direct cumulative impacts to fish species” is an unsupported over-generalization with no science or common sense applied. The DEIS has no collective science data to support this assertion. However, there are most probably direct cumulative impacts [BPA’s own fish projects show this] to fish species caused by BPA’s energy production activities and the wind farm projects along the Columbia River, since they do contribute to BPA’s energy production activities, must also contribute to the direct cumulative adverse impacts on fish species. Where is the cumulative impacts analysis on direct and indirect cumulative impacts to fish species in the region?

Potential indirect cumulative impacts to fish species can occur through a somewhat complex relationship among wind projects interconnected to BPA transmission system, Columbia River hydro operations, and operation of this hydroelectric generation system to meet Clean Water Act (CWA) and ESA requirements for listed fish species. There are currently over 2,000 MW of wind energy connected to the transmission grid within BPA’s Balancing Area, and several thousand more MW of wind power are expected to be developed and connected to the grid in the next few years.³⁵ The majority of these projects are concentrated in the geographic area east of the Columbia River Gorge, and the overall amount of wind power on BPA’s transmission system largely depends on wind velocities in this particular area. Accordingly, the amount of wind power on BPA’s system can fluctuate widely and relatively quickly, depending on whether wind speeds in this area are low (meaning very little wind power is being generated in this area) or high (meaning wind projects in this area are generating close to or at full capacity).

Within BPA’s Balancing Area, there must be a match between generation and loads at all times. BPA has historically reserved capability in the hydroelectric system to provide balancing services for wind power output swings when needed. However, the increasingly large

proportional share of wind power on BPA's system and the natural fluctuation of this power have combined to result in large, unscheduled swings in wind generation of up to several hundred megawatts within a single hour that cannot be handled by reserved capability alone. In such situations, BPA must immediately decrease generation in the BPA Balancing Area to maintain the constant balance of generation and load needed to keep the system stable. Using the hydroelectric system to decrease generation in these situations is often not available because:

(1) reservoir space at the hydro projects is being maintained for required flood protection (meaning that additional water cannot be stored); and/or (2) additional water cannot be spilled, rather than run through turbines, at the hydro projects due to CWA limits on the level of total dissolved gases in the river and potential impacts on ESA-listed fish species from higher levels of total dissolved gases. For these reasons, BPA currently is working with wind project developers and operators to develop measures for temporarily reducing sources of wind generation within the BPA Balancing Area when necessary. As part of a comprehensive review of wind project interconnections and their effects that was conducted in winter 2008, BPA has established 35 BPA. Factsheet: How BPA Supports Wind Power in the Pacific Northwest. DOE/BP 4002. March 2009.

3-277

transmission operation protocols under which BPA's dispatch system automatically instructs wind project operators to reduce their generation to specified levels if necessary for reliability and ESA or CWA compliance. BPA has issued Dispatcher Standing Order (DSO) 216 to document these protocols, and is continuing to refine and clarify this DSO as more is learned about wind project operations relative to BPA's transmission system (visit http://www.transmission.bpa.gov/wind/op_controls/default.cfm for more information). These measures ensure that wind power on BPA's transmission system does not cumulatively impact Columbia River hydro operations necessary for listed fish species.

The proposed project would be subject to DSO 216, which would avoid any contribution from the proposed project to indirect cumulative impacts to fish species. In addition, because the proposed project is located at the west end of the Columbia River Gorge rather than the east end (i.e., approximately 60 miles to the west of the Columbia Plateau wind generation vicinity), wind patterns in the project vicinity can vary significantly at any given point in time from those in the area where the majority of existing and proposed wind projects are located. This difference adds diversity in wind energy production and further reduces the potential for any contribution of the proposed project to indirect cumulative impacts to fish species during periods of time when generation needs to be decreased to maintain transmission system stability. The added diversity should assist BPA in implementing regulation requirements on the hydro system. Overall, the proposed project would not be expected to contribute, either directly or indirectly, to cumulative impacts to fish species.

Comment: There is no way that the proponent can know that since the proposed wind farm would be subject to DSO 216 and that this authority would "avoid any contribution from the proposed project to indirect cumulative impacts to fish species"!! In the NEPA booklet, Considering Cumulative Impacts, p. 8, Table 1.2, Principles of cumulative effects analysis, the

*#2 statement states “Cumulative effects are the total effect, including both direct and indirect effects [my underline emphasis], on a given resource, ecosystem, and human community of all actions taken [my underline emphasis], no matter who (federal, nonfederal, or private) has taken the actions. Individual effects from disparate activities [my underline emphasis] may add up or interact to cause additional effects not apparent when looking at the individual effects one at a time [my underline emphasis]. The additional effects contributed by actions unrelated to the proposed action must be included in analysis of cumulative effects.” Not only do all the current and future wind farms have to be included in the cumulative impacts analysis, but also to be included are any other development proposals in the affected region. For example, the proposed Cascade Locks, OR off-reservation casino that would contribute cumulative impacts on the Columbia River and the human and wildlife habitats. For example, the proposed SDS Lumber Broughton(WA) condominium development that would potentially introduce 1000-1500 new inhabitants on the shores of the Columbia River, inhabitants who would most certainly impact the Columbia River, for as we all know all treated sewage [this is not drinking water, folks!] goes into the Columbia River, as does everything that comes from our septic fields. For example, SDS has proposed a resort in Cascade Locks, OR, contributing more sewage water and resource depletion into the Columbia River waters, a river that is already considered one of the most toxic and needs to be cleaned up, not dirtied up some more. For example, SDS has a 50 lot subdivision proposal in Carson, WA, a unincorporated area which has no sewage treatment plant, and has approximately 2600 residents who all use septic fields. Everything flows downhill, as we all know, and it all ends up in the poor Columbia River. So, I would say that the wind farm proponent has failed, miserably, to do any cumulative impacts analyses that take into account direct and indirect impacts from a variety of activities that **MUST** be considered for this DEIS.*

*Certainly, and I consider a fatal flaw of the DEIS, neither BPA or SDS Lumber have defined a **BASELINE CONDITION** for the resources, ecosystems, and human communities that would be impacted by the proposed project and all other projects that contribute to cumulative impacts.*

3.14.3.6 Energy and Natural Resources

Past and present land development, timber harvest, and agricultural uses have resulted in a cumulative use of energy and depletion of energy resources in the project vicinity. The the Project would have a positive effect on energy, in that it would produce more energy than that used to build and operate the facility. The project would consume a limited amount of natural resources for construction, including steel, concrete, and fuel for machinery. The amount of these resources used would be insignificant compared to available supply. The Middle Mountain

wind project would be similar in the balance between consumption of energy and generation of renewable energy to the Project although both the energy payback and the amount of resources consumed would be smaller, since the Middle Mountain project would have only six turbines, and is anticipated at 9 MW to be approximately 12 percent of the size of the Project. The I-84 bridge improvements would consume steel, concrete and fuel. The combined consumption of these natural resources is small compared to available supply. The Proposed Action thus would contribute incrementally, though in a relatively minor way, to the cumulative impact on use of natural resources in the region.

3.14.3.7 Public Health and Safety

Past development of high voltage transmission lines across the project site has created a low level of EMF exposure. The project will include 34.5-kV collector lines and systems, primarily located underground. There will be a new substation located adjacent to BPA's existing North Bonneville to Midway 230-kV transmission line, and a new interconnection from the substation to the 230-kV transmission line. Adding additional overhead and underground cables would cumulatively increase the overall level of EMF exposure. The electric and magnetic fields

3-278

generated by the collector lines and underground systems under the Proposed Action, which are described in Section 3.6, Environmental Health, would contribute to the cumulative levels of EMF in the project vicinity, though only slightly because of cable shielding and undergrounding, the minor nature of these project elements, and the distance to existing residences.

During construction of the Project, there would be a slight increase in risk of traffic or worker accidents during the construction period. This impact would take place in the background of existing land use patterns based on commercial forestry, agriculture, and residential development. Effects of construction of the Middle Mountain wind project and I-84 bridge replacements would most likely be similar, though the impact of the Middle Mountain project would be smaller, given the smaller size of the project. Given the anticipated low number of incidents and the available capacity of the local emergency responders and hospitals to respond to those incidents, the cumulative impact would be relatively minor, and would be reduced once construction is completed.

3.14.3.8 Noise

Past and present development activities have introduced noise sources to the vicinity, including residential construction and development, commercial forestry operations, motor vehicles, machinery and domestic livestock and pets. Implementation of the cumulative actions identified in Sections 3.14.1 and 3.14.2 would be expected to generate various levels of noise through the project vicinity, as would the Proposed Action. Depending on the proximity and timing of these actions, there could be cumulative noise impacts if actions are undertaken simultaneously and in relative close relation to each other. For most of the cumulative actions, it is expected that they would not result in cumulative noise impacts due to temporal or spatial separation. However, given the expected timing of the I-84 bridge improvement projects in the vicinity of the proposed

project, it is possible, however not expected, that receptors in the area could be exposed to cumulative noise impacts during the construction of these roadway projects in combination with the Proposed Action.

Operation of the Proposed Action would result in elevated noise levels from the movement of the turbines, maintenance activities, and operation related traffic. The operation noise levels would vary with the speed of the turbines. While the noise levels are not predicted to exceed regulated noise levels, the Proposed Action would contribute in minor ways to cumulative increases in noise levels in the project vicinity. These contributions would be lessened through the application of mitigation measures described in Section 3.7 Noise.

3.14.3.9 Land Use and Recreation

The cumulative past, present and reasonably foreseeable actions identified in Sections 3.14.1 and 3.14.2 have resulted in changes to land use and would be expected to continue the incremental growth of developed land uses in the project vicinity. The Proposed Action would be consistent with existing land use planning and zoning designations for project facilities, and would not result in any inconsistencies with existing or planned adjacent land uses. The Proposed Action also would have little or no effect on existing land use patterns. The land use impact of the Middle Mountain wind project has not been studied but is unlikely to be inconsistent with local land use codes, to cause changes to local land use patterns, or to create cumulative impacts.

3-279

The the Project would have little to no impact on recreation resources, and this is most likely the case for the Middle Mountain wind project as well. The I-84 bridge replacements may have a beneficial impact to recreation users, as roadway improvements may improve access to recreational resources in the area. Given the abundant recreational resources in the area and the low level of impacts, the Proposed Action's contribution to cumulative impacts to recreation would be minor.

3.14.3.10 Visual Resources

While parts of the Gifford Pinchot National Forest near the project area remain undeveloped, past and present development activities have changed the visual landscape in the immediate project vicinity by introducing manmade features and altering natural forms. These uses include residential, commercial and agricultural development, the construction of highways, bridges and roads, electrical transmission towers and hydroelectric dams, and telecommunication facilities. Ongoing human activities in the vicinity also contribute to continuing cumulative visual impacts, primarily views of clear-cutting and agricultural openings in natural vegetation patterns. Reasonably foreseeable future actions would be expected to continue this trend, as the past and present patterns of land use are expected to continue.

During project construction, the Project would contribute to cumulative visual impacts through visible construction activities, although some viewers interested in viewing project construction may consider the project's contribution to be a positive impact. After construction is complete,

the presence of the proposed wind turbines would contribute to cumulative visual impacts on nearby residents and motorists passing by on county roads, SR 14 and I-84.

The visual impacts of the Project would not be higher than low to moderate at any of the viewpoints examined. In considering the two specific reasonably foreseeable future projects, Hood River County estimated that the proposed Middle Mountain project would be visible as far away as 9.32 miles from that project³⁶. The two projects are approximately 12 air miles apart, and there may therefore be a few locations where both projects would be visible, though these would be background views at the limit of visibility. The visual impact of the I-84 bridge improvements would be limited to the period of construction. Oregon Department of Transportation states that “New bridge designs will complement the aesthetic appeal of the Gorge and reflect the allure of the adjacent Historic Columbia River Highway.” Thus, these new bridges may result in a positive impact to visual resources³⁷.

Past and present development of wind energy projects has also taken place at other locations in the Columbia River Gorge. The visual effect of these projects on the regional landscape and the experience of viewers is also a consideration, since long-distance drivers passing through the Gorge would recall seeing wind energy development in the Columbia Gorge. To assess this impact, the visibility of the ten wind projects east of the project area was modeled, using the following assumptions:

36 See: <http://www.co.hood-river.or.us/vertical/Sites/%7B4BB5BFDA-3709-449E-9B16B62A0A0DD6E4%7D/uploads/%7B909769CE-99F0-47B5-9CAF-77015BF9D737%7D.PDF>.

37 See: <http://www.oregon.gov/ODOT/HWY/REGION1/ColumbiaGorge/>.

3-280

- Visibility was modeled to 20 miles. This distance is considered very conservative and was chosen to accommodate recreation users with binoculars
- Visibility was modeled using bare-earth surfaces without vegetation. In reality, many views will be blocked by trees, particularly in the project vicinity.
- Visibility was modeled from single points representing the approximate location of each project taken from the Northwest Power and Conservation Council’s on-line Northwest Power Generation Map³⁸.
- This visibility analysis documents visibility of even single elements of wind energy facilities, such as distant and fleeting views of wind energy nacelles and/or turbine blade tips, and does not differentiate these sightings from a more prominent view of entire turbines or generation facilities.
- The visibility analysis also does not account for the overall visual or aesthetic context of landscapes that are not in a pristine condition, most particularly the presence of existing electrical transmission lines which dominate the viewscape in many areas analyzed. Overall, these assumptions almost certainly represent a significant overstatement of the visibility of these facilities, and their cumulative impacts to the landscape.

For a motorist driving east on I-84, wind energy projects first become visible near Wishram, approximately 35 miles to the east of the Project area. From the point, wind projects are visible (using the assumptions stated) for approximately 52 of the following 64 miles (Figure 3.14-2).

Construction of the Project would add some additional views of wind turbines in addition to the past and present wind power development projects and existing electrical transmission facilities. Travelers on I-84 through the Gorge would be able to see the Project for a time while traveling near Hood River. Travelers along I-84 could each see at least some part or elements of the project, for approximately 12.5 miles traveling west and 6.5 miles traveling east³⁹. At normal highway speeds this would result in an additional visual impact for between 7 and 12 minutes. Travelers along SR 14 would not see the Proposed Action, which would be blocked by the bluff to the north of the road.

The visual impact of the Project along I-84 would be variable, with the number of turbine strings and turbine equipment elements visible changing with topography. In many places only a few turbines would be visible, and the area where the most turbines would be visible (directly across the Columbia River from White Salmon and Bingen) would also be the area where the viewer would be the farthest from the project area (See Figure 3.9-1).

38 See: <http://www.nwcouncil.org/maps/power/Default.asp>

39 The project area is within view for approximately 17 miles, however in each direction the curvature of the road and the location of the project mean that the project would be behind drivers and passengers for some of that distance.

3-281

The maximum impact of the Project along I-84 can be pictured by referring to Figures 3.9-10 (Viewpoint 13) or 3.9-8 (Viewpoint 11), which show viewpoints located on I-84. From Viewpoint 11, for instance, a traveler proceeding west would see a maximum of 25 turbine hubs and 70 blade tips, all at a distance of 14 kilometers (8.9 miles), or far background distance. From Viewpoint 13, a traveler proceeding east would see a maximum of 12 turbine hubs and 25 blade tips, at a distance of around 5.5 kilometers (3.4 miles) or middle-ground distance. As discussed in Section 3.9, however, these numbers overstate the visual impact, for the following reasons:

- The number of hubs and blade tips visible is calculated using bare-earth surface models. In reality, views of many turbines will be blocked by trees.
- All turbine blades will not be visible when the blades are rotating.
- Atmospheric haze, when present, will reduce the visibility of the turbines, especially at background distances. For westbound travelers, the Project would be the last wind power project visible, and for eastbound travelers it would be the first. Building the project would therefore add a small cumulative visual impact for long-distance travelers.

3-282

Figure 3.14-2

Job No. 33758687 Existing Wind Projects Visibility from I-84

A similar cumulative impact could occur, probably on a more consistent basis, for residents of and frequent visitors to the local area. While residents of White Salmon, for example, might not see turbines from both Whistling Ridge and Middle Mountain on a daily basis, they would likely experience repetitive views of wind turbines (or portions of wind turbines) through their local travels over a period of weeks, months or years. The “significance” of these perceptions would be individual in nature and inherently subjective, and is considered in the context of an altered landscape that includes hydroelectric generation facilities, transmission towers and lines, roads, bridges, highways and other land uses. Consequently, some local residents and frequent visitors might perceive what they individually consider to be a substantial change to the overall character of the local landscape. Although the geographical and topographical setting of the Project (including north-south trending ridge lines) limits its regional visibility, such a response would be more likely with the development of multiple wind projects.

3.14.3.11 Historic and Cultural Resources

Cultural and historic resources in the project vicinity have been and are being affected because of past, present, and current development and activities. These cumulative impacts include the redevelopment of land used for pioneer settlements, such as the Underwood town site north of the project area, and natural degradation of wooden flumes that were used in the late 1800s and early 1900s to transport logs to the Columbia River. Although the Proposed Action would not affect any known upland archaeological or historic resources, there is the potential for the Proposed Action to impact previously undiscovered cultural resources or artifacts. Mitigation measures are identified in Section 3.10, Historic and Cultural Resources, to lessen or avoid the potential for this impact. However, if the Proposed Action does impact previously undiscovered cultural resources or artifacts, it would contribute incrementally to the adverse cumulative impact to cultural resources in the area.

3.14.3.12 Transportation

The cumulative actions identified in Sections 3.14.1 and 3.14.2 have resulted in increases in traffic and would be expected to continue the incremental growth of traffic in the project vicinity. The Proposed Action would contribute to cumulative traffic levels in the project vicinity, but generally only during the construction phase of the Proposed Action. Construction of the Project is scheduled for a one-year period beginning in 2011. Construction of the I-84 bridges would take place in 2009, 2010 and 2011, with the majority of construction taking place in 2010. There could be some potential cumulative traffic congestion for travelers along I-84 during periods when both construction projects were active. However, workers traveling to the Whistling Ridge site could use SR 14 as an alternative route.

40 See:

<http://www.oregon.gov/ODOT/HWY/REGION1/ColumbiaGorge/May2009GorgewideNewsletter.pdf>, especially the construction schedule snapshot on page 2.

3-284

3.14.3.13 Public Services and Utilities

Past and present development and activities have resulted in an incremental increase in demand for public services and utilities. The Proposed Action would not be expected to adversely affect the overall capacity or ability to serve of any utility in the area, and thus would not contribute to cumulative impacts to utilities. By providing a potential backup or alternative power source for the Skamania County Public Utility District (PUD), the Proposed Action may contribute to a positive impact on utilities.

Construction of the Project, and the use of construction workers from outside the immediate area, could result in a minor and temporary increase in the demand for public services including police departments, providers of emergency medical services, and local fire departments, and would contribute to a cumulative increase in demand when added to the construction of the Middle Mountain wind project and I-84 bridge improvement projects. The temporary increased demand for services during the construction period caused by the average of 143 workers (265 during the peak month) would be substantially reduced during operation for the permanent workforce of nine full-time workers.

3.14.3.14 Socioeconomics

During construction, the Proposed Action would contribute incrementally to a positive cumulative impact on the economy of the local community by providing additional employment and increased need for goods and services. While the Proposed Action and other cumulative actions would increase the number of construction workers in the project vicinity, there appears to be sufficient vacant rental dwellings and available temporary housing, hotel/motel, camping, and RV units in the general project vicinity to accommodate the potentially overlapping construction schedules of the Proposed Action and some of the possibly concurrent cumulative actions such as the construction of the Middle Mountain wind project and the I-84 bridge improvement projects.

During operation, the Proposed Action would employ nine full-time workers. The operational workforce would have a minor cumulative affect on population, employment, and housing in the project vicinity. The fiscal impact of the project would be highly positive, as the project's assessed value of up to \$87.5 million would generate approximately \$800,000 per year in tax distributions to municipal, county, and other local jurisdictions. Operation of the Proposed Action would be expected to have a major contribution to cumulative financial benefits to Klickitat and Skamania counties.

3.15 RELATIONSHIP BETWEEN SHORT-TERM USES OF THE ENVIRONMENT AND LONG-TERM PRODUCTIVITY

The Proposed Action under consideration does not pose short-term impacts that would significantly alter the long-term productivity of the affected environment. The turbines and associated facilities would take less than 5 percent of the arable land in the 1,152-acre study area out of production, and the remainder of the land could still be used for commercial forestry. After decommissioning of the project, all of the land could revert to its previous uses. Little change in the long-term environmental productivity of the land would have been caused.

3.16 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENT OF RESOURCES

Irreversible commitments of resources occur when a non-renewable resource such as minerals or petroleum-based fuels is used for the construction or operation of a Proposed Action. An irretrievable commitment of resources occurs when a federal agency gives up all rights or protections for a particular resource that it has ownership of or jurisdiction over, whether it be land, trees, water, animal or plant species, or some other resource.

The Proposed Action would include the use of steel, gravel, wood, and other non-renewable material to construct the wind turbines, access roads, electrical power line, operations and maintenance facilities, and substations. Materials would come from outside sources or from local borrow pits. Petroleum-based fuels for vehicles and equipment would also be required. Development of the proposed action would result in the irretrievable commitment of a small amount of commercial forestry land. These commitments are irretrievable rather than

irreversible because the project could be decommissioned in the future and previous land uses restored. In addition, many materials used to construct and operate the project could be recycled upon decommissioning.

3.17 INTENTIONAL DESTRUCTIVE ACTS

BPA, like other utilities and government agencies, experiences incidents of criminal activity such as vandalism, theft and burglary. Some of these incidents cause significant operational and

3-286

financial impacts to the agency. Between 2007 and 2009, BPA experienced approximately 128 incidents of burglary, theft and vandalism. These incidents cost the agency approximately \$1,624,110. The BPA Security and Emergency Response Office works closely with Federal Law Enforcement Agencies and, local and state police to ensure all incidents are appropriately reported, investigated and prosecuted. This effort has resulted in the return of BPA property and in court ordered restitution to be paid by the convicted parties.

Issues concerning international terrorist activity, domestic terrorism and sabotage remain a significant concern for BPA and other critical infrastructure operators. BPA maintains close liaison with Federal Law Enforcement Agencies, Department of Homeland Security, and Local jurisdictions to ensure effective communication of information and intelligence.

The impacts from vandalism and theft, though expensive, do not generally cause a disruption of service to the area. Stealing equipment from electrical substations, however, can be extremely dangerous. In fact, nationwide, many would-be thieves have been electrocuted while attempting to steal equipment from energized facilities. On Oct. 11, 2006, a man in La Center, Washington, was electrocuted while apparently attempting to steal copper from an electrical substation.

Federal and other utilities use physical deterrents such as fencing, cameras, and warning signs to help prevent theft, vandalism and unauthorized access to facilities. In addition, through its Crime Witness Program, BPA offers up to \$25,000 for information that leads to the arrest and conviction of individuals committing crimes against BPA facilities. Anyone having such information can call BPA's Crime Witness Hotline at (800) 437-2744. The line is confidential, and rewards are issued in such a way that the caller's identity remains confidential.

Acts of sabotage or terrorism on electrical facilities in the Pacific Northwest are rare, though some have occurred. These acts generally focused on attempts to destroy large transmission line steel towers. For example, in 1999, a large transmission line steel tower in Bend, Oregon was toppled.

Depending on the size and voltage of the line, destroying towers or other equipment could cause electrical service to be disrupted to utility customers and end users. The effects of these acts would be as varied as those from the occasional sudden storm, accident or blackout and would depend on the particular configuration of the transmission system in the area. While in some situations these acts would have no noticeable effect on electrical service, in other situations,

service could be disrupted in the local area, or if the damaged equipment was part of the main transmission system, a much larger area could be left without power.

When a loss of electricity occurs, all services provided by electrical energy cease. Illumination is lost. Lighting used by residential, commercial, industrial and municipal customers for safe movement and security is affected. Residential consumers lose heat. Electricity for cooking and refrigeration is also lost, so residential, commercial, and industrial customers cannot prepare or preserve food and perishables. Residential, commercial, and industrial customers experience comfort/safety and temperature impacts, increases in smoke and pollen, and changes in humidity, due to loss of ventilation. Mechanical drives stop, causing impacts as elevators, food preparation machines, and appliances for cleaning, hygiene, and grooming are unavailable to residential

3-287

customers. Commercial and industrial customers also lose service for elevators, food preparation, cleaning, office equipment, heavy equipment, and fuel pumps.

In addition, roadways experience gridlock where traffic signals fail to operate. Mass transit that depends on electricity, such as light rail systems, can be impacted. Sewage transportation and treatment can be disrupted.

A special problem is the loss of industrial continuous process heat. Electricity loss also affects alarm systems, communication systems, cash registers, and equipment for fire and police departments. Loss of power to hospitals and people on life-support systems can be life-threatening.

Overhead transmission conductors and the structures that carry them are mostly on unfenced utility rights-of-way. The conductors use the air as insulation. The structures and tension between conductors make sure they are high enough above ground to meet safety standards. Structures are constructed on footings in the ground and are difficult to dislodge.

While the likelihood for sabotage or terrorist acts on the Proposed Action or alternatives is difficult to predict given the characteristics of the project, it is unlikely that such acts would occur. If such an act did occur, it could have a significant impact on the transmission system or electrical service because the North Bonneville-Midway 230-kV transmission line is an integral part of BPA's transmission system; however, any impacts from sabotage or terrorist acts likely could be quickly isolated. The Department of Energy, public and private utilities, and energy resource developers include the security measures mentioned above and others to help prevent such acts and to respond quickly if human or natural disasters occur.

3.18 ADVERSE EFFECTS THAT CANNOT BE AVOIDED

Implementation of the Proposed Action would result in some adverse impacts that cannot fully be avoided even with implementation of mitigation measures. However, most of these impacts would occur during the construction phase of the Proposed Action and thus would be temporary. For the proposed wind project, the unavoidable adverse impacts include:

- Short-term earth-disturbing activities of 108 acres during construction (56 acres of permanent disturbance and 52 acres of temporary disturbance). These impacts, while unavoidable, would take place in landscape of managed timber lands which has for many years and will continue to be a fragmented environment with ongoing disturbance. During construction, direct mortality to birds could occur through nest disturbance.
- Short-term potential for landslide and erosion during construction and operations.
- Short-term impacts to air quality similar to that of existing logging operations during construction.
- Short-term and localized impacts to water resources during construction and operation of the project.

3-288

- Short-term and minimal risk of unintentional or accidental fire or explosion or discharge to the environment during both construction and operations.
- Short-term and minimal delays in traffic in some areas during construction.
- Short-term and minimal risk of accident during construction.
- Short-term accidental fire, release of hazardous materials, or injury could occur during construction, operation, or decommissioning of the project.
- Short-term noise impacts during construction is exempt so long as it occurs during daytime hours, and operation noise is predicted to be less than the nighttime threshold of 50 dBA Leq per Washington State and Skamania County regulations.
- Long-term visual impact to surrounding areas where turbines were visible, including some areas inside the Columbia River Gorge National Scenic Area.
- Long-term mortality to birds and bats through turbine collisions.
- Long-term yet minor unavoidable adverse impacts to energy or natural resources through the consumption of fossil fuels for construction and maintenance of the Proposed Action.
- Long-term socioeconomic impacts are considered to be beneficial as The Project would provide employment during construction and operation. Additionally, increased tax revenues would offset the impacts to public services and utilities.
- Permanent loss, temporary disturbance and fragmentation of existing habitat for a number of wildlife species.

Comment: Without a socio-economic impacts analysis, the statement “Long-term socioeconomic impacts are considered to be beneficial” is baseless and not supported by any data or analysis. There is nothing in the DEIS to show just how much Skamania County would benefit, or not, from this proposed wind farm. What is clear, from previous statements, is that Klickitat County stands to reap most of the benefits for their school district.

Under the No Action alternative, although many of the potential impacts of the Proposed Action would not occur, the existing project area would continue to be utilized for commercial forestry operations. Additionally, BPA’s North Bonneville-Midway 230-kV and the Underwood Tap to Bonneville Powerhouse 1-North Camas 115-kV transmission lines would continue to remain in place and would be subject to impacts related to the need for ongoing repairs and maintenance of these existing transmission lines.

3-289

Comment: The proponent for this project is being very truthful here. There are "many...potential impacts of the Proposed Action..." that would "not occur" if this wind farm proposal was denied by EFSEC!! This would be a good thing for the environment and for our community. BPA has failed to do a cumulative impact analysis of the existing transmission lines for the DEIS and this is a fatal flaw. BPA has also failed to do a cumulative impact analysis of their FUTURE actions in regard to these existing transmission lines and BPA's proposals to put in NEW, and BIGGER transmission lines. [I will address this in another document.] This is just one very important reason why this Whistling Ridge wind farm proposal should be denied. BPA is a federal agency and is subject to NEPA and its cumulative impacts analyses. BPA has, fatally for the DEIS, not done its job. This DEIS should be sent back to BPA and SDS for further analysis and data-gathering.

CUMULATIVE IMPACT ANALYSES MATTER!

BEFORE THE HEARING EXAMINER
FOR SKAMANIA COUNTY

COMMUNITY DEVELOPMENT
DEPARTMENT

In the Matter of the Appeals of) NO. SEP-08-35
)
Friends of the Columbia Gorge,) FINDINGS, CONCLUSIONS, AND
Save our Scenic Area, Gifford Pinchot Task) DECISION
Force, and Columbia Riverkeeper)
)
Of a SEPA DNS.)

SUMMARY OF DECISION

The appeals of the October 8, 2008 Determination of Nonsignificance issued for the County's proposed zoning text and map amendments are **GRANTED**.

SUMMARY OF RECORD

Background

Skamania County seeks to amend the text and maps of its zoning code (Title 21 Skamania County Code) consistent with its adopted Comprehensive Plan and subarea plans. The County issued a Determination of Nonsignificance for the proposed amendments (known as the Planning Commission Recommended Draft) on October 8, 2008. Save our Scenic Area, and a group of organizations including Friends of the Columbia Gorge, Gifford Pinchot Task Force, and Columbia Riverkeeper filed appeals of the Determination of Nonsignificance on October 22, 2008.

Hearing Date

The Hearing Examiner for Skamania County held an open record hearing on the appeals on January 21 and 22, 2009.

Testimony

The following individuals presented testimony under oath at the open record appeal hearing:

1. Karen Witherspoon, Director of Community Development, Skamania County
2. Heather Watson, Assistant Planner, Skamania County
3. Dean Apostol, Landscape Architect¹
4. K. Shawn Smallwood, Ph.D., Ecologist²
5. Richard James, E-Coustic Solutions, Acoustical Engineer³
6. Nina Pierpont, M.D., Ph.D., Physician⁴
7. Nathan Baker, Staff Attorney, Friends of the Columbia Gorge

¹ Please refer to Exhibit G.1 for Mr. Apostol's qualifications.

² Please refer to Exhibits G.4 and C.21 for Mr. Smallwood's qualifications.

³ Please refer to Exhibit 7.1 for Mr. James' qualifications.

⁴ Please refer to Exhibit 1.1 for Dr. Pierpont's qualifications.

Legal Counsel

- Attorney J. Richard Aramburu represented Appellant Save our Scenic Area
- Attorney Richard A. Poulin represented Appellants Friends of the Columbia Gorge, Gifford Pinchot Task Force, and Columbia Riverkeeper
- Attorney Peter Banks, Skamania County Prosecutor, represented Skamania County

Exhibits

The documents listed on Appendix A to this Decision (Exhibit List) were admitted into the record. Additional documents were filed on January 26, 2009, after the Hearing Examiner had closed the record to new evidence. The Hearing Examiner did not consider the January 26 documents and they are not admitted into the record.

In addition to the documents identified in Appendix A, the Hearing Examiner considered the following legal memoranda:

- Pre-Hearing Brief of Appellants Friends of the Columbia Gorge, Inc.; Gifford Pinchot Task Force; and Columbia Riverkeeper (December 9, 2008)
- Opening Brief of Save our Scenic Area (December 9, 2008)
- Response Brief of Skamania County (January 2, 2009)
- Reply Brief of Appellants Friends of the Columbia Gorge, Inc.; Gifford Pinchot Task Force; and Columbia Riverkeeper (January 15, 2009)
- Citations to Exhibits of Appellants Friends of the Columbia Gorge, Inc.; Gifford Pinchot Task Force; and Columbia Riverkeeper (January 29, 2009)
- SOSA's Exhibits Citations and References (January 29, 2009)

The Hearing Examiner also considered the 2007 Comprehensive Plan, the Carson Community Subarea Plan, the Swift Subarea Plan, the West End Community Comprehensive Subarea Plan, and the Skamania County Code.

Upon consideration of the testimony and exhibits admitted at the open record hearing, the Hearing Examiner enters the following Findings and Conclusions:

FINDINGS

General

1. Skamania County seeks to amend the text and maps of its zoning code (Title 21 Skamania County Code) consistent with its adopted Comprehensive Plan and subarea plans. The amendments would apply to all lands within unincorporated Skamania County that are not designated as Columbia River Gorge National Scenic Area (hereafter, "National Scenic Area" or "Scenic Area").⁵ The Scenic Area generally includes the southern portion of Skamania County, although there are "islands" of urban area (including unincorporated land) that are not within the Scenic Area. Thus, the proposed

⁵ Land uses within the National Scenic Area are governed by Title 22 of the Skamania County Code (Columbia River Gorge National Scenic Area Ordinance).

amendments would apply to some parcels that, while not designated as Scenic Area, are surrounded by Scenic Area lands. *AR-50; Testimony of Ms. Witherspoon; County Exhibit 2.*

2. In the testimony and written materials there are references to two proposed drafts of Title 21 – the (1) Board-Initiated Draft and the (2) Planning Commission Recommended Draft. The Board-Initiated Draft was the first draft of the proposed amendments. The Planning Commission Recommended Draft contains the changes to the first draft that were recommended by the Planning Commission after considering public comment. The changes are substantial. The draft of Title 21 that is under review is the Planning Commission Recommended Draft, found in the record at AR-72 to 226.⁶ *AR-51.*
3. According to the 2007 Comprehensive Plan, Skamania County is approximately 1,070,080 acres in area. It is the only county in Washington State that spans the crest of the Cascade Mountains. Approximately 80 percent of the County (855,000 acres) is within the Gifford Pinchot National Forest. Approximately five percent of the County (59,876 acres) is owned by the State of Washington.⁷ Approximately 85,000 acres of the remaining land is within the National Scenic Area. *2007 Comprehensive Plan, pages 17-18.*
4. The planning documents in effect for the portions of Skamania County outside of the National Scenic Area include the 2007 Comprehensive Plan, the Swift Subarea Plan, the West End Community Subarea Plan, and the Carson Community Subarea Plan. With respect to those lands governed only by the 2007 Comprehensive Plan (i.e., not within a subarea), there are three land use designations: Rural I (2,758 acres), Rural II (13,440 acres), and Conservancy (817,826 acres). *AR-57.* The zoning classifications currently in effect for those designations include the following: Residential 1, 2, 5, and 10, Rural Estate, Community Commercial, Commercial Recreation, Industrial, Resource Production 10 and 20, Natural, and Unmapped. *SCC 21.24.021.* In addition, there are two zoning classifications applicable to the Northwestern Lake area – Residential 2 and Residential 5. *SCC 21.55.*
5. The Swift Subarea includes approximately 92,191 acres, and the Comprehensive Plan indicates that approximately 34,000 of the acres are privately owned.⁸ There are six land use designations within the Swift Subarea, including Swift Recreational, Swift Commercial Resource Lands, Swift Forest Lands 20, Mountain Recreational 20,

⁶ The proposed zoning map is found at AR-232.

⁷ The County provided slightly different numbers in its brief – a total land area of 1,073,370 acres, with 932,034 acres consisting of state or federal public lands and the remaining 141,336 acres (13 percent) privately owned. *Response Brief of Skamania County, page 1.* These numbers do not affect the outcome of the decision.

⁸ There is some discrepancy between the total acreage reported in the Environmental Checklist and the total acreage reported in the Comprehensive Plan. The total acreage in this finding is based on the Environmental Checklist. It is not clear whether the acreage of privately owned land has also changed from what is reported in the Comprehensive Plan.

Mountain Recreational 10, and Mountain Recreational 5. *2007 Comprehensive Plan, page 18; Swift Subarea Plan, pages 14 – 21; AR-57.*

6. The West End Subarea includes approximately 60,000 acres, and the Comprehensive Plan indicates that approximately 31,000 of the acres are privately owned.⁹ There are seven land use designations within the West End Subarea, including Rural Lands 2, Rural Lands 5, Rural Lands 10, Forest Lands 20, Commercial Resource Lands, Neighborhood Commercial, and Community Commercial. *2007 Comprehensive Plan, page 18; West End Subarea Plan, Figure 3-1; AR-57.*
7. The Carson Subarea includes approximately 2,000 acres. There are four land use designations within the Carson Subarea, including High Density Residential, Rural Residential, Rural Estate, and Business Center. *AR-57; Carson Subarea Plan, pages 2 – 5.*
8. Much of Skamania County is classified as “Unmapped”, meaning that no zoning has been assigned.¹⁰ Within unmapped areas, “all uses which have not been declared a nuisance by statute, resolution, ordinance, or court of jurisdiction are allowable.” *SCC 21.64.020.* Land uses within unmapped areas are not subject to the standards or conditions of the zoning code. *Id.*
9. The unmapped lands in Skamania County are mostly commercial forestland or Gifford Pinchot National Forest. According to County Ordinance No. 2008-01, at least 15,000 acres of the unmapped lands are privately owned. *Exhibit H.4; Testimony of Ms. Witherspoon.*
10. Skamania County has had a moratorium in effect since July 10, 2007 (date of adoption of most recent Comprehensive Plan) on the following development activities on unmapped lands:
 - The acceptance and processing of any building, mechanical or plumbing permits on any parcel of land that is 20 acres or larger that was created by deed since January 1, 2006
 - The acceptance and processing of land divisions
 - The acceptance and processing of SEPA checklists related to forest practice conversions

⁹ There is some discrepancy between the total acreage reported in the Environmental Checklist and the total acreage reported in the Comprehensive Plan. The total acreage in this finding is based on the Environmental Checklist. It is not clear whether the acreage of privately owned land has also changed from what is reported in the Comprehensive Plan.

¹⁰ Prior to 2007, the County’s Comprehensive Plan only addressed the southern portion of Skamania County. *2007 Comprehensive Plan, pages 10 and 21.*

Exhibit H.4. The reasons for the moratorium include that much of the unmapped land is on rugged terrain that is not served by County roads or electricity, and that many areas are prime habitat for federal or state listed species of fish and wildlife. *Exhibit H.4.*

11. The Planning Commission Recommended Draft (and associated zoning map) would accomplish the following:
- Zone all previously unmapped land, including the land under federal ownership.
 - For the land outside of the subareas, eliminate the Resource Production 10 and 20 zones and add Business Park, Forest Lands 20, and Commercial Resource Lands 40 zones.
 - Zone the Swift Subarea consistent with the Swift Subarea Plan (zoning designations: Mountain Recreational 5, 10, and 10, Swift Forest Lands 20, Swift Commercial Resource Lands 40, and Swift Recreation).
 - Zone the West End Subarea consistent with the West End Subarea Plan (zoning designations: Rural Lands 2, 5, and 10, West End Forest Lands 20, West End Commercial Resource Lands 40, and Neighborhood Commercial).
 - Add a new section to the zoning code (SCC 21.70.170) on alternate energy systems, which would apply to the installation of any alternate energy facility located within unincorporated Skamania County, except for the General and Special Management Areas of the National Scenic Area (AR-203).

A list of all of the proposed zoning designations and the acreage allocated to each is set forth in the Environmental Checklist at AR-56 to 57. AR-50, 51, 56, and 57; County Exhibit 2.

12. The proposed Alternate Energy Systems section contains standards relating to the following facilities:
- Rooftop Wind Energy Systems¹¹
Key provisions:
 - One per structure
 - Maximum height: 15 feet above maximum for structure
 - Small-Scale Wind Energy Facilities¹²
Key provisions:
 - No limit on number
 - Maximum height: 65 to 80 feet
 - Minimum property line setback: 1.1 times the height
 - Large-Scale Wind Energy Facilities¹³

¹¹ The proposed definition for rooftop wind energy system is "a small wind energy system that is installed onto a structure supplying power directly to that structure." AR-82.

¹² The proposed definition for small-scale wind energy facilities is "Wind turbines which will be used primarily to reduce on-site consumption of utility power to farms, homes, or businesses." AR-83 (SCC 21.08.010).

Key provisions:

- No limit on number
 - Maximum height: 500 feet
 - Minimum property line setback (exterior): 50 feet plus height of structure
 - Minimum setback from residential structures or zones: one-half mile
 - Large-Scale Solar Facilities¹⁴
 - Geothermal Resources¹⁵
 - Bio-Energy Facilities¹⁶
- Key provision:

- Minimum setback from residential structures or zones: one-half mile

AR-203 to 214 (SCC 21.70.170).

13. The current zoning ordinance does not contain any standards relating to alternate energy systems, although geothermal energy facilities are identified as conditional uses in the R-1, R-2, R-5, R-10, Rural Estate, and Resource Production zones. *SCC 21.28.030, 21.32.031, 21.36.031, 21.40.030, 21.44.030, and 21.56.030.* The County would regulate wind power facilities as "utilities" under the existing code. *Testimony of Ms. Witherspoon.* Public Facilities and Utilities¹⁷ are allowed in the residential and Rural Estate zones. Semi-Public Facilities¹⁸ are conditionally allowed in the residential and Rural Estate zones, and Semi-Public Facilities and Utilities are conditionally allowed in the Resource Production zones. *SCC 21.28.020 and -.030, 21.32.020 and -.031, 21.36.020 and -.031, 21.40.020 and .030, 21.44.020 and -.030, and 21.56.030.* The Hearing Examiner was not able to locate any use classification relating to private utility systems.
14. Under the Planning Commission Recommended Draft, rooftop wind turbines would be allowed outright in the residential zones, and small-scale wind energy facilities would be

¹³ The proposed definition for large-scale wind energy facility is "An electricity-generating facility consisting of wind turbines or other such devices and their related or supporting facilities that produce electric power from wind to be sold and used off-site." *AR-79 (SCC 21.08.010).*

¹⁴ The proposed definition for large-scale solar facilities is "photovoltaic energy systems and/or solar thermal technology energy systems that use reflective materials that concentrate the sun's heat energy to drive a generator that produces electricity." *AR-79 (SCC 21.08.010).*

¹⁵ The proposed definition of geothermal energy facilities is "A facility used to produce electricity by extracting and converting the natural thermal energy from the earth." *AR-78 (SCC 21.08.010).* There are no standards for Geothermal Resources other than compliance with RCW 78.60.

¹⁶ The proposed definition for bio-energy is "Includes a range of biomass feedstock and technologies for conversion of these materials into useful energy." *AR-76 (SCC 21.08.010).*

¹⁷ "Facilities which are owned, operated, and maintained by public entities which provide a public service required by local governing bodies and state laws." *SCC 21.08.010 (70).*

¹⁸ "Facilities intended for public use which may be owned and operated by a private entity." *SCC 21.08.010 (73).*

allowed in the residential zones with administrative review.¹⁹ In addition, “public, semi-public and/or private facilities and/or utility systems” would be allowed outright in the residential zones. Although the proposed definitions for “public facilities and utility systems” and “semi-public facilities and utility systems” include “electrical transmission, distribution and generation facilities”, the electrical generation facilities that fall under more restrictive definitions (such as wind turbines) would not be regulated as a “public, semi-public and/or private facilities and/or utility systems.” Thus, a large-scale wind energy facility would *not* be allowed outright in a residential zone.²⁰ *AR-81, 82, 99, 100, 102, 103, 105, 106, 108, 109; Testimony of Ms. Witherspoon.*

15. Although alternative energy systems would be regulated under the Alternative Energy Systems section of the zoning code, it is not clear how certain traditional electricity generating facilities, such as coal-fired plants, would be regulated. The Planning Commission Recommended Draft does not contain use categories or specific standards for such facilities. If categorized as “public, semi-public and/or private facilities and/or utilities” they would be allowed outright in most zones. *See generally AR-76-84; Opening Brief of Save our Scenic Area, page 10.*
16. Under the Planning Commission Recommended Draft, large-scale wind energy facilities and bio-energy facilities (the most controversial uses) would not be allowed outright in any zone.²¹ Instead, they would be conditional uses in the following zones:
 - Industrial
 - Forest Lands 20 (large-scale wind energy only)
 - Commercial Resource Lands 40
 - Carson Industrial Zone (large-scale wind energy only)
 - West End Forest Lands 20 (large-scale wind energy only)
 - West End Commercial Resource Lands 40
 - Swift Forest Lands 20 (large-scale wind energy only)
 - Swift Commercial Resource Lands 40

¹⁹ Small-scale wind energy facilities would not be allowed within the High Density Residential Zone of the Carson subarea. *AR-139.*

²⁰ To avoid confusion, the Hearing Examiner urges the County to clarify this issue in the final version of the zoning code. Appellant SOSA made much of the fact that the language “electrical transmission, distribution and generation facilities” could be read as including wind-energy and other alternative energy facilities. However, the Hearing Examiner considers this to be a language problem (albeit a significant language problem) rather than an environmental review problem. It is clear that the County intends to regulate wind-energy and other alternative energy facilities in accordance with the stricter standards established for those facilities, and it is the Hearing Examiner’s opinion that no reviewing official looking at the larger statutory scheme could reasonably interpret otherwise. Consequently, the Hearing Examiner will not evaluate the environmental impacts of the proposed zoning code on the false assumption that large-scale wind energy facilities would be allowed outright in the residential zones.

²¹ Under the prior Board-Initiated Draft, large-scale wind energy facilities would have been administrative review uses in some zones, and allowed outright in others. *See e.g., AR-121, 128, and 148.*

AR-122, 125, 128, 148, 161, 163, 179, 182. None of the zones identified above would allow residential uses.

17. Although the 2007 Comprehensive Plan specifies that the Hearing Examiner “may deny a conditional use permit if he or she finds the use is inappropriate for the area” (2007 Comprehensive Plan, Policy LU.6.1, page 31), the proposed criteria for conditional use permit approval do not appear to give the Hearing Examiner discretion to deny a conditional use permit. Proposed SCC 21.16.070(A) states, “If the Hearing Examiner determines that the use is *not compatible* with permitted or existing uses in the specific area of the proposed use then the proposed use may be approved or approved with conditions to make it compatible with the area.” AR-88 (*emphasis added*). The quoted language is a change from the current SCC 21.16.070, which states, “If the Hearing Examiner determines that the use is not compatible with permitted or existing uses in the specific area of the proposed use then the proposed use shall be denied.” SCC 21.16.070(A).
18. The 2007 Comprehensive Plan does not contemplate the type of energy facilities described in the Planning Commission Recommended Draft. With respect to the Conservancy designation, which includes the majority of the County and which could be implemented by the Residential 10, Forest Lands 20, Commercial Resource Lands 40, and Natural zones (see 2007 Comprehensive Plan, Figure 2-2, and AR-97 to 98), the Comprehensive Plan lists only the following utility uses as being appropriate within the designation: “Public facilities and utilities, such as parks, public water access, libraries, schools, utility substations, and telecommunication facilities.” 2007 Comprehensive Plan, page 26.
19. Ms. Karen Witherspoon, Director of Community Development for Skamania County, was the Responsible Official for State Environmental Policy Act (SEPA) review of the code amendments. Ms. Witherspoon issued a Determination of Nonsignificance (DNS) for the Planning Commission Recommended Draft on October 8, 2008.²² AR 47-48.
20. On October 7, 2008, the County mailed notice of the DNS to numerous agencies, tribes, and interested parties, including the Washington Department of Fish and Wildlife, the Washington Department of Natural Resources, the United States Forest Service, the Washington Department of Ecology, and the Columbia River Gorge Commission. AR-64-68. The County published the DNS in the Skamania County Pioneer on October 8, 2008. AR-69-70.
21. No agency submitted comments directly in response to the October 8, 2008 DNS. *Testimony of Ms. Witherspoon.* However, on June 5, 2008 the Washington Department of

²² Ms. Witherspoon had issued a DNS for the Board-Initiated Draft also, and the DNS was appealed by some of the Appellants in this case. Ms. Witherspoon withdrew the DNS in response to the changes recommended by the Planning Commission. See AR-50.

Fish and Wildlife (WDFW) submitted a comment letter on the original Board-Initiated Draft that contained the following language:

WDFW would like to re-iterate our calls for a cumulative effects analysis of regional wind power development in the Columbia River Gorge. Such an analysis is typically not possible or required during permitting and siting of an individual wind power development. The County zoning update process is the best opportunity we have to conduct this analysis of potential adverse environmental impacts from development of wind power sites, as well as associated power lines, roads, and other infrastructure. Such an analysis would evaluate the number, location, and type of turbines; the number and type of species in an area; species behavior; topography; and weather factors influencing direct and indirect mortality factors.

Exhibit C.12. No cumulative effects analysis has been conducted for the proposed zoning code amendments, although some of the specific language changes requested by WDFW (i.e., not allowing large-scale energy uses outright on commercial resource lands) have been incorporated into the Planning Commission Recommended Draft. *Exhibit C.12; AR-128.*

22. The County did not consider the June 5, 2008 WDFW letter in the environmental review of the Planning Commission Recommended Draft because of the timing of the submittal. In compiling its environmental review record the County made a distinction between those comments submitted in response to the October 8, 2008 DNS, the comments submitted in response to the DNS for the prior Board-Initiated Draft, and the comments submitted to the Planning Commission on the ordinance itself. Ms. Witherspoon testified that WDFW submitted a later letter (also not included in the environmental review record) that did not include a request for a cumulative effects analysis. *Testimony of Ms. Witherspoon.*
23. Save our Scenic Area filed an appeal of the DNS on October 22, 2008. *AR-30 through 40.* The appeal was timely under the 14-day deadline specified in the DNS. *AR-47 to 48.* The appeal alleged that the proposal (mainly, the portions relating to wind turbines) would have probable, significant, adverse impacts on the following:
 - Birds and animals,
 - Noise,
 - Geology, soils, and topography,
 - Fire and hazard,
 - Relationship to existing land use plans,
 - Land use and housing,
 - Light and glare,
 - Aesthetics and scenic resources,
 - Special areas (i.e., Columbia Gorge National Scenic Area),

- Recreation,
- Transportation,
- Water Supply and Aquifers, and
- Human health.

In addition, Save our Scenic Area alleged that the County did not actually consider environmental factors prior to issuing the DNS, that the proposal would result in cumulative impacts, and that the proposal would set a precedent for further actions with significant environmental effects. Save our Scenic Area requested that the Hearing Examiner reverse the issuance of the DNS and order the County to prepare an Environmental Impact Statement (EIS). *AR-35 through 40.*

24. The organizations Friends of the Columbia Gorge, Gifford Pinchot Task Force, and Columbia Riverkeeper jointly filed an appeal of the Determination of Nonsignificance on October 22, 2008. *AR-3 through 24.* The appeal was timely under the 14-day deadline specified in the DNS. *AR-47 to 48.* The appeal alleged the following (paraphrased):

- An EIS must be prepared for non-project actions that may lead to significant adverse impacts.
- The County improperly relied on the Klickitat County FEIS.
- The County failed to consider cumulative impacts, and the precedent set by the proposal.
- The County failed to consult with other agencies.
- The County failed to consider impacts to special and sensitive areas, wildlife, rare plants, native plant communities, and water resources.
- The County failed to ensure consistency with the Comprehensive Plan, Critical Areas Ordinance, and federal wildlife laws.
- The County did not analyze the impacts of the Northwestern Lake Recreational zones, or the impacts of increased residential development.
- The County did not consider or adequately protect against impacts to cultural resources and recreation, noise impacts, fire risk, transportation impacts, and impacts associated with new energy transmission infrastructure.

AR-6 through 23.

25. The County stipulated to all Appellants' standing to challenge the DNS. There are declarations in the record from members and/or staff of Friends of the Columbia Gorge, Columbia Riverkeeper, and Gifford Pinchot Task Force, some of whom reside in Skamania County, that their interests would be adversely affected by the proposed zoning code amendments. According to the declarations, members of the Appellant organizations pursue recreational and wildlife viewing activities in or near the areas that would be affected by the zoning ordinance. *Argument of Mr. Banks; Exhibits F.4 through F.9.*

26. In response to the appeals, the County argued that the scope and impact of the zoning amendments is smaller than argued by the Appellants because most of Skamania County consists of public land, that the court decision *King County v. Boundary Review Board*, 122 Wn.2d 648 (1993) is not applicable, that the State of Washington has preempted local control over wind power projects, and that the proposed amendments would be an improvement over the existing regulatory scheme. *Response Brief of Skamania County*.
27. In the Environmental Checklist for the Planning Commission Recommended Draft, the County discloses, in general terms, the presence of mountainous terrain, water features, threatened and endangered species, bird migration routes, and unstable soils within the County, but claims that the proposal would have no impact on those and other elements of the environment because it is a non-project action. In the supplemental sheet for non-project actions, the County does not identify or analyze the impacts associated with the type of development that might result from the proposed amendments, but indicates that the impacts of future development would be determined and mitigated on a project-specific basis based on County regulations. *AR-50 to 62*.
28. Assistant Planner Heather Watson prepared the September 30, 2008 Environmental Checklist, in consultation with Ms. Witherspoon and other County staff. As background research, Ms. Watson reviewed the Planning Commission Recommended Draft of the zoning code amendments, a Final Environmental Impact Statement (FEIS) issued by Klickitat County for its Energy Overlay Zone (AR-71),²³ the August 2003 Wind Power Guidelines promulgated by the Washington Department of Fish and Wildlife (AR 351-359), and some SEPA checklists and threshold determinations issued by other jurisdictions for legislative actions. Although Ms. Watson was aware that the County had been approached regarding a possible wind energy development, she did not consider the project in preparing the Environmental Checklist because no application had been filed. *Testimony of Ms. Watson*.
29. Although both Ms. Witherspoon and Ms. Watson reviewed the Klickitat County FEIS prior to issuance of the DNS, neither provided testimony or other evidence identifying which specific portions of the FEIS or supporting studies were persuasive in making the determination. In addition, neither provided evidence suggesting that Skamania County and Klickitat County have similar environmental conditions. *See generally, Testimony of Ms. Witherspoon and Ms. Watson*. Although the checklist notes, "The Eastern portion of Skamania County that abuts Klickitat County was included in studies prepared for this [the Klickitat County] EIS" (AR-50), no specific references to the studies, or conclusions drawn from the studies, were provided.²⁴ In addition, the assumptions used by Klickitat

²³ Klickitat County is immediately east of Skamania County.

²⁴ By chance, the Hearing Examiner found a reference to eastern Skamania County in the Avlän Study Report attached to the Klickitat County FEIS (AR-71, Appendix B). The study indicates that two avian sampling points were in southeast Skamania County, in the general vicinity of the panhandle that extends south of the Klickitat County line. The area represented by the sampling points is an extremely small fraction of Skamania County as a whole. *AR-71, Appendix B, Figure 1*.

County in evaluating the environmental impacts of the Energy Overlay Zone are not reflected in the proposed zoning text. For example, the Planning Commission Recommended Draft would allow a maximum wind turbine height of 500 feet, whereas the visual impact analysis conducted by Klickitat County was based on a height of 100 feet. *AR-205; AR-71, page 3-108*. The 500-foot height limit was not based on environmental factors; its purpose was to ensure that the type of turbines currently in existence would be conforming. *Testimony of Ms. Witherspoon*.

30. Prior to adoption of its Energy Overlay Zone, Klickitat County, like Skamania County, did not have ordinances that specifically addressed energy development. Energy facilities were reviewed on a case-by-case basis through the conditional use permit process, which, the FEIS notes, "has led to a lack of consistent policy for energy facility siting." *AR-71, page 1-3 to 1-4*. Klickitat County issued a Determination of Significance (DS) for the non-project action on June 6, 2002, and issued the FEIS in September of 2004. *Exhibit H.2; AR-71*.
31. In the FEIS, Klickitat County predicted that the Energy Overlay Zone might encourage greater energy development within the Overlay boundaries, and discourage energy development outside of the Overlay boundaries "because of the greater uncertainty in the permitting process". *AR-71, page 1-6*. The prediction turned out to be accurate. The development of wind power facilities in Klickitat County has far exceeded the projections contained in the FEIS. Whereas the FEIS assumed that four wind power projects (1,000 MW generating capacity total) would be developed in Klickitat County between 2004 and 2024, as of January 30, 2008 there were 12 wind power facilities in Klickitat County (1500+ MW) that were permitted and/or constructed or had permits pending.²⁵ These facilities are depicted on a Klickitat County Wind Projects Map. *Exhibit E.2*. During the past year, applications for two wind facilities in addition to those depicted on the map have been filed.²⁶ *Exhibits E.3, E.4, and E.5; AR-71, page 1-2*.
32. Skamania County is a member of the Mid-Columbia Economic Development District (MCEDD), and Skamania County Commissioner Paul Pearce serves on the MCEDD Board of Directors as the Chair of the Executive Committee. The counties that constitute MCEDD, in addition to Skamania County, include Klickitat County (WA), Sherman County (OR), Wasco County (OR), and Hood River County (OR). *Exhibit H.10, page 1; Exhibit H.13*.
33. The mission of MCEDD is "to promote the creation of family-wage jobs, the diversification of the economic base, and the growth, development and retention of business and industry within the five-county district." *Exhibit H.10, page 2*. One of

County line. The area represented by the sampling points is an extremely small fraction of Skamania County as a whole. *AR-71, Appendix B, Figure 1*.

²⁵ Although the map depicting the wind power facilities is dated January 30, 2008, it includes some projects that did not receive SEPA threshold determinations until April of 2008. *Exhibit E.2, Exhibit 6.3, Exhibit 6.4*.

²⁶ It should be noted that one of those projects – the Goodnoe II Project – included approximately 320 acres of land owned by the Washington Department of Natural Resources. *Exhibit E.5*.

MCEDD's projects has been to establish the Columbia Gorge Bi-State Renewable Energy Zone (CGBREZ). "This self-declared zone was created to reduce the region's dependency on federal subsidies, bring economic vitality to the region, establish a national model for energy self-sufficiency, and provide a model of self-reliance for other rural economies in the 21st Century. *Exhibit H.10, page 9; see also Exhibit D.6.*

34. Skamania County has demonstrated its support of the CGBREZ, and its interest in wind power in particular, in several ways. On December 18, 2007, the Skamania County Board of Commissioners passed Resolution 2007-59, which "endorses the creation of the Columbia Gorge Bi-State Renewable Energy Zone." *Exhibit H.9.* In the preamble to the resolution, the Commissioners identify the counties within the zone as possessing "world class renewable energy assets including wind, sun, biomass, water and geothermal" and as desiring to develop renewable energy projects. *Exhibit H.9.* On September 30, 2008, the Skamania County Board of Commissioners passed Resolution 2008-51, which endorses several policies and actions relating to the CGBREZ, such as streamlining government permitting, encouraging investment in new energy technologies, and expanding regional transmission capacity for renewable energy projects. *Exhibit H.12; Exhibit H.11.* On December 23, 2008, the Board "discussed the need for the County to pay for Skamania County Economic Development Director to attend an upcoming conference of the American Wind Energy Association". *Exhibit H.14.*
35. Skamania County contains areas that have been mapped by the U.S. Department of Energy National Renewable Energy Laboratory as Wind Power Class 4 ("good") or better. The wind power classifications range from Class 1 to Class 7, with Class 1 referring to "poor" resource potential (wind speeds not exceeding 12.5 miles per hour at 50 meters), and Class 7 referring to "superb" resource potential (wind speeds of 19.7 miles per hour or greater). *Exhibits D.1 and D.2.*
36. To facilitate potential wind energy projects, there are existing high-voltage Bonneville Power Administration electric transmission lines in the southern portion of Skamania County and on the west side of Swift Reservoir. *Exhibits H.1, D.1, and D.2.*
37. Skamania County has not yet received an application to develop a large-scale wind energy facility. However, SDS Lumber has approached Skamania County on multiple occasions over the past several years to discuss a possible large-scale wind energy project (Saddleback Project) on its property within the County. Ms. Witherspoon met with representatives of SDS and entities such as the Bonneville Power Administration on two or three occasions for "pre-application meetings" to discuss the permitting requirements for the project. Multiple pre-application meetings have been held because of changes in the development team. The project, if developed, would consist of at least 40 wind turbines. Although the last formal pre-application meeting was approximately two years ago, individuals associated with the project have been involved in the County's code update process and the president of SDS was present at the subject appeal hearing. *Testimony of Ms. Witherspoon.*

38. The Bonneville Power Administration (BPA) has produced a map entitled "Current and Proposed Wind Project Interconnections to BPA Transmission Facilities" (Exhibit D.4). This map depicts the SDS Saddleback project as a proposed wind generation facility of 70 megawatts (MW). The project location is in the southeast corner of Skamania County. *Exhibit D.4.*
39. Although no party was able to identify any specific wind power projects located or proposed on National Forest land, United States Forest Service regulations do not preclude the development of wind energy facilities. Wind energy uses are governed by the Forest Service's special use regulations set forth in 36 CFR 251, subpart B. Applications for wind energy facilities are processed in accordance with 36 CFR 251.54, Forest Service Manual 2726 ("Energy Generation and Transmission"), and Forest Service Handbook 2709.11 ("Special Use Administration"). In September of 2007, the Forest Service proposed amendments to the manual and handbook to specifically address wind energy uses. *72 Federal Register 184; Exhibit D-9, page 4-29; see also Testimony of Mr. Apostol.*
40. Although under SEPA each project is reviewed on an individual basis, there appears to be a general consensus among reviewing officials that large-scale wind energy facilities generate the type of impacts that are appropriately reviewed through an environmental impact statement. *Exhibits E.3, E.5, 6.1, 6.2, 6.3, and 6.4; Testimony of Ms. Witherspoon.* A typical large-scale wind energy facility includes numerous turbines that are arranged in "strings", electrical collector and/or transmission lines connecting the turbines to each other and to the electrical grid, access roads to each of the turbines, electrical substations, and support structures. The following examples of wind energy proposals in the region illustrate the scale of development associated with large-scale wind energy facilities:

Lakeview Light & Power Project (Harvest Wind) in Klickitat County (as described in DS issued April 25, 2008):

- 55 turbines with a maximum height of 410 feet each
- New 3.1-mile long electrical transmission line
- New substation occupying two acres
- An operations building
- Approximately 20 miles of new access roads
- 98.6 acres of land impacted (46.6 acres of temporary construction impact and 52 acres of long-term impact)

Exhibit 6.3.

Pacific Wind Development Project (Juniper Canyon) in Klickitat County (as described in DS issued April 11, 2008):

- 167 turbines with a maximum height of 492 feet each
- Two new substations occupying a total of 15 acres
- Unpaved access roads connecting the turbines and other facilities

Exhibit 6.4.

Windy Point Partners, LLC Project (Windy Point II) in Klickitat County (as described in DS issued July 9, 2008):

- 61 turbines
- Possible new substation
- Approximately 17 miles of new access roads
- 76 acres of land permanently disturbed

Exhibit 6.1.

Northwest Wind Partners, LLC Project (Goodnoe II) in Klickitat County on private and DNR land (as described in DS issued July 11, 2008):

- 17 turbines (added to an existing facility)
- Electrical transmission lines
- 15 acres of land permanently disturbed

Exhibit 6.2.

Stateline Wind Project in Walla Walla County, Washington and Umatilla County, Oregon (as described in Federal Register, June 5, 2000):

- 250 to 450 245-foot-tall turbines, arranged in several strings and spaced 200 to 300 feet apart
- New substation occupying one to two acres
- Eight to ten miles of new overhead transmission lines
- New access roads
- Operations building
- Water tank

Exhibit 5.4.

41. The National Academy of Sciences prepared a report, Environmental Impacts of Wind-Energy Projects, which “provides analyses to help to understand and evaluate the positive and negative environmental effects of wind-energy facilities.” *Exhibit 4.4, Executive Summary, page 1.* The study addresses both the ecological and the human impacts of wind energy. *Exhibit 4.4, Chapters 3 and 4.* The study also includes recommendations for improving wind-energy planning and regulation. *Exhibit 4.4, Chapter 5, page 181.* With respect to planning, the recommendations of the National Academy of Sciences include the following:

- Standardized studies should be conducted before siting and construction and after construction of wind-energy facilities to evaluate the potential and realized ecological impacts of wind development. Pre-siting studies should evaluate the potential for impacts to occur and the possible cumulative impacts in the context of other sites being developed or proposed. *Exhibit 4.4, Executive Summary, page 9.*
- Regulatory reviews of individual wind-energy projects should be preceded by coordinated, anticipatory planning whenever possible.... This planning could be

implemented at scales ranging from state and regional levels to local levels. *Exhibit 4.4, Executive Summary, pages 12-13.*

Visual impacts

42. Skamania County contains unique and exceptional scenic resources, including the National Scenic Area in the southern portion of the County, Mt. St. Helens National Monument in the northwest corner of the County, and the base of Mt. Adams near the northeast corner of the County. Photographs depicting some of Skamania County's scenic resources are provided in Exhibit B.5 and Exhibit B.1 (see page 1-6). *2007 Comprehensive Plan, pages 13 and 35; Exhibits H.3, B.5 and B.1.*
43. The Swift Subarea is one of the areas that, under the Planning Commission Recommended Draft, could be developed with large-scale wind energy facilities. The Swift Subarea Plan describes the area as "mountainous with sweeping vistas", and as being one of the gateways into the Mt. St. Helens National Volcanic Monument, "which is a popular recreation and sightseeing location bringing thousands of tourists through the Swift Subarea every year." *Swift Subarea Plan, pages 7 and 9.*
44. Based on U.S. Department of Energy National Renewable Energy Laboratory mapping, Skamania County's best wind resources are found on ridgelines that lie transect to the Columbia River Gorge. The ridges may be visible from key viewpoints. Some are near the National Scenic Area boundary. *Exhibits D.1 and D.2; Exhibit B.5; Testimony of Mr. Apostol.*
45. Wind turbines of the maximum height permitted under the Planning Commission Recommended Draft (500 feet) have the potential to dramatically alter the landscape. To put the massive scale in perspective, the tallest building in Portland is 546 feet tall. Even a turbine that is only 300 feet tall could have a blade sweep diameter comparable to the length of a Boeing 747 Jumbo Jet. *Exhibit B.5; Testimony of Mr. Apostol.*
46. The visual impact associated with wind turbines is based not only on the scale of the structures, but on the amount of land that must be cleared to accommodate them. In a forested area, the clearing required for a string of turbines can be substantial (in the example provided in Exhibit B.5, four acres per turbine). With respect to aesthetic impacts, complex, ecologically fragile, and scenic landscapes are the poorest locations for large wind turbines, and open, level, simple landscapes (such as might be found in established agricultural areas) are the best locations for large wind turbines. *Exhibit B.5; Exhibit B.4; Testimony of Mr. Apostol.*
47. Landscape aesthetics have measurable, objective standards. It is possible to map aesthetically sensitive areas and use such information when making zoning decisions. Mr. Dean Apostol, the Appellants' landscape architect, recommended mapping as one means for the County to minimize aesthetic impacts. He also recommended that the County adopt aesthetic standards. *Testimony of Mr. Apostol; Exhibit B.5.*

48. The National Forest Service (NFS) has developed a Scenery Management System for the inventory and analysis of the aesthetic values of national forests. The Scenery Management System is described in an NFS publication entitled "Landscape Aesthetics -- A Handbook for Scenery Management" (Exhibit B.1). The Handbook provides a multi-step process for mapping scenic resources. The concepts and processes contained in the Handbook are not limited to national forests; some jurisdictions use the Handbook to evaluate scenic impacts. *Exhibit B.1; Testimony of Mr. Apostol.*
49. The American Wind Energy Association (AWEA) has prepared a Wind Energy Siting Handbook that provides information regarding the regulatory and environmental issues associated with the development of wind energy facilities. In its handbook, the AWEA notes that government agencies with approval authority over wind farms often require a formal assessment of the visual compatibility of a wind farm, such as the extent to which the wind farm adversely affects the aesthetics of vistas known to be important to the community. According to the AWEA, a visual impact assessment should include a characterization of baseline conditions, photo simulations, and specific investigation of the potential visual impacts based on identified changes from the baseline condition. *Exhibit D.9, pages 5-28 to 5-31; see also Exhibit B.4.*
50. The use of aesthetic criteria to control land uses is not new to Skamania County; the Columbia Gorge National Scenic Area Ordinance (Title 22 of the Skamania County Code) contains aesthetic criteria. All development applications for the National Scenic Area must include "a list of all key viewing areas from which the proposal would be visible." *SCC 22.06.060(A)(1)(e)*. The key viewing areas, which are defined by ordinance, include Cook-Underwood Road, I-84, the Columbia River, the Pacific Crest Trail, and numerous other locations. *SCC 22.04.010(91)*. Those developments visible from key viewing areas must comply with certain standards, including that the development must be "visually subordinate"²⁷ to its setting as seen from the viewing areas. *SCC 22.18.030; see also Exhibit B.4.*
51. With respect to large-scale wind energy facilities, the Planning Commission Recommended Draft does not contain standards or criteria relating to aesthetic impacts, nor does it require a visibility analysis as an application requirement. *AR- 205 to 212.*
52. Based on Geographic Information System (GIS) mapping prepared by a consultant with significant prior experience with the National Scenic Area (see Exhibit B.2), 415-foot-tall wind turbines in the southeast portion of Skamania County, but outside of the National Scenic Area, would be visible to a six-foot-tall observer from Cook-Underwood Road within the National Scenic Area and from Interstate 84 (I-84) on the Oregon side of the Gorge.²⁸ With respect to the western portion of the study area, the visibility would be

²⁷ "Visually subordinate means a description of the relative visibility of a structure or use where that structure or use does not noticeably contrast with the surrounding landscape, as viewed from a specified vantage point, generally a key viewing area. As opposed to structures that are fully screened, structures that are visually subordinate may be partially visible. They are not visually dominant in relation to their surroundings...." *SCC 22.04.010(181)*.

²⁸ Within the study area, I-84 passes through the Hood River Urban Area. *Exhibit B.3.*

greatest significant from Cook-Underwood Road (i.e., only in the northernmost portion of the study area would turbines not be visible), but not as significant from I-84 (i.e., only in the southernmost portion of the study area, adjacent to the NSA boundary, would turbines be visible). With respect to the eastern portion of the study area, which generally corresponds to the panhandle lying south of Klickitat County, turbines would be visible from I-84 at nearly all locations, and would be visible from Cook-Underwood Road at locations near the NSA boundary. *Exhibit B.3.*

53. A viewshed analysis was prepared specifically for the Saddleback project, which, if developed, would be located in the southeast portion of Skamania County. According to the submitted site plan, 44 wind turbines would be located along some north-south ridgelines located immediately north of the Scenic Area boundary.²⁹ The turbines would be visible for several miles, and would be particularly visible from areas to the west and north of the project and from the south side of the Columbia River Gorge (I-84 and environs). Views from Cook-Underwood Road would also be affected. *Exhibits 2.2a, 2.2b, and 2.2c.*

Wildlife Impacts

54. Wind turbines typically kill at least some birds and bats. Bird fatalities are generally caused by collision with the turbines or associated infrastructure. Bat fatalities can be caused by collision or by "barotrauma" from air pressure changes near the turbines.³⁰ The extent of the impact depends on factors such as the type of species present and how they use the landscape, the type of habitat that is provided (forested areas are more sensitive), and design features such as the height of the turbines. *Testimony of Mr. Smallwood; Exhibit C.14; see generally, Exhibit 4.4, Chapter 3.*
55. Klickitat County had an Avian Study Report (WEST, 2003) prepared as part of its FEIS. The purpose of this study was to "provide data on avian use of potential wind power development areas in Klickitat County." *AR-71, Appendix B, page 1.* In addition to data on avian use, the study included predictions of the number of collisions per turbine by avian group for each of six study regions. *AR-71, Appendix B, page 3.* Two of the avian sampling points were in southeast Skamania County, in the general vicinity of the panhandle that extends south of the Klickitat County line. *AR-71, Appendix B, Figure 1.* However, the study did not include collision predictions with respect to the Skamania County sites. *AR-71, Appendix B, page 3 and Figure 1.*
56. Overall, the WEST study predicted relatively low avian fatality rates throughout Klickitat County, with the highest rate of raptor fatalities west of U.S. 97 and within 1.5 miles of the Columbia River (0.058 per year per turbine), the lowest rate of raptor fatalities east of

²⁹ It should be noted that because no formal application has been submitted to the County, the site plan submitted by the Appellants might not represent the layout ultimately reviewed.

³⁰ Pulmonary barotrauma is lung damage due to the expansion of air in the lungs that is not accommodated by exhalation. In a study of bat fatalities from a wind energy facility in Alberta, Canada, more than 90 percent of the bats exhibited internal hemorrhaging and pulmonary lesions consistent with barotrauma, and approximately half showed no sign of external injury such as would be caused by direct collision. *Exhibit C.14.*

Rock Creek and greater than 1.5 miles from the Columbia River. The prediction for passerines was the same for all study areas, at 1.6 fatalities per year per turbine. The prediction for all birds combined was similar for the study areas, with annual fatalities per turbine ranging from 1.624 east of Rock Creek and more than 1.5 miles from the Columbia River and 1.725 east of Rock Creek and less than 1.5 miles from the Columbia River. *AR-71, Appendix B, Table 32.*

57. The Appellant's wildlife expert, Dr. Kenneth Smallwood, is uniquely qualified to testify on the issue of the effects of wind turbines and other types of infrastructure on wildlife. He has a Ph.D in ecology, and has served as a consultant to the California Energy Commission, conducting research on bird behavior in the Altamont Pass Wind Resources Area. He has published 56 peer-reviewed articles, including three specifically relating to Altamont Pass. *Exhibit G.4.* Mr. Smallwood submitted that the Klickitat County FEIS underestimates the potential impact of wind turbines on birds. Mr. Smallwood reviewed the avian and bat fatality rates of the Big Horn Wind Energy Project, a 133-turbine facility that was recently constructed in Klickitat County. During the environmental review process, the developer of the Big Horn facility predicted low fatality rates for birds and bats, based in part on the results of the Klickitat County FEIS.³¹ The project was then constructed and avian and bat mortality was monitored for a year. Mr. Smallwood evaluated the monitoring results, and developed estimates of actual bird and bat mortality. With respect to raptors, he found that the number of deaths was 12 to 16 times higher than the number predicted in the preliminary studies. With respect to bats, he found that the number of deaths was more than two times higher than originally predicted. *Exhibits C.19 and C.22.*
58. Although the WEST study underestimated the avian mortality associated wind power facilities, it provided some general conclusions that are relevant to the appeals:
- Avian mortality would be reduced by siting turbines where lowest avian use occurs
 - Avian mortality would be reduced by siting turbines away from riparian areas
 - Avian mortality would be reduced by siting turbines in agricultural areas rather than in native landscapes
 - Impacts to raptors would be reduced by avoiding siting turbines at the crests and edges of hilltops, where raptors use the uplift created by the cliff face. "A requirement to consider avoiding wind turbine placement within 50 meters of hilltop rim edges is recommended to be included in the Energy Overlay Comprehensive Plan."

AR-71, page 3-64.

³¹ The estimates associated with the Big Horn facility correlate fairly closely with the estimates contained in the Klickitat County FEIS. In the Avian Study Report, WEST estimated that the number of raptor deaths per turbine per year would range from 0.022 to 0.058 depending on geographic location. The preliminary Big Horn studies estimated that the number of raptors killed per year by the entire project would be three to four, or 0.022 to 0.03 raptors per turbine. *AR-71, Appendix B, Table 32; Exhibit C-19.*

59. Skamania County is predominately forested. Forested areas support more special-status species that would be vulnerable to turbine collision. *Exhibit C.21, page 15; Testimony of Mr. Smallwood.*
60. Skamania County's planning documents acknowledge that at least portions of the County provide habitat for protected species. For example, according to the Swift Subarea Plan, the Swift area may contain or provide habitat for the following bird and bat species that are federally listed as Endangered, Threatened, or Species of Concern: Bald Eagle, Northern Spotted Owl, Pacific Townsend's Big-Eared Bat, and Peregrine Falcon. *Swift Subarea Plan, page 8.* No evidence was presented that the County considered the presence of protected species when determining which zones should allow large-scale wind energy development.
61. Turbine collision is not the only impact to wildlife associated with large-scale wind energy facilities. The infrastructure associated with wind turbine development (roads, transmission lines) has potential to adversely affect wildlife by fragmenting habitat. *Exhibit 4.4, Chapter 3, pages 105-108.* The Planning Commission Recommended Draft and proposed zoning map do not restrict energy uses to areas where infrastructure is available or could be developed with minimal environmental impact. Although energy uses such as large-scale wind energy facilities would be conditionally allowed in substantial portions of the County, the existing road and electricity infrastructure is extremely limited or nonexistent in some areas. *Exhibit H.4; County Exhibit 2.*
62. Pine Creek, located within the Swift Subarea, provides spawning grounds for bull trout, a federally listed species. The U.S. Fish and Wildlife Service considers the Pine Creek bull trout population to be "especially important in achieving recovery for this species." *Exhibit C.17; Swift Subarea Plan, page 8.* Pine Creek is "especially vulnerable to land management activities on account of its steep slopes and highly erosive volcanic soils." *Exhibit C.17, page 2; see also Exhibit C.16.*
63. There are map-based tools that can be used on a countywide level to determine where energy facilities and other development would minimize impacts to wildlife. For example, Mr. Smallwood has developed an indicators approach for assessing the impacts of wind power development on bird species at any location in California. *Exhibit C-21, pages 4-5.*
64. The Planning Commission Recommended Draft contains measures to protect wildlife from impacts associated with large-scale wind energy development. These include the following (paraphrased):
- Take "reasonable efforts" to preserve existing trees, vegetation, and water resources
 - Flag construction limits
 - Design wind energy structures to discourage bird nesting, by using tubular rather than lattice supports, avoiding use of external ladders and platforms, avoiding use of guy wires, and using bird deterrent devices on guy wires

- Control weeds to avoid creating raptor habitat
- Use anti-perching devices on transmission lines
- Set back turbines at least 2,500 feet from known nesting sites of state and/or federally threatened or endangered raptor species and at least 1,500 feet from wetlands identified on the National Wetlands Inventory maps
- Monitor raptor nest activity prior to commencing construction
- Survey avian use of the site prior to finalizing site design
- Remove animal carcasses to avoid attracting foragers
- Should consult with WDFW before making final siting decisions
- Restore temporarily disturbed areas

AR-209 to 210. The measures do not include minimum setbacks from ridgelines.³²

65. Although all development within the County would be subject to the critical areas code, the County did not present any evidence that it evaluated the presence of critical areas prior to establishing zoning districts or allowed uses within the zones. *Testimony of Ms. Witherspoon.*
66. The 2007 Comprehensive Plan contains policies that support protecting wildlife on a planning level rather than on a project-specific basis. These include the following:

Policy E.4.2: Develop strategies for preserving, protecting or restoring important habitats and corridors, particularly if they are at risk of significant degradation. Some strategies may include ... promoting land use plans and development that avoid impacts on habitat....

Policy E.4.4: Coordinate with other jurisdictions and agencies to protect environmentally critical habitats, particularly ecosystems and watersheds that span jurisdictional boundaries.

2007 Comprehensive Plan, page 46.

Air quality

67. According to the Klickitat County FEIS, biomass involves combustion of an organic fuel (such as wood), and consequently the emissions from such facilities include nitrogen oxides, carbon monoxide, particulate matter, sulfur dioxide, greenhouse gases, and toxic air pollutants (i.e., toluene, formaldehyde, etc.). *AR-71, page 3-9.* The FEIS notes that both biomass and natural gas-fired plants could affect visibility within the National Scenic Area, even though the Scenic Area is not within the overlay, and recommends the use of state-of-the-art air pollution technologies to mitigate impacts. *AR-71, page 1-7.*

³² The County Critical Areas Ordinance would also not require a minimum setback from the edge of a bluff or mountain ridge. Development on slopes steep enough to be classified as a Landslide Hazard Area requires preparation of a geotechnical report. No minimum setback is specified. *SCC 21A.06.020.*

68. The United States Forest Service (USFS) monitors air quality within the Scenic Area, as well as within national forests in the Pacific Northwest region, through chemical analysis of lichen tissue. Based on study conducted between 1993 and 2001, the USFS found that mean concentrations of sulfur, nitrogen, lead, cadmium, copper, and zinc within the Scenic Area were significantly higher than means within the national forests, and were comparable to levels found within urban areas. *Exhibit A.3*. Cultural resources such as rock art might be adversely affected by the air pollution. *Exhibits A.1 and A.5*. Other ecological effects associated with nitrogen deposition are described in *Exhibit A.4*. *Exhibit A.4*.
69. The visibility within the Columbia Gorge National Scenic Area is poor compared to the conditions within many national parks and scenic areas in the western U.S., and is comparable to conditions within locations in California and in northwest Washington. *Exhibit A.1, pages 3 and 4*.
70. The Planning Commission Recommended Draft includes the following air quality/pollution control standard relating to bio-energy facilities: "All applicable air emission permits shall be obtained and all conditions complied with." *AR-214*.

Noise/Health

71. The Planning Commission Recommended Draft contains the following standards with respect to the noise generated by large-scale wind energy facilities:
- i. The owner/operator shall operate the project in compliance with applicable Washington State Environmental Noise Levels, Chapter 173-60 WAC.
 - ii. Applicants shall provide documentation of expected noise generation levels.

AR-207. The Washington noise standards are based on the land use classification of both the noise source and the noise receiver. When the receiver is a residential property, the daytime noise limit ranges from 55 to 60 dBA³³ depending on the classification of the noise source. At night, the maximum ranges from 45 to 50 dBA. *WAC 173-60-040*.

72. Mr. Richard James, an acoustical engineer, provided credible testimony that wind turbines generate a type of noise that is not adequately measured by the dBA scale used in the Washington noise standards. The dBA scale is designed to detect noises audible to humans. Wind turbines generate low-frequency noise (20 Hz or lower) that might cause the body to resonate even if it is not audible. Such effects are measurable on the C-weighted scale (dBC). *Testimony of Mr. James*.
73. Wind turbines have unique sound characteristics due to the interaction of the blades with the air around the towers. As described in one of the articles submitted by the Appellants:

³³ "dBA" means the sound pressure level in decibels measured using the "A" weighting network on a sound level meter." *WAC 173-60-020*.

"The interaction of the blades with air turbulences around the towers create low frequency and infrasound components, which modulate the broadband noise³⁴ and create fluctuations of sound level. The low frequency fluctuations of the noise is described as 'swishing' or 'whooshing' sound, creating an additional disturbance due to the periodic and rhythmic characteristic." *Exhibit 1.12, page 11*. Mountainous conditions can exacerbate the noise effects of wind turbines. *Testimony of Mr. James*.

74. Mr. James recommended a minimum distance of 1.2 miles between turbines and residences, based on health effects research conducted by Dr. Nina Pierpont. *Testimony of Mr. James*.
75. Dr. Pierpont, a pediatrician, interviewed by telephone 23 members of ten families, and through those interviews obtained information on a total of 37 people (she obtained information on young children from their parents). The ten families were not from the same town or situated around the same wind farm; some families lived in Canada and others lived in various Western European countries. Only one family lived in the United States. The families lived distances ranging from 0.19 mile to 0.93 mile from minimum 328-foot-tall, modern (i.e., constructed 2004 or later) wind turbines. Six of the ten families lived less than one-half mile from the turbines. Based on the interviews, Dr. Pierpont found that most study members experienced sleep disturbance, and at least half experienced a variety of other systems such as headaches, dizziness, and memory problems, which symptoms improved when the member was away from the turbines.³⁵ Dr. Pierpont calls the constellation of symptoms "Wind Turbine Syndrome." Her theory is that the low-frequency noise or vibration associated with wind turbines stimulates receptors for the balance system in a discordant fashion. Dr. Pierpont recommends that wind turbines be set back a distance of at least 1.2 miles from residences.³⁶ *Exhibit 8.3 (see in particular, pages 8, 12, 20, 22, 23, 26, 60, and 61)*.
76. Dr. Pierpont's research has several limitations. The study was based on an extremely small number of families, and the only families that were included in the study were those in which a member reported severe effects and the family considered the problem to be serious enough to take action to reduce turbine exposure (such as moving to a new location). Dr. Pierpont did not physically examine any of the participants; the information obtained was based on medical histories taken by telephone. *Exhibit 8.3, page 18; Testimony of Dr. Pierpont*. The study was not epidemiological in nature; it does not show how prevalent any of the symptoms were within the larger community. Individuals outside of the selected families who lived near turbines but did not experience symptoms were not interviewed. *Testimony of Dr. Pierpont; Exhibit 8.3, page 51*. Wind Turbine

³⁴ "Broadband noise is characterized by a continuous distribution of sound pressure with frequencies greater than 100 Hz." *Exhibit 1.12, page 4*.

³⁵ Mr. Banks objected to the hearsay nature of Dr. Pierpont's testimony on this issue.

³⁶ All of Dr. Pierpont's subjects lived less than a mile from wind turbines. The recommendation of 1.2 miles is based on surveys conducted by Robyn Phipps of New Zealand. *Exhibit 8.3, page 8*. Robyn Phipps is not a medical doctor. *Exhibit 8.1, page 2*.

Syndrome (or the same group of symptoms) is not described in any medical journal or other professional literature.³⁷ *Exhibit 8.3, page 15; Testimony of Dr. Pierpont.*

77. The National Academy of Sciences does not consider noise produced by wind turbines to be a "major concern" for people living more than a half-mile from the turbines. *Exhibit 4.4, Chapter 4, page 159.* However, it notes that "industry standards ... for assessing and documenting noise levels emitted may not be adequate for nighttime conditions and projects in mountainous terrain. This work on understanding the effect of atmospheric stability conditions and on site-specific terrain conditions and their effects on noise needs to be accounted for in noise standards. In addition, studies on human sensitivity to very low frequencies are recommended." *Exhibit 4.4, Chapter 4, page 176.*

Shadow Flicker

78. Shadow flicker is the phenomenon in which the blades of a wind turbine, as they rotate in sunny conditions, "cast moving shadows on the ground resulting in alternating changes in light intensity." *Exhibit 4.4, Chapter 4, page 160.*
79. According to one article, for individuals with photosensitive epilepsy (one in 4,000 people), "flicker from turbines that interrupt or reflect sunlight at frequencies greater than 3 Hz poses a substantial risk of inducing photosensitive seizures." *Exhibit 2.1, page 4.* However, modern large wind turbines do not generate shadow flicker at frequencies greater than 3 Hz. *Exhibit 4.4, Chapter 4, page 161 ("Flicker frequency due to a turbine is on the order of the rotor frequency (i.e., 0.6 – 1.0 Hz)"); see also Exhibit 2.1, page 4.*
80. Although shadow flicker might still be considered annoying even if not an actual health hazard, shadow flicker only occurs during a limited portion of the day, and only during certain conditions. As described in the National Academy of Sciences publication on wind-energy projects, "Even in the worst situations, shadow flicker only lasts for a short time each day – rarely more than half an hour. Moreover, flicker is observed only for a few weeks in the winter season." *Exhibit 4.4, Chapter 4, page 161.*
81. Shadow Flicker can be easily modeled on a project-specific basis, and shadow flicker modeling was performed for the Wild Horse Wind Power Project in Kittitas County. *Exhibit 4.4, Chapter 4, page 161.* As described in the FEIS for the project, the shadow flicker frequency for each turbine would be less than one-fifth the frequency reported to trigger seizures, and the project would not have a shadow flicker impact on residences due to distance and intervening terrain. *Exhibit 5.2, page 3.15-1.* With respect to an off-site alternative location with potential shadow flicker impacts (potential exposure ranging from six minutes to two hours), micro-siting of some of the turbines was identified as a potential mitigation measure. *Exhibit 5.2, page 3.15-2.*

³⁷ "Other than articles on the internet, there is currently no published research on wind turbine associated symptoms." *Exhibit 8.3, page 15.*

CONCLUSIONS

Jurisdiction:

The Hearing Examiner is granted authority to conduct hearings and make decisions on appeals of State Environmental Policy Act (SEPA) threshold determinations pursuant to Skamania County Code (SCC) 2.80.060(A)(13).

Standards for Review of a SEPA Threshold Determination:

SEPA requires an Environmental Impact Statement (EIS) to be prepared "on proposals for legislation and other major actions having a probable significant, adverse environmental impact." RCW 43.21C.031.

- "Significant" as used in SEPA means a reasonable likelihood of more than a moderate adverse impact on environmental policy. Significance involves context and intensity and does not lend itself to a formula or a quantifiable test. *WAC 197-11-794*. Several marginal impacts when considered together may result in a significant adverse impact. *WAC 197-11-330(3)(c)*.
- "Probable" as used in SEPA means likely or reasonably likely to occur. Probable is used to distinguish likely impacts from those that merely have a possibility of occurring, but are remote or speculative. *WAC 197-111-782*.

In *King County v. Boundary Review Board*, 122 Wn.2d 648 (1993), the Washington Supreme Court clarified that the term "probable" does not mean that an impact must be "inevitable" before an EIS may be required. In that case, the City of Black Diamond had issued a DNS for a proposed annexation of unincorporated King County land. The land was "largely uninhabited" (*Id.* at 656), and while some of the owners identified preferred future land uses, none presented a formal development proposal to the City. In response to argument that any future development of the property is too speculative to warrant full environmental review, the Court held, "a proposed action is not insulated from full environmental review simply because there are no existing specific proposals to develop the land in question or because there are no immediate land use changes which will flow from the proposed action. Instead, an EIS should be prepared where the responsible agency determines that significant adverse environmental impacts are probable following the government action." *Id.* at 664. The Court explained its reasoning as follows:

One of SEPA's purposes is to provide consideration of environmental factors at the earliest possible stage to allow decisions to be based on complete disclosure of environmental consequences. Decision-making based on complete disclosure would be thwarted if full environmental review could be evaded simply because no land-use changes would occur as a direct result of a proposed government action. Even a boundary change, like the one in this case, may begin a process of government action which can "snowball" and acquire virtually unstoppable administrative inertia.

Id.

In determining an impact's significance, the responsible official must take into account that:

- (a). The same proposal may have a significant adverse impact in one location but not in another location;
- (b). The absolute quantitative effects of a proposal are also important, and may result in a significant adverse impact regardless of the nature of the existing environment;
- (c). Several marginal impacts when considered together may result in a significant adverse impact; For some proposals, it may be impossible to forecast the environmental impacts with precision, often because some variables cannot be predicted or values cannot be quantified.
- (d). A proposal may to a significant degree:
 - i. Adversely affect environmentally sensitive or special areas, such as loss or destruction of historic, scientific, and cultural resources, parks, prime farmlands, wetlands, wild and scenic rivers, or wilderness;
 - ii. Adversely affect endangered or threatened species or their habitat;
 - iii. Conflict with local, state, or federal laws or requirements for the protection of the environment; and
 - iv. Establish a precedent for future actions with significant effects, involves unique and unknown risks to the environment, or may affect public health or safety.

WAC 197-11-330(3).

A threshold determination "shall not balance whether the beneficial aspects of a proposal outweigh its adverse impacts, but rather, shall consider whether a proposal has any probable significant adverse environmental impacts." *WAC 197-11-330(5)*. Thus, in *King County v. Boundary Review Board*, the Court rejected the argument that an EIS need not be prepared for the annexation proposal because development could also take place under county jurisdiction, stating, "The specter of adverse environmental effects in the absence of government action ... is itself not a justification for evading full environmental review." *King County v. Boundary Review Board*, 122 Wn.2d at 666. Even proposals designed to improve the environment might have significant adverse environmental impacts. *WAC 197-11-330(5)*.

The lead agency must make its threshold determination "based upon information reasonably sufficient to evaluate the environmental impact of a proposal." *WAC 197-11-335*.

If a DNS is issued, the agency has the burden of demonstrating "that environmental factors were considered in a manner sufficient to be a prima facie compliance with the procedural dictates of SEPA." *Lassila v. City of Wenatchee*, 89 Wn.2d 804, 814 (1978). To uphold the DNS, the reviewing body "must be presented with a record sufficient to demonstrate that ACTUAL consideration was given to the environmental impact of the proposed action or recommendation." *Id. (emphasis in original)*.

Clear error is the standard of review applicable to substantive decisions under SEPA.

Cougar Mt. Assocs. v. King County, 111 Wn.2d 742, 747, 765 P.2d 264 (1988). The determination by the governmental agency is clearly erroneous only if the reviewing tribunal is left with "the definite and firm conviction that a mistake has been committed." *Id.* at 747 (quoting *Polygon Corp. v. Seattle*, 90 Wn.2d 59, 69, 578 P.2d 1309 (1978)). In deciding this appeal, the Hearing Examiner must accord the County's SEPA determination "substantial weight." *RCW 43.21C.090*. The burden of proof is on the Appellants to show that the threshold determination was clearly erroneous.

Conclusions Based on Findings:

1. The County has not demonstrated that it has considered environmental factors to the extent required by SEPA. Most significantly, the County did not consider County-specific environmental studies prior to developing the zoning text and map amendments and did not consider the types of development that might result from the amendments. The County was not able to articulate a strong rationale for some the proposed alternative energy development standards, even though such standards have the potential to create environmental impacts. *Findings 12, 27, 28, 29, and 65.*
2. The Appellants have demonstrated, consistent with *King County v. Boundary Review Board*, that development with significant adverse environmental impacts is probable after adoption of the proposed zoning amendments.
 - A. The zoning amendments would facilitate the development of large-scale wind energy and other alternative energy facilities on or near lands known for their unique scenic resources and habitat value. Some of the alternative energy uses are not identified in the Comprehensive Plan or the existing zoning code. *Findings 3, 11, 12, 13, 14, 16, 18, 42, and 43.*
 - B. The potential significant, adverse environmental impacts of large-scale wind energy facilities are many and well documented. The Hearing Examiner finds most compelling the evidence regarding aesthetic and wildlife impacts. These impacts can and should be evaluated on a planning level rather than when individual projects are proposed. With full environmental analysis, the County might decide to refine the zoning map or development regulations to avoid environmental impacts. *Findings 40 – 66.*
 - C. Although based on the evidence submitted the Hearing Examiner is not convinced that an adverse impact to public health is probable if wind turbines are allowed to be sited less than 1.2 miles from residences, wind turbines do generate noise and the impact should be evaluated prior to adopting a setback standard. *Findings 71-77.*
 - D. The significant, adverse environmental impacts associated with wind energy facilities are not ameliorated by the conditional use permit requirement. Under the proposed zoning amendments, a conditional use cannot be denied. *Finding 17.*

- E. The significant, adverse environmental impacts associated with wind energy facilities would not be fully addressed by project-specific environmental impact statements. Because project proposals are tied to specific parcels of land, the ability to consider alternative locations that might reduce environmental impacts is limited.
- F. Development of wind energy facilities is probable after the zoning action due to the County's unique wind resources, the County Commissioners' expressed interest in and support of alternative energy development, and the fact that a developer has already approached the County with a potential wind power project. *Findings 31-38.*
3. The significance of the County action is not diminished by the fact that only a small fraction of the County located outside of the scenic area and the incorporated areas is privately owned. Even five percent of the County's total acreage (an amount less than the actual private ownership) is a significant amount of land.³⁸ Further, no evidence or legal authority was presented to suggest that the County's regulations would not apply to the 60,000 acres of land owned by the State of Washington. Klickitat County, for example, is processing permit applications for wind energy facilities located on Washington DNR land. *Finding 40.* Finally, even if the County does not have jurisdiction to regulate public lands within its boundaries³⁹, the County's regulations might be influential to state and federal decision makers when evaluating requests for alternative energy facilities. For example, 36 CFR 251.56 states that special use approvals on National Forest land "may be conditioned to require State, county, or other Federal agency licenses, permits, certificates, or other approval documents, such as a Federal Communication Commission license, a Federal Energy Regulatory Commission license, a State water right, or a county building permit." *36 CFR 251.56(a)(2).*
4. Contrary to the County's assertion, the proposed wind energy regulations would not be preempted by the Washington Energy Facilities Site Locations Act (EFSLA) (Chapter 80.50 RCW) automatically. The EFSLA establishes a certification process that is mandatory for development of certain types of energy facilities (e.g., natural gas transmission pipelines in excess of 14 inches in diameter and 15 miles in length; stationary thermal power plants with generating capacity of 350,000 KW or more; facilities capable of processing more than 25,000 barrels per day of petroleum into refined products) but that is voluntary for the development of energy facilities that exclusively use alternative energy resources, such as wind, solar, geothermal, and biomass energy. *RCW 80.50.060; RCW 80.50.020(7), (11), (15), and (18).* When certification under the EFSLA is sought, the Energy Facility Site Evaluation Council holds a public hearing "to determine whether or not the proposed site is consistent and in compliance with city, county, or regional land use plans or zoning ordinances." *RCW*

³⁸ In *Ullock v. Bremerton*, 17 Wn. App. 573 (1977) the court reviewed an EIS prepared for a rezone of five acres.

³⁹ In *South Dakota Mining Assoc. v. Lawrence Co.*, 155 F.3d 1005 (1998), the court determined that federal laws allowing mining on National Forest land preempted a county ordinance prohibiting mining.

80.50.090. If the site is not consistent with the local ordinances, then the Council must determine whether to recommend to the governor that the state preempt the local ordinances. *WAC 463-28-060*. Even if the Council recommends preemption, it must include conditions in the draft certification agreement that considers local interests and the purposes of the ordinances that are preempted. *WAC 463-28-070*. The governor ultimately decides whether to approve the certification agreement. *RCW 80.50.100*. Because state preemption must be applied for, is discretionary, and is granted only after consideration of local ordinances, RCW 80.50 does not provide a rationale for avoiding full environmental review of the County's alternative energy regulations.

5. The Appellants have met their burden of proving that the County's issuance of a DNS was in error.

DECISION

Based upon the preceding Findings and Conclusions, the appeals of the October 8, 2008 Determination of Nonsignificance issued for the County's proposed zoning text and map amendments are granted. The Determination of Nonsignificance is reversed, and remanded to the County for preparation of an Environmental Impact Statement for the zoning text and map amendments.

Dated February 19, 2009.

Subject: Whistling Ridge harms the scenic Columbia Gorge & Hood River

I wish to make comments on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

I live in Hood River, OR and I am concerned this project will cause visual pollution of our viewshed, which is one reason tourists visit here.

In addition this proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. The photo simulations in the DEIS are inadequate and misleading. Some of them have cloudy backgrounds, thus not adequately representing the full extent of the impacts, and other simulations are out scale. Additional viewpoints need to be considered, including views from the Historic Columbia River Highway. The DEIS erroneously concludes that the scenic impacts would not be significant, even though most of the turbines would be visible from designated key viewing areas within the National Scenic Area. In addition, the BPA and EFSEC have not adequately consulted with the Yakama Nation to ensure the protection of cultural resources.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS, issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project. If another DEIS is issued the 50-turbine layout should be rejected.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines. As you read the letters and impact statements that will be sent to you regarding this wind power project, the same ideas that have been covered before will be mentioned again, no doubt. But what I wish to have you connect with is how much we take for granted the beauty of this place and the life inhabiting it that makes it impact our senses.

In our endeavor to make ourselves warm and happy, we hastily provide less than satisfactory power alternatives and arrive at an ugly display that destroys the beauty inherent in the place. It becomes a heartless displacement of animal and plant life as well as ruining natural geological formations that render peace and joy of heart to all who pass by to witness them. For some reason we are obsessed with destruction rather than with preservation of the Gorge for generations to come. Support a healthy scenic Gorge by presenting a true draft environmental impact statement that covers all the bases as well as the heights.

This current proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines. It is vital that we develop alternate and renewable energy sources, but it is just as vital that we do not repeat the same kinds of mistakes we have committed with dirty energy; namely, destroying the natural world, its ecosystems, and beauty in order to develop more energy.

This project has not been well analyzed in the DEIS. Another more critical look is required. In addition, this proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

We do need to use all different ways to generate energy and wind energy is one of several options. It is not an option for the Columbia Gorge as planned for by Whistling Ridge. The loss it would incur does not justify building it.

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines. This area is some of the most beautiful landscape in the country. Its beauty can not be sacrificed just for first choice location of an energy company. Remember the gulf oil spill - repair after the fact is never available.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

A wholistic energy assessment should be the first thing on the review program for any proposed development - not just first cost and/or specific company investment return profit figures. The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. The photo simulations in the DEIS are inadequate and misleading. Some of them have cloudy backgrounds, thus not adequately representing the full extent of the impacts, and other simulations are out of scale. Additional viewpoints need to be considered, including views from the Historic Columbia River Highway. The DEIS erroneously concludes that the scenic impacts would not be significant, even though most of the turbines would be visible from designated key viewing areas within the National Scenic Area.

In addition, the BPA and EFSEC have not adequately consulted with the Yakama Nation to ensure the protection of cultural resources. In the early 1990's the Department of Energy made similar misjudgements when first attempt to site the Environmental Molecular Sciences Laboratory (EMSL) at the edge of the Columbia River in Richland, WA and then were forced to relocate the facility after excavation was started due to the discovery of native american grave sites. This was a multi-million dollar expense. We should not put this project in the same potential position without serious research and thought regarding its appropriate siting location.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS, issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project. If another DEIS is issued the 50-turbine layout should be rejected.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: Whistling Ridge Negatively Is Bad for the Gorge Economy

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

As a native and resident of the Gorge, I find the proposed construction crazy. The wind blows all over Eastern Washington and Oregon, so there is no shortage of alternative sites. Further, tourism is now the only real hope for towns like Hood River, White Salmon and The Dalles. To destroy the natural beauty that draws tourists is to doom the only real growth engine this region has.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. The photo simulations in the DEIS are inadequate and misleading. Some of them have cloudy backgrounds, thus not adequately representing the full extent of the impacts, and other simulations are out scale. Additional viewpoints need to be considered, including views from the Historic Columbia River Highway. The DEIS erroneously concludes that the scenic impacts would not be significant, even though most of the turbines would be visible from designated key viewing areas within the National Scenic Area. In addition, the BPA and EFSEC have not adequately consulted with the Yakama Nation to ensure the protection of cultural resources.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS, issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project. If another DEIS is issued the 50-turbine layout should be rejected.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am firmly opposed to the proposed Whistling Ridge wind energy project. These unsightly towers do not belong at the very edge of a National Scenic Area. We mustn't let one individual's greed and ambition ruin a national treasure. If California must have the power generated by these wind turbines, then they should be located in California or at the very least, way out in eastern Oregon or Washington where their visual and environmental impact is less egregious.

Please do not permit this project to go forward. We hike often in the eastern end of the Columbia Gorge -- it is a wonderful area. The presence of huge wind turbines would ruin the experience completely!

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: opposed to the wind project

I am totally opposed to this wind project in the gorge. The Whistling Ridge project is a disaster. Proposed to be located seven miles northwest of White Salmon, Friends of the Gorge writes "the proposed wind turbines would cover more than 1,000 acres of highly visible ridgelines and would be seen from several designated key viewing areas in the Gorge including Interstate 84, the Historic Columbia River Highway, Columbia River, Cook-Underwood Road, and Panorama Point. The project would also be highly visible from communities and cities such as Mill A, Underwood, Hood River, and White Salmon." In addition, the project is proposed in a forest zone where three special-status wildlife species are documented presently including the northern spotted owl, western gray, and northern goshawk.

Please do not allow this project to continue.

Subject: Concern about Whistling Ridge Project and its negative impact on the Gorge

I am writing to express my concern about the Whistling Ridge Energy Project, proposed in the Underwood, Washington area (near the Skamania and Klickitat county lines).

I have reviewed some of the materials related to the project, and I am concerned about the extent of wildlife impacts. The proposed project may result in greater wildlife impacts than other wind energy facilities in Washington because of its location along a forested ridgeline in the foothills of the Cascade Mountains. This project is proposed to sit on the boundary of the Columbia River Gorge National Scenic Area, and it is not clear why that location has been selected. The project would directly impact the beauty and appeal of the Lewis and Clark National Trail and the Columbia River Gorge Scenic Area - one of the treasures of Washington and Oregon heritage. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat. The proposal fails to provide a credible alternatives analysis. Additional time is required for proper review. The EFSEC and BPA need to consider other alternatives, as well as other sites for wind energy. Additional planning is required for other configurations, deleting turbines to reduce impacts.

The DEIS proposal fails to present adequate and credible analysis of the impacts of this project over time and fails to consider an overall plan which recognizes other existing and potential future wind energy projects. The photo simulations are poorly accomplished.

Please allow the time to consider other viewpoints, including views from the Historic Columbia River Highway and the Native tribes that may be impacted by the proposed projects.

Thank you for extending the public comment period.

Respectfully,

M. Kristin Price

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

Surely there are plenty of places to site wind turbines so that they don't besmirch the wonderful vistas to/in/from the Columbia Gorge National Scenic Area. It's a scenic area; wind turbines are anything but scenic!

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. This wind farm will give the Skamania County economy the boost it needs. We are too dependent on timber harvests and federal timber payments. Too many residents are stuck in low-income brackets while unemployment ranks far above the state average. Fortunately, Skamania has another natural resource to develop: wind. Bringing another industry here is exactly what our county needs. It will stimulate local spending, create jobs, and provide new tax revenues. How can that be a bad thing? Skamania County needs to diversify its resources and revenue, and Whistling Ridge can make that happen. I hope the Council approves the SDS application and that the project advances quickly.

Sincerely,
Rachel Wold

Re: Whistling Ridge DEIS

Dear EFSEC Council Members/BPA Representatives:

NOTE: This communication is organized into two parts. Part One summarizes our concern about undue political pressure applied to prevent federal agencies from commenting on this DEIS. Part Two is an analysis of the Visual Resources Section of the DEIS.

PART ONE

We had not planned on commenting on the visual impact in detail; however, we recently discovered that significant political pressure has been exercised by a member(s?) of the Skamania Board of County Commissioners (BOCC) activating, it appears, US Senate and House Representatives as well. This pressure was designed to prevent the USFS and the Department of the Interior from submitting any further comment and to retract previously submitted comments regarding the DEIS. In Skamania County Resolution 2010-51 the BOCC "demand, in the strongest possible terms, that Interior's comment be immediately retracted and removed from the public record on this matter" is, we believe, a direct attempt to undermine EFSEC's/BPA's capacities and responsibilities to examine all relevant information regarding the environmental impact of this proposed project.

We have attached the above-mentioned resolution and our letters to the BOCC and Secretary Salazar of the U.S. Department of the Interior regarding the same, dated August 23, 2010. Furthermore, we include a number of email strings below, to demonstrate some of what causes us to question the fairness of this purported "public process." These emails are copies obtained via a Public Information Request at Skamania County, WA, of Commissioner Paul Pearce's email communications in the public domain.

Subject: Re: e-mail from Posner re USFS

Chief of the USFS? That's good timing. It is a mission critical task to not only get the USFS to back off but to very importantly take a position like BPA dis in their EIS that the boundary is the boundary. If they don't, and they continue to muddy the public record, the USFS is giving Friends of the Gorge an appeal issue under NEPA that will delay the project for years in federal courts. They are acting contrary to the Administration and the State's renewable energy objectives and supporting greater harm to the environment. This scenic issue.....of the project next to the NSA is absolutely a project critical issue. We have not been able to find enviro groups willing to show courage to stand up and oppose friends of gorge on the general issue of scenery vs clean energy when considering the alternative of dead, oil poisoned ecosystems. I'm still trying to find such a group if any of you know of one.

What are the prospects of political engagement on this issue????

Paul i think you were going to ask if Brian might be able to attend and testify at the public hearings. Were you able to have that conversation?

Whistling Ridge DEIS Keith Brown, Ph.D. and Teresa Robbins

Begin forwarded message:

Subject: e-mail from Posner re USFS

I received a call from Lynn Oliver, US Forest Service. Lynn has some questions on the visual resource analysis that was done for WR. One of his questions was whether or not a Landscape Architect was consulted during development of this section. He would also like to know who did the analysis and what their qualifications are.

Generally, he expressed concerns about the quality of the analysis and whether or not it took into account the special characteristics of the Gorge.

Stephen Posner

06/10/2010 01:43 PM Subject Request for meeting with Mary Wagner

The Congressman has asked me to provide assistance to Skamania County Commissioner Paul

Attempted Suppression of Expert Comments and Visual Resource Analysis for
Whistling Ridge DEIS Keith Brown, Ph.D. and Teresa Robbins

Pearce who is requesting a meeting with Regional Forester Mary Wagner to be held as soon as possible.

The purpose of the meeting is to update Mary Wagner on the status of the Whistling Ridge Energy Project sited in Skamania County.

While the project is outside the National Scenic Area on privately held commercial timber land, the Forest Service has in the past, formally submitted concerns about the project because several of the 50 turbines would be visually seen from inside the NSA.

Commissioner Pearce would like Mary to know about the status of the project, the current review process and its economic benefit to Skamania County.

It is reasonable to expect the Commissioner would request that the USFS not write an official letter of objection as the project is reviewed by EFSEC (Energy Facility Site Evaluation Council) and BPA. Commissioner Pearce would bring Jason Spadaro to the meeting and would invite staff from Baird and Murray's office to attend (Kelly Love Parker and Page Phillips). I believe 30 minutes would be sufficient.

Could you check Mary Wagner's schedule and see if there are dates available in the next week?

I appreciate its short notice but time is critical as the public comment period begins June 16th.

I believe the Commissioner would be very flexible in his schedule to accommodate her schedule.

Best to you,

Kelly

Kelly Parker (Love)

District Director

Congressman Brian Baird

This proposed meeting actually took place, on June 15, 2010, with stated agenda items designed to pressure the USFS to withhold valid comments regarding this project and its impact. We can't help but fear the deck is

being stacked against a fair and objective review of environmental impacts. Below is an email and attached Draft Meeting Agenda, as found on Skamania County Commissioner Paul Pearce's email from Jason Spadaro, dated June 14, 2010: (Please take particular notice to Agenda Items 4 & 5)

Attempted Suppression of Expert Comments and Visual Resource Analysis for
Whistling Ridge DEIS Keith Brown, Ph.D. and Teresa Robbins

June 14, 2010

Skamania County meeting with USFS Regional Forester
regarding Whistling Ridge Wind Energy Project

Attendees:

Mary Wagner, USFS Regional Forester
Lenise Lago, USFS
Dan Harkenrider, USFS
Paul Pearce, Skamania County Commissioner
Jason Spadaro, Whistling Ridge Energy/SDS Lumber Company
Curt Smltch, Thompson Smltch (working with SDS Lumber)
Page Phillips, Office of Senator Patty Murray
Kelly Love Parker, Office of Congressman Brian Baird
Steven Sparks, Office of Congressman Brian Baird
Office of Senator Maria Cantwell (by telephone)

Agenda:

1.

Sec. 3. Purposes (Sec. 644a)

The purposes of sections 544 to 544p of this title are -

(1) to establish a national scenic area to protect and provide for the enhancement of the scenic, cultural, recreational, and natural resources of the Columbia River Gorge; and

(2) to protect and support the economy of the Columbia River Gorge area by encouraging growth to occur in existing urban areas and by allowing future economic development in a manner that is consistent with paragraph (1)

2.

Sec. 17. Savings provisions (Sec. 544o)

(a) Nothing in sections 544 to 544p of this title shall -

(1) affect or modify any treaty or other rights of any Indian tribe;

(2) except as provided in section 13(c), authorize the appropriation or use of water by any Federal, State, or local agency, Indian tribe, or any other entity or individual;

(3) except as provided in section 13(c), affect the rights or jurisdictions of the United States, the States, Indian tribes or other entities over waters of any river or stream or over any ground water resource or affect or interfere with transportation activities on any such river or stream;

(4) except as provided in section 13(c), alter, establish, or affect the respective rights of the United States, the States, Indian tribes, or any person with respect to any water or water-related right;

(5) alter, amend, repeal, interpret, modify, or be in conflict with any interstate compact made by the States before November 17, 1988;

(6) affect or modify the ability of the Bonneville Power Administration to operate, maintain, and modify existing transmission facilities;

(7) affect lands held in trust by the Secretary of the Interior for Indian tribes or individual members of Indian tribes or other lands acquired by the Army Corps of Engineers and administered by the Secretary of the Interior for the benefit of Indian tribes and individual members of Indian tribes;

(8) affect the laws, rules and regulations pertaining to hunting and fishing under existing State and Federal laws and Indian treaties;

(9) require any revision or amendment of any forest plan adopted pursuant to the National Forest Management Act of 1976 (Act of October 22, 1976, Public Law 94-588, as amended (16 U.S.C. 1600 et seq.)); or

(10) establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas.

3. History of USFS correspondence on Whistling Ridge Energy Project in contradiction to the above (all correspondence attached):

- May 6, 2009 letter to Allen J. Fiksdal, EFSEC Manager
- May 19, 2009 letter to Allen J. Fiksdal, EFSEC Manager
- May 20, 2009 letter from Congressman Brian Baird to Regional Forester Mary Wagner
- June 17, 2009 letter from Regional Forester Mary Wagner to Congressman Brian Baird
- May 28, 2010 telephone call to EFSEC staff by Lynn Oliver

4. Any comments by the USFS are an attempt to extend the scope and reach of the National Scenic Area, constituting hostility toward regional economic development in timber dependent Counties and setting dangerous precedence against economic development in Counties adjacent to the CRGNSA.

- Where is the USFS authority to issue these comments?
- Where does the Scenic Area authority and right to restrict economic development in neighboring Counties end?
- Does the Forest Service comment on all other industrial activities in Urban Exempt Areas and areas outside the boundary that are visible from the CRGNSA? Including activities in Portland, Vancouver, Camas, etc? Or is it just clean energy in Skamania County that the USFS opposes?
- See map showing all lands that will be excluded from wind energy development if wind turbines visible from within the National Scenic Area are denied. Note that thousands of megawatts of existing wind energy development in operation would not have been allowed.

5. Conclusion

- No part of the Whistling Ridge Wind Energy Project lies within the Columbia Gorge National Scenic Area.
- No improvements requiring National Scenic Area Land Use Permits are required for the Whistling Ridge Energy Project.
- The Columbia River Gorge Commission and U.S. Forest Service lack jurisdiction to comment on a proposed land use action located entirely outside of the National Scenic Area boundary in Skamania County.
- Commenting on the project will be prejudicial to Skamania County, the project applicant and the wind energy industry, potentially denying Skamania County opportunity for economic development and diversification and supporting project delaying appeals by project opponents.

The attempt at pressure did not end with the meeting as evidenced in the following email dated June 17, 2010 which now also references National Park Service's comment letter:

Public Information Request data

From: Jason Spadaro [REDACTED]
Sent: Thursday, June 17, 2010 5:53 PM
To: Paul Pearce
Cc: Phillips, Paige; Kelly.Parker@mail.house.gov; DeVaney, Jon; kimberly [REDACTED]
Subject: Whistling Ridge
Attachments: Appendix%20B.pdf

I don't mean to sound like a broken record but page three of the attached SEPA scoping notes documents more USFS comments that are sitting in the SEPA/NEPA record on Whistling Ridge. These comments, combined with Harkenrider's, and Regional Forester Mary Wagner's response to Congressman Baird's letter enable Friends of the Gorge appeal of the project EIS, delaying the project and threatening eligibility for renewable energy incentives.

Paul, are you comfortable forwarding this to Mary Wagner as further evidence of the mess her staff has created?

The National Park Service comment letter has the same effect.

Thank you everyone for helping and working on this issue. It is appreciated.

Best,
Jason Spadaro

PART TWO

We feel the pressure exerted may have resulted in the USFS not doing as in-depth an analysis of the deficiencies of the DEIS and thus, our Visual Resources analysis will focus on how the USFS comments presented during the scoping process remain valid, yet unaddressed.

The first page of the USFS 2009 scoping letter (attached) alerts the risk of significant impacts...

“The purpose of this letter is to inform you of the risk of significant impacts to protected scenic resources if the proposed energy project is built as currently planned. This letter is not meant to imply that the project outside of the Scenic Area is regulated by the Scenic Area Act. In a letter dated May 8, 2008, the Columbia River Gorge Commission provided technical assistance in response to a request by the Oregon Department of Energy regarding a similar project in Oregon. In that letter, the Gorge Commission explained that the National Scenic Area Act specifically prohibits the implementation of a buffer around the boundaries of the Scenic Area. However, the letter also explains how Scenic Area resources would be affected by the project and how they could be protected. By requesting comments on the project, I assume that EFSEC would similarly benefit from scenic resources technical expertise in this matter.

Diana Ross, CRGNSA landscape architect, provided me the following analysis of the Aesthetics portion of the application starting on page 4.2-27. My comments are based on the findings of that portion of the application and the recommendations made by my staff.”

Starting on page 3-155, the DEIS uses the same methodology and visual simulations, though fewer viewpoints than in the SDS application. It appears to completely ignore the risks of significant impacts and recommendations identified in the USFS scoping letter. It simply depicts the same inaccurate and misleading conclusions presented in the SDS application.

We ask, as Lynn Oliver of the USFS asked, “Was a qualified landscape architect consulted in the preparation of the DEIS?” None appear in the List of Preparers (pages 6–1 to 6–7). We must conclude one was not. The quality of this DEIS would have been substantially improved had the recommendations of Diana Ross, CRGNSA landscape architect been utilized. Her analysis of the application and our comments regarding relevant points of the DEIS follow:

“1) Key Viewing Areas (KVAs)

As mentioned in the application, the effects to scenic resources in the Scenic Area are assessed by analyzing the effects of a project on lands visible from 26 selected public vantage points from which the public views the landscape. It was not foreseen at the time the Act was passed that any development outside of the Scenic Area would be seen from these viewpoints. However, it is clear from the application that several Scenic Area Viewsheds (the land seen from these vantage points) will be affected.

9 of the 21 viewpoints analyzed are also Key Viewing areas (#6 & 9 were missing).”

DEIS table (page 3-177) shows that Key Viewing Areas #6 (SR-14) and #9 (Tom McCall Point) are still missing and that #10 (Panorama Point) has been deleted. Why were these not included in the DEIS? Clearly, they are required in order to accurately analyze the visual impact of this proposed project.

“2) Methodology and Summary of Scenic Impacts

There are many unknowns in the summary of methods on page 4.2-30-31 of the application. For example, the methods section did not disclose the heights used for the turbines or whether the software placed and sized the turbines or whether this was done in Photo Shop as an art project.”

The height of the turbines used is disclosed. The methods of creating the visual simulations including the use of “Photoshop” are described (pages 3-160 & 161). The simulations created using these methods are seriously flawed and do not represent an accurate visual depiction of what the viewer will experience. This is documented in the August 19, 2010 Dean Apostol, Landscape Architect memo on the DEIS presented to BPA and EFSEC ...

“In short, the images provided are too few and otherwise limited to be able to accurately assess the potential visual impacts of the proposal.

The images included in the DEIS vary greatly in scale. For example, the turbines appear much larger in the simulation for viewpoint 3, a distance of 7.6 kilometers, than they do for viewpoint 1, a distance of 6.4 kilometers. How can this be? The turbines should appear larger in the closer view. The answer must be that the reproduced image provided, no matter what focal length was used, does not reflect the distance. This is also evident in comparing viewpoints 11 and 12, which are similar view angles. The turbines in the simulation for viewpoint 12 appear smaller and farther away than those for viewpoint 11, even though the former is 3 kilometers nearer according to the data provided on the image.”

The USFS 2009 scoping analysis continues...

“There are also several questions concerning the methods used to 1) choose viewpoints, 2) define visual quality and viewer sensitivity, and 3) represent and make conclusions about impact.

1) Choosing viewpoints in the Scenic Area should be based on Key Viewing Areas. Several of these were missing from the discussion (SR-14, Tom McCall Point) and others are linear viewpoints where only one or no views were picked in the NSA (Columbia River, Hwy 35, I-84, Historic Columbia River Highway). Therefore, it is unclear whether the impacts to NSA scenic resources were adequately captured.”

As pointed out earlier, SR-14 and Tom McCall viewpoints are still missing and Panorama Point has been deleted in the DEIS. It is abundantly clear from Dean Apostol’s WRE DEIS analysis (2010) that the impacts to the NSA were not adequately captured in the DEIS.

“Figures 3.9-1 and 3.9-2 are useful in assessing the potential visibility of proposed turbines from within the National Scenic area and elsewhere. But they fail to note the full extent to which the turbines would be exposed to key viewing areas. The analysis treats the scenic impact problem as a viewpoint impact as opposed to a view corridor impact, but several of the affected KVAs are corridors, not points. These corridors include designated scenic roads and the Columbia River. The DEIS should be revised to analyze the distance along the entire length of these KVAs from which the project would be visible and to simulate views from multiple points along these KVAs in order to identify where the greatest impacts are likely to occur.

As it stands, the viewpoints chosen for analysis may not be truly representative: I-84, the Columbia River and the Historic Columbia River Highway all have multiple possible view locations that may experience greater impacts than the single locations chosen by the applicant. Each of these view corridors come within 3 miles of the project, yet all sample viewpoints are more than 4 miles from the project. Additional views along these three KVAs should be analyzed. For example, a simulation from the Historic Columbia River Highway at Mitchell Point directly across the Columbia River from the project is critical.”

Mitchell Point is a significant view point and should have been, but is not considered in the DEIS, and according to the letter (received by BPA August 3, 2010) from the Friends of the Historic Columbia River Highway:

“The Mitchell Point overlook is even more visually sensitive than I-84, both because it is higher in elevation and it is a place where people stop, get out of their cars and take photos. It is closer to the proposed project than Viento State Park, Koberg State Park and the single location on the Hood River to Mosier section of the Historic Columbia River Highway State Trail that were analyzed. This site must be analyzed for visual impact from the proposed project.”

Continuing, the USFS scoping analysis (2009) points out...

"2) The NSA is a nationally known and protected landscape of high quality and high sensitivity. All KVA scenic analyses should reflect this. The results of the applicant's analysis are heavily weighted on the assignment of existing scenic quality and viewer sensitivity. These methods were not tracked and do not represent the reality of the Scenic Area."

The visual sensitivity assessment is heavily influenced by what appears to be an arbitrary decision.

Quoting from the DEIS: "Moderate levels of sensitivity were assigned to areas where turbines would be visible from 0.5 mile to 5 miles within the primary view of residences and roadways" (page 3-159).

This is not based on any scientific studies presented. It is, in our opinion, self-serving and results in a measurement scale purposely designed to create faulty conclusions the proponent wants to support... namely that any turbine sited further than 0.5 mile will not have a high level of viewer sensitivity. This is not analyzing the facts to determine the impact, but skewing the measurement tools and analysis to achieve the desired results for the proponent.

The visual contrast method, as thoroughly discussed in the Dean Apostol comment (2010), is a more objective method and would be less susceptible to manipulation by such arbitrary decisions. The analysis should be redone using the visual contrast method rather than the Federal Highway Administration Process that was used.

"In my opinion, the FHWA method is not a suitable method for evaluating the visual impacts of wind energy projects in general, and this project in particular. This system was designed to be used only for assessing impacts from highway related development".

"... visual contrast is a useful way of measuring impacts regardless of whether a resource management objective has been established, because it relies on simple and time tested analytical standards"

This visual contrast method was indeed recommended in the USFS scoping comments (2009), but once again ignored in the preparation of the DEIS...

“3) The conclusions made on the summary chart would more accurately be made using degree of contrast with the natural landscape both during the day and at night, and distance of the viewer from the project area. This assumes that the most visually impacted viewpoints have been found and that the simulations accurately depict the degree of contrast. The impact summaries starting on page 4.2-68 discuss these contrasts but the ratings do not reflect the discussion. For example the text for viewpoint #1 states that “the presence of the turbines would reduce the scene’s degree of intactness by introducing a large number of highly visible engineered vertical elements” but the impact rating is low to moderate.”

Rather than adjusting the rating to reflect the discussion in the original application, the sentence referenced just above regarding viewpoint #1 was deleted from the DEIS. A discussion was added in an attempt to justify the proponents desired low to moderate ratings. The “average scenic value” (DEIS 3-168) within the NSA is high scenic value in contrast to most other landscapes outside the NSA, not moderate.

“The American Society of Landscape Architects included the Columbia River Gorge as one of the 100 most outstanding landscapes in the United States, ranking it along with Yosemite, Yellowstone and other national icons.” (Apostol 2010).

The USFS scoping comments (2009) continues...

“The Summary of Existing Scenic Quality and Project Visual Impacts on page 4.2-67 did not rate any viewpoint as having a high level of impact defined as: turbines “highly visible in areas with a high number of sensitive viewers” and greatly altering levels of vividness, unity, and intactness. Viento State Park was rated as highest impact (moderate to high) but the photo print did not show any turbines (Figure 4.2-17).

The Summary of Existing Scenic Quality and Project Visual Impacts in the DEIS (page 3-177), incredulously does not rate the anticipated visual impact on any viewpoint as high. The same flawed methods were used in the DEIS as in the SDS application. None of the needed changes suggested by the USFS were addressed.

The Viento State Park photomontage in the DEIS (Figure 3.9-11), still does not show a single turbine. The same “photo prints” used in the SDS application are used in the DEIS. Despite a year to prepare the DEIS, no new photos or photomontages were utilized nor were the former photos even corrected.

As Dean Apostol (2010) points out:

“This is a very misleading photomontage. The image is very faint, and the size does not correspond to the relatively short view distance of 6.4 kilometers (4 miles). The wireframe view indicates that the 18 turbines seen from this viewpoint would be very high contrast and would have high impacts, similar to those discussed under Viewpoint 11. All 18 turbines break the skyline, there are overlapping rotors and a jumbled, chaotic composition. The turbines located at the high point in the center of the image are particularly strong impact. The turbines would be framed by Dog Mountain, seen on the left side of the photo, and a portion of Underwood Bluff, seen on the right side of the photo (Figure 3.9-11). These are very natural, highly intact landforms, exacerbating the contrast that the turbines would introduce. Existing development prohibitions on these landforms, which lie within the National Scenic Area, are at the highest protection level, allowing no visual contrast. This illustrates the high sensitivity of the viewshed.”

Pointing out further limitations with the pictures, the USFS scoping comments (2009) continue...

“ It is generally very difficult to fully depict the visual effect of viewing the landscape in a small photo and because of these limitations, pictures with clouds at the skyline should not be used”. In addition, many non-NSA viewpoints and non-KVA viewpoints were added making it difficult to assess the effects in the Scenic Area. The scenic impacts both at night and during the day would be better depicted using photos of existing turbines in the Gorge. The existing development east of the Scenic Area provides a better indication of the impact on the scenic resource than represented in these visualizations. The visualizations are important for finding the number and location of the visible turbines, but have limited utility for assessing scenic impact.”

The exact same small photos used in the application with clouds are used in the DEIS, disregarding the comments of the USFS. We agree with Dean Apostol's (2010) statement:

“The photomontage images in the DEIS are flawed. The scale and distance appear to be inconsistent. Atmospheric conditions on some photos are hazy. Use of a white cloud background reduces apparent color contrast of turbines skylined on visually prominent ridges.”

This should have been addressed in the preparation of the DEIS. It must be addressed with more realistic depictions of the turbines both during the day and at night in a revised DEIS. The public will be more accurately informed and then could make relevant comment.

We agree with the findings of Dean Apostol (2010)...

"The visual impact analysis provided in the DEIS is faulty and incomplete. In addition, the DEIS's conclusions that visual sensitivity is only low to moderate and that impacts would be low to moderate from most viewpoints (Table 3.9-2) are not supported by the facts. The project as presented would have substantial adverse impacts to scenic resources."

Finally the USFS scoping comments (2009) made the following recommendations, which were either ignored or not adequately addressed.

"3) Recommendations

In order to assure that the scenic resource impact is adequately analyzed, I recommend the following improvements to the scenic resource impact assessment:

- *Include a discussion or summary of the most visible turbines,*
- *Include photographs of existing energy projects visible in the NSA,*
- *Do not use visual simulations (at a small scale with clouds in the picture) to depict the visual impact of visible turbines,*
- *Make certain that the most visible viewpoints have been covered, especially with respect to the linear viewpoints, and*
- *Make certain to include the night-time effects in your analysis."*

Instead the DEIS:

Does not include "photographs of existing energy projects visible in the NSA"

Uses "visual simulations (at a small scale with clouds in the picture) to depict the visual impact of visible turbines"

Leaves out the two specifically USFS requested viewpoints SR-14 (#6), Tom McCall Point (#9) and eliminates Panorama Point (#10)

Does not "include the night-time effects" in the analysis.

The USFS scoping comments (2009) concludes with the following:

"In order to prevent the scenic impact of the turbines visible from the Scenic Area Key Viewing Areas, I also recommend that the applicant eliminate turbine locations found to be visible from Scenic Area KVAs. I am hopeful that close attention to these impacts will result in a solution which will fit the unique area that this project will potentially benefit."

The SDS applicant has steadfastly refused to even consider any alteration or adjustment to the proposed Whistling Ridge Energy Project, totally ignoring expert feedback and recommendations, while actively seeking to suppress the inclusion of additional expert comment, as well as the removal of previously submitted comment.

We believe the attempt to suppress the USFS and the Department of the Interior is motivated due to the validity of these expert comments... comments that point out fatal flaws in both the application and the DEIS.

It saddens us that EFSEC and BPA have attached your names to this poorly constructed and inaccurate document. Having done so has reduced our trust in and your credibility as regulatory agencies. Our analysis of both the Noise and Visual Resources sections of this DEIS cause us, justifiably, to fear that the poor methodologies and resulting assessments may be replete throughout the DEIS. Please, do the right thing and redo this DEIS with the use of expert and independent feedback, appropriate methodologies, accurate and realistic representations and objective assessment.

Sincerely,

**Keith Brown, Ph.D.
Teresa Robbins**

RESOLUTION 2010-51

(A Resolution Demanding Retraction of the Department of Interior Comments on the Draft Environmental Impact Statement for the Whistling Ridge Wind Energy Project and explanation of its Actions in Commenting without Authority or Jurisdiction against the Secretary's and Administration Policy)

WHEREAS, Whistling Ridge Energy Project filed an Application for Site Certification to the Washington Energy Facility Site Evaluation Council ("EFSEC") on March 10, 2009 for the Whistling Ridge Energy Project; and

WHEREAS, EFSEC is lead agency pursuant to the State Environmental Policy Act, and Bonneville Power Administration ("BPA") is federal lead agency pursuant to the National Environmental Policy Act; and

WHEREAS, EFSEC and BPA have independently issued a joint Draft Environmental Impact Statement for this Project and are seeking public comment on the DEIS; and

WHEREAS, the entire project is located outside of the Columbia River Gorge National Scenic Area ("Scenic Area") on privately owned lands in Skamania County; and

WHEREAS, Federal Government regulation of private lands as well as the economic survival of Skamania, other local counties and communities were major concerns when the Columbia River Gorge National Scenic Area ("Scenic Area Act") was debated in Congress; which resulted in several major compromises to address these concerns before passage of the Scenic Area Act in its final form, without which, Congress would not have enacted the Scenic Area Act and President Reagan would not have signed it into law. These compromises included the purchase or trade of private lands that were regulated for the protection of scenery in the Special Management Areas, the designation of Urban Areas that are completely exempt from restrictions and the designation of an external boundary that by Congressional direction is the absolute boundary with no buffers or setbacks outside of the Scenic Area. Congressional intent is found in the "Savings Provision" at 16 USC § 544o(a)(10) which states:

Nothing in [this Act] shall . . . establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas."; and

WHEREAS, The National Trail System Act, 16 USC §§ 1241 – 1251 authorizes Congress to designate National Scenic and Historic Trails but does not, by mandate or implication, authorize Interior to regulate or restrict private lands or to even negatively comment on or oppose private projects proposed on private lands nearby, or visible from, designated trail sections; and

WHEREAS, Skamania County recently received a copy of the U.S. Department of the Interior (“Interior”) DEIS comment letter dated July 19, 2010, wherein Interior raises concerns about visibility of the proposed project from the Scenic Area and the nationally designated Lewis and Clark National Historic Trail and suggests elimination of Whistling Ridge wind turbines that are visible from both the Scenic Area and the Lewis and Clark National Historic Trail; and

WHEREAS, many thousands of miles of trails are designated throughout the Western United States under the National Trail System Act. With the exception of federal lands, and lands acquired by the Federal Government for preservation of trails, the Federal Government has no authority to regulate or restrict the use of private lands near trails designated under the National Trail System Act, for any reason, especially for purported visual effects on trail segments. Moreover, as described in the Interior letter, the “trail” at issue here is coextensive with US Interstate 84 and Washington State Highway 14 which are not pristine “trail” segments—they are major, busy multi-modal transportation corridors, including the only sea level train route (on both sides of the Columbia River) through the Cascades, with over 80 commercial trains transiting per day.

NOW, THEREFORE, BE IT RESOLVED THAT THE Board of Commissioners being concerned and alarmed with Interior’s comments and apparent attempt at inappropriate Federal intervention on the consideration of the Whistling Ridge application, find as follows:

The Board finds: Interior’s reference to the National Trail Systems Act and the Scenic Area as authority for the comment letter is an abuse of federal authority that exceeds the legal and policy directives and Congressional intent of both the National Trail Systems Act and the Scenic Area Act. Interior’s comments are particularly egregious where they recommend that renewable wind energy construction (proposed on private lands outside of the Scenic Area and miles away from any trail segments in Skamania County) that are visible from the National Trail Systems Act and the Scenic Area should be eliminated from the Project, or that the proponent must justify “feasibility” for the locations visible from I-84.

The Board finds: Many man-made structures and activities are visible and will be visible along these “trails” that follow Interstate highways, where the most visible of “impacts” on travelers are the many semi trucks, trains, transmission lines, dams, industrial facilities, mines, and coal, gas and nuclear power generating facilities, as well as many cities, homes, commercial buildings, advertising signs and billboards, that they pass by. It is a gross abuse of federal authority to negatively comment on, and seek to obstruct a renewable energy project on private lands merely because a small portion is remotely visible from an Interstate highway.

The Board finds: Consistent with our concerns raised above regarding National Trail Systems Act authority, that Interior’s recommendation of restricting private land development in view of the Scenic Area is in direct violation of the critically important Scenic Area Act compromises and Savings Provisions the intent of which was to allow local counties economic development opportunity for their continued survival.

The Board finds: Interior's comments and recommendations have serious policy implications not only for renewable energy development but also for other non-wind energy related projects that are visible from the Scenic Area and National Historic Trails, such as electrical transmissions systems, dams, rail transportation, interstate commerce and traffic, as well as residential, commercial and industrial development in Skamania and other Counties near the Scenic Area and/or Counties located near similarly designated trails under the National Trails System Act.

The Board finds: Interiors comments contradict both the Secretary's publicly stated policy as it pertains to renewable energy as well as contradicting the clear energy policy direction of the current Administration.

The Board finds: Finally, in addition to the comment concerning the Scenic Area and the Interstate Highway corridor, Interior provided specific comments related to purported groundwater issues—issues raised by local citizen neighbor opponents at the NEPA/SEPA comment hearing. Skamania County has regulatory responsibility for groundwater issues, and will work with EFSEC to address the citizen comment. This is *not* a federal issue. Interior has no authority to insert itself into this uniquely local issue, and its decision to do so demonstrates its lack of regard for Skamania County's authority: strongly suggesting inappropriate collaboration with Whistling Ridge project opponents.

NOW, THEREFORE, BE IT FINALLY RESOLVED THAT THE Board of Commissioners reacting to this clear abuse of authority without jurisdiction, hereby demand, in the strongest possible terms, that Interior's comments be immediately retracted and removed from the public record on this matter, and further respectfully request that the Secretary and the Administration clarify how Interior has acted within its authority, consistent with the stated policy direction of the Secretary and the Administration, and what this letter means for the implementation of the Administration's declared land management and energy policies.

DATED this 3rd day of August 2010.

IN REPLY REFER TO:
ER10/492

Electronically Filed

July 19, 2010

Andrew M. Montafio
Environmental Project Manager
Bonneville Power Administration – KEC-4
P.O. Box 3621
Portland, Oregon 97208

Dear Mr. Montafio:

The U.S. Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (DEIS) for the Bonneville Power Administration's Whistling Ridge Energy Project, Skamania County, Washington. The Department offers the following comments for use in developing the Final Environmental Impact Statement for the project.

Lewis and Clark National Historic Trail

The proposed Whistling Ridge Energy project is located within five miles of the Lewis and Clark National Historic Trail (NHT), a congressionally-designated NHT, which follows the Columbia River and is within the area analyzed in the DEIS for potential visual impacts. In addition, US Interstate 84 and Washington Route 14 are the state-designated Lewis and Clark auto tour routes in the project area. Many visitors experience Lewis and Clark NHT by traveling the auto tour routes and stopping at interpretive and recreational sites along the way. The Department considers the viewshed along the river and auto tour routes to be a critical part of the trail visitor experience.

The Lewis and Clark NHT was established by Congress in an amendment to the National Trails System Act in 1978. 16 U.S.C. § 1244(a). As administrator of the trail, the National Park Service (NPS) is charged under this Act with the identification and protection of the historic route, remnants, and artifacts of the trail for public use and enjoyment.

Based on the analysis of visual impacts in the DEIS, it appears that a varying number of turbines will be visible from the trail's historic river and auto tour routes from near

Koberg Beach State Park to Lindsey Creek State Park. This approximately 15-mile stretch of the Columbia River Gorge has numerous recreational opportunities and scenic views that add significantly to enjoyment of the historic trail. Of the five viewpoints along US Interstate 84 analyzed in the DEIS, Viewpoint 14 at Viento State Park, is rated in Table 3.9-2 as having an anticipated moderate to high level of visual impact. However, on page 3-193 of the DEIS, the potential visual impact for this viewpoint is stated as only moderate. Furthermore, it appears that the turbines were inadvertently omitted in the photomontage in Figure 3.9-11. While difficult to discern the impact at this location without clarification on the accuracy of the visual simulation, we believe that the impact should be rated as high given the placement of turbines on the skyline within four miles of a park located along the auto tour route.

Turbine string A1-A7 would be highly visible from numerous locations along the trail due to its placement on a ridgeline close to the Columbia River Gorge. The NPS recommends removing or relocating these seven turbines, if feasible. This would significantly reduce the impact to visual resources along the historic trail. The visual resources in this region—Columbia River Gorge National Scenic Area and Lewis and Clark NHT—are important resources that should be protected.

SPECIFIC COMMENTS

Water Resources Section 3.3

Pg. 3-26: Section 3.3.1.3 lacks sufficient information on the existing groundwater environment to support the finding of little or no impact. Suggest the section more fully address the depth to groundwater, flow direction, and transmissivity (permeability) of the aquifer as it relates to possible affects on the area domestic and agricultural ground-water resources (also see section 3.3.1.5). Helsel et.al. (2002) is a good reference for this type of analysis.

Pg. 3-29: Because section 3.3.3 addresses mitigation procedures for the isolation of groundwater from chemical spills, we assume that chemicals will be present on site during both construction and operation. Suggest the document include a discussion of potential chemical spills, and aquifer transmissivity (permeability), as it relates to the potential movement of contaminants toward nearby domestic or agricultural water wells.

IN REPLY REFER TO
ER-09/423

April 15, 2010

The Honorable Brian Baird
United States House of Representatives
2350 Rayburn House Office Building
Washington, D.C. 20515-4703

The Honorable Doc Hastings
United States House of Representatives
1203 Longworth House Office Building
Washington, D.C. 20515-4704

Dear Congressmen Baird and Hastings:

The National Park Service (NPS) was recently made aware of your letter dated November 18, 2009, concerning the Whistling Ridge Energy Project (Project), through Friends of the Columbia Gorge and the Lewis and Clark National Historic Trail office. We apologize for the delay in responding, as we have been unable to locate any record indicating that we received the letter.

Your letter expresses concern that NPS, through its May 18, 2009 comments on the Project, is acting outside of NPS jurisdiction to obstruct the Project. The NPS takes your concerns very seriously. NPS recognizes the limitations on its authorities outside of NPS-administered lands. In our letter dated May 18, 2009, NPS made recommendations, not demands, which would help to protect the viewshed from the Lewis and Clark National Historic Trail (NHT) corridor. NPS noted certain advantages to developing the overall wind farm at the proposed location but recommended decreasing the number of turbines in one corridor to alleviate some of the visual impacts. We recognize that NPS is not the action agency for this Project. Nonetheless, NPS has a responsibility under the National Environmental Policy Act (NEPA), 42 U.S.C. §§ 4321-4370f, to provide comments within NPS' special expertise with respect to environmental impacts. *See* 40 C.F.R. Part 1503.

As administrator of the Lewis and Clark NHT, the NPS is obligated to protect the natural, cultural, historic, and scenic resources of the trail for public use and enjoyment by present and future generations. Therefore, we believe we have an obligation to the American people to provide comments on this project as it moves through the NEPA process, and offer suggestions to the project proponent that will help minimize significant impacts to the trail. We fully support

TAKE PRIDE[®]
IN AMERICA 

the development of renewable energy generation in an environmentally-sensitive manner that is cognizant of surrounding natural, cultural, historic, and scenic resources.

While we do not intend to retract our May 18, 2009 letter, per your recommendation, we hope this letter offers sufficient clarification. If you have any further questions or concerns, please do not hesitate to contact me.

Sincerely,

A handwritten signature in black ink that reads "Rory D. Westberg". The signature is written in a cursive style with a large, prominent "R" at the beginning.

Skamania County Commissioners
P.O. Box 790
Stevenson, WA 98648

August 23, 2010

RE: Skamania County Resolution 2010-51

Dear Commissioners:

We were unaware of this action when we last saw you on August 17th or we would have approached you at that time.

We write to express our concern and dismay regarding Resolution 2010-51. It is certainly within the purview of the BOCC to seek support for a project you believe will benefit the county. It is NOT, in our opinion, your right to suppress opinions of experts uniquely qualified to comment and provide valid perspective on the impact Whistling Ridge Energy Project would have on the National Scenic Area and Historic Trails. To *“demand, in the strongest possible terms, that Interior’s comment be immediately retracted and removed from the public record on this matter”* is, we believe, a direct attempt to undermine EFSEC’s capacity to examine all relevant information regarding the environmental impact of this project.

To quote the May 6, 2009 scoping comment letter of Daniel T. Harkenrider, Area Manager for the Columbia Gorge National Scenic Area, “In a letter dated May 8, 2008, the Columbia River Gorge Commission provided technical assistance in response to a request by the Oregon Department of Energy regarding a similar project in Oregon. In that letter, the Gorge Commission explained that the National Scenic Area Act specifically prohibits the implementation of a buffer around the boundaries of the Scenic Area. **However, the letter also explains how Scenic Area resources would be affected by the project and how they could be protected. By requesting comments on the project, I assume that EFSEC would similarly benefit from scenic resources technical expertise in this matter.”** *(emphasis added)*

This process, to work effectively and be valid, must necessarily seek and examine comment from all perspectives. Dependent upon a variety of opinion, it particularly benefits from the technical expertise that can be provided by personnel of agencies such as the Office of Environmental Policy and Compliance of the Department of Interior and the Columbia River Gorge National Scenic Area.

You have sought and received support for this project from Congressman Baird. You did not object to this support and ask it be retracted because he holds federal office. You did not ask to retract the support voiced by Klickitat county officials. You did not ask to retract the support voiced by White Salmon officials.

BOCC support of this particular project has been steadfast, but your actions have discounted any environmental impact. This is evidenced in the disregard of requests to do an EIS during the Title 21 revision public hearings; the placement of a “permanent hold” on Title 21 zoning after the Hearing Examiner ruled that an EIS be completed by the county before proceeding; and finally, removing from the Hearing Examiner, responsibilities to hear appeals of SEPA determinations, thus forcing residents to go to court (at great personal expense) for any future

appeal. And now, through this resolution, the BOCC seeks to remove valid expert concerns about the environmental impact of this project.

The BOCC has every right to disagree and present counter-evidence, but no right to squelch or disallow others' opinions. You have the opportunity to present an analysis of the draft EIS. Have you identified any deficiencies? There are valid deficiencies identified by the Department of Interior, and previously depicted during the scoping process by the USFS Columbia Gorge National Scenic Area Landscape Architect. We, too, have identified and documented numerous deficiencies. And it is all of our rights to express them.

Suppression will result in skewed decisions not based on full perspectives and facts. Better decisions are made when a broad spectrum of information is provided.

Respectfully,

Keith Brown and Teresa Robbins

Secretary Ken Salazar
Department of the Interior
1849 C Street N.W.
Washington, D.C. 20240

August 23, 2010

RE: Whistling Ridge Energy Project in Skamania County, Washington and efforts to stifle comment by the US Department of the Interior

Dear Secretary Salazar:

On August 3, 2010 the Skamania Board of County Commissioners passed Resolution 2010-51 (*see attached*) in which they “...demand, in the strongest possible terms, that Interior’s comment be immediately retracted and removed from the public record...”. This is a blatant attempt to prevent appropriate special expertise from weighing in and being duly considered (as required by the NEPA process) with respect to the environmental impacts of the above listed project. This resolution refers specifically to the July 19, 2010 letter from the Department of the Interior Office of Environmental Policy and Compliance (Portland, Oregon) written to Andrew M. Montano of the Bonneville Power Administration (*see attached*).

Member(s) of the Board of County Commissioners (BOCC) have activated considerable political pressure to attempt to thwart federal agency experts’ (Department of Interior as well as the United States Forest Service) capacities to provide vital and valid comment regarding this project. Unfortunately, this BOCC has a demonstrated history of attempting to sidetrack appropriate environmental analysis (*see attached letter to BOCC from Keith Brown and Teresa Robbins*).

Furthermore, on November 18, 2009, Congressmen Brian Baird and Doc Hastings requested retraction of comments provided by the Department of Interior National Park Service (NPS) in relation to the same project (*see attached*). We concur with the NPS response: “We fully support the development of renewable energy generation in an environmentally-sensitive manner that is cognizant of surrounding natural, cultural, historic, and scenic resources” and that “NPS has a responsibility under the National Environmental Policy Act (NEPA)... to provide comments within NPS’ special expertise with respect to environmental impacts.” Also, “... we believe we have an obligation to the American people to provide comments

on this project as it moves through the NEPA process, and offer suggestions to the project proponent that will help minimize significant impacts to the trail” (Lewis and Clark, NHT).

The draft EIS comment period closes August 27, 2010 for this project. We ask that you strongly confirm these agencies’ right and responsibility to comment, as well as provide them any necessary support to achieve this.

Respectfully submitted,

Keith Brown and
Teresa Robbins

File Code: 2370

Date: May 6, 2009

Allen J. Fiksdal
EFSEC Manager
Energy Facility Site Evaluation Counsel
905 Plum Street SE
PO Box 43172
Olympia, WA 98504-3172

Dear Mr. Fiksdal:

It is my understanding that your office is accepting agency comment on the proposed Whistling Ridge Energy Project application for site certification. The Forest Service is submitting the following comment with respect to the Columbia River Gorge National Scenic Area--one of America's natural wonders known worldwide for its scenic beauty and the variety and quality of its recreational opportunities. Since the Scenic Area was created by Congress in 1986, new developments occur within a controlled framework that protects the resources that make the Scenic Area special. I understand that only a small portion of the proposal is located within the boundaries of the Scenic Area. This letter concerns impacts that will result from wind turbines visible from within the Scenic Area.

The purpose of this letter is to inform you of the risk of significant impacts to protected scenic resources if the proposed energy project is built as currently planned. This letter is not meant to imply that the project outside of the Scenic Area is regulated by the Scenic Area Act. In a letter dated May 8, 2008, the Columbia River Gorge Commission provided technical assistance in response to a request by the Oregon Department of Energy regarding a similar project in Oregon. In that letter, the Gorge Commission explained that the National Scenic Area Act specifically prohibits the implementation of a buffer around the boundaries of the Scenic Area. However, the letter also explains how Scenic Area resources would be affected by the project and how they could be protected. By requesting comments on the project, I assume that EFSEC would similarly benefit from scenic resources technical expertise in this matter.

Diana Ross, CRGNSA landscape architect, provided me the following analysis of the Aesthetics portion of the application starting on page 4.2-27. My comments are based on the findings of that portion of the application and the recommendations made by my staff:

1) **Key Viewing Areas (KVAs)**

As mentioned in the application, the effects to scenic resources in the Scenic Area are assessed by analyzing the effects of a project on lands visible from 26 selected public vantage points from which the public views the landscape. It was not foreseen at the time the Act was passed that any development outside of the Scenic Area would be seen from these viewpoints. However, it is clear from the application that several Scenic Area Viewsheds

(the land seen from these vantage points) will be affected.

9 of the 21 viewpoints analyzed are also Key Viewing areas (#6 & 9 were missing).

- 1-SR 141
- 4 & 22- Cook-Underwood Road
- 10-Panorama Point
- 11-I-84 Westbound
- 12-Koberg State Park (Columbia River)
- 13-I-84 Eastbound
- 14-Viento State Park (Columbia River)
- 19-Historic Columbia River Highway

2) **Methodology and Summary of Scenic Impacts**

There are many unknowns in the summary of methods on page 4.2-30-31 of the application. For example, the methods section did not disclose the heights used for the turbines or whether the software placed and sized the turbines or whether this was done in Photo Shop as an art project.

There are also several questions concerning the methods used to 1) choose viewpoints, 2) define visual quality and viewer sensitivity, and 3) represent and make conclusions about impact.

1) Choosing viewpoints in the Scenic Area should be based on Key Viewing Areas. Several of these were missing from the discussion (SR-14, Tom McCall Point) and others are linear viewpoints where only one or no views were picked in the NSA (Columbia River, Hwy 35, I-84, Historic Columbia River Highway). Therefore, it is unclear whether the impacts to NSA scenic resources were adequately captured.

2) The NSA is a nationally known and protected landscape of high quality and high sensitivity. All KVA scenic analyses should reflect this. The results of the applicant's analysis are heavily weighted on the assignment of existing scenic quality and viewer sensitivity. These methods were not tracked and do not represent the reality of the Scenic Area.

3) The conclusions made on the summary chart would more accurately be made using degree of contrast with the natural landscape both during the day and at night, and distance of the viewer from the project area. This assumes that the most visually impacted viewpoints have been found and that the simulations accurately depict the degree of contrast. The impact summaries starting on page 4.2-68 discuss these contrasts but the ratings do not reflect the discussion. For example the text for viewpoint #1 states that "the presence of the turbines would reduce the scene's degree of intactness by introducing a large number of highly visible engineered vertical elements" but the impact rating is low to moderate.

The Summary of Existing Scenic Quality and Project Visual Impacts on page 4.2-67 did not rate any viewpoint as having a high level of impact defined as: turbines "highly

3) Recommendations

In order to assure that the scenic resource impact is adequately analyzed, I recommend the following improvements to the scenic resource impact assessment:

- Include a discussion or summary of the most visible turbines,
- Include photographs of existing energy projects visible in the NSA,
- Do not use visual simulations (at a small scale with clouds in the picture) to depict the visual impact of visible turbines,
- Make certain that the most visible viewpoints have been covered, especially with respect to the linear viewpoints, and
- Make certain to include the night-time effects in your analysis.

In order to prevent the scenic impact of the turbines visible from the Scenic Area Key Viewing Areas, I also recommend that the applicant eliminate turbine locations found to be visible from Scenic Area KVAs. I am hopeful that close attention to these impacts will result in a solution which will fit the unique area that this project will potentially benefit.

Sincerely,

/s/ Daniel T. Harkenrider

Re: Comments about the Proposed Whistling Ridge Energy Project
Draft Environmental Impact Statement

Date: July 15, 2010

**THE PROPOSED WHISTLING RIDGE ENERGY PROJECT IS
ILLEGAL UNDER TITLE 22 OF THE SKAMANIA COUNTY CODE**

Background Facts:

Whistling Ridge Energy LLC is proposing a wind farm in an area of Skamania County which is located just outside the boundaries of the Columbia River Gorge National Scenic Area. (NSA) The proposed wind turbines are 430+/- feet tall and must be equipped with strobe lights at the top to satisfy FAA regulations. Cook Underwood Road is a designated "Key Viewing Area" within the NSA, located in Skamania County. Many, if not all, of the proposed turbines

and the strobe lights thereon will be highly visible from the Cook Underwood Road Key Viewing Area, as well as from numerous points throughout the NSA.

Issue: Is the proposed project legal under Title 22 of the Skamania County Code (Title 22)?

Summary: Although the National Scenic Area Act prohibits the creation of buffer zones¹, there are no provisions in The Act which prevent Skamania County, or any other governmental entity with jurisdiction, from protecting the NSA from scenic intrusions originating from outside the Scenic Area. For example, Oregon has recognized this principal. The Oregon EFSC provides that before issuing a site certificate the Council must determine by a preponderance of evidence that there will be no significant adverse impacts to the

¹ "SEC. 17 SAVINGS PROVISIONS.

(a) Nothing in sections 544 to 544P of this title shall-
(10) establish protective perimeters or buffer zones around the scenic area or each special management area. The fact that activities or uses inconsistent with the management directives for the scenic area or special management areas can be seen or heard from these areas shall not, of itself, preclude such activities or uses up to the boundaries of the scenic area or special management areas. 16 USC 544o (a)(10)."

scenic, aesthetic, recreational, and wildlife resources of the Columbia River Gorge. OAR 345-022-0000(1)(a).

Title 22 includes numerous provisions demonstrating that Skamania County, like Oregon, has protected the NSA Key Viewing Areas within Skamania County from scenic intrusions originating from both inside and outside the Scenic Area.

Conclusion: Title 22 protects the “Viewshed” of Cook Underwood Road, and requires that any development which can be seen from Cook Underwood Road be “Visually Subordinate” to its setting as seen from Cook Underwood Road. Because the proposed Whistling Ridge Energy Project cannot meet the test of visual subordination the project is illegal. The proposed project violates both the letter and the spirit of Title 22.

Analysis: This comment is directed to sections 3.8.2 (Applicable Land Use Regulations) of the DEIS. Section 3.8.2 of the DEIS briefly

mentions Title 22 and incorrectly assumes that, because the Whistling Ridge project is located outside the NSA boundaries, Title 22 is not applicable.

Section 22.02.050 of Title 22 provides, in pertinent part, that “This title applies to all lands in that portion of Skamania County lying within the Columbia River Gorge National Scenic Area...and to no other lands within the county...” The Cook Underwood Road Key Viewing Area lies within the National Scenic Area. Thus, Title 22 applies to the Cook Underwood Road Key Viewing Area.

“Viewshed” is defined in Section 22.04.010 as “a landscape unit seen from a key viewing area.”²

“Development” is defined in Section 22.04.010 to mean “any land division or structure, including but not limited to new construction

² “Landscape Unit” is an undefined term and must therefore be given its’ ordinary and common meaning, which would include any structure which is visible from a key viewing area.

of buildings and structures, and mining, dredging, filling, grading, paving and excavation.”

Section 22.04.010(j) of Title 22 designates Cook Underwood Road as a “Key Viewing Area”.

Section 22.18.030 entitled “ADDITIONAL STANDARDS GOVERNING NEW DEVELOPMENTS VISIBLE FROM KEY VIEWING AREAS” provides extensive standards for developments, such as the Whistling Ridge Energy Project, which are visible from key viewing areas. Section 22.18.030A provides that “The provisions in this section shall apply to proposed developments on sites topographically visible from key viewing areas”. ***Thus, to the extent any of the turbines and/or their strobe lights are visible from Cook Underwood Road, (or any other key viewing area) the requirements of Section 22.18.030 must be met.***

In order to meet the requirements of Section 22.18.030B, the portion of the Whistling Ridge Project which is visible from Cook Underwood Road must be “visually subordinate to its setting as seen from” Cook Underwood Road. Visually Subordinate is defined in Section 22.04.010 as follows:

“Visually Subordinate” means a description of the relative visibility of a structure or use where that structure or use does not noticeably contrast with the surrounding landscape, as viewed from a specified vantage point, generally a key viewing area. As opposed to structures that are fully screened, structures that are visually subordinate may be partially visible. They are not visually dominant in relation to their surroundings. Visually subordinate forest practices in the SMA shall repeat form, line, color, or texture common to the natural landscape, while changes in their qualities of size, amount, intensity, direction, pattern, etc., shall not dominate the natural landscape setting”. (Emphasis added).

Clearly, the proposed wind turbines and their strobe lights which are visible from Cook Underwood Road can not pass the test of visual subordination.

Additionally, Section 22.18.030L of Title 22 provides that “Exterior lighting shall be directed downward and sided, hooded and

shielded such that it is not highly visible from key viewing areas". Section O. provides that "The silhouette of new buildings shall remain below the skyline of a bluff, cliff or ridge as seen from key viewing areas". Clearly, the proposed Whistling Ridge project cannot pass these tests.

The project's proponents are likely to point to the language in Section 22.02.050 of Title 22 stating that "This title applies to all lands in that portion of Skamania County lying within the Columbia River Gorge National Scenic Area...*and to no other lands within the county...*" and argue that, based on the italicized language, Title 22 is not applicable to the proposed project because it lies (in some cases approximately just 60+/- feet) outside the NSA. While it may be true that the project lies outside the NSA,³ **it is undeniable that Cook Underwood Road does lie within of the NSA. It is also undeniable that some or all of the turbines and their strobe lights will be highly visible from Cook Underwood Road and**

³ The proposed project is so close to the NSA, that an on the ground survey should be required to insure no encroachment.

therefore lie within the view shed of Cook Underwood Road.
Application of Title 22 to the Cook Underwood Road "Key
Viewing Area" results in the proposed project being illegal,
because the proposed project would impact the Cook
Underwood Road view shed in a manner that is prohibited by
Title 22.

Section 22.02.050 merely states that lands lying outside the NSA
boundaries are not entitled to scenic protection and in no way
whatsoever states or implies that Key Viewing Areas within the NSA
are not protected from scenic intrusions originating outside the
boundaries of the NSA.

The project's proponents may also point to section 22.02.120(A)(10) of Title 22 and argue that, since Title 22 does not create "buffer zones", Title 22 does not apply to the project. Section 22.02.120(A)(10) provides:

- A. Nothing in this Title shall:
 - 10. Establish protective perimeters or buffer zones outside

of the Columbia River Gorge National Scenic Area.

“Buffer Zone” is a defined term in Title 22, therefore in order to interpret section 22.02.120(A)(10) it is necessary to consider and apply the statutory definition of “buffer zone”. Section 22.04.010 (18) of Title 22 provides:

18. **BUFFER or BUFFER ZONE** means an area adjacent to a water resource or other sensitive area that is established and managed to protect sensitive natural resources *from human disturbance*. In instances that involve a wetland, stream or pond, the buffer zone includes all or a portion of the riparian area.(emphasis added)

Reading section 22.02.120(A)(10) in conjunction with the statutory definition of “buffer zone” makes it plain that the prohibition against buffer zones in no way detracts from the protection given to key viewing area viewsheds elsewhere in Title 22. *Rather, it merely provides that nothing in Title 22 shall be interpreted to protect areas outside the NSA from “human disturbance”.* WRE is legally entitled to disturb the project areas outside the NSA however they wish (subject to Skamania County Zoning and Comprehensive Plan

limitations), so long as the project doesn't impinge on the protection granted Key Viewing areas elsewhere in Title 22.

If title 22 had been intended to limit the protection granted key viewing areas to intrusions originating from within the NSA, then the definitional and other sections referenced herein would have been so written and so limited and SCC 22.02.120(A)(10) would read something like; ... 'Establish protective perimeters or buffer zones outside the NSA, or prohibit visual intrusions on key viewing areas which originate from outside the boundaries of the NSA.' Alternatively, the definition of "buffer zone" would have been written differently to specifically negate the scenic protections granted key viewing area viewsheds elsewhere in Title 22.

Although the National Scenic Area Act prohibits the creation of buffer zones, there are no provisions in The Act which prevent Skamania County, or any other governmental entity with jurisdiction, from protecting the NSA from scenic intrusions originating from outside the Scenic Area. For example, Oregon has recognized this

principal. The Oregon EFSC provides that before issuing a site certificate the Council must determine by a preponderance of evidence that there will be no significant adverse impacts to the scenic, aesthetic, recreational, and wildlife resources of the Columbia River Gorge. OAR 345-022-0000(1)(a).

Title 22 includes numerous provisions demonstrating that this Ordinance protects the NSA Key Viewing Areas within Skamania County from scenic intrusions originating from both inside and outside the Scenic Area. Title 22 clearly asserts jurisdiction over visual impacts seen from Cook Underwood Road which originate from outside the NSA boundaries and clearly prohibits intrusions on the Cook Underwood Road view shed which originate from outside the NSA.

Viewshed is defined in Section 22.04.010 as “a landscape unit **seen from** a key viewing area”. (emphasis added) This definition is

not limited to landscape units which originate from within the NSA boundaries.

Section 22.04.010 provides that “Development means **any** land division or **structure**, including but not limited to new construction of buildings and structures, and mining, dredging, filling, grading, paving and excavation.”(emphasis added) Section 22.04.010 does not define development to mean “any land division or structure, including but not limited to new construction of buildings and structures, and mining, dredging, filling, grading, paving and excavation **within the National Scenic Area Boundary**” The definition or the term “development” is not limited to developments which are located within the NSA boundaries.

Section 22.18.030A provides that “The provisions in this section shall apply to proposed developments on sites topographically visible from key viewing areas”. Section 22.18.030A does not state “...shall apply to proposed developments on sites **within the National Scenic**

Area Boundary topographically visible from key viewing areas". *The protection afforded the Cook Underwood key viewing area view shed by Section 22.18.030, is not limited to protection from visual impacts of development located within the NSA boundaries.*

Section 22.18.030O. provides similar support for the conclusion that Title 22 protects the Cook Underwood Road key viewing area from scenic impacts originating from outside the NSA boundaries. Section O. provides that "The silhouette of new buildings shall remain below the **skyline** of a bluff, cliff or ridge as seen from key viewing areas".(emphasis added) This section **does not state** that "The silhouette of new buildings **within the National Scenic Area Boundary** shall remain below the skyline of a bluff, cliff or ridge as seen from key viewing areas".

"Skyline" is defined by Section 22.04.010 as follows: " Skyline means the line that represents the place at which a landform, such as a cliff, bluff or ridge, meets the sky, as viewed from a specified

vantage point, only a key viewing area... ” Once again, this definition is *not limited* to skylines within the NSA.

As well, as a matter of fact, the only “skyline of a bluff, cliff or ridge” within Skamania County which can be seen from the Cook Underwood Road Key Viewing Area is from looking in a Northerly direction, towards the proposed project. Cook Underwood Road itself is located on the Underwood bluff and to the south the topography slopes downward to the Columbia River. Oregon lies on the other side of the river.

Pursuant to well established rules of statutory construction, if Title 22 had been intended to protect the view shed of the Cook Underwood Road Key Viewing Area (or any other key viewing area) only from visual impacts originating from within the boundaries of the NSA, the Ordinance would have specifically done so by including that limitation in the definitional sections discussed above. Since no such limitations exists in Title 22, it is clear that the View Shed of

Cook Underwood Road is protected by the express provisions of Title 22 from visual impacts originating from both within and outside of the NSA boundaries.

Title 22 includes numerous provisions demonstrating that Skamania County, like Oregon, has protected the NSA Key Viewing Areas within Skamania County from scenic intrusions originating from both inside and outside the Scenic Area.

THE PROPOSED WHISTLING RIDGE ENERGY PROJECT IS ILLEGAL UNDER TITLE 22, BECAUSE IT CANNOT PASS THE TEST OF VISUAL SUBORDINATION.

Respectfully Submitted

Re: Whistling Ridge Energy Project, Draft Environmental Impact Statement

Submitted VIA E-mail to efsec@commerce.wa.gov

Dear Responsible Official:

I am writing on behalf of the Gifford Pinchot Task Force (GP Task Force) to comment on the Draft Environmental Impact Statement (DEIS) for the Whistling Ridge Energy Project. The Task Force supports the biological diversity and communities of the Northwest through conservation and restoration of forests, rivers, fish, and wildlife. The GP Task Force is a non-profit organization with over 4,000 members in the Pacific Northwest. One of our primary campaigns focuses on protection and restoration of public lands and the preservation of critical habitat for endangered and threatened wildlife. Although we are supportive of finding alternative

ways of producing energy, we are concerned by the clearing of the forest landscape necessary for this project as well as the potential for interference with bird and wildlife migration, nesting, and foraging. Thank you for the opportunity to comment on the plan.

The project is likely to cause significant adverse impacts to the natural resources of the area because of the considerable forest land clearing that must be undertaken for the 50 + wind turbines that will be sited in this location. Some of the effects include direct impacts to wildlife habitat, wildlife displacement, avian death, fragmentation of wildlife migration corridors, and severe edge effects to intact interior forest habitat.

Clearing traditionally forested land close to an intact forest boundary (i.e the Gifford Pinchot National Forest (GPNF)) can create severe edge effects including increased disease incursion on the edge environments, noxious weed invasion, significant changes in microclimates, increase risk of fire, and increase nest predation for birds nesting in traditionally interior habitat. The most glaring failure of this DEIS is the lack of adequate data on potential effects this land clearing will have on barred owl and spotted owl competition. This project will clear forest land near historic activity centers for spotted owl and within the White Salmon spotted owl special emphasis areas (SOSEA). Although the DEIS discusses these areas and claims that destruction of the forested landscape will have little if any effect on spotted owl (DEIS, Page 3-49 - 3-56) it does not discuss or analyze the effects this large clearing can have on increased competition on spotted owl habitat on the edges of this cleared land.

Barred owls are known to be a more dominant species and can easily force spotted owl to move from nesting sites. Barred owls are more adept at using edge forests and second growth forest and will aggressively defend territories. By forcing barred owl into other locations through loss of their current foothold habitats in this area and creating environments more suitable for barred owl encroachment will create unsuitable spotted owl habitat and force spotted owls out of current occupied territory. By failing to analyze this effect of loss of forest habitat the DEIS fails to properly assess the true effects of this project on spotted owl.

The DEIS also fails to properly assess this area for wildlife migration corridors. While the DEIS does specifically look at some species of concerns like the western gray squirrel and indicates that other wildlife were present in the area (DEIS, Page 3-69) it fails to properly assess the loss of this habitat or any potential use as migration corridor from the Gorge to the Gifford Pinchot National Forest. Clearing these areas will significantly affect use of the area by large mammals like bear and cougar as migration routes and will significantly alter use by deer and elk especially if forage is not available for the ungulate species. The private forest lands along the edge of the GPNF are important as migration travel ways from the gorge to the forests. These areas have traditionally been frequented by the large elk herds of south Mount St. Helens, deer, and a variety of predators including black bears and cougar. Clearing these forest lands is forcing more of these animals into dangerous urban areas to meet their migratory needs. The DEIS fails to properly assess direct and indirect impacts to wildlife because it neglects to analyze an important need of many predator and herd species: migration corridors.

Birds suffer direct impacts from wind turbines. Establishing a wind turbine facility in an important migratory passageway such as the Gorge could significantly increase the risk to the population. The DEIS does measure the risk to Bald and Golden Eagles as relatively low (DEIS, 3-77) however wind facilities have notoriously killed more birds than predicted in their DEIS. Siting turbines in canyons and on ridgelines increases the risk of fatalities for migrating birds. Studies done in Montana and California have found greater increases in bird fatalities along migratory passways when siting occurred at low and high points. (Harmata et. al (2000), Smallwood and Thelander (2005), and Thayer (2007)). The siting of turbines in the locations as planned are likely to have a higher impact than what is estimated in the DEIS.

One of the most prolific threats to our national forest is the change in use of forested acreage surrounding national forest lands. The clearing of the land so near one of our national forest for a wind project only increases this threat. Significant impacts can result from the loss of forest habitat including: direct impacts to wildlife, sediment in streams due to increase in roads, as well as climate change effects. The Gifford Pinchot National Forest is the 4th largest carbon storage forest in the country and the loss of its surrounding forested habitat puts this valuable forest at risk of increased fires, microclimate changes, soil decimation, and many other threats.

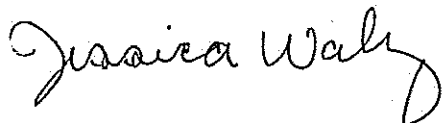

The DEIS fails to look at the direct and indirect impacts this wind project can and will have on the surrounding forest environments including on the GPNF.

We applaud the DEIS for incorporating an extensive section on visual impacts, however one of the major flaws of the DEIS is a failure to include much analysis of the visual impacts from hiking trails or viewpoints from within the Gifford Pinchot National Forest. The Gifford Pinchot National Forest is used extensively throughout the year as a destination for hikers, bikers, mount climbers, cross country skiers and other outdoor enthusiasts. One of the main draws is its views including views of Mount Hood from across the Gorge, the Gorge itself, as well as areas surrounding the GPNF. One of the potential impacts to the view shed is looking toward the northeast to Mount Adams and to the southeast to Mount Hood. We would like additional visual analysis done from areas on the GPNF which include visual simulations of the views from that area to be included in the Final Environmental Impact Statement.

Roads also have a tremendous impact on the environment. Roads wash sediment into streams, they fragment habitat, and they can fail causing more damage to stream environments. Very little to no analysis is given to the environment affects of increasing the road mileage on the area (DEIS, Page 3-226-3-227). The Final Environmental Impact Statement should include the analysis of sediment from gravel as well as paved road leaching into streams.

Thank you for the opportunity to comment on the DEIS for the Whistling Ridge Project. If you have any questions or concerns please do not hesitate to contact me at [REDACTED].

Thank You,

Jessica Walz

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

I would like to voice my strong support for the Whistling Ridge Energy Project. This wind farm will give the Skamania County economy the boost it needs. We are too dependent on timber harvests and federal timber payments. Too many residents are stuck in low-income brackets while unemployment ranks far above the state average. Fortunately, Skamania has another natural resource to develop: wind. Bringing another industry here is exactly what our county needs. It will stimulate local spending, create jobs, and provide new tax revenues. How can that be a bad thing? Skamania County needs to diversify its resources and revenue, and Whistling Ridge can make that happen. I hope the Council approves the SDS application and that the project advances quickly.

Sincerely,
Jim & Keenan Webber

Subject: Letter from a Columbia Gorge Wildflower Lover

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

The area where this project would be built is home to many species of wildflowers, birds and mammals. There can be no doubt that they will be adversely affected by the destruction of habitat that wind turbines require. The Columbia Gorge Region is home to over 700 species of wildflowers, many of which grow only here.

I'm also concerned about birds. The nearby wind project in Klickitat County is killing hundreds of birds and bats every year. And it isn't even an area where there are lots of birds. The ridge top project could very well be even more destructive to birds.

Lastly, the Columbia Gorge Scenic area includes the skyline, at least the quality of the scenic area does. This project will have a horrible impact on the scenic beauty of this area. There is no place like it in our country. It's worth protecting.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Hello Energy Facility Site Evaluation Council,

The Whistling Ridge Energy Project helps the state utilities reach the goals set by Initiative 937. It on industrial timber lands and the project plans are compatible with the State Forest Practices Act and County Planning Regulations. This is a west side wind project which is the most feasible and most cost-effective option for bringing 15% new renewable energy on the grid by 2020. SDS Lumber has developed a good plan for join us of its timber lands to generate clear energy. This is a unique match that helps stabilize a major employer from cyclical financial cycles of the lumber market. The are has been used as an industrial timber lands for over 100 years. Environmental studies show that the impacts are minimal.

I urge you to approve the EFSEC Certificate for this project.

Sincerely,
David McClain

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

I spend many spring, summer and fall evenings in White Salmon near Pucker Huddle Road viewing sunsets over Underwood Mountain. I strongly oppose use of this site for wind energy production. It does not belong here in the most scenic area of the Gorge.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. The photo simulations in the DEIS are inadequate and misleading. Some of them have cloudy backgrounds, thus not adequately representing the full extent of the impacts, and other simulations are out scale. Additional viewpoints need to be considered, including views from the Historic Columbia River Highway. The DEIS erroneously concludes that the scenic impacts would not be significant, even though most of the turbines would be visible from designated key viewing areas within the National Scenic Area. In addition, the BPA and EFSEC have not adequately consulted with the Yakama Nation to ensure the protection of cultural resources.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS, issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project. If another DEIS is issued the 50-turbine layout should be rejected.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing about the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

I am concerned because this project appears to have questionable use while impacting wildlife and the Gorge area in a significantly negative way. The Columbia River Gorge National Scenic Area still needs to be preserved in as high a quality state as possible, not only because it is a treasure but because in-tact ecosystems are of increasing value in the face of ever continuing development.

I sincerely hope alternatives will be seriously considered, and am supporting the following concerns:

The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. The photo simulations in the DEIS are inadequate and misleading. Some of them have cloudy backgrounds, thus not adequately representing the full extent of the impacts, and other simulations are out scale. Additional viewpoints need to be considered, including views from the Historic Columbia River Highway. The DEIS erroneously concludes that the scenic impacts would not be significant, even though most of the turbines would be visible from designated key viewing areas within the National Scenic Area. In addition, the BPA and EFSEC have not adequately consulted with the Yakama Nation to ensure the protection of cultural resources.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS, issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project. If another DEIS is issued the 50-turbine layout should be rejected.

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am a strong supporter of solar and wind energy development, but I am also a strong supporter of preserving our natural heritage. The Columbia River Gorge is a scenic treasure ever bit as important to preserve and protect as the Grand Canyon, or Yellowstone Park, or Niagara Falls.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. EFSEC and BPA need to consider other alternatives, including other means of providing electricity (including increasing efficiency and reducing consumption), other sites for wind energy, other configurations, deleting turbines to reduce impacts, alternative routes for hauling turbines to avoid traffic impacts to the National Scenic Area, etc. Only two alternatives are meaningfully considered in the DEIS (the proposal and the no-action alternative). This is inadequate.

The DEIS has other flaws. The DEIS fails to adequately analyze the potential cumulative impacts of this project when considered with other existing and likely future wind energy projects and other development projects in the region. The photo simulations in the DEIS are inadequate and misleading. Some of them have cloudy backgrounds, thus not adequately representing the full extent of the impacts, and other simulations are out scale. Additional viewpoints need to be considered, including views from the Historic Columbia River Highway. The DEIS erroneously concludes that the scenic impacts would not be significant, even though most of the turbines would be visible from designated key viewing areas within the National Scenic Area. In addition, the BPA and EFSEC have not adequately consulted with the Yakama Nation to ensure the protection of cultural resources.

Lastly, EFSEC and BPA need to fix the flaws in the DEIS, issue a revised or supplemental DEIS, and make substantial revisions to the EIS to fully inform the public about the true environmental impacts of the project. If another DEIS is issued the 50-turbine layout should be rejected.

Thank you for extending the public comment period and allowing me to submit these comments into the record.

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am writing to comment on the DEIS for the Whistling Ridge Energy Project, proposed in the Underwood, WA area, near the Skamania and Klickitat county lines.

This proposal is likely to have different and greater wildlife impacts than any other wind energy facility proposed in the State of Washington, because it is proposed along a forested ridgeline in the foothills of the Cascade Mountains and on the boundary of the Columbia River Gorge National Scenic Area. The proposed project would cause significant negative impacts to sensitive wildlife and plant habitat, and would degrade the outstanding scenic beauty of the Lewis and Clark National Historic Trail and Columbia River Gorge National Scenic Area.

I am a strong supporter of solar and wind energy development, but I am also a strong supporter of preserving our natural heritage. The Columbia River Gorge is a scenic treasure ever bit as important to preserve and protect as the Grand Canyon, or Yellowstone Park, or Niagara Falls.

I am concerned that the DEIS is fundamentally flawed because it fails to provide a credible alternatives analysis. Re: Comments on the Whistling Ridge DEIS--BPA's inadequate input on areas that should be covered by the DEIS--such as cumulative impacts on ecosystems, fish and other wildlife; transmission lines; land use issues; etc.

Dear EFSEC and BPA,

In this process of evaluating the Draft Environmental Impact Statement for the Whistling Ridge wind farm proposed project, the Bonneville Power Administration (BPA) has been a strangely absent co-proponent. SDS has been front and center as a strong proponent of this wind farm proposal, the first-ever that might be situated in the middle of the Northwest forest. But, BPA and their technical expertise and knowledge do not appear to be adequately presented in this DEIS. Why not? BPA is a Federal agency and they are subject to all the rules and regulations of the National Environmental Policy Act but in this DEIS their input is strangely silent and non-existent, especially in some very critical areas that require in-depth analysis and discussion. The public should be able to address all aspects of this proposal.

For example, BPA seems to be proposing a lot of different transmission projects throughout WA and other states; one such project is their I-5 Corridor Reinforcement Project. **[I-5 Corridor Reinforcement Project EIS (DOE/EIS-0436)]¹**

¹ The I-5 Corridor Reinforcement Project Environmental Impact Statement will evaluate the environmental impacts of BPA's proposed 500-kilovolt transmission line and substations.

What is the scope of the analysis in the Draft EIS?

The EIS will evaluate environmental impacts potentially created from the construction, operation and maintenance of a new 500-kV transmission line and substations. See Where the I-5 Corridor Reinforcement Project Could be Located for EIS project area maps. In the EIS, BPA will identify environmental impacts

that could be created by the project. The EIS will also propose mitigation measures that could avoid or reduce potential impacts. Impacts and any mitigation measures that would avoid or reduce impacts would be analyzed for each environmental resource. All components of the project would be addressed, including the following:

- Towers,
- Conductors,
- Counterpoise,
- Fiber Optic Cable,
- Right-of-Way Clearing,
- Access Roads,
- Staging Areas,
- Gates,
- Substation Facilities

Specifically, the Draft EIS will include the following chapters:

- Summary
- Purpose and Need for Action
- Alternatives
- Affected Environment
- Environmental Consequences
- Consultation, Permit and Review Requirements
- EIS Preparers
- List of Agencies, Organizations and Persons Sent the EIS
- References
- Glossary and Acronyms
- Index

What alternatives will be analyzed in the I-5 Corridor Reinforcement Project EIS?

Alternatives that will be considered in the EIS include the following:

- Action alternatives that propose building a new transmission line on specific routes and building substations at specific locations. The number of action alternatives will be determined after the scoping process is complete and public comments and additional technical studies are analyzed; and
- A **No Action** alternative that will analyze the impacts of not building a new transmission line and substations.

What impacts and issues will be addressed in the I-5 Corridor Reinforcement Project EIS?

BPA is asking for comments on the proposal and suggestions about topics to consider in the EIS. Typical issues that BPA has considered on similar projects are listed below. Each project is unique and BPA wants to know if you are aware of issues in the project area that are not on this preliminary list.

The EIS will evaluate direct, indirect and cumulative impacts to:

- Land Use
- Cultural Resources
- Aesthetics

<http://www.bpa.gov/corporate/i-5-eis/what-included.cfm>] These projects do not appear to be connected through one, all-encompassing DEIS that would address the cumulative impacts and effects of BPA's past, present, and future building of bigger and bigger transmission lines throughout our region. I'm not sure whether BPA thinks that none of us will notice and not connect the transmission lines! But I noticed and I'm sure a lot of other people have, too.

Cumulative impacts and effects analyses, under NEPA, are not done on a project by project basis. They are done on a regional and/or geographical area. BPA is the regional energy producer for WA, OR, ID and parts of Montana. *See attached PDF file BPA_Wind_Power_Efforts_March_2010.pdf.* BPA has not adequately addressed the impacts of all their regional transmission projects that are allegedly supposed to carry all the energy that is or will be produced by beau coup wind farms in WA, OR, and other parts of the West, and also by the proposed Whistling Ridge wind farm project. *See attached PDF file BalancingArea.pdf.*

BPA needs bigger and bigger transmission lines because they have to do something to integrate and balance all the wind energy that is being produced. They do not have adequate transmission capability for all of these wind farms. The question one may ask then is: Why are so many wind farms being subsidized into existence so that BPA has to build 200 foot tall new transmission lines all over the West?? Isn't there a better way? Can't we do more to conserve energy, use more efficiencies in existing technologies in order to save and conserve energy so that we won't have to build more, and more transmission lines, more backup gas plants to balance wind energy inefficiency, and wind farms in our rural areas? Are our rural areas being used up, being subjected to environmental injustices, being degraded through their industrialization—just to supply more and more energy to metropolitan urban areas, areas that cannot seem to get enough energy?? If we produce it, they will suck it up. It is time to turn off the energy tap from the NW. Let us all learn to live within our energy means.

In reading the Whistling Ridge DEIS, I couldn't help but notice BPA's absence throughout the document. After some research, I came across BPA's I-5 Corridor Reinforcement Project DEIS (DOE/EIS-0436). **See footnote 1 for full text.** What quickly became obvious to me, after reading about this I-5 project to build a 500-kilovolt transmission line and substations, was that the Whistling Ridge DEIS didn't have any of

-
- Sensitive Plants and Animals and their Habitats
 - Fish and Water Resources
 - Erosion and Soils
 - Socioeconomics and Public Services
 - Electric and Magnetic Fields
 - Noise
 - Public Health and Safety
 - Air Quality
 - Recreation
 - Environmental Justice

the information, as far as I was able to (not) find, about the existing transmission lines that would be used by the wind farm project and whether new ones would be proposed at some future date, the substation that is being proposed and what effects it would have on the environment, etc. The I-5 EIS “will evaluate environmental impacts potentially created from the construction, operation and maintenance of a new 500-kV transmission line and substations.” Why aren’t the BPA transmission lines that Whistling Ridge would use not evaluated in the Whistling Ridge DEIS? The I-5 EIS continues, “All components of the project would be addressed, including the following:

- Towers,
- Conductors,
- Counterpoise,
- Fiber Optic Cable,
- Right-of-Way Clearing,
- Access Roads,
- Staging Areas,
- Gates,
- Substation Facilities.“

I don’t even know what counterpoise is but I sure would like to know its meaning! What are staging areas? Why aren’t all these “components” addressed by BPA in the Whistling Ridge DEIS? Cumulative impacts are measured in the past, present, and future and BPA has built transmission lines in the past, present, and will in the future. Cumulative impacts have to be done on a regional basis, not on a project basis. Why hasn’t BPA done cumulative impacts analyses for their transmission lines and substations? For their towers and conductors? For their access roads? For their staging areas? Gates? Substation facilities? So many questions, so few answers.

In the I-5 BPA proposal, the following talks about “No Action Alternative”: “A **No Action alternative** that will analyze the impacts of not building a new transmission line and substations.” So, why doesn’t the Whistling Ridge DEIS have a BPA analysis about the impacts of not building any new transmission lines, or using the old transmission line, or substations? Why isn’t the “No Action Alternative” addressed more fully and thoughtfully in the DEIS? SDS Lumber, the co-proponent, made a lackadaisical effort to address the “No Action Alternative” (probably because they don’t want one!) but I sensed that their heart wasn’t in it. However, BPA is a Federal agency and we all know that they have no heart, so I do expect them to whole-heartedly address, in excruciating technical detail, what the impacts of a “No Action Alternative” would be.

Further, the I-5 EIS goes on to say that it “...will evaluate direct, indirect and cumulative impacts to:

- Land Use
- Cultural Resources
- Aesthetics
- Sensitive Plants and Animals and their Habitats

- Fish and Water Resources
- Erosion and Soils
- Socioeconomics and Public Services
- Electric and Magnetic Fields
- Noise
- Public Health and Safety
- Air Quality
- Recreation
- Environmental Justice.”

From the Whistling Ridge DEIS, it is very apparent that BPA did not address any of these issues as they pertain to transmission lines and substations, technology that BPA should know something about! They should. Their own BalancingArea.pdf (see attachment), states the following impacts to fish:

“BPA’s Balancing Area: Balancing Fish, Water, and Wind

Potential cumulative impacts to fish and other aquatic resources from past, present, and future development in the region include the **loss of riparian habitat**, increased sediment loading, **increased stream temperatures**, pollution from herbicide and insecticide use, changes in peak and low stream flows, **fragmentation of fish habitat**, decreases in stream bank stability, and altered nutrient supply. Since wind projects in the region are typically located in upland areas and generally well away from fish habitat, these projects are not expected to have a significant contribution to direct cumulative impacts to fish species.

However, the interconnection of existing and proposed wind-powered generation projects in the region to the BPA transmission system does poses the potential for cumulative impacts to listed Columbia River fish species through a somewhat complex relationship among the wind projects, general Columbia River hydrosystem operations (see map below), and operation of the hydrosystem to meet Clean Water Act (CWA) and Endangered Species Act (ESA) requirements for listed fish species.” [my bold emphasis]

So, there is a cumulative impacts issue for fish. This is not adequately addressed in the Whistling Ridge DEIS, and it is apparent from this document that BPA has knowledge about the issue and could have addressed it in the DEIS. SDS is not the lone proponent on this wind farm project and cumulative impacts are not done on a single project basis. ALL of BPA’s regional infrastructure has cumulative impacts on fish and it should be part and parcel of this wind farm DEIS.

Other areas not addressed in the Whistling Ridge DEIS are electric and magnetic fields from transmission lines. Why didn’t BPA address this issue in the DEIS? Are there health effects for humans and wildlife from transmission lines? If bigger and taller transmission lines are built are there bigger electric and magnetic fields? Can transmission lines cause forest fires? What are the environmental impacts of

transmission lines? Habitat fragmentation? How much pesticide is used on an annual basis to keep the transmission area free of vegetation and pests? What are the environmental effects of this pesticide use? Etc., etc., etc.

I've got a lot of questions about BPA's portion of this DEIS and my questions have not been adequately addressed or answered.

All of the above direct and indirect cumulative impacts should have been addressed by BPA in the Whistling Ridge DEIS, especially as they pertain to the technical aspects of regional energy production. And, BPA is a regional energy producer.

BPA has not, as they are obligated to do through Federal regulations, actively participated in this NEPA process for the Whistling Ridge wind farm proposal. The DEIS is fatally flawed and incomplete because of their lack of technical input about the cumulative impacts and effects of this project on our environment and ecosystems. BPA needs to be an active participant in this process and so far they have totally abrogated their regulatory obligations under NEPA. The Whistling Ridge wind farm DEIS is incomplete and should be redone with BPA's input.

Thank you.

Sincerely,

/e-signature/Mary J. Repar

27 August 2010

BPA's wind power efforts surge forward

As the nation seeks new sources of clean electricity, wind has emerged as the most mature and promising new resource. It is free of CO₂ emissions, relatively cost effective compared to other new generating resources and is, thus far, the most viable non-hydro renewable resource available on a large scale. Its assimilation into the U.S. and Pacific Northwest generation resource base is advancing rapidly, thanks to concerted efforts to meet and overcome challenges to dealing with wind's variability.

Others, primarily independent companies, are developing wind resources. The Bonneville Power Administration's major role is to provide the reliable transmission that delivers electricity from wind farms, often located in remote areas, to the region's communities. Bringing a variable and difficult to predict energy resource, such as wind, onto the power grid in large amounts is one of the great engineering and economic challenges in the power industry today. BPA is maintaining a remarkable pace of connecting wind power onto its transmission system and has among the highest levels of wind power in its transmission system compared to load of any grid balancing authority in the country.

Growth rate fuels progress

All but one of the states in BPA's service territory have enacted renewable electric generation standards for their retail utilities. These requirements, coupled with those of other Western states, have set off a "gold rush" of wind developers to the region.

The growth rate of wind interconnections is astounding. In 2009 alone, the amount of wind power integrated into BPA's transmission system went from 1,500 megawatts to more than 2,500 megawatts. It is now above 2,700 megawatts. In the next two years, BPA expects a near doubling of wind on its system. By 2013, BPA may have more than 6,000 MW of wind power on its system.

As wind power continues to grow, the energy industry faces dramatic change. This is an exciting time for the industry, and BPA is helping lead the nation into a new age of renewable power.

BPA and the region's wind community have been working aggressively to adapt to wind power's rapid growth. In 2009, the agency released an accelerated

18-month work plan for wind integration activities. BPA's Wind Integration Team is tackling five projects to better manage large amounts of wind power in BPA's balancing authority area. All of these projects, summarized below, are on or ahead of schedule.

Making it work

Given the challenges, how can 6,000 megawatts of wind, and perhaps more ultimately, successfully operate in a balancing area with just under 11,000 megawatts of peak load? BPA is focusing its efforts in four areas to make it work.

- Building transmission to support wind integration.
- Using existing transmission capacity in new ways.
- Exploring new sources of generation capacity reserves.
- Developing partnerships with other utilities and the wind power community.

Building transmission to support wind integration

The region needs new transmission to meet growing demand for energy, particularly renewable energy. Because BPA owns and operates three-quarters of the region's high-voltage transmission, the agency plays a vital role in facilitating the development of renewable energy. Simply put, wind and other resources will not be developed unless transmission is available to get those resources to market. This is particularly challenging because, on average, wind projects in the BPA service territory only operate at about 30 percent of their capacity.

To determine transmission needed to support additional wind generation, as well as to shore up reliability, BPA initiated a new process called Network Open Season in 2008 to better manage the queue of customers seeking BPA's transmission services. Previously, many potential developers had sought to reserve transmission for plants still in the planning stage or plants that might never be built. The result was a long and unmanageable queue. Under Network Open Season, BPA offers firm network transmission service to customers who request it, but the customers must make a financial commitment for that service. This winnows out the speculative requests for transmission.

In 2009, BPA confirmed financial commitments for 6,410 megawatts of transmission service requests. Three-quarters of the requested service capacity were for wind generation.

BPA was able to accommodate more than 20 percent of the requests with existing capacity. It was also able to offer a new "conditional firm service" to provide still more transmission service from existing capacity of the system. Conditional firm allows some curtailment of service under certain conditions. This allowed BPA to make the most efficient use of its existing system before proposing new construction.

Network Open Season did show, however, that BPA needs to move forward with four new transmission

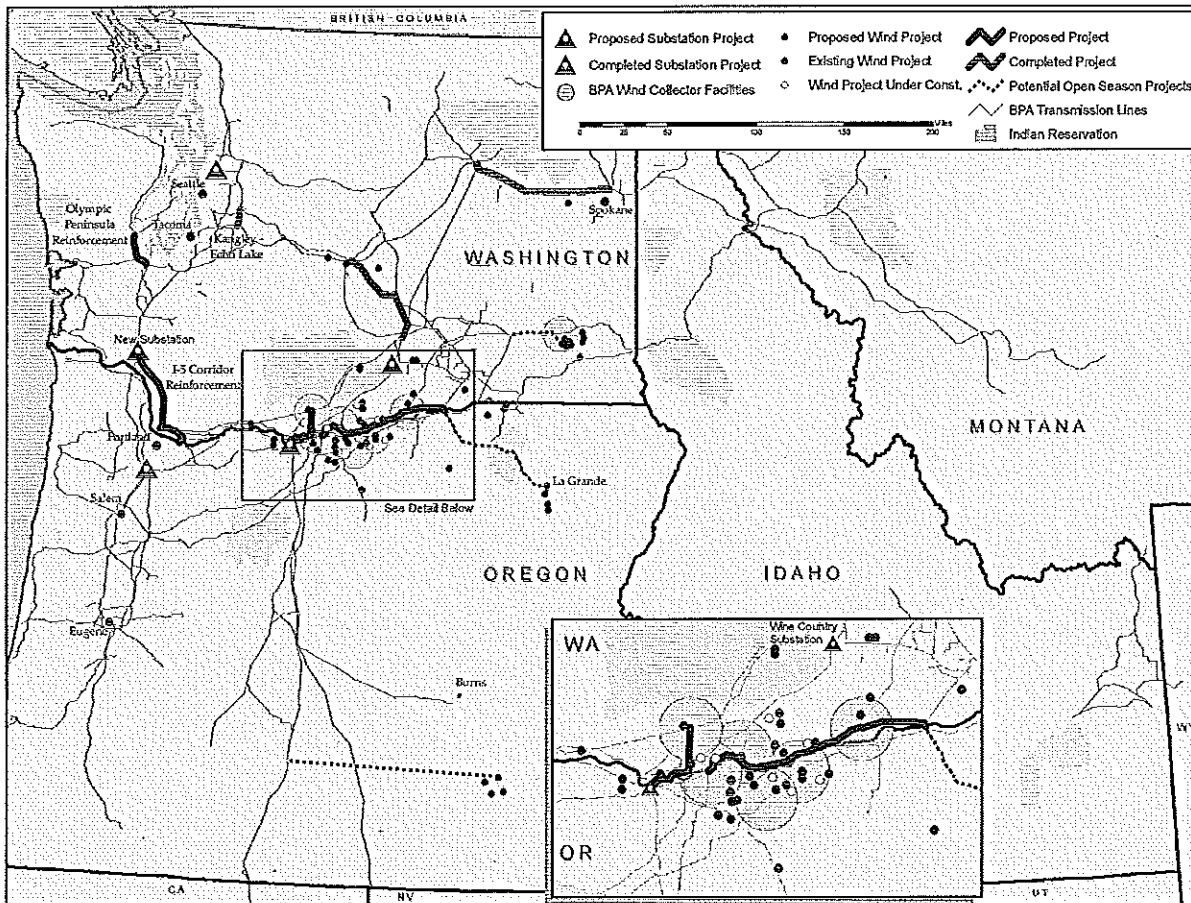

BPA wind initiatives are stretching the capability of the existing system.

projects. Together, these projects would bring 1,800 megawatts of new wind generation to the region. BPA is ahead of schedule on the construction of the first project and is conducting environmental work on the others. The feasibility of these projects was enhanced by access to increased borrowing authority granted BPA under the American Recovery and Reinvestment Act. BPA will pay this money back with interest to U.S. taxpayers, but the expanded borrowing authority provides increased capital for critical projects. BPA is completing its second Network Open Season and plans to conduct the process annually.

Changing grid management for wind power integration

BPA's Wind Integration Team is developing new processes and systems to wring as much efficiency as possible out of existing transmission and generating reserve assets. Basically, BPA is stretching the capability of the existing system through efficiencies from operational improvements. If these initiatives succeed and are implemented over the long term,

Completed and Proposed BPA Transmission Line & Wind Projects

Most of the wind power in the Northwest is clustering in the heart of BPA's grid.

they could make a significant dent in the amount of balancing reserves needed to support a tripling of the wind generation interconnected to BPA's system.

New protocols manage extreme wind ramps

BPA has seen unscheduled wind generation swings of more than 1,000 megawatts in less than an hour on its system. New operating protocols introduced in 2009 help manage sudden fluctuations in wind generation. When wind picks up and unscheduled generation threatens to deplete BPA's balancing reserves, BPA dispatch now automatically sends an electronic signal to wind plants to reduce their generation to scheduled levels. So far, BPA dispatchers have applied the protocols several times a month. Likewise, when large decreases

in scheduled wind generation deplete BPA's ability to provide balancing energy, BPA revises the wind schedules downward, and receiving utilities must make up the difference with their own resources.

Shorter scheduling intervals

Historically, utilities schedule power deliveries by the hour. As a pilot project, BPA is allowing within-hour changes to power schedules for wind projects that are exceeding their hourly schedule. Intra-hour scheduling can help wind generators avoid curtailment of excess generation and could make it possible for them to sell excess power that otherwise might be limited. This has the potential to help reduce reserve requirements and generation imbalance charges. BPA is evaluating possible expansion of this project.

The challenge

Wind is a variable power resource that is hard to predict. That's a challenge because, unless generation matches demand second by second, the transmission system will destabilize. If the system becomes unbalanced, blackouts can result. Think of it in terms of a computer. We use surge protectors to prevent a sudden increase in electricity. Some sensitive electronic equipment also incorporates voltage sag protectors. Without these protections, equipment can suffer the equivalent of a "black out."

To maintain system balance in the high-voltage grid, utilities use balancing reserves, or generation held available to manage fluctuations between power load

and power generation. In the Northwest, the hydro system has historically provided all the balancing reserves we need, because hydro generation can be increased or decreased quickly. But the hydro system has limits. To support continued large-scale wind power growth, we are learning to operate the existing system in new ways.

As with most coastal climates, Northwest winds are not steady. They tend to ramp up or down quickly and often unexpectedly. System operators are inventing new techniques to maintain the constant balance needed between power loads and generation levels. Some solutions already have been put in practice; others are on the way.

BPA Balancing Authority Load & Total Wind Generation

March 3–10, 2010

BPA now operates the hydro system to respond to and balance both variations in power loads and unexpected changes — up and down — in wind power output.

New wind forecasting applications

Wind output is difficult to predict, making it hard to schedule accurately. This uncertainty increases the amount of reserves BPA must hold to keep loads and generation in balance. BPA has installed 14 anemometers throughout the region to better predict wind availability and is using the data to develop a more accurate wind power forecast system for the Columbia Basin.

Dynamic transfer

Dynamic transfer is one of the most important techniques to reliably and cost-effectively integrate large amounts of variable renewable generation resources. This technique would allow a dispatcher in one balancing authority to control and take responsibility for supplying balancing reserves for a generator located in another balancing authority. A study identifying available dynamic transfer capacity on 11 key transmission paths completed in February 2010 found moderate amounts of available dynamic transfer capability. BPA is making this capability available to its customers on a pilot basis.

Managing large wind fleets is proving most efficient when handled across large geographic areas.

Customer-supplied imbalance reserves

Also known as self-supply, this project would allow wind generators in the BPA balancing authority area to supply their own imbalance reserves rather than relying on BPA for such services. BPA plans to launch this project on a pilot basis in October 2010, once the necessary technical adjustments are in place on both BPA and participating wind project systems. Wind project owners likely will use the Joint Initiative's Dynamic Scheduling System to facilitate supplying their reserves.

There are more than 30 discrete balancing authorities in the Western Electricity Coordinating Council

(see box, page 6.). The result is numerous system operators, each of whom has individual requirements to maintain a constant balance between load and generation. This fragmentation is a challenge for the development of wind power in the Northwest, because wind generated in one balancing authority often serves consumers in another balancing authority that may be located across several intervening balancing authorities.

Exploring generation capacity reserves

Wind project operators in BPA's balancing authority pay for integration services for their projects, so that the consumers who pay to purchase wind power both receive the benefits of wind power and pay the costs of the resource. For 2010–2011, the rate reflects the costs of generation imbalance reserves provided from federal hydropower resources.

As the wind resource grows, even with efficiencies, new resources likely will be needed to provide balancing services for variable renewable resources. In preparation, BPA has begun to explore options for adding flexibility capacity.

Key terms

Balancing Authority: A balancing authority is an entity that is responsible for maintaining a constant balance between power load and power generation in a geographic area. It is usually a utility or other transmission provider such as a regional transmission organization. There are 14 balancing authorities in the Pacific Northwest. BPA's balancing authority area includes primarily rural portions of Oregon and Washington, plus small portions of northern Idaho and northwest Montana.

Balancing Reserves: Generation held available to be ready to use if needed to maintain the balance between power load and power generation as loads fluctuate and/or as real-time generation differs from scheduled generation.

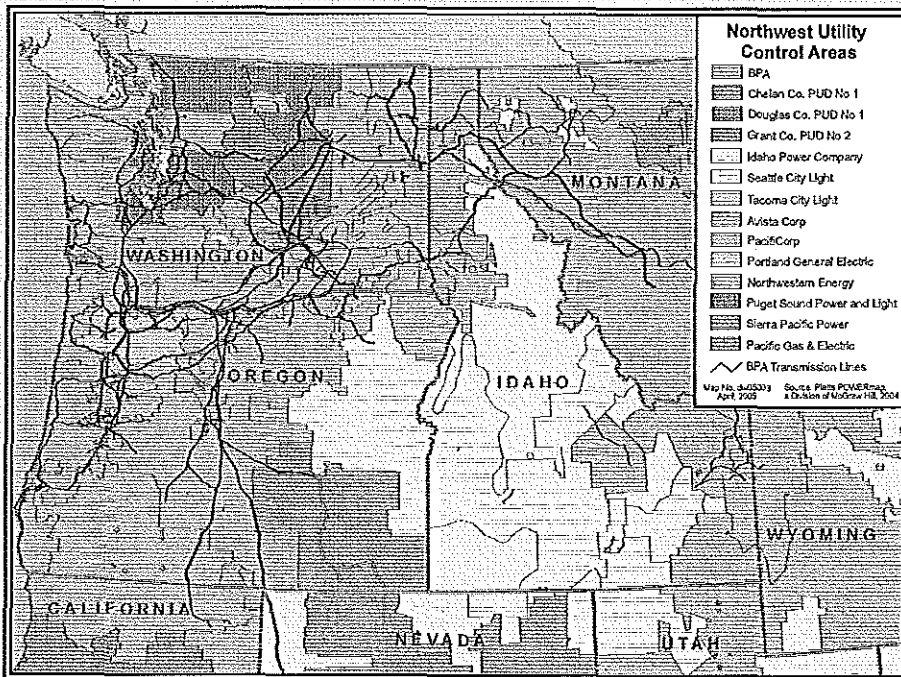

Part of a much larger picture

Most of the Northwest's wind generation is in rural portions of eastern Oregon and Washington, while most consumers of wind power are in larger metropolitan areas in balancing authorities managed by other utilities. Worldwide, managing large wind fleets is proving most efficient when handled in unified systems that cover large geographic areas with millions of people and many, diverse power sources, such as in Spain and Texas.

Utilities in the Northwest are working together to realize similar benefits across their smaller balancing authorities. BPA is among many Western utilities participating in a Joint Initiative of ColumbiaGrid, WestConnect and the Northern Tier Transmission Group — entities managing and coordinating some transmission issues among utilities — to develop

common approaches to wind integration. For example, the Joint Initiative is creating a common system for dynamically scheduling control of a wind generator from a resident balancing authority to another balancing authority where the wind power is being consumed.

On a still larger scale, utilities throughout the Western Interconnection — the interconnected power system of the Western United States, British Columbia, Alberta and small parts of Mexico — are working to redesign transmission and power resource planning and adapt the way the grid works to help meet state and national renewable power objectives. The Western Electricity Coordinating Council, the reliability organization for the Western Interconnection, is leading this effort.

BPA is the balancing authority responsible for maintaining a constant balance between the power load and power generation in the area shown in teal. (A balancing authority is also known as a control area.) Most of the wind power on line and planned for the Pacific Northwest is clustered in BPA's balancing authority at the eastern end of the Columbia River Gorge. However, 80 percent of the wind power in BPA's balancing authority area serves loads in other utilities' balancing authorities.

Energy storage technologies could be a valuable source of such flexibility to the degree they can absorb excess wind energy when it is not needed and return it to the grid during periods of greater demand. For example, BPA is working with the Pacific Northwest National Laboratory on its study of various options including pumped storage, compressed air storage, batteries and flywheels. PNNL is also examining residential applications such as hot water heaters as potential sources of energy storage for the grid.

BPA is working with the U.S. Army Corps of Engineers and the Bureau of Reclamation on the potential for pumped hydro storage in the Northwest. This represents a new application of an existing but evolving technology that could help fill the need for more

BPA has begun to explore options for adding flexibility capacity.

frequent uses of ramping generation to respond to wind variability.

BPA's Balancing Area Balancing Fish, Water, and Wind

Potential cumulative impacts to fish and other aquatic resources from past, present, and future development in the region include the loss of riparian habitat, increased sediment loading, increased stream temperatures, pollution from herbicide and insecticide use, changes in peak and low stream flows, fragmentation of fish habitat, decreases in stream bank stability, and altered nutrient supply. Since wind projects in the region are typically located in upland areas and generally well away from fish habitat, these projects are not expected to have a significant contribution to direct cumulative impacts to fish species.

However, the interconnection of existing and proposed wind-powered generation projects in the region to the BPA transmission system does pose the potential for cumulative impacts to listed Columbia River fish species through a somewhat complex relationship among the wind projects, general Columbia River hydrosystem operations (see map below), and operation of the hydrosystem to meet Clean Water Act (CWA) and Endangered Species Act (ESA) requirements for listed fish species.

Many of the region's wind generators are located within what is known as the BPA Balancing Area. In BPA's balancing area, like in all balancing areas, there must be a match between generation and load at all times. Within BPA's Balancing Area, most existing and proposed wind projects are concentrated in one geographic area, located to the east of the Columbia River Gorge. Because of this concentration, the amount of wind power on BPA's transmission system tends to vary with the sometimes widely fluctuating wind velocities (and hence wind project output) in this area. That is, when wind speeds are low in this area, there is very little wind power generated, and the amount of wind power on BPA's system is low. Conversely, when wind speeds are high, the wind projects are generating close to or at full capacity, and the amount on BPA's system is high.

The proportion of wind power on BPA's transmission system has grown quickly and dramatically in recent years, and even greater future growth is expected. As of January 2010, there were more than 2,700 MW of total wind generation interconnected to the BPA system. In addition, BPA expects to have up to 6,000 MW of total wind generation interconnected to the system by 2013.

The combination of an increasingly large proportional share of wind power on BPA's system and the natural fluctuation of this power results in large, unscheduled swings in wind generation of up to several hundred megawatts within a single hour. **To address this situation, BPA currently reserves capacity in the hydrosystem to provide balancing services for these swings when needed.**

The potential for impacts to Columbia River fish arises when the electrical output from wind generators in the region exceeds their hourly generation schedules. In such situations, BPA must immediately decrease generation elsewhere in the system to maintain the constant balance of generation and load needed to keep the system stable. This can be accomplished in one of three ways. First, BPA can reduce overall Columbia River water flows and generation by releasing less water from Columbia River hydroprojects and putting the water into storage. Second, BPA can decrease hydroproject generation by spilling water at the dams rather than running it through the dam turbines. Third, BPA can reduce other sources of generation within the BPA Balancing Area.

During certain times and conditions, the first option of reducing flows is not available because reservoir space is being maintained for required flood protection at the hydro projects. At these times, river flows are already high due to spring runoff or other required drafts to maintain flood control space. Because of these flood control requirements, there simply is no space at the reservoirs in which to store additional water to decrease generation during these periods.

Likewise, the second option – spilling water at the dams – is not available during certain times and conditions because this spilling results in elevated levels of total dissolved gases developing in the river. As the amount of water spilled increases, so does the level of total dissolved gases. The CWA standards for total dissolved gases, which were established to protect fish, limit the level of dissolved gas saturation permissible in the river when migrating salmon are present. Naturally occurring levels of gas in the Columbia and Snake rivers varies between 105 and 120 percent of equilibrium total gas saturation pressure (ambient atmospheric pressure). The state standard for saturation in these rivers is limited to 110 percent of saturation at any point of sample collection without a state waiver. The U.S. Army Corps of Engineers has obtained a state waiver from Oregon and Washington that allows the level of gas in the rivers to be 120 percent. Running the river to this level, but no higher, to avoid CWA violations has become a fundamental component of how spill and resultant fish passage has been managed at hydroelectric power generation facilities.

Another issue with the second option is the increased potential to actually harm ESA-listed fish species. Higher levels of gas supersaturation associated with increased spilling increases the risk of ESA-listed fish species being affected by gas bubble trauma from excessive uncompensated gas pressure which they cannot avoid. Species, life-stage, size and genetics are all important factors in determining the tolerance of fish to supersaturated waters. Acute mortality will occur when gas bubbles are present in the heart in sufficient quantity to prevent the movement of blood. Various sublethal effects have also been reported to significantly impact

mortality, most importantly blindness, decreased tolerance to stress, loss of lateral sense, and secondary infections. Permanent affects to individuals and large-scale mortality in populations may occur after only short-term exposure to high levels of gas, especially in environments where compensating pressures do not exist. Avoiding such impacts to ESA-listed fish species is also a fundamental component of how spill and resultant fish passage has been managed at hydroelectric power generation facilities.

Because of these issues with the first and second options, BPA currently is working towards implementing the third option. Accordingly, BPA is working with wind project developers and operators to develop measures for temporarily reducing sources of wind generation within the BPA Balancing Area when necessary. As part of a comprehensive review of wind project interconnections and their effects that was conducted in winter 2008, BPA has established transmission operation protocols under which BPA's dispatch system automatically instructs wind project operators to reduce their generation to specified levels if necessary for reliability and ESA or CWA compliance. BPA has issued Dispatcher Standing Order (DSO) 216 to document these protocols, and is continuing to refine and clarify this DSO as more is learned about wind project operations relative to BPA's transmission system (visit http://www.transmission.bpa.gov/wind/op_controls/default.cfm for more information). These measures ensure that wind power on BPA's transmission system does not cumulatively impact Columbia River hydro operations necessary for listed fish species.

Subject: I support Whistling Ridge

Hello Energy Facility Site Evaluation Council,

Wind power is our future. It goes with hydro power hand in glove. Fossil power is affordable now, but as sources of coal and gas decline, and as global demand for them increases, these electricity generating fuels will make fossil power by far the most expensive source. Not in ten years, but in five. The states with the highest percentage of wind power will be the most prepared for that high cost future.

I've been on the turbine roads at Whistling Ridge (and Coyote Crest). The sites are challenging, but the wind resource is strong. The developers have solid plans for high quality projects. It's time to get wind power generation a little closer to the people who use it.

Thank you,
Dave Malen

Sincerely,
Dave Malen

Subject: Whistling Ridge Negatively Impacts Columbia Gorge

I am so saddened by even the thought of Whistling Ridge Energy Project in the Underwood Washington area.
The impact would last a life time, not only to the world acclaimed scenery that is beyond price, but to the sensitive habitat and wildlife as well.

There is a need for wind and solar energy, yes.
However, there are other areas, especially in Sherman County and other areas in NE Oregon, beyond the scenic area of the Columbia River.
There are places that migrating birds are not passing through as well.
Please, please reconsider the location of this project.

Thank you for allowing me to submit these comments into the record.

Sincerely,
Annette Lange Hildebrand

Re: Inadequacy of the Environmental Justice analyses for the proposed BPA and SDS Lumber Whistling Ridge wind farm project located in rural Skamania County; and, cumulative impacts of environmental injustice on the rural environment and inhabitants, both human and wildlife

Dear EFSEC and BPA,

An area which I thought got very short shrift and not enough in-depth analysis, in the DEIS, was the subject of Environmental Justice (EJ). To me, a lay person, EJ means that the exploitation of the environment (including wildlife, ecosystems, habitats, etc.) and humans should not be allowed by individuals, entities, and agencies, in order to benefit themselves. BPA and SDS are both entities, one Federal, the other private. BPA certainly must adhere to Executive Order 12898, "Federal Actions to address Environmental Justice in Minority populations and Low-Income Population."

In doing my research on the EJ issue, I came across the following statement from the Environmental Protection Agency (EPA) (**see attachment, entitled NEPA_ej_nepa_epa0498.pdf**); although this is EPA-specific, I believe it also pertains to another Federal agency, BPA: "On February 11, 1994, President Clinton issued Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations." This Executive Order is **designed to focus the attention of federal agencies on the human health and environmental conditions** in minority communities and low-income communities. **It requires federal agencies to adopt strategies to address environmental justice concerns within the context of agency operations.** In an accompanying Presidential memorandum, the President emphasizes existing laws, including the **National Environmental Policy Act (NEPA) should provide opportunities for federal agencies to address environmental hazards in minority communities and low-income communities.** In April of 1995, the U.S. Environmental Protection Agency (EPA) released the document titled "Environmental

Justice Strategy: Executive Order 12898." The document defines the approaches by which EPA will ensure that **disproportionately high and adverse human health or environmental effects on minority communities and low-income communities are identified and addressed**. It establishes Agency-wide goals for American Indian, Alaska Native, and other indigenous peoples (e.g., Native Hawaiian). It also establishes Agency-wide goals for environmental protection, and lists actions the EPA would take to incorporate environmental justice into its mission." [my bold emphasis]

There is a section in the Executive Order 12898 (see attachment **EJ_presidential_order_12898.pdf**) on EJ, "Sec. 4-4. Subsistence Consumption of Fish and Wildlife, 4-401. Consumption Patterns. In order to assist in identifying the need for ensuring protection of populations with differential patterns of subsistence consumption of fish and wildlife, Federal agencies, whenever practicable and appropriate, shall collect, maintain, and analyze information on the consumption patterns of populations who principally rely on fish and/or wildlife for subsistence. Federal agencies shall communicate to the public the risks of those consumption patterns" which is pertinent to the DEIS and I believe was NOT adequately addressed. BPA must have a lot of information on the Indian tribes, who "principally rely on fish and/or wildlife for subsistence" so they didn't they include it in the EJ section of the DEIS? There are cumulative impacts to wildlife and humans from BPA's energy generation. Where are the cumulative impacts and effects analyses in the DEIS?

Another section deals with discrimination, "6-602. *Executive Order No. 12250*. This Executive order is intended to supplement but not supersede Executive Order No. 12250, which requires consistent and effective implementation of various laws prohibiting discriminatory practices in programs receiving Federal financial assistance. Nothing herein shall limit the effect or mandate of Executive Order No. 12250." Well, I think that rural areas are being discriminated against by being littered with Federally subsidized wind farms whose impermeable surfaces and hundreds of miles of environment-destroying, prairie criss-crossing maintenance roads are highly destructive to the rural environment. Why aren't these wind farms located in urban areas, areas which they primarily serve with their energy production?

The "No Action" Alternative for the Whistling Ridge DEIS was also not adequately explored in the EJ section. In *Morongo Band of Mission Indians v. Federal Aviation Administration*, 161 F.3d 569, 98 Cal. Daily Op. Serv. 8560 (9th Cir. 11/23/1998)¹, it states "**NEPA's regulations require agencies to "[r]igorously explore**

[4] November 23, 1998

and objectively evaluate all reasonable alternatives." 40 C.F.R. S 1502.14. "The existence of a viable but unexamined alternative renders an environmental impact statement inadequate." [my bold emphasis] Where is the rigorous exploration of the "No Action" alternative in the DEIS? It does not exist. That is one big reason why DEIS should NOT be written by the proponents of projects—they tend to be heavily biased toward having their project built!

In the EPA document (see attachment) that I have already cited, there is the following statement: "EISs are required to be broad in scope, *addressing the full range of potential effects of the proposed action on human health and the environment*. Regulations established by both the Council on Environmental Quality (CEQ) and EPA require that socioeconomic impacts associated with significant physical environmental impacts be addressed in the EIS." [my bold and *italic emphasis*]." There is certainly no "full range of potential effects of the proposed action on human health and the environment" analysis in the DEIS. Health effects that might or would occur—audio, visual, environmental—are downplayed in the EIS and information that is contradictory is not included. What are the benefits and detriments of siting hundreds if not thousands of wind farms in rural environments? What are the impacts to the rural communities and their way of life? What are the impacts to water resources? To air quality? Wind farm proponents talk about turbines as if they do not change air quality, but propellers whirling around do change the chemical composition of air. Where is the analysis to look at this air quality issue? Wind turbines can change the flow of wind in the area where they are located. How do wind turbines changing local wind patterns affect the local area? How does it affect crops? Rainfall? Rural areas have

[5] MORONGO BAND OF MISSION INDIANS, PETITIONER, v. FEDERAL AVIATION ADMINISTRATION; WILLIAM WITHYCOMBE, REGIONAL ADMINISTRATOR, FAA, RESPONDENTS.

[15] SUMMARY

[16] OPINION

[17] The Morongo Band of Mission Indians ("Morongo Band" or "Tribe") petitions for review of a Record of Decision ("ROD") of the Federal Aviation Administration ("FAA"), implementing the Los Angeles International Airport ("LAX") East Arrival Enhancement Project ("AEP"). The Morongo Band raises claims under the National Environmental Policy Act ("NEPA"), 42 U.S.C. SS 4321-4370d, section 106 of the National Historic Preservation Act ("NHPA"), 16 U.S.C. S 470f, section 4(f) of the Transportation Act, 49 U.S.C. S 303(c), and various FAA regulations.

[48] NEPA's regulations require agencies to "[r]igorously explore and objectively evaluate all reasonable alternatives." 40 C.F.R. S 1502.14. "The existence of a viable but unexamined alternative renders an environmental impact statement inadequate." Resources Ltd. v. Robertson, 35 F.3d 1300, 1307 (9th Cir. 1994) (quoting Idaho Conservation League v. Mumma, 956 F.2d 1508, 1519 (9th Cir. 1992)). An agency, however, is "entitled to identify some parameters and criteria -- related to Plan standards -- for generating alternatives to which it would devote serious consideration. Without such criteria, an agency could generate countless alternatives." Id. (quoting Mumma, 956 F.2d at 1522). The "touchstone for our inquiry is whether an EIS's selection and Discussion of alternatives fosters informed decision-making and informed public participation." City of Angoon v. Hodel, 803 F.2d 1016, 1020 (9th Cir. 1986) (internal quotations and citation omitted).

water resources that are used by many urban areas. If these water resources are used and abused, we will all suffer.

In conclusion, the environmental justice section of the Whistling Ridge DEIS, p. 3-250+, is not adequately address by BPA, a Federal agency. Nor is it adequately addressed by SDS, the co-proponent of this wind farm project. Rural areas are being disproportionately impacted by these Federally-subsidized wind farms, and thorough, data-rich, regional cumulative impacts analyses have not been done, to date, by BPA or SDS. Environmental justice practices demand a complete analysis of cumulative impacts on human health and the environment. BPA should, as a Federal agency, know this and should have done its Federally-mandated environmental justice analysis of the cumulative impacts and effects of its actions on rural communities in its region of energy production.

Presidential Documents

Title 3—

Executive Order 12898 of February 11, 1994

The President

Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

Section 1-1. *Implementation.*

1-101. Agency Responsibilities. To the greatest extent practicable and permitted by law, and consistent with the principles set forth in the report on the National Performance Review, each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States and its territories and possessions, the District of Columbia, the Commonwealth of Puerto Rico, and the Commonwealth of the Mariana Islands.

1-102. Creation of an Interagency Working Group on Environmental Justice.

(a) Within 3 months of the date of this order, the Administrator of the Environmental Protection Agency ("Administrator") or the Administrator's designee shall convene an interagency Federal Working Group on Environmental Justice ("Working Group"). The Working Group shall comprise the heads of the following executive agencies and offices, or their designees: (a) Department of Defense; (b) Department of Health and Human Services; (c) Department of Housing and Urban Development; (d) Department of Labor; (e) Department of Agriculture; (f) Department of Transportation; (g) Department of Justice; (h) Department of the Interior; (i) Department of Commerce; (j) Department of Energy; (k) Environmental Protection Agency; (l) Office of Management and Budget; (m) Office of Science and Technology Policy; (n) Office of the Deputy Assistant to the President for Environmental Policy; (o) Office of the Assistant to the President for Domestic Policy; (p) National Economic Council; (q) Council of Economic Advisers; and (r) such other Government officials as the President may designate. The Working Group shall report to the President through the Deputy Assistant to the President for Environmental Policy and the Assistant to the President for Domestic Policy.

(b) The Working Group shall: (1) provide guidance to Federal agencies on criteria for identifying disproportionately high and adverse human health or environmental effects on minority populations and low-income populations;

(2) coordinate with, provide guidance to, and serve as a clearinghouse for, each Federal agency as it develops an environmental justice strategy as required by section 1-103 of this order, in order to ensure that the administration, interpretation and enforcement of programs, activities and policies are undertaken in a consistent manner;

(3) assist in coordinating research by, and stimulating cooperation among, the Environmental Protection Agency, the Department of Health and Human Services, the Department of Housing and Urban Development, and other agencies conducting research or other activities in accordance with section 3-3 of this order;

(4) assist in coordinating data collection, required by this order;

(5) examine existing data and studies on environmental justice;

(6) hold public meetings as required in section 5-502(d) of this order; and

(7) develop interagency model projects on environmental justice that evidence cooperation among Federal agencies.

1-103. *Development of Agency Strategies.* (a) Except as provided in section 6-605 of this order, each Federal agency shall develop an agency-wide environmental justice strategy, as set forth in subsections (b)-(e) of this section that identifies and addresses disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations. The environmental justice strategy shall list programs, policies, planning and public participation processes, enforcement, and/or rulemakings related to human health or the environment that should be revised to, at a minimum: (1) promote enforcement of all health and environmental statutes in areas with minority populations and low-income populations; (2) ensure greater public participation; (3) improve research and data collection relating to the health of and environment of minority populations and low-income populations; and (4) identify differential patterns of consumption of natural resources among minority populations and low-income populations. In addition, the environmental justice strategy shall include, where appropriate, a timetable for undertaking identified revisions and consideration of economic and social implications of the revisions.

(b) Within 4 months of the date of this order, each Federal agency shall identify an internal administrative process for developing its environmental justice strategy, and shall inform the Working Group of the process.

(c) Within 6 months of the date of this order, each Federal agency shall provide the Working Group with an outline of its proposed environmental justice strategy.

(d) Within 10 months of the date of this order, each Federal agency shall provide the Working Group with its proposed environmental justice strategy.

(e) Within 12 months of the date of this order, each Federal agency shall finalize its environmental justice strategy and provide a copy and written description of its strategy to the Working Group. During the 12 month period from the date of this order, each Federal agency, as part of its environmental justice strategy, shall identify several specific projects that can be promptly undertaken to address particular concerns identified during the development of the proposed environmental justice strategy, and a schedule for implementing those projects.

(f) Within 24 months of the date of this order, each Federal agency shall report to the Working Group on its progress in implementing its agency-wide environmental justice strategy.

(g) Federal agencies shall provide additional periodic reports to the Working Group as requested by the Working Group.

1-104. *Reports to the President.* Within 14 months of the date of this order, the Working Group shall submit to the President, through the Office of the Deputy Assistant to the President for Environmental Policy and the Office of the Assistant to the President for Domestic Policy, a report that describes the implementation of this order, and includes the final environmental justice strategies described in section 1-103(e) of this order.

Sec. 2-2. *Federal Agency Responsibilities for Federal Programs.* Each Federal agency shall conduct its programs, policies, and activities that substantially affect human health or the environment, in a manner that ensures that such programs, policies, and activities do not have the effect of excluding persons (including populations) from participation in, denying persons (including populations) the benefits of, or subjecting persons (including populations) to discrimination under, such programs, policies, and activities, because of their race, color, or national origin.

Sec. 3-3. Research, Data Collection, and Analysis.

3-301. Human Health and Environmental Research and Analysis. (a) Environmental human health research, whenever practicable and appropriate, shall include diverse segments of the population in epidemiological and clinical studies, including segments at high risk from environmental hazards, such as minority populations, low-income populations and workers who may be exposed to substantial environmental hazards.

(b) Environmental human health analyses, whenever practicable and appropriate, shall identify multiple and cumulative exposures.

(c) Federal agencies shall provide minority populations and low-income populations the opportunity to comment on the development and design of research strategies undertaken pursuant to this order.

3-302. Human Health and Environmental Data Collection and Analysis. To the extent permitted by existing law, including the Privacy Act, as amended (5 U.S.C. section 552a): (a) each Federal agency, whenever practicable and appropriate, shall collect, maintain, and analyze information assessing and comparing environmental and human health risks borne by populations identified by race, national origin, or income. To the extent practical and appropriate, Federal agencies shall use this information to determine whether their programs, policies, and activities have disproportionately high and adverse human health or environmental effects on minority populations and low-income populations;

(b) In connection with the development and implementation of agency strategies in section 1-103 of this order, each Federal agency, whenever practicable and appropriate, shall collect, maintain and analyze information on the race, national origin, income level, and other readily accessible and appropriate information for areas surrounding facilities or sites expected to have a substantial environmental, human health, or economic effect on the surrounding populations, when such facilities or sites become the subject of a substantial Federal environmental administrative or judicial action. Such information shall be made available to the public, unless prohibited by law; and

(c) Each Federal agency, whenever practicable and appropriate, shall collect, maintain, and analyze information on the race, national origin, income level, and other readily accessible and appropriate information for areas surrounding Federal facilities that are: (1) subject to the reporting requirements under the Emergency Planning and Community Right-to-Know Act, 42 U.S.C. section 11001-11050 as mandated in Executive Order No. 12856; and (2) expected to have a substantial environmental, human health, or economic effect on surrounding populations. Such information shall be made available to the public, unless prohibited by law.

(d) In carrying out the responsibilities in this section, each Federal agency, whenever practicable and appropriate, shall share information and eliminate unnecessary duplication of efforts through the use of existing data systems and cooperative agreements among Federal agencies and with State, local, and tribal governments.

Sec. 4-4. Subsistence Consumption of Fish and Wildlife.

4-401. Consumption Patterns. In order to assist in identifying the need for ensuring protection of populations with differential patterns of subsistence consumption of fish and wildlife, Federal agencies, whenever practicable and appropriate, shall collect, maintain, and analyze information on the consumption patterns of populations who principally rely on fish and/or wildlife for subsistence. Federal agencies shall communicate to the public the risks of those consumption patterns.

4-402. Guidance. Federal agencies, whenever practicable and appropriate, shall work in a coordinated manner to publish guidance reflecting the latest scientific information available concerning methods for evaluating the human health risks associated with the consumption of pollutant-bearing fish or

wildlife. Agencies shall consider such guidance in developing their policies and rules.

Sec. 5-5. *Public Participation and Access to Information.* (a) The public may submit recommendations to Federal agencies relating to the incorporation of environmental justice principles into Federal agency programs or policies. Each Federal agency shall convey such recommendations to the Working Group.

(b) Each Federal agency may, whenever practicable and appropriate, translate crucial public documents, notices, and hearings relating to human health or the environment for limited English speaking populations.

(c) Each Federal agency shall work to ensure that public documents, notices, and hearings relating to human health or the environment are concise, understandable, and readily accessible to the public.

(d) The Working Group shall hold public meetings, as appropriate, for the purpose of fact-finding, receiving public comments, and conducting inquiries concerning environmental justice. The Working Group shall prepare for public review a summary of the comments and recommendations discussed at the public meetings.

Sec. 6-6. *General Provisions.*

6-601. *Responsibility for Agency Implementation.* The head of each Federal agency shall be responsible for ensuring compliance with this order. Each Federal agency shall conduct internal reviews and take such other steps as may be necessary to monitor compliance with this order.

6-602. *Executive Order No. 12250.* This Executive order is intended to supplement but not supersede Executive Order No. 12250, which requires consistent and effective implementation of various laws prohibiting discriminatory practices in programs receiving Federal financial assistance. Nothing herein shall limit the effect or mandate of Executive Order No. 12250.

6-603. *Executive Order No. 12875.* This Executive order is not intended to limit the effect or mandate of Executive Order No. 12875.

6-604. *Scope.* For purposes of this order, Federal agency means any agency on the Working Group, and such other agencies as may be designated by the President, that conducts any Federal program or activity that substantially affects human health or the environment. Independent agencies are requested to comply with the provisions of this order.

6-605. *Petitions for Exemptions.* The head of a Federal agency may petition the President for an exemption from the requirements of this order on the grounds that all or some of the petitioning agency's programs or activities should not be subject to the requirements of this order.

6-606. *Native American Programs.* Each Federal agency responsibility set forth under this order shall apply equally to Native American programs. In addition, the Department of the Interior, in coordination with the Working Group, and, after consultation with tribal leaders, shall coordinate steps to be taken pursuant to this order that address Federally-recognized Indian Tribes.

6-607. *Costs.* Unless otherwise provided by law, Federal agencies shall assume the financial costs of complying with this order.

6-608. *General.* Federal agencies shall implement this order consistent with, and to the extent permitted by, existing law.

6-609. *Judicial Review.* This order is intended only to improve the internal management of the executive branch and is not intended to, nor does it create any right, benefit, or trust responsibility, substantive or procedural, enforceable at law or equity by a party against the United States, its agencies, its officers, or any person. This order shall not be construed to create any right to judicial review involving the compliance or noncompliance

of the United States, its agencies, its officers, or any other person with this order.

THE WHITE HOUSE,
February 11, 1994.

Final Guidance For Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses

April 1998

DISCLAIMER AND ACKNOWLEDGMENTS

The mention of company or product names is not to be considered an endorsement by the U.S. Government or by the Environmental Protection Agency. With the technical assistance of Science Applications International Corporation (SAIC), this document was prepared in partial fulfillment of EPA Contract 68-WE-0026, Work Assignment 72-IV.

This guidance was prepared under the direction of an EPA Workgroup co-chaired by Arthur Totten and Bill Dickerson of the Office of Federal Activities and helped by Karen Norris. The Workgroup members included the following:

Region 1: James Younger

Region 2: Joe Bergstein

Region 3: Roy Denmark

Region 4: Heinz Mueller; Chris Hoberg

Region 6: Yvonne Vallette; Jack Ferguson

Region 8: Gene Kersey

Region 10: Rick Seaborne

Office of Administration and Resource Management: Rob
M. Lee

Office of Air and Radiation: Will Wilson

Office of Environmental Justice: Alex Varela

Office of Water, American Indian Environmental Office:
Elizabeth Bell

Office of Federal Activities: Marshall Cain; Bill Dickerson;
Arthur Totten

Office of General Counsel: Jim Havard; David Coursen;
Mary O'Lone

Office of Prevention, Pesticides and Toxic Substances:
Bruce Sidwell

Office of Regional Operations and State/Local Relations:
Ann Cole

Office of Research and Development: Candace Castillo

Office of Solid Waste and Emergency Response: Kent
Benjamin

This guidance is intended to improve the internal management of EPA with respect to environmental justice under NEPA. It will not be deemed to create any right, benefit or trust obligation either substantive or procedural, enforceable by any person, or entity in any court against the agency, its officers, or any other person. Compliance with this guidance will not be justiciable in any proceeding for judicial review of agency action.

1.0 PURPOSE

On February 11, 1994, President Clinton issued Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations." This Executive Order is designed to focus the attention of federal agencies on the human health and environmental conditions in minority communities and low-income communities. It requires federal agencies to adopt strategies to address environmental justice concerns within the context of agency operations. In an accompanying Presidential memorandum, the President emphasizes existing laws, including the National Environmental Policy Act (NEPA) should provide opportunities for federal agencies to address environmental hazards in minority communities and low-income communities. In April of 1995, the U.S. Environmental Protection Agency (EPA) released the document titled "Environmental Justice Strategy: Executive Order 12898." The document defines the approaches by which EPA will

ensure that disproportionately high and adverse human health or environmental effects on minority communities and low-income communities are identified and addressed. It establishes Agency-wide goals for American Indian, Alaska Native, and other indigenous peoples (e.g., Native Hawaiian). It also establishes Agency-wide goals for environmental protection, and lists actions the EPA would take to incorporate environmental justice into its mission.

In August 1997, the EPA Office of Environmental Justice released the "Environmental Justice Implementation Plan." The Implementation Plan supplements the EPA environmental justice strategy. It provides estimated time frames for undertaking revisions, identifying the lead agents and determining the measures of success for each action item. Several EPA offices are developing more specific plans and guidance to implement Executive Order 12898 and this Agency-wide strategy.

This document serves as a guidance to incorporate environmental justice goals into EPA's preparation of environmental impact statements (EISs) and environmental assessments (EAs) under NEPA. The National Environmental Policy Act of 1969 (42 U.S.C. §4321 et seq.) serves as the Nation's basic environmental protection charter. A primary purpose of NEPA is to ensure that federal agencies consider the environmental consequences of their actions and decisions as they conduct their respective missions. For "major Federal actions significantly affecting the quality of the human environment," the federal agency must prepare a detailed environmental impact statement (EIS) that assesses the proposed action and all reasonable alternatives. EISs are required to be broad in scope, addressing the full range of potential effects of the proposed action on human health and the environment. Regulations established by both the Council on Environmental Quality (CEQ) and EPA require that socioeconomic impacts associated with significant physical environmental impacts be addressed in the EIS.

Environmental assessments have also become very important components of the NEPA process. Originally intended to serve as a mechanism for determining whether an agency's action was significant, thereby meriting an EIS, EAs are important analyses on their own. As a matter of policy, EAs completed by EPA regularly address

socioeconomic effects associated with environmental impacts of Agency actions.

The purpose of this guidance is to assist EPA staff responsible for developing EPA NEPA compliance documentation, including EISs and EAs, in addressing a specific concern -- that of environmental justice. Because analyzing and addressing environmental justice may assist in determining the distributional effects of environmental impacts on certain populations, it is entirely consistent with the NEPA process. This guidance is intended to:

- heighten awareness of EPA staff in addressing environmental justice issues within NEPA analyses and considering the full potential for disproportionately high and adverse human health or environmental effects on minority populations and low-income populations;
- present basic procedures for identifying and describing junctures in the NEPA process where environmental justice issues may be encountered;
- present procedures for addressing disproportionately high and adverse effects to evaluate alternative actions, and;
- present methods for communicating with the affected population throughout the NEPA process.

As seen throughout this guidance document, environmental justice issues can be and should be analyzed and addressed using many of the same tools currently intrinsic to the NEPA process.

1.1 Background

1.1.1 What is Environmental Justice?

Environmental Justice has been defined by a variety of organizations interested in the topic. EPA's Office of Environmental Justice offers the following definition:

"The fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means that no group of people,

including racial, ethnic, or socioeconomic group should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies."

The goal of this "fair treatment" is not to shift risks among populations, but to identify potential disproportionately high and adverse effects and identify alternatives that may mitigate these impacts.

1.1.2 Executive Order 12898

Executive Order 12898 and its accompanying memorandum have the primary purpose of ensuring that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations ..."⁽¹⁾ The Executive Order also explicitly called for the application of equal consideration for Native American programs. To meet these goals, the Order specified that each agency develop an agency-wide environmental justice strategy.

The Presidential Memorandum that accompanied the Executive Order calls for a variety of actions. Four specific actions were directed at NEPA-related activities, including:

1. Each federal agency must analyze environmental effects, including human health, economic, and social effects, of federal actions, including effects on minority communities and low-income communities, when such analysis is required by NEPA.
2. Mitigation measures outlined or analyzed in EAs, EISs, or Records of Decision (RODs), whenever feasible, should address significant and adverse environmental effects of proposed federal actions on minority communities and low-income communities.
3. Each federal agency must provide opportunities for community input in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving

accessibility of public meetings, official documents, and notices to affected communities.

4. In reviewing other agencies' proposed actions under Section 309 of the Clean Air Act, EPA must ensure that the agencies have fully analyzed environmental effects on minority communities and low-income communities, including human health, social, and economic effects.

As noted earlier, the purpose of this guidance is to assist EPA personnel in identifying and evaluating disproportionately high and adverse human health or environmental effects in minority communities and low-income communities within the context of NEPA documents prepared by EPA for actions which EPA complies with the procedural requirements of NEPA (*e.g.*, research and development activities, facilities construction, wastewater treatment construction grants, EPA-issued National Pollutant Discharge Elimination System (NPDES) permits for new sources, and programs under the EPA Voluntary NEPA Compliance Policy), including instances where EPA satisfies its NEPA compliance obligation as a cooperating agency. It is also meant to improve the affected communities' access to the NEPA process.

1.2 Principles/Philosophy of this Guidance

This guidance highlights important ways in which EPA-prepared NEPA documentation may help to identify and address EJ concerns. The rationale and associated implications of the guidance will be described in the remainder of this document. This section provides a summary listing of the major implications.

EPA officials should be vigilant in identifying where EPA actions may have disproportionately high and adverse human health or environmental effects on minority and/or low-income communities.

Identification should occur as early as possible, preferably during any initial screening exercise. The screening exercise should identify the presence of minority or low-income communities and whether such communities are likely to experience adverse environmental or human health effects as a result of proposed EPA actions.

The sensitivity to environmental justice concerns should sharpen the focus of the analysis. While the analytical tools to be used are similar, the analysis should focus both on the overall affected area and population and on smaller areas and/or communities within the affected area.

It is desirable that EPA NEPA analysts tasked with identifying and addressing environmental justice issues work as a team. This team should be comprised of an interdisciplinary staff that includes individuals familiar with environmental justice issues, public participation mechanisms and outreach strategies, Native American concerns and issues and who are experienced in the risk assessment process. Additionally, the team should consult with EPA's Regional Environmental Justice coordinators (refer to Appendix A), who are valuable resources in identifying local community groups among other functions.

Where proposed actions may affect tribal lands or resources (e.g., treaty-protected resources⁽²⁾, cultural resources and/or sacred sites⁽³⁾) EPA will request that the affected Indian Tribe⁽⁴⁾ seek to participate as a cooperating agency (40 CFR 1508.5). Where differences occur regarding the preferred alternative or mitigation measures that will affect tribal lands or resources, the affected Indian Tribe may request that a dispute resolution process be initiated to resolve the conflict between the tribe and the Agency.

Environmental justice concerns may lead to more focused analyses, identifying significant effects that may otherwise have been diluted by examination of a larger population or area. Environmental justice concerns should always trigger the serious evaluation of alternatives as well as mitigation options.

Identifying the "affected community" is particularly important. The effects of the proposed action will often vary depending on the distance of the affected community from the action and the type of effect created by the action (e.g., airborne or waterborne pollution, increased traffic, etc.). Effects on the community should be discussed in terms of reasonable increments from the site of the action.

Community involvement is particularly important in cases involving potential environmental justice issues. Early and sustained communications with the affected community

throughout the NEPA process is an essential component of environmental justice.

For meaningful community involvement to be achieved in circumstances where environmental justice is an issue, technical assistance supplied by EPA should be available to the community to assist in their full participation (e.g., interpretation of scientific documents, development of alternatives or mitigation measures).

EISs and RODs, and EAs and FONSI (Finding of No Significant Impact) should document the analyses used to identify the presence or absence of disproportionately high and adverse effects and present the results of those analyses. The ROD and the FONSI should document the conclusion of these analyses (i.e., whether the action will or will not have a disproportionately high and adverse effect on minority and/or low-income communities) and describe any mitigation that will be undertaken to avoid or minimize such effects.

1.2.1 EPA Actions Requiring NEPA Compliance

EPA is required to comply with NEPA for its research and development activities, facilities construction, wastewater treatment construction grants under Title II of the Clean Water Act and under certain Appropriations Acts, and EPA-issued National Pollutant Discharge Elimination System (NPDES) permits for new sources subject to new source performance standards. The Agency is exempted by statute for actions taken under the Clean Air Act and for most Clean Water Act programs. The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), requires EPA to comply only with the substantive, not the procedural, requirements of other environmental laws for on-site responses. In the case of other EPA programs, the courts have found EPA procedures to be "functionally equivalent" to the NEPA process and therefore these EPA programs are exempt from NEPA procedural requirements. Also, EPA voluntarily prepares EISs for a number of actions pursuant to a long-standing statement of Agency policy.

Exhibit 1 identifies EPA's major program areas and indicates which actions are subject to NEPA, which Congress has exempted from NEPA, which have been

found to be functionally equivalent to NEPA, and which receive NEPA-like analyses. This guidance is applicable solely to EPA programs and actions subject to NEPA and not those identified as "functionally equivalent" in Exhibit I. However, this should not preclude its use as reference where "functionally equivalent" programs or actions processes may benefit from the information contained therein.

1.2.2 EPA Review of Proposed Actions Under Clean Air Act §309

As a result of §309 of the Clean Air Act, EPA has a key role in the overall implementation of NEPA. Specifically, §309 mandates that EPA "review and comment in writing on the environmental impact of any matter relating to duties and responsibilities granted pursuant to this chapter or other provisions of the authority of the Administrator, contained in any (1) legislation proposed by any federal department or agency, (2) newly authorized federal projects for construction and any major federal agency action (other than a project for construction) to which Section 4332(2)(C) of this title applies [subject to Section 102(2)(C) of NEPA], and (3) proposed regulations published by any department or agency of the Federal government. Such written comment shall be made public at the conclusion of any such review" (42 U.S.C. §7609(a)).

In conducting §309 reviews, EPA is further directed by the Presidential Memorandum that accompanied Executive Order 12898 to ensure that agencies fully analyze environmental effects of their proposed actions on minority and low-income communities, including human health, social, and economic effects. As a result of both §309 and the Presidential Memorandum, EPA is able to assist other federal agencies in evaluating proposed actions that are subject to NEPA by identifying possible environmental justice concerns that may result from such actions and by offering alternative solutions and mitigation measures for unavoidable impacts.

Although mention is made here of EPA's responsibilities under §309, this document is not intended to provide guidance for §309 reviews. EPA's §309 guidance should be used for that purpose. This guidance supplements the Council on Environmental Quality's *"Environmental*

Justice Guidance Under the National Environmental Policy Act" and is tailored to EPA's conduct in actions for which EPA must comply with NEPA and where EPA has jurisdiction as a cooperating agency. It does not provide guidance related to other federal agencies' actions or for EPA's review of other federal agencies' EISs.

1.3 Organization of this Guidance

The remainder of this guidance is organized as follows: **Chapter 2** describes key environmental justice terms and factors and the application of the key definitions and factors in the context of standard NEPA analyses; **Chapter 3** describes key steps in the NEPA process, including both EISs and EAs, where analyses of environmental justice concerns should be incorporated; **Chapter 4** discusses public participation approaches of direct relevance to minority and/or low-income communities; and **Chapter 5** provides a brief overview of methodological tools that can be used to identify and assess potential disproportionately high and adverse effects.

2.0 KEY TERMS AND FACTORS FOR CONSIDERATION IN EVALUATING

ENVIRONMENTAL JUSTICE CONCERNS

The purpose of this section is to introduce key terms and concepts to heighten the EPA analyst's awareness of how disproportionately high and adverse effects may be identified. The discussion is based on guidance prepared by a task force of the Interagency Working Group on Environmental Justice (IWG). The IWG was created by Executive Order 12898 and is comprised of the heads (or representatives) of 17 departments and agencies.

The identification and analysis of disproportionately high and adverse human health or environmental effects on minority communities and low-income communities should occur throughout the NEPA process, from the initial phases of the screening analysis through the consideration and communication of all alternatives and associated mitigation techniques.

In conducting an EPA NEPA analysis that is sensitive to environmental justice concerns, the inter-disciplinary team

of EPA NEPA analysts should have an understanding of key terms central to environmental justice and should understand what factors need to be considered to ensure that all relevant concerns are identified and evaluated in a direct and explicit manner. The team should include experts familiar with available and appropriate public participation procedures and strategies and, where such concerns may arise, individuals familiar with the unique concerns of Native American Tribes and populations. Developing a keen sensitivity to potential environmental justice concerns and modifying the scope of the analysis can have a dramatic impact on whether environmental justice concerns are identified and addressed adequately and appropriately. Therefore, the EPA NEPA analyst must be sensitive to what issues and factors to look for to avoid the possibility that disproportionately high and adverse effects may be inadvertently missed, incorrectly characterized, or inappropriately minimized. So as to avoid potential oversights of environmental justice concerns, the EPA NEPA analyst should work closely with the affected community in drafting an EIS or EA, and where the community's concerns warrant, EPA should formalize this interaction (e.g., community advisory boards).

Appendix A includes the Council on Environmental Quality's (CEQ's) "Environmental Justice Guidance Under the National Environmental Policy Act" which incorporates the IWG-developed guidance on key terms in Executive Order 12898 that are pertinent to environmental justice analyses. That guidance was developed to assist federal agencies in conducting analyses of disproportionately high and adverse effects of their programs, policies, and activities. The guidance is not static but provides for informed judgment in every case; this means that EPA NEPA analysts will need to make careful decisions to ensure that environmental justice concerns are identified and addressed.

The remainder of this chapter is organized into two sections. The first section addresses terms that should be considered in identifying the existence of minority communities or low-income communities. The second section identifies factors that often are associated with disproportionately high and adverse effects, including cumulative and indirect impacts, on minority or low-

income members of the larger community. Methodological approaches for conducting analyses appear in Chapter 5.

2.1 Defining Minority and/or Low-Income Population

The purpose of this section is to assist the analyst in determining whether there is a minority community or low-income community that may be addressed in the scope of EPA's NEPA analysis.

2.1.1 Minority and Minority Population

The first part of the guidance on minority population provided by the IWG provides a numeric measure: over 50 percent of the affected area. The remainder of the guidance calls for the analyst to use his or her best judgment in evaluating the potential for EJ concerns. It is important that the EPA NEPA analyst consider both the circumstances of any groups residing within the affected area, as well as the percentage of the affected community that is composed of minority peoples.

Within its guidance, the IWG explains that a minority population may be present if the minority population percentage of the affected area is "meaningfully greater" than the minority population percentage in the general population or other "appropriate unit of geographic analysis." The term "affected area," although not defined by the guidance, should be interpreted as that area which the proposed project will or may have an effect on. The IWG guidance also advises agencies not to "artificially dilute or inflate" the affected minority population when selecting the appropriate unit of geographic analysis. Clearly, a key element here is the selection of the appropriate level of geographic analysis; that is, selecting a comparison population to which the population in the affected area will be compared to identify if there are "meaningfully greater" percentages. The selection of the appropriate unit of geographic analysis may be a governing body's jurisdiction, a neighborhood census tract, or other similar unit. This is done to prevent artificial dilution or inflation of the affected minority population. In an EPA NEPA analyses, the analyst should use the potentially affected population under various alternatives as a benchmark for comparison wherever possible. In addition, a simple demographic comparison to the next larger geographic area or political jurisdiction

should be presented to place population characteristics in context and allow the analyst to judge whether alternatives adequately distinguish among populations. For example, all preliminary locations for a project could fall in minority neighborhoods, therefore, a comparison among them would not reveal any population differences. Consequently, an additional alternative would be necessary to allow any disproportionately high and adverse effects to be identified.

The fact that census data can only be disaggregated to certain prescribed levels (*e.g.*, census tracts, census blocks) suggests that pockets of minority or low-income communities, including those that may be experiencing disproportionately high and adverse effects, may be missed in a traditional census tract-based analysis. Additional caution is called for in using census data due to the possibility of distortion of population breakdowns, particularly in areas of dense Hispanic or Native American populations. In addition to identifying the proportion of the population of individual census tracts that are composed of minority individuals, analysts should attempt to identify whether high concentration "pockets" of minority populations are evidenced in specific geographic areas.

The IWG guidance also advises agencies to consider both groups of individuals living in geographic proximity to one another, or a geographically dispersed/transient set of individuals, where either type of group "experiences common conditions" of environmental exposure or effect within the guidance provided for minority population. This can result from cultural practices, educational backgrounds, or the median age of community residents (*e.g.*, disproportionate numbers of elderly residents, children, or women of child bearing age may be more susceptible to environmental risks).

A factor that should be considered in assessing the presence of a minority community is that a minority group comprising a relatively small percentage of the total population surrounding the project may experience a disproportionately high and adverse effect. This can result due to the group's use of, or dependence on, potentially affected natural resources, or due to the group's daily or cumulative exposure to environmental pollutants as a result of their close proximity to the source. The data may show that a distinct minority population may be below the

thresholds defined in the IWG key terms guidance on minority population. However, as a result of particular cultural practices, that population may experience disproportionately high and adverse effects. For example, the construction of a new treatment plant that will discharge to a river or stream used by subsistence anglers may affect that portion of the total population. Also, potential effects to on- or off-reservation tribal resources (e.g., treaty-protected resources, cultural resources and/or sacred sites) may disproportionately affect the local Native American community and implicate the federal trust responsibility to tribes.⁽⁵⁾

The EPA NEPA analyst should look at each situation on a case-by-case basis to determine if there may be disproportionately high and adverse effects on a minority population.

The EPA NEPA analyst should make every effort to identify the presence of distinct minority communities residing both within, and in close proximity to, the proposed project, and to identify those minority groups which utilize or are dependent upon natural resources that could be potentially affected by the proposed action. Non-traditional data gathering techniques, including outreach to community-based organizations and tribal governments early in the screening process, may be the best approach for identifying distinct minority communities and/or tribal interests within the study area. See Chapter 4 for a discussion of public outreach techniques.

2.1.2 Low-Income Population

This guidance recommends that pursuant to the CEQ guidance, low-income populations in an affected area (that area in which the proposed project will or may have an effect) should be identified with the annual statistical poverty thresholds from the Bureau of the Census' Current Population Reports, Series P-60 on Income and Poverty. In conjunction with census data, the EPA NEPA analyst should also consider state and regional low-income and poverty definitions as appropriate. In identifying low-income populations, agencies may consider as a community a group of individuals living in geographic proximity to one another or set of individuals (such as migrant workers or Native Americans) where either type of group

experiences common conditions of environmental exposure.

As with the identification of minority communities, the level of aggregation of available data is an issue of concern when seeking to determine whether one or more low-income communities may be affected by a project. Also, as with minority communities, "pockets" of low-income individuals may be masked by aggregated data. The level of aggregation of data, as well as how current the available data are, should be taken into account by the EPA NEPA analyst.

Determining the existence and location of low-income and minority communities within the reaches of a projects' influence can be a difficult task. Several means of gathering this information are available; however, it is up to the EPA NEPA analyst to ascertain which techniques will best suit the project at hand. Further, the EPA NEPA analyst must be flexible and open to consider additional avenues which may be unique to select projects or geographic areas. The use of national decennial census data in depicting low-income/poverty and minority statistics is one of the most common methods used. While the census provides valuable information for the EPA NEPA analyst, there are often many gaps associated with the information. Therefore, it may be necessary for the EPA NEPA analyst to validate this information with the use of additional sources. The additional methods available in locating the populations of interest include contacting local resources, government agencies, commercial database firms, and the use of locational/distributional tools. (Please see Chapter 5 regarding the use of locational/distributional tools.)

Local resources should be sought for local and up-to-date knowledge of a given area and its inhabitants as well as a lead to other sources of information. Examples of local resources include: community and public outreach groups, community leaders, and state universities (i.e., economic departments).

State government agencies such as the Department of Economic Development, Planning and Development Department, State Minority Business Office, and State Enterprise Zone Offices are also valuable resources to contact. For example, if an area is designated as an

"enterprise zone", unique economic and demographic data may exist in that particular area, access to which could enhance the EPA NEPA analyst's ability to assess the economic situation of a given area.

Local resources and state governments can both be contacted for information regarding factors that are characteristic of low-income communities and which may assist in identifying these communities. These factors may include: limited access to health care, an inadequate, overburdened or aged infrastructure, and particular dependence of the community, or components of the community, on subsistence living (*e.g.*, subsistence fishing, hunting, gathering or farming). In some cases, these factors can be evaluated directly from traditional information sources. For example, the age and condition of water treatment facilities and presence of lead service lines should be available from municipal utilities. Outreach to community groups may be the most reliable data collection method in other cases, such as those where the degree to which the cultural and dietary habits of low-income or minority families and their economic condition dictate subsistence living. Consequently, where the community median household income may exceed that of the poverty line, conditions generally associated with low-income communities may be present, resulting in cumulative effects that may meet the threshold for environmental justice concerns.

Commercial database firms are often capable of tailoring census data information of human communities and income/poverty level to specified areas of geographic detail. For example, by manipulating specified census bureau tract data with customized buffer areas, statistics can be generated to accommodate current growth estimates from local government agencies or planning departments. Locational/distributional tools are also capable of determining the locations of certain human communities. Examples include maps, aerial photographs, and geographical information systems (GIS). Further explanations of these tools are presented in Chapter 5.

2.2 Considering Effects

This section discusses the term "disproportionately high and adverse human health or environmental effects" and

provides an overview of some factors that should be considered in assessing the presence of such effects. It also addresses how the concept of environmental justice plays in conducting cumulative and indirect impact analyses in support of NEPA.

2.2.1 Disproportionately High and Adverse Effects

Disproportionately high and adverse effects encompass both human health and environmental effects. The IWG's guidance suggests the need for the analyst to exercise informed judgments as to what constitutes "disproportionate" as well as "high and adverse." This, in turn, suggests some level of comparative analysis with the conditions faced by an appropriate comparison population. As noted in Section 2.1.1, alternatives need to be drawn so that the potentially affected populations under various alternatives are distinctive and allow disproportionality to be assessed.

2.2.2 Cumulative and Indirect Effects

EPA NEPA analyses must consider the cumulative effects on a community by addressing the full range of consequences of a proposed action as well as other environmental stresses which may be affecting the community. Cumulative impacts are defined in 40 CFR 1508.7, as "the incremental impact(s) of the action when added to other past, present, and reasonably foreseeable future actions...." For example, when considering a project that will have a permitted discharge to the surrounding surface waters, it may be of concern to populations who rely on subsistence living patterns (*i.e.*, fishing) and already receive public water through lead service lines; the cumulative effects associated with both the discharge and the lead service lines must be taken into account. In such cases, mitigation measures need to be developed and analyzed to reduce an adverse cumulative effect. In addition, minority populations and low-income populations are often located in areas or environments that may already suffer from prior degradation. EPA analysts need to place special emphasis on other sources of environmental stress within the region, including those that have historically existed, those that currently exist, and those that are projected for the future. Common variables of concern may include:

- Number/concentration of point and nonpoint release sources, including both permitted and non-permitted.
- Presence of listed or highly ranked toxic pollutants with high exposure potential (e.g., presence of toxic pollutants included within EPA's 33/50 program).
- Multiple exposure sources and/or paths for the same pollutant.
- Historical exposure sources and/or pathways.
- Potential for aggravated susceptibility due to existing air pollution (in urban areas), lead poisoning, existence of abandoned toxic sites.
- Frequency of impacts.

Source data, including historical, existing, and projected sources, yielding projected effects in concert with that from the resulting proposed action should be analyzed with respect to minority or low-income receptors. As noted above, these include cultural, health and occupation-related variables such as:

- Health data reflective of the community (e.g., abnormal cancer rates, infant and childhood mortality, low birth weight rate, blood-lead levels).
- Occupational exposures to environmental stresses which may exceed those experienced by the general population.
- Diets, or differential patterns of consumption of natural resources⁽⁶⁾, which may suggest increased exposures to environmental pathways presenting potential health risk.

The EPA NEPA analyst may have difficulty in determining the point at which stress levels become too great, exceeding risk thresholds. This lack of a definitive threshold should encourage the EPA NEPA analyst to compare the cumulative effects of multiple actions with appropriate community, regional, state, or national goals, standards, etc. to determine whether the total effect is significant.

With respect to natural resources, analysts should look to the community's dependence on natural resources for its

economic base (e.g., tourism and cash crops) as well as the cultural values that the community and/or Indian Tribe may place on a natural resource at risk. Further, it is essential for the EPA NEPA analyst to consider the cumulative impacts from the perspective of these specific resources or ecosystems which are vital to the communities of interest.

Several methods for determining cumulative effects are described within CEQ's January 1997 handbook entitled, "Considering Effects Under the National Environmental Policy Act." The EPA NEPA analyst may wish to consider these methods in assessing cumulative effects on low-income and/or minority communities.

In the process of determining future actions, for example, it is essential for the EPA NEPA analyst to apply judgment and experience, to go beyond the number of projects that are funded in the area, and predict which of the actions in the early planning stage have realistic potential to move forward. The EPA NEPA analyst should use the best available information from similar projects in the region and also consult with local government planning agencies which may have master development plans in the region. In addition, private land-owners and organizations may be willing to disclose their future land use plans.

Although cumulative effects analyses commonly involve assumptions and uncertainties, exhausting all applicable analyses will provide the greatest likelihood of accurately depicting the possibility of disproportionately high and adverse effects on low-income and/or minority communities. Analysts should be as resourceful as possible in addition to seeking information from traditional sources. Decisions should be supported by the best data currently available and/or the best data gathering techniques in conjunction with all appropriate analyses.

EISs and EAs must also address indirect impacts [40 CFR 1502.16(b), 1508.8(b) 1508.9], which are characterized as those that are caused by the action and are reasonably foreseeable, but that occur later in time and/or at a distance. Indirect effects include growth effects related to induced changes in the pattern of land use; population density and/or changes to infrastructure; or growth rates and related effects to the air, water and other natural systems, including ecosystems.

Increased urbanization may occur around a new facility due to increased employment or due to transportation system upgrades. This may result in disproportionately high and adverse effects to low-income communities due to increased air pollution, lower housing values, and reduced access to fishing/farming locations. In addition, recreational lands and water may be indirectly affected by government actions. In the case of activities potentially affecting Native Americans, potential impacts, both direct and indirect, can occur to sacred sites and/or other natural resources used for cultural purposes. For example, the loss of a sacred site, or other impacts to larger areas of religious and spiritual importance may be so absolute that religious use of the site abruptly ceases--a direct impact. However, discontinued use may result in other indirect impacts. Proposed actions may also result in business failures, and associated unemployment, erosion of tax bases, and reduced public services. These types of effects may be exacerbated for low-income communities and minority communities due to an inability to relocate, to travel long distances to find alternative means of employment, or to attract new industry or commerce.

The potential for indirect impacts to affect a community is best understood when the analytical team is thoroughly familiar with the local community. It is important that the EPA NEPA analyst gain a full understanding of potential cultural impacts to the community. This is best accomplished through direct communication using effective public participation and consultation. A discussion of public participation approaches appears in Chapter 4.

2.2.3 Environmental Exposure

Executive Order 12898 provides that environmental human health research, whenever practicable and appropriate, shall include diverse segments of the population in epidemiological and clinical studies, including segments at high risk from environmental hazards, such as minority and low-income populations and workers who may be exposed to substantial environmental hazards. The Executive Order further states that environmental human health analyses, whenever practicable and appropriate, shall identify multiple and cumulative exposures.

In addressing the term "environmental hazard" for the purpose of research, data collection and analysis provisions in the Executive Order, the IWG Key Terms guidance states that it is "a chemical, biological, physical or radiological agent, situation, or source that has the potential for deleterious effects to the environment and/or human health." The IWG points out that the factors that may be important in defining a *substantial*⁽⁷⁾ environmental hazard are the likelihood, seriousness, and the magnitude of the impact. The IWG Key Terms provides guidance for "multiple environmental exposure" and "cumulative environmental exposure."

The EPA NEPA analyst should include individuals who are familiar with collecting and analyzing data that assesses the potential environmental and human health risks potentially borne by minority and low-income communities as a result of the project or activity. EPA NEPA analysts gain a better understanding of potential environmental risks to the community by directly using effective public participation and consultation techniques. An assessment of such potential risks should then be used to determine whether disproportionately high and adverse effects may be borne by minority communities or low-income communities.

2.3 Summary of Factors to Consider in Environmental Justice Analyses

This section provides an overview of many of the factors that should be considered when identifying and evaluating environmental justice concerns. Given the subjective nature of some of the elements that are important to environmental justice analyses, some consideration of the *factors* or characteristics that may lead to disproportionately high and adverse effects to a community may prove to be useful when conducting such analyses. EPA's Office of Environmental Justice points out that an understanding of the underlying factors that contribute to environmental justice concerns allows for a more thorough identification of the concerns and the development of more effective mitigation measures.

In focusing the identification of environmental justice concerns, the EPA NEPA analyst may approach the analysis of environmental justice from three vantage points: 1) whether there exists a potential for disproportionate risk;

2) whether communities have been sufficiently involved in the decision-making process; and 3) whether communities currently suffer, or have historically suffered, from environmental and health risks or hazards. The factors listed in this section are provided within the context of these three approaches for identifying potential environmental justice concerns and provide the EPA NEPA analyst with a starting point in determining what factors to consider in an environmental justice assessment. However, almost every situation will have its own nuances. As such, the EPA NEPA analyst should be prepared to apply these factors flexibly to fit a specific situation, just as the IWG guidance provided above may require judgments to ensure that communities are defined in a fair manner (See Exhibit 3 for Summary of Factors).

Exhibit 3. SUMMARY OF FACTORS TO CONSIDER IN ENVIRONMENTAL JUSTICE ANALYSIS	
<i>FACTORS ASSOCIATED WITH POTENTIAL EXPOSURE TO/AND RISKS FROM ENVIRONMENTAL HAZARDS</i>	
<p>The general factors that should be considered include DEMOGRAPHIC factors, GEOGRAPHIC factors, ECONOMIC factors, and HUMAN HEALTH and RISK factors. For each of these, specific variables for consideration are listed.</p>	
DEMOGRAPHIC FACTORS	
<p>Demographic factors are one of the key components of environmental justice. Race, ethnicity, and low-income status are some of the primary considerations of the environmental justice movement. However, numerous other demographic factors also may play vital roles in an environmental justice assessment. These include, but are not limited to:</p>	
Population Age	Older or younger populations may be more susceptible to risks, when taking into account special health concerns of the elderly and potential for greater exposure in younger populations (<i>e.g.</i> , ingestion of soil). In addition, children's immature bodily defense systems may make them more susceptible to toxic effects.
Population Density	High population density may promote a synergistic effect between industrial pollutants and typical urban pollutants (<i>e.g.</i> , ground level ozone), especially if industry is located in close proximity (5 miles or less) to high density populations. Low population density may lead the NEPA analyst to underestimate the actual environmental harm to the affected population when conducting a risk assessment.
Population Literacy	If documents are technically complex and not adequately explained communities with lower levels of education may encounter difficulty in its ability to understand or sufficiently identify and interpret risk

	and other factors.
Population / Economic Growth	Rapid or severe changes in population or economic growth rate may result in potential impacts to existing community or public services and infrastructure. Changes in growth rate may include: (1) an increase in low-income or minority population(s) in an area (e.g., migration), (2) high birth rates, and (3) cumulative impacts due to multiple sources of population increases.
GEOGRAPHIC FACTORS	
Certain communities may be at high risk from environmental hazards or exposed to substantial environmental hazards due to geographic factors that isolate them from other surrounding communities or that tend to allow pollutants to accumulate in the environment surrounding the community. Such factors include, but are not limited to:	
Climate	Weather patterns (e.g., prevailing winds) that may concentrate pollutants in a certain area, allow pollutants to migrate, increase certain exposure pathways (such as respiration), or cause pollutants to behave in a manner that differs from that expected under normal weather conditions.
Geomorphic Features	Mountains, hills, or other surface features, natural or human in origin, that may affect pollutant dispersal and may focus or funnel pollutants in particular directions or to particular locations.
Hydrophic Features	Presence of surface water and/or aquifers that may provide drinking water, subsistence fisheries, cultural significance and use, and recreational use.
ECONOMIC FACTORS	
Economic factors can be divided into two categories: the economic condition of the individuals in the community in question, and the overall economic base of the community. The economic condition of the individuals in the population, if poor, may exacerbate risk factors and may preclude avoidance of risk factors. The economic condition of the community at large may result in situations that preclude the local government's ability to adequately protect the population or may promote the acceptance of disproportionately high and adverse effects. Such factors include, but are not limited to:	
<u>Individual Economic Conditions</u> Income Level / Health Care Access	This includes such issues as whether affordable or free quality health care is available and, whether any cultural barriers exist to seeking health care. Many low-income and/or minority communities lack adequate levels and quality of health care, often due to lack of resources or lack of access to health care facilities.
Infrastructure Conditions	Consideration should be given to whether existing infrastructure provides sufficient protection from adverse impacts (e.g., protection of domestic water supply, especially if the community relies on

	public or non-public drinking wells or surface water; adequacy of sewage facilities) and the effect that new facilities may have on the ability of existing infrastructure to be reliable and provide adequate protection. In many low-income and/or minority communities, historic allocation of resources has resulted in inadequate infrastructure development and maintenance.
Life-Support Resources	This includes subsistence living situations (<i>e.g.</i> , subsistence fishing, hunting, gathering, farming), diet, and other differential patterns of consumption of natural resources. If a community is reliant on consumption of natural resources, such as subsistence fishing, an additional exposure pathway may be associated with the community that is not relevant to the population at large. Similarly, dietary practices within a community or ethnic group, such as a diet low in certain vitamins and minerals, may increase risk factors for that group.
Distribution of Costs	Consideration of the distribution of costs to pay for environmental projects to the extent that regulations and programs are paid for by user fees on necessary goods and services (<i>e.g.</i> , sewer and water bills, garbage services, electric bills, gasoline taxes). These have a substantial negative effect on low-income families who must pay a disproportionate fraction of their income for these goods and services, the addition of user fees for another plant or facility may add to the disparate treatment of those individuals.
<u>Community Economic Base</u> Industrial	Reliance on polluting industries for jobs and economic development. If the community is reliant on polluting industries for jobs and tax revenue, there may be reluctance to take actions that would avoid risk to health and the environment at a cost to the industry. In addition, minority or low-income communities may not enjoy other benefits in proportion to the risks or impacts they bear.
Brownfields	Communities with low revenues may be unable to finance economic rehabilitation efforts that would improve the physical environment of a community.
Natural Resources	Reliance on natural resources for economic base (<i>e.g.</i> , tourism, crops; use of resources to create salable items, such as woven baskets among Native Americans; subsistence and commercial fisheries).
Other	Other indirect effects which a low-income or minority population, due to economic disadvantage, may not be able to avoid, that will have a synergistic effect with other risk factors (<i>e.g.</i> , vehicle pollution, lead-based paint poisoning, existence of abandoned toxic sites, dilapidated housing stock).
HUMAN HEALTH AND RISK FACTORS	

Evaluation of human health and risk factors relevant to environmental justice concerns may prove to be complicated when detailed technical analyses of risk factors and interaction of toxic chemicals are undertaken. However, the following include, but are not limited to, factors which allow for consideration of whether more detailed risk assessments or analyses specific to minority or low-income populations are appropriate:

Emissions	Number of point and nonpoint sources of emissions including permitted and non-permitted (violations) releases.
Toxics	Presence of or exposure to highly toxic pollutants.
Exposures	Multiple exposure sources and/or paths for the same pollutant.
Pollutants	Exposure to multiple pollutants.
Pesticides	Exposure to pesticides by workers and to the misuse of pesticides.
Locations	Exposure through multiple locations (e.g., workplace, home, school, ambient).
Concentrations	Exposure to emissions from concentrated locations of the same type of industry (or industries).
Health Data	Health data for population in question (e.g., abnormal levels of cancers, asthma, emphysema, birth defects, low birth weight, infant and childhood mortality blood-lead levels asbestosis). This data could indicate historical hazards and health risks which, in concert with the effects of the proposed action could cumulatively or indirectly raise environmental justice issues.
Research Gaps	Research gaps (e.g., subsistence consumption, demographics dietary effects, synergistic effects of chemicals).
Data Collection	Data collection/analysis reliability and validity.

FACTORS RELATED TO CULTURAL AND ETHNIC DIFFERENCES AND COMMUNICATIONS CONCERNS

When determining whether communities have been afforded opportunity for meaningful involvement, broad factors for consideration include the following. Other considerations for public participation are discussed in Chapter 4 of the "*Guidance on Environmental Justice in EPA's NEPA Compliance Analyses.*"

Public Access	Whether community members have access to the decision-making process (i.e., whether the community is fairly represented on commissions, boards, etc., and whether the community is fairly made aware of their role in the decision-making process).
Cultural Expectations	Cultural expectations and understanding of the decision-making process.
Meaningful Information	Access to meaningful and understandable information, such as clear presentation of what a facility produces, what pollutants it releases, how these are managed, and the potential risk to the population.
Job Security	Potential for fear within the community that participating in the process may jeopardize job security.

Literacy Rate	If a low literacy rate exists, consideration should be given to the clarity and accuracy of presentations to the community and whether non-written materials, such as videos, have been considered for use in presentations.
Translations	Consideration of non-English translations, both written and oral during community presentations or public meetings.
Community Representation	Consideration should be given to whether representatives were selected by community decree or by outside sources without proper consultation with the community.
Community Identification	Whether identification of minority and/or low-income communities took into account all potentially-impacted communities. If communities were geographically defined rather than culturally defined, certain communities that are impacted, given other cultural factors, may be unfairly excluded.
Indigenous Populations	<p>In addition, when projects or activities may affect tribal lands or resources or Native American communities, the NEPA analytical team should include one or more analysts familiar with Native American issues and culture, and the Agency should formally request the affected Indian Tribe(s) to seek participation as a cooperating agency. Specific factors to consider in such situations include, but are not limited to:</p> <p>The trust responsibility to and treaties, statutes and executive orders with federally-recognized Indian Tribes.</p> <p>Effect of insufficient financial and technical resources for the development and implementation of tribal environmental programs.</p>
<i>FACTORS RELATED TO HISTORICAL AND POLICY ISSUES</i>	
Environmental justice assessments may require looking at historical conditions, existing conditions, and the impact of future actions. Many of the factors discussed above, such as cumulative risk, will necessarily address this question, but certain other factors may also require consideration, including:	
Industrial Concentration	Concentration of industries that may create a high risk of exposure to environmental hazards for the community's economic base. Factors that may lead to such a result include government/industry arrangements that may reduce available public funding for adequate protection of low-income or minority populations (e.g., tax breaks provided to certain industries to encourage the location of such industries to a certain area).
Inconsistent Standards	Non-uniformity in enforcement and site-selection standards across communities including methods for pursuing enforcement targeting, compliance actions and compliance initiatives.
Research Gaps	Research gaps and past data collection practices and validity. For

	example, data relevant to low-income communities may not be adequately collected and analyzed given the potential for inadequate resources within the community to collect and analyze data.
Program Gaps	Program gaps between tribal, state, and federal programs (such as asbestos worker protection programs) that may have subjected communities to high risk of exposure to environmental hazards. Such gaps include the lack of explicit Congressional authorization for tribal participation in and delegation/authorization of certain EPA programs and the sufficiency of funding and technical assistance for the development of tribal environmental programs.
Non-Inclusive Processes	Decision-making and documentation processes that were non-scientific, and/or non-inclusive in nature (e.g., selection of community representatives by potentially-affected industry rather than by community decree).
Past Practices	Adequacy of past resource allocation practices.
Cultural Diversity	Past and present cultural diversity or lack thereof on decision-making boards, within agencies, commissions, etc.
Obligations	Adherence to prior agreements, such as treaties, statutes and executive orders with tribes. EPA should be particularly careful not to diminish tribal resources, including cultural and natural resources and treaty rights, without tribal concurrence and EPA should ensure the protection of such resources from environmental harm.

3.0 INCORPORATING ENVIRONMENTAL JUSTICE INTO THE NEPA PROCESS

3.1 Overview of the NEPA Process

A general framework for implementing NEPA requirements is presented in regulations (40 CFR Parts 1500 through 1508) promulgated by the Council on Environmental Quality (CEQ). Federal agencies, in turn, have developed their own rules for NEPA compliance that are consistent with the CEQ regulations while addressing the specific missions and program activities of each agency. EPA's regulations are found at 40 CFR Part 6. Over the past 25 years, the NEPA framework for environmental review of proposed federal actions has been substantially refined, based on further congressional directives, action by CEQ, and an extensive body of case law.

As stated in Section 1.0, an EIS is required for major federal actions significantly affecting the quality of the human environment. The basic analytical planning process

for EISs required under NEPA and its implementing regulations for assessing the environmental impacts that may result from a government action includes:

1. **Definition:** Define the purpose and need for the action.
2. **Screening:** Preliminary delineation of potential impacts.
3. **Scoping:** Outline proposed action; define objectives; define scope; identify decisions that need to be made; focus resources; initiate public participation.
4. **Affected Resources:** Define the resources that may be affected if the action meets the proposed objectives.
5. **Alternatives:** Identify and define practical alternatives for meeting objectives.
6. **Mitigation:** Identify possible mitigation measures to minimize or avoid potential impacts.
7. **Consequences:** Predict the environmental impacts and other consequences of the proposed action and alternatives.
8. **Decisions:** Make decisions regarding a course of action, including mitigation measures developed to address environmental effects threatened by proposed actions.
9. **Monitoring:** Observing, recording, and documenting mitigation measures to evaluate their effectiveness.

CEQ regulations (40 CFR Part 1502) dictate the process that federal agencies must follow for all EISs, except where compliance with the regulations would be inconsistent with statutory requirements or where agency procedures allow for exceptions for national security reasons. Public participation and involvement is required throughout the NEPA process, beginning with scoping.

Proposed actions predicted to present less significant impacts often are analyzed in environmental assessments (EAs). As mentioned in Section 1.0, EAs are important analytical tools, originally intended to aid in the determination of significance of the effects of a proposed action. Compared to EISs, there are fewer detailed regulatory requirements for EAs as to content, format or

public participation. The scale of EAs usually depends on the relative significance of the projected impacts.

Environmental justice issues encompass a broad range of impacts covered by NEPA, including impacts on the natural or physical environment and interrelated social and economic effects. The CEQ implementing regulations define "effects" or "impacts" to include those that are "ecological...aesthetic, historic, cultural, economic, social or health, whether direct, indirect or cumulative." In preparing EISs, NEPA requires EPA to consider both impacts on the natural or physical environment and interrelated social and economic impacts. In analyzing social and economic impacts, unique cultural aspects should also be reviewed. EPA, as a matter of policy, will consider interrelated social and economic impacts in EAs. This serves as a base to further the goals of the Executive Order. Environmental justice concerns may arise from impacts on the natural or physical environment, such as human health or ecological impacts on minority populations and low-income populations, or from inter-related social or economic impacts.

Moreover, EISs and EAs should document the extent to which environmental justice issues have been identified and addressed. The initial step in the analysis of potential effects is to assess whether there indeed will be potential physical or natural environmental impacts. If it is determined by the analytical team that there will be no environmental effects, and thus no disproportionately high and adverse effects, then this finding should be documented and no further analysis of effects is necessary.

If preliminary analysis indicates that there is a potential for environmental effects, then a more detailed assessment is conducted to estimate the level of those effects. There are occasions in which "grey areas" may be encountered. The EPA NEPA analyst may be unsure as to whether the environmental effects are *de minimis*, meaning when there are very small effects, or something greater than *de minimis* yet less than significant natural or physical impacts demanding an EIS. This guidance suggests that when the EPA NEPA analyst is unsure whether these environmental impacts are *de minimis* or something more than *de minimis* but less than significant, the EA should include an analysis of interrelated social and economic effects (and, as

described in Section 3.2 below, there now should be an EIS-like scoping process if the screening analysis indicates that there may be disproportionately high and adverse effects on minority and/or low-income communities). The EA should include socioeconomic analyses scaled according to the severity of the impacts.

Following an EIS or EA, the Agency must announce its decision in a Record of Decision (ROD) or a FONSI. The ROD, and where appropriate the FONSI, should document the conclusion of the findings presented in the EIS or EA (i.e., whether the action will or will not have a disproportionately high and adverse effect on minority and/or low-income communities) and include a description of those mitigation measures that the Agency is committing to implement to reduce or avoid environmental consequences associated with the proposed action.

3.2 Incorporating Environmental Justice Concerns into this Process

One of the most important means by which EPA can ensure that disproportionately high and adverse effects on minority and/or low-income communities are identified and analyzed, is to "institutionalize" the process of identification and analysis. The next sections of this Chapter describe the screening-level analysis that begins the process, and how environmental justice considerations can be integrated into later steps and activities required under CEQ and EPA regulations.

As noted in Chapter 1, one effect of incorporating environmental justice considerations into NEPA analyses will be to more sharply focus these analyses. To do this, it is necessary to assess the distribution of environmental impacts demographically and/or geographically, as well as to assess the overall impacts to the affected communities. As described in Chapter 5, the analytical tools commonly used for analyzing potential impacts may have to be modified to allow this more refined focus. Overall, the evaluation of environmental justice concerns raises a number of issues related to "significance" and to other NEPA procedures. The discussion below describes several issues that are relevant to the determination of significance and the consequent level of analysis; also included are discussions of how consideration of such issues should

affect the determination and subsequent analyses. The analytical team should keep in mind that the presence of disproportionately high and adverse effects may or may not necessarily change the final decision, but will change the focus of the analysis and may result in additional mitigation measures.

3.2.1 Environmental Justice Screening Analysis

In preparing for any proposed action, one of the first actions is a preliminary delineation of potential impacts and of the potentially affected area. A screening for environmental justice concerns should be incorporated into this initial NEPA screening analysis. This section describes a two-step screening process, the results of which then guide subsequent actions related to environmental justice.

The first step in identifying potential environmental justice concerns should be a screening-level analysis to determine the existence of a low-income and/or minority population. Depending on the outcome, it may then be necessary to enhance public participation to gain a fuller understanding of the potential environmental justice issues (see Chapter 4), initiate development of alternatives and mitigation options, and/or initiate analyses to identify and assess disproportionately high and adverse human health or environmental effects (see Chapter 5). In addition, if the proposed project may affect tribal lands or resources, then EPA, in keeping with federal and EPA policies of government-to-government relations, will formally request that affected Indian Tribe(s) seek to participate as a cooperating agency.

The screening analysis should occur as soon as the proposed action is well understood, around the time planning for scoping begins for EISs and planning begins for EAs. Although neither the impacts nor the full area to be affected may be fully understood at this point, it is usually possible to make fair approximations. In the screening analysis, two questions should be addressed, as described below.

Question 1

Does the potentially affected community include minority and/or low-income populations?⁽⁸⁾

If yes, this should trigger both an enhanced outreach effort to assure that low-income and minority populations are engaged in public participation and analysis designed to identify and assess the impacts. Also, a positive response to this question should increase the team's sensitivity to the potential for cumulative impacts.

In general, census and other data should be used to characterize the population within the affected area, in terms of minority (*i.e.*, racial or ethnic), economic, and educational demographics. However, it should be noted that census data have been shown to be unreliable in some cases, in part because the level of aggregation may not offer a fine enough mesh to identify the existence of such communities. Also, census data are based on self-reporting. These data are not always consistent and are prone to undercounting minority populations and low-income populations due to a perceived reluctance for certain populations to divulge information (see Section 2.1.1). This is a screening-level analysis, so extensive efforts to validate census data should not be necessary at this stage, unless there is substantial uncertainty in (a) the answer to the screening question or (b) the ability to delineate the affected area at this early stage. Because the applicability of the census data can only be determined on a case-by-case basis, the EPA NEPA analyst should supplement this information with data from other sources. For example, additional information can be obtained from: local resources through questions, interviews, and research; geographical mapping system (GIS) or other similar overlay mapping systems; and economic impact analyses.

Environmental effects are often realized in inverse proportion to the distance from the location or site of the proposed action (*i.e.*, the closer the population is to the action, the greater the potential impacts). As a result, an effort should be made to correlate the demographic analysis to the area most likely to bear environmental effects. On the other hand, depending on the resource affected, and the users of that resource, proximity to the site may not correlate with the likelihood of disproportionately high and adverse effects on minority communities or low-income communities.

It also is important during the initial screening stages to locate all minority communities or low-income

communities within the region surrounding a proposed location. The analytical teams should keep in mind that sometimes distinct minority communities or low-income communities may be geographically located within another minority community or low-income community. In some cases, a minority community or low-income community that is surrounded by another minority community or low-income community may bear disproportionately high and adverse effects compared to the surrounding communities. In addition, the EPA NEPA analyst should be sensitive to situations where the affected community represents the majority population over the extended area. For example, locations along the United States-Mexico border include entire counties where minority populations represent a majority of the population in the county. These areas are predominantly Latino, although when the county population is compared to the population of the entire state, the proportion represents a much smaller percentage of the population. Similarly, counties in the Mississippi Delta region represent areas where African Americans comprise a majority of the total population.

Question 2

Are the environmental impacts likely to fall disproportionately on minority and/or low-income members of the community and/or tribal resources?

A positive response should trigger both an enhanced outreach effort to assure that low income and minority populations are engaged in public participation and an analysis designed to identify impacts on both the larger population and on minority and/or low-income members of the population. A positive response could result from any of several factors, including the following:

Within a potentially affected area, minority and/or low-income populations could be unevenly distributed, thus subject to different levels or intensity of impacts than the larger population. This pattern should cause concern for cumulative impacts. An example would be subsistence dependence on an affected resource by members of a community.

The impacts may affect a cultural, historical, or protected (e.g., treaty) resource of value to an Indian Tribe or a

minority population, even when the population is not concentrated in the vicinity.

If the answer to both screening questions is "no," then the environmental justice screening analysis should be documented in scoping notices and in EISs/EAs and RODs/FONSI. In addition, certain unique cultural, geographic, or economic factors may exist within an area that could warrant additional investigation. Also, later information and analyses may show that the screening analysis was mistaken. Indeed, analysts should re-examine the screening questions (and the key factors identified in Chapter 2) at key steps in the NEPA process (*e.g.*, following scoping, in drafting the EIS/EA, in soliciting comments on draft EISs, in responding to comments, and in preparing RODs and FONSI).

3.2.2 Environmental Justice and the Determination of Significance

CEQ regulations (40 CFR 1508.27) detail factors that should be considered in making a determination of whether a proposed action is significant, thereby requiring a "detailed statement" (*i.e.*, an EIS). Economic or social effects alone do not trigger an EIS [40 CFR 1508.14].

According to CEQ's *Guidance for Considering Environmental Justice under the National Environmental Policy Act*, the "...Executive Order does not change the prevailing legal thresholds and statutory interpretations under NEPA and existing case law. For example, for an EIS to be required, there must be a sufficient impact on the environment to be 'significant' within the meaning of NEPA. Agency consideration of impacts on low-income populations, minority populations or Indian tribes may lead to the identification of disproportionately high and adverse human health or environmental effects that are significant and that otherwise would be overlooked." CEQ requires that significance be evaluated in terms of "intensity" or "severity of impact." Here too, the narrowed focus could affect the determination. Several factors that affect the evaluation of intensity are relevant to situations involving environmental justice issues. These include the degree of scientific controversy, uncertainty (since distributional analysis is relatively new in the NEPA context and this

introduces an element of uncertainty in impact assessment), and cumulative significance of related actions.

Environmental justice concerns should sensitize EPA NEPA analysts to the need to focus analyses on relevant contexts. Focusing the analysis may show that potential impacts, which are not significant in the NEPA context, are particularly disproportionate or particularly severe on minority and/or low-income communities. As mentioned previously, disproportionately high and adverse effects should trigger the serious consideration of alternatives and mitigation actions in coordination with extensive community outreach efforts.

3.2.3 Scoping and Planning

Scoping consists of identifying and defining the range of actions, alternatives and impacts that will be considered in an environmental impact statement (40 CFR 1508.25). During the scoping phase of the EIS process, EPA must consider connected, cumulative and similar actions to the proposed action, identify alternatives to the proposed action that may mitigate or avoid potential environmental consequences, and assess potential impacts (direct, indirect, and cumulative). A similar planning process is used for EAs.

The identification of environmental justice concerns and the incorporation of these concerns into the scoping analysis can have implications for the nature and extent of the scoping analysis, the EIS and/or the EA.⁽⁹⁾ Indian Tribe representation in the process should be sought in a manner that is consistent with the government-to-government relationship between the United States and tribal governments, the federal government's trust responsibility to federally-recognized tribes, and treaty rights. This will help to ensure that the NEPA process is fully utilized to address concerns identified by tribes and to enhance protection of tribal environments and resources. As defined by treaties, statutes, and executive orders, the federal trust responsibility may include the protection of tribal sovereignty, properties, natural and cultural resources, and tribal cultural practices.

3.2.3.1 Incorporating Environmental Justice Concerns into EA Development

If the environmental justice screening analysis does not identify minority communities or low-income communities, and suggests no disproportionately high and adverse effects on those communities and/or on tribal resources, then the EA and FONSI should describe the analysis and note the conclusion.

If the initial screening analysis identifies an affected community that is minority and/or low-income or identifies a disproportionately high and adverse effect upon a minority community, and/or on tribal resources, or on a low-income community, then a smaller scale scoping analysis (than that undertaken for an EIS) should be conducted and some level of public participation should be designed and implemented to solicit community involvement and input, and to develop alternatives and mitigation measures. Mitigation measures should be developed and alternatives should be crafted so as to allow an evaluation of the relative disproportionality of impacts across reasonable alternatives. The EA also should include a comparative socioeconomic analysis that is scaled and tailored to evaluate the potential effects to the minority and/or low-income community (*i.e.*, in the case of environmental justice concerns, the EA should include socioeconomic analyses scaled according to the severity of the impacts).

3.2.3.2 Incorporating Environmental Justice Concerns in EIS Scoping

If the environmental effects of a project are deemed significant, the scoping notices (including the notice of intent for the EIS) should include a description of the results of the environmental justice screening analysis: If the results of the screening analysis are negative (*i.e.*, any potentially affected population is not a minority community or low-income community and the effects are not likely to fall disproportionately on a minority and/or low-income community, and/or on tribal resources), then the scoping notice should state this finding and request additional information on whether there may be disproportionately high and adverse effects that were overlooked during the screening analysis.

If the environmental justice screening analysis concludes that there is a potential for disproportionately high and

adverse effects, then the EPA NEPA analyst should ensure that the EIS scoping process raises environmental justice concerns and that sufficient data and information are generated to evaluate these potential effects. Prior to the full-scale scoping process, public outreach strategies should be developed and implemented. The public participation process should be used to define and evaluate environmental justice concerns by:

Consulting with community leaders and members of the surrounding communities to seek their assistance in identifying all minority and/or low-income communities that may be affected by the proposed action.

Consulting with officials in tribal, state and/or local government agencies over the environmental and human health concerns within the region and who may be familiar with the demographics of the affected populations. Where environments of Indian tribes may be affected, agencies must consider pertinent treaty, statutory or executive order rights and consult with tribal governments in a manner consistent with the government-to-government relationship.

Soliciting information from the local community on potential environmental justice issues through public participation efforts (see Chapter 4 for a discussion of public participation).

- Soliciting public comment on environmental issues through formal public notice and comment procedures tailored to the community (see Chapter 4).
- If the proposed activity is deemed significant to warrant the development of an EIS, or if the community has raised significant concerns to be addressed in an EA, EPA should establish a community advisory board to work with EPA in the development of the respective NEPA documents.

The public participation efforts designed as part of the scoping effort for an EIS should clearly describe any environmental justice concerns identified by EPA, and should specifically ask the public to suggest alternatives and mitigation measures aimed at reducing or avoiding disproportionately high and adverse effects. The Agency also should design comparative socioeconomic, environmental and health analyses of all reasonable

alternatives and mitigation measures that are tailored and/or scaled to evaluate the impacts to the affected minority and/or low-income community and/or tribal resources.

3.2.4 Identification of Affected Resources

CEQ regulations state that an EIS is required only when there is a significant impact on the physical or natural environment. Notwithstanding, early in the EA and/or EIS process, the EPA NEPA analyst should identify the physical environment and all natural resources that could be potentially affected by the proposed action and by alternative actions. The EPA NEPA analyst should develop a full understanding of baseline demographic, socioeconomic, and environmental conditions so that a comprehensive assessment of the types of impacts that may be imposed upon all human and natural resources (*e.g.*, air, water, soils, wildlife) can be conducted and an understanding of how these impacts may translate into human health concerns can be developed. For a detailed discussion on how effects to human health and natural resources might be determined, please reference Section 2.2.

To account for potential environmental justice concerns, EPA NEPA analysts should be sensitive to identifying whether affected resources are used by a minority or low-income community. In addition, analyses of potential effects on all surrounding resources should be focused narrowly or specifically toward how potential effects to these resources may translate into disproportionately high or adverse human health and/or environmental effects on minority and/or low income communities.

The EPA NEPA analyst should use all means available to identify particular natural resources that, if affected by the proposed action, could have a disproportionately high and adverse effect on minority and/or low-income communities. In particular, natural resources that support subsistence living (*e.g.*, hunting, fishing, gathering) should be identified. In addition, Indian Tribes may have treaty-protected resources on or off reservation lands and may hold some natural resources sacred due to religious beliefs and/or social/ceremonial ties. Alternatives and mitigation measures should be explicitly solicited from the affected community early in the process, such as during scoping.

Throughout the process, but especially beginning in this phase, the Agency should provide affected communities with technical assistance to ensure that the communities thoroughly understand the proposed action and have meaningful participation and input. All resources that could be affected should be thoroughly developed and documented. A discussion of all findings should be shared with potentially affected communities during public participation phases of the NEPA process to ensure full disclosure and to solicit additional public comment and input.

3.2.5 Identification of Alternatives

NEPA and the CEQ regulations require the identification and development of a reasonable array of alternatives. In addition, CEQ requires that all reasonable alternatives, including a "no action" alternative, must be analyzed rigorously and objectively. The selection of potential alternatives should begin early in the evaluation and, in fact, should be part of the scoping process. In addition, if environmental justice issues are identified, then alternatives should be drawn so as to allow an assessment of the disproportionate nature of the effects, as well as the magnitude of the effects, on the communities of concern.

An evaluation of potential environmental justice issues should be conducted for all reasonable alternatives. In addition, for each alternative that may result in potential environmental justice concerns, mitigation measures aimed specifically at those impacts should be identified and analyzed. The results of all analyses of environmental justice issues, including study results that identify no environmental justice issues, should be described fully in scoping documents, EISs and EAs. All results should be fully disclosed during public participation procedures, and public comment and input on the analyses and conclusions should be solicited. Chapter 2 provides an overview of the factors that should be evaluated to identify and define potential environmental justice concerns. These factors will also be helpful in understanding the need for mitigation or additional alternatives and identifying mitigation or alternative options.

The EPA NEPA analyst should keep in mind that the goal of identifying and developing alternatives for mitigating

disproportionately high and adverse effects is not to distribute the impacts proportionally or divert them to a non-minority or higher-income community. Instead, alternatives should be developed that mitigate or avoid effects to both the population at large and any disproportionately high and adverse effects on minority or low-income communities. In other words, the goal of developing reasonable alternatives is not to move the impacts around, but to identify viable alternative actions that meet program goals and avoid or reduce the environmental, socioeconomic, human health and/or ecological effects associated with the preferred action. Generally, the types of alternatives that may potentially lead to the avoidance or reduction of effects include: a) the identification of alternate locations or sites where impacts to susceptible populations or environments will be avoided; b) altering the timing of planned activities or periodic emissions to account for seasonal dependencies on natural resources; c) the adoption of pollution prevention practices and policies to reduce or mitigate emissions and/or impacts; d) reducing the size or intensity of an action; and e) taking no action.

3.2.6 Prediction of Environmental Consequences

CEQ regulations require government agencies to identify, predict and describe reasonably foreseeable beneficial as well as adverse changes to existing conditions that may result from implementing either the proposed action or alternative actions. Impacts across alternatives must be compared. The prediction and description of potential disproportionately high and adverse effects must begin during the screening and scoping stages of the process, as noted above. Throughout the NEPA process, environmental justice concerns should be identified, disclosed, and discussed with affected communities.

In preparing an EIS or EA, ecological and human health risk assessments are conducted to identify and evaluate potential environmental and human health impacts that may be imposed. In addition, interrelated socioeconomic impacts that would result from a proposed action and alternatives are analyzed. Chapter 5 provides an overview of the types of analyses and analytical tools that may be used to analyze these issues and approaches that may be appropriate to assess disproportionately high and adverse

effects. Again, throughout the development and public disclosure of EPA NEPA analyses and findings, full discussions of the analytical process undertaken to identify environmental justice concerns and all findings and conclusions should be disclosed to and discussed with all affected and interested parties.

In evaluating the environmental impacts of the proposed action and alternative actions in an EIS, CEQ regulations (40 CFR 1508.25) require EPA to consider: three types of actions (connected actions, cumulative actions, and similar actions); three types of alternatives (no action, other reasonable course(s) of actions, and mitigation measures not in the proposed action); and three types of impacts (direct, indirect, and cumulative). Environmental justice concerns should be identified and analyzed within the context of all actions, alternatives and impacts. Exhibit 4 provides examples of how environmental justice issues could arise and/or be considered for each of these variables.

3.2.7 Mitigation Measures

Regulations require that mitigation measures be developed to address environmental effects, including cumulative impacts, threatened by proposed actions (40 CFR 1502.14(f) and 1502.16(h)). In addition, mitigation measures should be developed specifically to address potential disproportionately high and adverse effects to minority and/or low-income communities. When identifying and developing potential mitigation measures to address environmental justice concerns, members of the affected communities should be consulted. Enhanced public participation efforts should also be conducted to ensure that effective mitigation measures are identified and that the effects of any potential mitigation measures are fully analyzed and compared (see Chapter 4). Mitigation measures may include a variety of approaches for addressing potential effects and balancing the needs and concerns of the affected community with the requirements of the action or activity. For example, potential mitigation measures for addressing disproportionately high and adverse effects could include:

1. Reducing pollutant loadings through changes in processes or technologies.

2. Reducing or eliminating other sources of pollutants or impacts to reduce cumulative effects.
3. Planning for and addressing indirect impacts prior to project initiation (*e.g.*, planning for alternative public transportation alternatives if the project may result in increased population growth).
4. Providing assistance to an affected community to ensure that it receives at least its fair' (i.e., proportional) share of the anticipated benefits of the proposed action (*e.g.*, through job training, community infrastructure improvements).
5. Relocating affected communities, upon request or with concurrence from the affected individuals.
6. Establishment of a community oversight committee to monitor progress and identify potential community concerns.
7. Changing the timing of impact-causing actions (*e.g.*, noise, pollutant loadings) to reduce effects on minority communities or low-income communities.
8. Conducting medical monitoring on affected communities and providing treatment or other responses if necessary.

If mitigation measures are determined to be necessary to reduce disproportionately high and adverse effects on minority and/or low-income communities, and/or tribal resources, then the measures should be committed to in the FONSI or ROD. This provides an additional avenue for public notice and involvement. Other steps that can be considered to ensure that mitigation measures are effective and are implemented include the following:

- Establishing the mitigation measure as a requirement in the permit or authorizing document.
- Requiring financing at the outset of the project for both implementing the measure and monitoring its effectiveness. Ensure clearly defined monitoring guidelines are in place.
- Requiring monitoring reporting, which should be made available to the public.

- Identifying clear consequences and penalties for failure to implement effective mitigation measures.

3.2.8 Decisions

The two NEPA decision documents identified in CEQ regulations are: 1) a ROD following an EIS and, 2) a FONSI following an EA. All EPA NEPA decision documents should include a concise summary of all steps undertaken to identify environmental justice concerns and the results of those steps. In cases where environmental justice concerns are identified, the decision documents should fully discuss these concerns, explain all alternatives and mitigation options that were analyzed, and explain how environmental justice concerns factored into the decision. In cases where effects to tribal lands or resources have been identified and the Indian Tribe and EPA disagree as to the preferred alternative or mitigation measures, the Indian Tribe may request that the EPA initiate a dispute resolution process to resolve this conflict. In addition, public participation efforts related to environmental justice concerns should be documented in the decision document. Finally, mitigation measures that are evaluated, disclosed to the public, and chosen in conjunction with the alternative to be implemented should be identified and discussed. If no concerns are identified, this finding should be stated along with the basis of EPA's conclusion.

4.0 PUBLIC PARTICIPATION

Adequate public participation is crucial to incorporating environmental justice considerations into EPA's NEPA actions, both to enhance the quality of the analyses and to ensure that potentially affected parties are not overlooked and excluded from the process. Public participation under NEPA involves two-way communications, with EPA receiving information, comments, and advice, as well as disseminating information on possible approaches, analyses, and decisions. This is particularly important when there are potential environmental justice issues involved. To sufficiently and adequately address potential environmental justice concerns and communicate with potentially affected communities, the EPA NEPA analyst should include one or more persons who are familiar with environmental justice issues and appropriate communications strategies. It is important that EPA take

steps to encourage and facilitate more active participation by low-income communities and minority communities in its NEPA process. This goal can be accomplished through careful identification of target audiences and aggressive community outreach beyond the traditional forms.

There are established procedures for public participation in NEPA actions and decision-making processes (as in other federal actions). However, these procedures have not always been successful in informing or gaining participation by minority communities and low-income communities. Although they may be most affected, they may be the least informed, simply because of the means of communications used; this can be for any number of obvious reasons, such as language, culture, educational level or geographic location. In most cases, relatively simple approaches--well within the purview of "standard" public participation techniques--can overcome most barriers to informing and seeking involvement of interested or affected communities. This in turn can ensure that federal decisions are consistent with Executive Order 12898 and enhance the actual and perceived fairness of federal actions.

The first subsection below briefly describes public participation that is required during the NEPA process by CEQ and EPA regulations. The next subsection then identifies a number of the special concerns and unique issues that may arise in addressing environmental justice issues, and identifies several mechanisms that may be used in EPA's NEPA process to address those special concerns and issues.

4.1 Public Participation Under NEPA

Public participation is one of the hallmarks of NEPA, and is reflected in CEQ's and EPA's NEPA regulations. According to 40 CFR 6.400(a), "EPA shall make diligent efforts to involve the public in the environmental review process...." There are several clearly defined steps in public participation under NEPA, and these are described below.

Scoping. CEQ regulations require "scoping" following the publication of a notice of intent to prepare an EIS, but before the EIS is prepared. CEQ regulations define scoping as "an early and open process for determining the scope of

issues to be addressed and for identifying the significant issues related to a proposed action" (40 CFR 1501.7). In general, scoping has three broad purposes: identifying public and agency concerns with a proposed action, defining issues and alternatives to be examined in detail, and saving time by ensuring that relevant issues are identified early and drive the analyses (see 40 CFR 1500.4(g), 1500.5(d)). A public meeting is held during scoping, with notice of the meeting made in the *Federal Register*, local newspapers, and utilizing other means of announcing public meetings, depending on case-specific circumstances.

Scoping for EAs is not addressed in either CEQ or EPA regulations. In practice, EA scoping can range from a process more or less identical to that used for EISs, to relatively minimal involvement of outside parties.

CEQ has indicated that the scoping process ends "once the issues and alternatives to be addressed in the EIS have been clearly identified," usually "during the final stages of preparing the draft EIS..." (CEQ "Guidance Regarding NEPA Regulations"). It is emphasized that public participation does not end here, but continues throughout the NEPA process, as described below, and even beyond.

Public review of EISs and EAs. As with scoping, CEQ and EPA NEPA regulations clearly specify the means by which the public is involved in reviewing draft and final EISs. EPA regulations require at least one public meeting on all draft EISs (40 CFR 6.400(c)). The meeting is generally announced in the *Federal Register* and in local newspapers and by other means. Regulations also provide other means of soliciting comments and information. Comments must be solicited from other appropriate federal, tribal, state, and local agencies, and from the public, specifically including a request for comments from "those persons or organizations who may be interested or affected" (40 CFR 1503.1(a)(4)).

EPA then has to consider and address all comments received on the draft EIS in preparing the final EIS, and final EISs must include responses to comments. As with draft EISs, final EISs are noticed in the *Federal Register* and elsewhere. Again, interested parties may submit comments on final EISs prior to EPA's final decisions.

EAs must be made available to the public (40 CFR 1506.6; C.E.Q. 40 Questions, #38). A combination of methods may be used to provide notice of availability; the methods should be tailored to the needs of particular cases. Traditionally there has been limited public involvement before and during EA preparation by EPA unless there is a question of significance (*i.e.*, some question as to whether an EIS is necessary) or some particular public interest.

Public review of RODs and FONSI. Records of Decision on EISs must be disseminated to all those who commented on the draft or final EIS (40 CFR 6.400(e)). No public review is required prior to or after issuance of the ROD. Findings of No Significant Impact on EAs, in contrast, must be made available for public review before they become effective (40 CFR 6.400(d)), and this involves at least local notice and advertising. The FONSI and "attendant publication" must state that comments disagreeing with the decision may be submitted, and any such comments must be considered by EPA (40 CFR 6.400(d)).

4.2 Mechanisms to Enhance Participation

The public participation provision in Executive Order 12898 and its accompanying memorandum are designed to ensure that there is adequate and effective communication between federal decision makers and affected low-income communities and minority communities. This is consistent with the NEPA mandate to involve the public. The involvement of low-income communities and/or minority communities, however, presents some challenges to what has come to be the "normal" pattern of formal public participation under NEPA. In order to establish trust with all types of stakeholders, interaction with the affected community should:

- Encourage active community participation.
- Recognize community knowledge.
- Utilize cross-cultural formats and exchanges.

In all cases where EPA's initial screening indicates that there is a potential for disproportionately high and adverse effects on low-income and/or minority communities, the

Agency should make a concerted effort to identify stakeholders in the affected community and include the following groups and organizations in their outreach efforts:

- Environmental organizations and agencies
- Minority businesses, associations and trade organizations
- Civic associations and public interest groups
- Grassroots/community-based social service organizations
- Federal elected officials and agencies
- Homeowners' or tenants' associations, neighborhood watch groups and resident organizations
- Labor unions and organizations
- State and local elected officials and agencies
- News media, the Internet and other electronic media
- Tribal governments and Tribal organizations
- Religious groups and organizations
- Libraries, vocational and other schools, colleges and universities
- Medical community
- Legal aid providers
- Rural cooperatives
- Civil rights organizations
- Senior citizen's groups

Other sources of advice are ethnic and cultural-based environmental justice networks (e.g., Indigenous Environmental Network, Southwest Network for Environmental and Economic Justice, Southern Organizing Committee). The *People of Color Environmental Groups*

Directory⁽¹⁰⁾ is a valuable major source of information on such local groups and individuals. Similarly, Historically Black Colleges and Universities, Tribal Colleges and Universities or other higher education institutions located in areas with or serving predominantly minority or low-income areas, may be able to assist EPA in designing (and participating in) public participation strategies. Exhibit 5 identifies a number of particular communications challenges and possible approaches to overcoming these challenges in addressing environmental justice issues. These should be supplemented by case-specific advice--on challenges and on solutions--that are solicited from local experts and others familiar with both the proposed action and the affected community.

Exhibit 5. Communications Issues of Particular Concern in Low-Income and/or Minority Communities	
Challenge	Possible Approaches to Overcoming
Language or Communication barriers	<ul style="list-style-type: none"> • Provide assistance to hearing or sight impaired individuals • Provide simultaneous translation of meetings • Use local translators where possible • Translate key documents in entirety (notices, summaries, etc.) • Establish "comment line" (e.g., 800 number) for callers to leave recorded comments • Advertise meetings/process in alternative-language medium • Design communication strategy to reach all segments of population • Use facilitated meeting rather than conventional stand-up comments to encourage comments
Distance to meeting or inconvenient access (e.g., rural or cross-town)	<ul style="list-style-type: none"> • Arrange for "comment line" (e.g., 800 number) to provide remote access to meeting or to allow callers to leave recorded comments • Arrange for telephone tie-in from several locations (e.g., from several schools, religious centers)

	<ul style="list-style-type: none"> • Hold series of shorter meetings (down to 1-2 hours each) in multiple locations • Arrange for alternative transportation (possibly through proponent) • Ensure location is accessible to public transportation and identify itinerary in notices • Use local cable-channel broadcast with telephone call-in • Have proponent provide transportation vouchers • Seek advice of local groups/individuals • Arrange for satellite link-up (perhaps funded by proponent)
<p>Unfamiliar surroundings (government buildings, luxury hotel, etc.)</p>	<ul style="list-style-type: none"> • Use schools or other local facilities including religious centers, churches, temples, mosques • Have several smaller decentralized meetings, including open-air meetings (possibly with tent backup) in season • Seek advice from local groups/individuals • Use local facilitator • Establish "comment line" (e.g., 800 number) for callers to leave recorded comments or to participate from remote locations
<p>Outside normal EPA communications loops (i.e., <i>Federal Register</i>, newspapers)</p>	<ul style="list-style-type: none"> • Use pro-active approach to identify stakeholder (both groups and affected individuals). Consult with local advocates/public interest groups to identify outreach mechanisms and refer to the <i>People of Color Environmental Groups Directory</i>. • Disseminate information through alternative media (neighborhood organization newsletters, religious centers, fliers, local cable access channel, local radio broadcasts, etc.). • Co-sponsor public meetings with local community groups to nurture trust and credibility. • Make announcements to those on the mailing list; make follow-up phone calls to encourage attendance. • Direct consultation with tribal governments and public

	meetings at tribal facilities or on/near tribal lands.
Format of Meetings	<ul style="list-style-type: none"> • Use town hall type meetings. • Avoid "panel of experts" • Use small focus-group seminars or workshops. • Use community "experts" and comments as part of communication strategy • Seek advice of local groups. • Use a trained facilitator who is sensitive to environmental justice issues.
Schedule conflicts (i.e., conflict with working hours, working days)	<ul style="list-style-type: none"> • Conduct personal interviews using audio or video recording devices • Hold after-hours and/or weekend meetings or sessions • Hold meetings on successive days • Hold multiple shorter meetings at diverse times/days • Establish "comment line" (e.g., 800 number) for callers to leave recorded comments • Arrange for child-care (possibly funded by proponent)
Technically complex issues	<ul style="list-style-type: none"> • Provide sufficient background explanations beyond the usual means • Use plain language in meetings and printed material • Seek advice of local groups/individuals • Provide hands-on demonstrations/participation (e.g., tours of similar facilities/locations) • Use visual presentations (e.g., pictures, videos) • Provide two-way communication - Q & A • Use background summary reports, fact sheets, and abstracts • Provide technical and/or financial assistance to community, local organization, and/or tribal government to review,

	evaluate, and comment on the NEPA documents and provide meaningful input throughout the NEPA process.
Trust	<ul style="list-style-type: none"> • Clearly present goals of NEPA, the proposed action, the public involvement process, and what is expected to be gained from the process • Do not oversell: present uncertainties and limitations • Goals should be written and in clear language • Present experiences and track record, successes and failures

EPA-anticipated impacts and community perceptions of those impacts (and their fairness) can be very different, so both must be considered. When perceptions are the concern, an effort to involve and inform the community can go a long way toward building confidence that EPA's analyses and actions are well-intended and balanced. When actual impacts (i.e., disproportionately high and adverse human health or environmental effects) are the concern, the participation can serve to educate the Agency and help identify the means to identify alternatives and/or mitigate the impacts.

Although EPA and CEQ public participation regulations focus primarily on public meetings, there are other mechanisms that can also facilitate public input. Once community leaders and stakeholders have been identified and a dialogue established, a mailing list should be assembled so that information can be sent to this group, as well as formal announcements of a public meeting.

Another mechanism for providing information to the public is the establishment of information repositories which are accessible to members of the affected community. Locations can include libraries, churches, community centers, etc. Technical documents should contain a summary written to the lay public and translated, if necessary, into the dominant language of the affected community.

Meaningful public participation is based on the proposition that people should have a say in decisions which affect their lives in a significant way. Thus, for the public participation process to be effective, it must:

- Seek out and facilitate the involvement of those potentially affected;
- Contain the implicit commitment by decision makers to seriously consider the input of the public; and
- Communicate to participants how their advice was or was not utilized.

Minority communities and low-income communities are no different than any other in that there are nearly as many opinions as there are people. Thus, it is important not to focus exclusively on one mechanism (or one person or one group) for disseminating or soliciting information. Rather, it is important to use as many avenues as possible to solicit participation and to disseminate information. For example, when there are formal or informal representatives that purport to speak for a wider population, it is always advisable to seek divergent opinions.

Dr. Robert Bullard, Director of the School of Arts and Sciences at Clark Atlanta University, provides a framework for public participation when addressing environmental justice concerns during the NEPA process. Dr. Bullard points out that effective public involvement strategies have four common characteristics: inclusiveness, representation, parity, and communication. Inclusiveness refers to the assurance that all affected communities and stakeholders are represented and involved in the decision-making process. In terms of representation, he points out that it is crucial that the persons who are representing a specific community or stakeholder group truly reflect that community's, stakeholder's, and constituent's views, values, and norms. Parity involves all stakeholder groups having equal opportunity and capacity to provide input and full participation, as well as an equal voice in the decision-making process. Dr. Bullard further points out that an effective communications strategy accounts for different groups weighing and acting upon government actions and policies differently. An effective communications strategy recognizes, respects, and values cultural diversity of communities and stakeholders that represent a specific race, ethnic group, gender, age, geographic region, and a host of other characteristics.

As mentioned above, a recommended approach to ensure adequate public participation by minority and/or low-income communities when the screening analysis indicates there may be disproportionately high and adverse effects is to include a person familiar with environmental justice public participation issues on the "project review team." CEQ "Guidance Regarding NEPA Regulations" recommends that an interagency project review team be used when appropriate, with the team functioning as a source of information, a coordination mechanism, and an expert review team. When environmental justice issues must be faced, the review team should consult with the local community (including but not limited to organized groups concerned with environmental justice) during and following scoping, and should provide specialized expertise to EIS preparers.

The following are additional mechanisms for enhancing participation in the NEPA process: 1) allow public review of RODs; 2) government-to-government consultation with tribal governments, including formal requests for Indian Tribes to seek participation as cooperating agencies; 3) Community Advisory Boards for the development of NEPA documents; 4) community consultants; and 5) technical assistance to affected communities to enhance understanding of proposed action, technical documents, and full range of potential alternatives and mitigation measures.

In general, the effort expended in actively soliciting community involvement after the initial screening process should reflect the potential significance of the effects. As noted above, however, there should be some effort to communicate with stakeholders in all cases, including EAs, where the screening analysis identifies potential disproportionately high and adverse effects. Although the health or environmental impacts analyzed in EAs may not be "significant," from the NEPA standpoint, they may be perceived as significant by affected parties. Although this concern would not trigger an EIS, it should trigger more EIS-like scoping and public participation prior to and following EA preparation. To the extent practicable and consistent with regulations, an EIS-like public participation process should be undertaken for EAs when social or economic impacts will be or are perceived to be substantial, even when the impacts are not expected to be significant.

5.0 METHODS AND TOOLS FOR IDENTIFYING AND ASSESSING

DISPROPORTIONATELY HIGH AND ADVERSE EFFECTS

A fundamental step for incorporating environmental justice concerns into EPA NEPA compliance activities is identifying minority and/or low-income communities that may bear disproportionately high and adverse effects as a result of a proposed action. Once these minority and/or low-income communities are identified and located, the potential for disproportionately high and adverse effects to these communities must be assessed. It is important to understand where such communities are located and how the lives and livelihoods of members of these communities may be impacted by proposed and alternative actions. Minority communities and low-income communities are likely to be dependent upon their surrounding environment (*e.g.*, subsistence living), more susceptible to pollution and environmental degradation (*e.g.*, reduced access to health care), and are often less mobile or transient than other populations (*e.g.*, unable to relocate to avoid potential impacts). Each of these factors can contribute to minority and/or low-income communities bearing disproportionately high and adverse effects. Therefore, developing an understanding of where these communities are located and how they may be particularly impacted by government actions should be a fundamental aspect of the EA and EIS development process.

Currently, EAs and EISs generally evaluate and compare potential environmental, ecological, economic and/or human health risk impacts among and between broadly defined affected areas and populations. Potential impacts to smaller populations, individual communities, neighborhoods, census tracts, or environments (*e.g.*, single lake or watershed within a larger affected area) are not generally isolated, or disassociated from total impacts.

Minority and/or low-income communities are often concentrated in small geographical areas within the larger geographically and/or economically defined population center targeted for study. Minority communities and low-income communities may comprise a very small percentage of the total population and/or geographical area. Therefore,

the assumptions and inputs used in conjunction with traditional analytical tools for studying potential impacts under NEPA, and the results of the analyses, may not fully reflect the impacts that may be borne by these smaller communities or populations. An analysis of disproportionate impacts will develop an understanding of how the total potential impacts vary across individual communities. This allows analysts to identify and understand what portion of the total impacts may be borne by minority or low-income communities, to assess whether they are disproportionately high and adverse, and to develop alternatives and mitigation measures if necessary.

As described in Chapter 3, the first step in identifying the potential for environmental justice concerns is to characterize the population affected by the proposed action in terms of racial and ethnic composition and in terms of relative income distribution. The composition of the population should then be compared to the characteristics of the population (*e.g.*, percentage of minority populations residing near a proposed project versus the percentage of minority populations located within a single or multiple-county area surrounding the proposed project). Populations surrounding the proposed project should be characterized in terms of income distribution levels, as well as in terms of racial and ethnic diversity.

Many of the potential effects that may be borne by minority and/or low-income communities may be analyzed or assessed using the same analytical tools that are currently used in the development of EAs and EISs. However, once a potential environmental justice issue is identified, these tools may need to be modified or more likely, the scope of the analyses may need to be narrowed to focus on a smaller affected area or population.

Several types of analytical tools are currently available and are being refined and/or modified to assist analysts and decision makers in identifying potential environmental justice concerns and assessing potentially disproportionately high and adverse effects on minority and low-income communities. The following sections provide an overview of some of the available tools and the types of analyses that may be useful for identifying and assessing disproportionately high and adverse effects (by evaluating both total effects and effects on a smaller scale). It is not an

exhaustive listing of available tools, since many tools for identifying and assessing environmental justice concerns are still being developed, and it is not meant to promote or endorse one type of tool or analysis over any other. The application of any tool is dependent upon the type of study, the particular attributes of the area under study, and the data available to undertake the study.

5.1 Locational/Distributional Tools

Maps, aerial photographs, and geographical information systems (GIS) can be used to locate geographical areas where potential environmental justice issues may exist. Local maps and aerial photographs may provide a "snapshot," or general overview, of the locations of minority or low-income populations or communities and the proximity of the proposed project to these populations or communities. They also can identify key natural resources that may be affected. Although such tools are relatively simplistic, they may be useful for identifying distinct communities within a geographical area surrounding a candidate site, and for identifying clusters of facilities or sites that may contribute to cumulative impacts to a given region or community. By consulting maps or photographs that depict the locations of minority or low-income communities, as well as maps of the same geographical area that depict the locations of hazardous waste facilities, Superfund sites, Toxics Release Inventory facility sites, and/or wastewater discharges, analysts and EPA decision makers can gain a general understanding of the spatial relationships between the proposed project and the surrounding communities. These tools can assist the EPA NEPA analyst in identifying existing sources of environmental pollution and their proximity to minority and/or low-income communities.

By consulting maps or photographs that depict the locations of minority or low-income communities, as well as maps of the same geographical area that depict the locations of hazardous waste facilities, Superfund sites, Toxics Release Inventory facility sites, and/or wastewater discharges, analysts and EPA decision makers can gain a general understanding of the spatial relationships between the proposed project and the surrounding communities. Aerial photographs can be used to effectively depict the boundaries of an identified community and the spatial

relationship that exists between the community and natural resources and known pollutant sources.

Geographic information systems provide a much more powerful tool for identifying and locating populations of concern. GIS technologies are useful for characterizing environmental justice issues by identifying the locations of minority communities that potentially may be affected by proposed actions and providing a visual understanding of how potential impacts may be distributed within a geographical area. GIS provides the technology for displaying and overlaying locational information and population and site characterization information on one or more maps. GIS allows for the visual display of vast amounts of spatially oriented information. In addition, GIS systems can be used to display alternative "what if" scenarios and provide for relatively quick and easy general comparisons of the potential impacts presented by alternative locations.

Several EPA Headquarters and Regional offices are using and/or investigating the use of GIS technologies for identifying and analyzing environmental justice issues. GIS systems such as ARC/INFO and Landview II are geographic references or computerized atlases. These systems can create maps using digitized geographical boundary files such as the U.S. Census Bureau TIGER/Line '92 files, and other commercially available digitized boundary files (e.g., zip code boundaries, county boundaries, water body boundaries) to display locational information and geographical areas. GIS systems also can incorporate, and graphically display on computer-generated maps, other population and demographic information that is available in digitized format. Landview II includes 1990 demographic and economic data from the Bureau of Census, including population and housing characteristics and summary information on income, education levels, employment, race, and age. The census data are available in two databases, STF1A and STF3A, which contain digitized data files. The census databases are then spatially linked to the TIGER files that contain geographic and political boundaries. Each county in the census database is divided into several census tracts that are subdivided into census blocks. The blocks are aggregated into block groups containing between 250 to 550 housing units. This level of data aggregation allows the user to identify locations of

relatively small, homogeneous communities and to visualize, on the computer screen, the relative proximity of these communities to the proposed project and mitigation activities.

GIS allows users to easily display, on a single map, general locational and demographic information (*e.g.*, zip code boundaries, proposed facility site locations, pollutant concentrations, income level, ethnic background, population density). GIS also will allow a user to display data in terms of policy or decision criteria. For example, income distribution data for individual census tracts may be segregated by percent of population below the poverty level (*e.g.*, census blocks shaded differently to correspond to areas where 0 - 25 percent of the population is below the poverty level, 25 - 50 percent is below the poverty level, etc.). GIS also can integrate additional census information on education, employment, race, and age to produce graphic depictions of all of this information on a single map to obtain a comprehensive profile of the communities surrounding the proposed project. More than one project can be displayed on a single map to allow for a comparison of population characteristics surrounding the proposed project. Again, the maps generated by the GIS are useful tools for identifying minority and/or low-income communities that should be targeted for further study due to potential environmental justice concerns.

Although the availability of census demographic information in digitized format can significantly enhance NEPA analytical capabilities, and can be particularly useful for environmental justice analyses, the EPA NEPA analyst should keep in mind that there are limitations associated with the accuracy of census information due to the manner in which the data are collected and tabulated. Census data are useful for screening analyses, but results should always be validated through public participation mechanisms, other data sources, or by touring the community and talking with local officials and community leaders.

Many other types of information pertinent to NEPA project evaluations also are available for use in GIS systems. For example, EPA has made available portions of the Toxics Release Inventory (TRI) database (including facility locations), the Biennial Reporting System (BRS) database, the Aerometric Information Retrieval System (AIRS), the

CERCLA Information System (CERCLIS), and the Permit Compliance System (PCS), in digitized data files for use in GIS applications. DOT's chemicals in transit information is also available for GIS applications.

To enhance the applicability of GIS technologies to NEPA assessments, including the assessment of potential cumulative impacts from existing and proposed projects, the geographical and demographic information provided in Census databases can be integrated with other available EPA information (e.g., facilities located within particular zip codes or counties that reported releases or emissions of a particular chemical in TRI reports, locations of NPL sites, etc.) and integrated with other NEPA factors using digitized data sets on soils, power lines, roads, streams, sources of electricity, locations of threatened and endangered species, and existing archaeological sites. These additional data sets are readily available from the U.S. Forest Service, the U.S. Geological Survey, the Department of Commerce, and state and local government agencies. Additional maps depicting community-specific issues (e.g., locations of subsistence farmers and locations of water bodies supporting subsistence fishing activities) also can be compiled, digitized and incorporated into a GIS system to further depict and analyze more specific environmental justice issues and concerns.

Other GIS, or computer mapping, systems that may enhance NEPA analyses of environmental justice concerns include CAMEO (Computer-Aided Management of Emergency Operations), ALOHA (Aerial Locations of Hazardous Atmospheres) and AILESP (American Indian Lands Environmental Support Project). CAMEO includes chemical-specific information, facility-specific information from EPA's Chemical Inventory database and TRI database, and transportation information. CAMEO integrates MARPLOT, a mapping application tool that generates maps from U.S. Bureau of Census TIGER files. ALOHA is a modeling tool for estimating the movement and dispersion of gases and estimating pollutant concentrations downwind from the source of a potential spill or emission. ALOHA files can be saved and used in a format compatible with CAMEO. AILESP includes permitted facilities on or near Indian lands from various EPA databases (e.g., AIRS, BRS, NCDB, PCS, RCRIS, TRI, CERCLIS), pounds of chemicals released, 1994 spill

and one time release data, pesticide use by county, toxic weighting factors for TRI chemicals, two year inspection and compliance information, 1990 population and census statistics, and stream reaches with fish advisories, contaminated sediments and contaminated fish tissue.

5.2 Ecological and Human Health Risk Assessments

Executive Order 12898 provides for agencies to determine if a proposed action will result in disproportionately high and adverse effects to minority or low-income populations. Due to the fact that the characteristics of these populations may differ significantly from the characteristics of the larger affected population, analyses should address both the minority or low-income population and the comparison populations. See Chapter 2 for a discussion of the environmental and socioeconomic factors that should be considered in identifying and assessing disproportionately high and adverse effects.

EPA has a formal risk analysis process which consists of two related, but separate, processes: risk assessment and risk management. Risk assessment characterizes the likelihood for a chemical or substance to cause adverse health effects to humans and can provide a means for assessing the possible impacts on a population, if exposure occurs. Risk assessment provides an estimate of the probability that human exposure to a chemical agent will result in an adverse health effect to the exposed individual, or an estimate of the incidence of the effect upon an exposed population. Risk management is the process whereby it is decided what actions are appropriate, given an estimate of potential risks and due consideration to other relevant factors. Information developed in the risk assessment process is used to guide decision makers in determining the appropriate action to take within the risk management process. When making risk management decisions in the context of environmental justice concerns, a number of factors should be considered along with human health risk calculations or evaluations. These include social concerns, economic concerns, and acceptance of the proposed action by the affected communities. Within the context of risk management, there is an opportunity to consider relevant environmental justice issues. In the risk management process, decisions are made regarding acceptable levels of exposure and risk.

Risk assessment, as conducted by EPA, conforms to the Agency's published guidelines that include four distinct parts: Hazard Identification, Dose-Response Analysis, Exposure Assessment, and Risk Characterization. These four parts provide the analytical tools for identifying disproportionately high and adverse effects. During the risk management process, criteria must be developed to guide the weighing of information. These criteria provide the basis for risk-based decisions with regard to disproportionately high and adverse effects. For example, risk assessments usually do not account for exposure traits of racial and ethnic groups or accurately account for actual environmental harm to human health where the population density is low (*e.g.*, rural communities, Indian Country). Human activity patterns governed by customs, social class, and ethnic and racial cultures may be introduced and considered during the risk management process to allow for the identification of disproportionately high and adverse effects.

To ensure that environmental justice concerns are considered within the risk management process, risk assessments should be conducted to determine exposure pathways and potential effects and the affected community should be involved in the development and implementation of the process. This can then be overlaid with information obtained from locational analyses using GIS and census data during the risk management process to identify minority or low-income populations that are located within the identified exposure pathways. Racial, ethnic, and cultural information can then be used to further refine the risk management process to account for disproportionately high and adverse effects.

To enhance the analysis of disproportionately high and adverse effects within EPA's health assessment studies, several efforts are underway to make relevant health and exposure information available to these studies. EPA's Office of Research and Development is currently developing the National Human Exposure Assessment Survey (NHEXAS). This survey is designed to generate a human exposure database to address some of the geographic and demographic questions relevant to environmental justice issues. NHEXAS will address exposure concerns by providing information on the magnitude, extent, and causes of human exposure.

EPA's Office of Policy, Planning, and Evaluation is currently developing an environmental justice database that will integrate health effects data from the National Health and Nutrition Examination Survey III (NHANES-III), demographic data from the 1990 Census, environmental data from air monitoring stations, and the Toxic Release Inventory database. This database integration will assist EPA staff in developing disease correlations with air exposure data in high impact populations.

Ecological assessments conducted as components of EAs and EISs generally involve identifying the natural resources (*e.g.*, air, water, soils) that will be used by proposed project or activity and the potentially affected environments (*e.g.*, watersheds, wetlands, wildlife habitats) that may be impacted by the proposed project (including alternatives). After a general cataloging and description of the surrounding environmental and ecological resources is compiled, the potential changes and impacts of the proposed action and alternative actions are assessed. Often, these analyses do not fully substantiate the beneficial or adverse effects on the surrounding geographical area or communities within the area. Instead, impacts may be described generally, with an assumption that they are distributed equally across all communities or residents within the affected region or area. As a consequence, the analysis may overlook or ignore environmental justice concerns. If adverse impacts are not quantified, then special consideration should be given to whether potential impacts could be borne by minority communities or low-income communities residing within the larger area and, if necessary, separate analyses should be designed and conducted to assess this. As discussed above, GIS systems can sometimes be used to identify such populations and to characterize the environments where the populations reside. In addition, county and state planning agencies and housing authorities may be useful sources of information for characterizing the unique aspects and vulnerabilities of these populations.

If environmental, ecological, or human health impacts to the affected geographical area are quantified, the distribution of such impacts should be assessed. The study should attempt to estimate the proportion of impacts borne by low-income and/or minority populations within the area of a project's impact compared to the general population in

and around the project, or the project's region of influence. While traditional risk modeling may not always be used in the NEPA process, impact assessments and risk management tools should be tailored to reflect the characteristics of these communities and study assumptions should reflect the characteristics of the individuals residing in low-income communities and minority-populated communities (*i.e.*, model assumptions should reflect the general health of these individuals and their general living conditions and unique locations relative to pollutant sources). When tailoring risk management tools to consider the distribution of impacts to low-income and/or minority communities, differential patterns of subsistence consumption of natural resources should be considered, including differences in rates of consumption for fish, vegetation, water, and wildlife among ethnic groups and among cultures. Further, it should be recognized that land and water resources not predominantly used by the general population may be important sources of consumption, economy, cultural use, and/or recreation for minority and/or low-income communities. Degradation of these resources may result in direct and disproportionately high and adverse effects to minority and/or low-income communities.

5.3 Socioeconomic Analyses

The analysis and understanding of potential socioeconomic impacts is also important. CEQ regulations note that economic or social effects alone do not trigger an EIS (40 CFR §1508.14). However, if environmental justice concerns are identified during the screening analysis or during the development of an EA, the potential interrelated socioeconomic impacts to both the total affected population (or a "control" population) and to the low-income and/or minority communities of concern should be evaluated, to the extent practicable. Cultural or Social Impact Assessments are additional tools that can be used for analyzing specific socioeconomic impacts to a community that shares a common cultural or spiritual environment.

In the development of EAs and EISs, deterministic models are generally used to predict potential impacts that a particular action may have upon particular economic indicators (*e.g.*, the level of employment and changes to income distribution or property values) for the community

surrounding the proposed project. Standard models provide for analyses of the potential effects that an action may have upon the local economy in both the short term, due to transient or temporary activities (e.g., construction, facility planning and startup activities), and the long term, due to sustained impacts to the area (e.g., permanent employment opportunities, reduction in housing quality, degradation of existing environment). Generally, NEPA modeling activities measure potential shifts in indicators such as income distribution and employment levels across general income distribution categories (e.g., percentage change in annual income to portion of affected population earning less than \$15,000, between \$15,000 to \$20,000, etc.). Standard socioeconomic models also can be used to predict impacts that proposed actions and alternatives may have upon available housing stock, housing quality, and property values.

Generally, standard socioeconomic models are employed to predict shifts and changes in particular socioeconomic indicators such as employment, income levels, and housing quality upon a large geographical area or population center, often a standard, pre-defined economic trade area. The data and information provided as inputs to the model and assumptions made in employing the model (including economic conditions and multipliers) broadly characterize the entire population of the large geographical area or population center surrounding the proposed project. The results of these modeling efforts may include potential impacts to various categories within the overall population characterized by income level or by housing category. However, these models generally do not allow (or at least have not been used so as to allow) for a distributional analysis of potential impacts to specific communities, individual populations, or to small geographical areas.

To predict or characterize more accurately the potential disproportionately high and adverse effects to minority or low-income communities and account for potential environmental justice concerns, standard socioeconomic models currently used for EAs and EISs may have to be modified or specifically tailored to account for an array of new variables, such as subsistence living, treaty-protected resources, cultural use of natural resources, sacred sites, dependence on public transit, community cohesion, and a relatively unskilled labor base. Environmental justice issues

and concerns may be integrated into some traditional socioeconomic analyses by first employing scoping activities and screening tools to identify potential minority and/or low-income communities prior to the employment of specific modeling techniques. It then may be possible to tailor modeling assumptions and input data on specific populations or targeted communities, rather than apply standard modeling techniques to large economic trade areas or standard metropolitan areas and using average input parameters that may not reflect adequately the characteristics of minority or low-income communities (*i.e.*, alter model assumptions to characterize the population affected by the environmental justice concern, rather than characterize the average individual in the entire study area). As noted above, Census databases contain demographic information (*e.g.*, income levels, race, age, employment levels) at the census tract and census block levels. Other potential sources of information include tribal, state and local planning agencies, and state housing, commerce, and welfare agencies. EPA analysts should keep in mind that some information on the characteristics of local communities and environments may be available only from community leaders, local government offices, and/or members of the community. Some information may be available from transcripts of public concerns raised at hearings for other government projects within the same region. In some cases, analysts may need to conduct interviews of local community leaders and members of the targeted population.

One option for modifying or tailoring socioeconomic analyses to identify and evaluate environmental justice concerns is to develop index or ranking systems for identifying and scoring potential disproportionately high and adverse effects to minority and/or low-income communities. Such an index or ranking system could be applied to specifically defined or targeted areas and used as a screening tool to identify environmental justice concerns in communities surrounding one or more candidate locations. Candidate locations that result in high index scores or rankings can either be dropped from consideration, targeted for additional and more thorough socioeconomic and risk analyses to investigate further potential disproportionately high and adverse effects, or development of additional alternative actions or projects designed to mitigate identified impacts.

An environmental justice screening index may be as simple as defining several levels or categories of potential impacts (*e.g.*, changes in employment levels, changes in income levels, and changes in overall health levels) or defining and scoring several socioeconomic indicators (*e.g.*, dependence on subsistence farming or fishing, percent of population below poverty level, average property value) and weighing each category of impact as to its importance to contributing to environmental justice issues. Decision criteria (*e.g.*, undertake further detailed social impact analyses, drop candidate location from consideration) could then be set for different ranges of index scores or rankings. The index also may combine preliminary information on potential economic impacts with information on other potential impacts (*e.g.*, environmental degradation, air emissions) to assign decision criteria for additional targeted analyses or studies.

EPA Region 6⁽¹¹⁾ developed a relatively sophisticated ranking scheme to determine whether an environmental justice indicator exists. The formula provides a means for determining whether an environmental justice situation exists and includes factors such as population exposed, degree of impact and degree of vulnerability.

Region 6 evaluates sites using an environmental justice formula and ranks facilities or actions on a scale of 0 to 100. Regional officials point out that although higher scores can indicate greater potential environmental justice concerns, the population density, percent minority population, and percent of economically depressed household data are the more important analytical factors. When evaluated independently, they often provide greater insight into potential environmental justice concerns and can be used alone to rank sites. Also, the user should realize that even a location with an index ranking of zero can have significant environmental justice concerns. For example, an unpopulated area will rank a zero, but if owned and/or used by minority and/or low-income groups, the site may have significant environmental justice importance. Recent examples of EPA's use of the EJ index include the draft EIS for Eagle Pass Mine, in Maverick County, Texas, and the Supplemental Draft EIS for Expansion of the Oak Hill Surface Lignite Mine into the DIII Area, Rusk County, Texas. Utilizing the EJ index on a scale of 1 to 100 wherein

higher values indicate more concern, neither EIS warranted a closer examination into EJ issues.

1. ⁰ Throughout this guidance, the term "disproportionately high and adverse effects" is used interchangeably with the longer phrase "disproportionately high and adverse human health or environmental effects on minority populations and low-income populations." This is done purely for editorial ease.

2. The term 'treaty-protected resources,' as it is used in the guidance, includes those resources that are protected by treaty, statute and/or executive order.

3. On May 24, 1996, the President issued Executive Order 13007 on Indian Sacred Sites to 1) accommodate access to and ceremonial use of Indian sacred sites, and; 2) avoid adversely affecting the physical integrity of such sacred sites.

4. For consistency throughout the document, the guidance will use the term "Indian Tribe" when referring to federally recognized tribes and "indigenous population" or "community" when generally referring to Native American, American Indian, Alaska Native, and/or Native Hawaiian peoples. Under environmental justice, the Agency's policy is to interact with both the tribal government on a government-to-government basis, as well as with any affected or interested indigenous person(s) as public stakeholders.

5. A distinction must be made between Native American communities that live within their own governmental jurisdictions and those that do not. The CEQ regulations recognize the government-to-government relationship between the federal government and tribal governments, and encourage federal agencies to involve tribal governments in the NEPA process when a proposed project may affect a tribe or tribal lands. See sections 1501.2 [Apply NEPA Early In The Process]; 1501.7(a)(1) [Scoping]; 1502.16 [Environmental Consequences]; 1503.1(a)(2)(ii) [Inviting Comments]; 1506.6(b)(3)(ii) [Public Involvement]; and 1508.5 [Cooperating Agency]. Native American programs include those Federal programs which are to be guided, as appropriate, by the government-to-government relationship, the Federal trust responsibility to federally recognized Indian Tribes, and the role of tribes as governments within the Federal system.

NEPA Compliance Coordinators should consult with the regional Indian Program Coordinator and should request that the Indian Tribes seek participation as a cooperating agency when a tribal government, land, resources, or interest may be affected by a project. While such cases may or may not trigger an environmental justice review, EPA must act consistent with the federal government's trust

responsibility to federally recognized Indian Tribes. Each case should be decided individually; if questions arise please consult with the American Indian Environmental Office and the Office of Federal Activities.

6. ⁰ The IWG key terms guidance describes differential patterns of consumption of natural resources as relating to "subsistence and differential patterns of subsistence, and means differences in rates and /or patterns of fish, water, vegetation and/or wildlife consumption among minority populations or low-income populations, as compared to the general population."

7. ⁰ It should be noted that the factors the IWG is providing for assessing environmental hazard were not necessarily developed in the context of NEPA analyses. These factors are, however, similar to the factors used in determining "significant" physical or natural environmental effects under NEPA.

8. Guidance on the terms "minority population" and "low-income population" is contained in Appendix A.

9. See CEQ "*Environmental Justice Guidance Under the National Environmental Policy Act*" page 10, Helpful Information to Inform the Public During the Scoping Process.

Whistling Ridge Energy LLC

Whistling Ridge Energy Project

Commenter Details

I am a retired biochemist and my wife (Dell Rhodes) is a retired psychology professor, both residing at [REDACTED]

One of Dell's academic specialties was cognitive neuroscience; this fact is relevant to the analysis below. We have lived at this address for about 9 years, having chosen to retire here in order to be close to the extraordinary natural environment in the Columbia Gorge and on the surrounding ridges and peaks. A photo simulation of the wind-farm visual effect at the top of Strawberry Mountain, immediately above our house, (accessible at the Whistling Ridge Project website, though not included in the Draft EIS document) shows considerable impact. However, the farm would not be visible from our residence. As retirees, we have absolutely no economic dependence, direct or indirect, on the outcome of the current site evaluation.

Summary Recommendation and Justification

We urge that the WEFSEC not allow this project to proceed at the present time. Our principal reason is that the May 2010 Draft EIS is fundamentally and legally deficient in applying well known principles of perceptual psychology to the assessment of the visual and auditory impacts of the proposed wind farm. Furthermore, the Whistling Ridge Energy Project would create an essentially permanent, potentially radical, change in the scenic features which motivated the establishment of the Columbia River Gorge National Scenic Area (CRGNSA), recognized nationally and internationally to contain one of the great landscapes of the world. As the WEFSEC currently lacks any rules for factoring cumulative effects into their siting decisions, approval of this major commercial assault on Gorge scenery would almost certainly prejudice in favor of approval of any future wind-

farm proposals flanking the Gorge, if only out of respect for due process (avoidance of arbitrariness). The result would be the effective gutting of the CRGNSA by non-legislative means. Although dismantling of the CRGNSA has been a long-term goal of local conservatives, including many political leaders in Skamania and Klickitat Counties, it seems almost certain that such an outcome would distress a significant majority of local residents, as well as many other Washington residents and even more Gorge-lovers worldwide.

Standing of Visual-Resource Impact in Influencing This Decision

From the mere fact that the WEFSEC devoted a significant fraction of the Draft EIS to Visual Resources and commissioned an ambitious photo simulation of the predicted effect of the wind turbines on approximately 20 views in and flanking the Gorge, it would appear that the WEFSEC recognizes the importance of visual impact to its evaluation. However, project proponents, and Jason Spadaro in particular, have kept up a steady public drumbeat to the effect that scenic impact is irrelevant because the project lies outside the CRGNSA. This position is a spectacular example of the Fallacy of the False Inverse, which should be familiar to anyone with a legal, mathematical, or philosophical background. The Fallacy goes like this: it is a true statement that if the project lay within the CRGNSA boundaries, it would be subject to view-impact regulation; therefore it is true that since the project lies outside the CRGNSA boundaries, it is not subject to view-impact regulation [the second conditional statement is the logical inverse of the first one]. The problem with this deduction is that the rules of logic dictate that the inverse of a true conditional statement is not necessarily true.

The following common-place example helps one understand why the inverse of a true statement may be false. It is true that all Ford cars have four wheels on the road. The inverse of this statement is the following: cars that are not Fords do not have four wheels on the road. The latter is clearly false, because Chevys, Cadillacs, VW's all have four wheels on the road. Back to the present case: the proponents' position is not only fallacious as a matter of logic; it is wrong legally. The lawful authority of the WEFSEC to determine the impact of the Whistling Ridge Energy Project on scenic values inside and outside of the CRGNSA exists independently of the authority of the Gorge Commission in this matter. Both the Gorge Commission and the WEFSEC "have four wheels on the road". The standards that the WEFSEC applies in order to minimize wind-farm visual impact may not be the same

as the CRGNSA rules, but that does not make them any less permissible or necessary. Quite independently of what the Gorge Commission does, the WEFSEC is empowered and charged to apply to an energy project any sort of scenic criteria it determines to be in the public interest. The WEFSEC should not be deflected from its public responsibility by illogic in the propaganda campaign of project proponents.

As the WEFSEC is tasked with considering all impacts of energy projects within the state, it must consider the possibility that the most important impact may be to visual resources in cases where the baseline value of the latter is very high. As the Draft EIS points out, view impact is more subjective than most other impacts; but that does not make it any less important. The CRGNSA is an entity created by the US Congress in recognition of the immense scenic values in the Gorge. Public awareness of and support for Gorge scenic values certainly is even stronger today than it was when the CRGNSA was established. These facts obligate the WEFSEC to high-prioritize the preservation of visual resources in this case.

Deficiencies in the Draft EIS Section on Visual Resources

There appear to be at least three weaknesses to this section of the document.

(1) In outlining the theoretical components of visual-impact analysis, the Draft EIS does not consider three elements of perceptual psychology which will aggravate the visual impact of any wind farm, especially in the Gorge.

(a) In evaluating scenery the mind pays special attention to skylines: the shapes and complexity of the profiles of ridges and peaks. Anything which interrupts a smooth contour is immediately homed in on to assess whether it is a natural or unusual feature. This attentional focus probably is hard wired [possible adaptive value: spotting predators/prey on the horizon] and not subject to habituation or extinction. From this perspective, nothing could be more jarring than a row of wind turbines atop a ridge; they completely interrupt the visual flow of the ridge line. We shall not get used to the interruption over time. The same row of structures against the background of a hillside would be less conspicuous. However, according to conventional wisdom, wind farms in mountainous country must be on top of the ridges, where they also have the greatest potential to distract.

(b) The text states that at higher rotation velocities (i.e., in strong winds), turbine blades would become blurred essentially to the point of

invisibility, reducing visual impact. This assessment ignores some hard-wired brain circuitry, which is primed to seek out and focus on motion [possible adaptive value: spotting moving predators/prey against a complex, camouflaging visual background]. Modern turbines have relatively low maximum velocities, slow enough that viewers will find their attention drawn toward their rotation even in strong winds. That is certainly my experience with the wind farms along US 97 east of Maryhill. If I detect any motion, my mind wants to watch the turbines, not the road. The same attentional concern has led many cities to ban dynamic billboards as traffic hazards. [It also should be pointed out that the prediction of visual blurring is engineering nonsense. At such a high velocity, the rotors would self-destruct.]

(c) Psychologists understand well an optical illusion which we all have experienced, the so-called “moon illusion”. As the moon rises above or approaches the horizon, the mind amplifies its apparent size in the visual field. If you take a digital photo of a moonrise or moonset and compare the resulting image to what you think you are seeing, the discrepancy can be quite a shock. A basic mental process, like the two phenomena described above, underlies the moon illusion and will make wind turbines on the horizon look larger than they really are. As a result, the photo simulations used in the Draft EIS to evaluate wind-turbine visual impact systematically underestimate the perceived size of the turbines to human viewers.

There is nothing soft about the science describing the three perceptual phenomena above. Research psychologists know how to quantify them and easily could verify their importance in the present context by performing the appropriate experiments at existing wind farms.

(2) The Draft EIS uses two arguments to downplay the significance of wind-farm visual impact, arguments so arbitrary and lacking in common sense as to make one wonder whether the EIS sponsors, the WEFSEC and the BPA, already have their minds made up to approve the project.

(a) It is suggested that since the Whistling Ridge area has only about 140 sunny days a year and sunny days are the only ones when the turbines will present a visual contrast to the background sky, the net visual impact of the facility will be minimal. This is nonsense for any number of reasons. The sunny days are concentrated in the summer. That is when there are the most daylight hours in which to enjoy the views. That is when the Gorge population is swollen by visitors, many of whom have come explicitly to enjoy the views. That is when residents spend the most time outdoors, much

of it including enjoyment of the views. Therefore that is when the most Gorge-viewing person-hours occur. Most of us spend little time savoring the view when the Gorge presents a thousand shades of gray, and experience heightened expectations that clear weather will allow us to enjoy the natural environment. View pollution is most likely to bring us down when we want the outdoors to recharge our spiritual batteries, in good weather.

(b) It is suggested that because the local scenery near Whistling Ridge already is significantly degraded by high-tension power lines and towers and by clear-cuts, the additional visual impact of wind turbines will be mitigated by the high background visual degradation. This is essentially the classic argument of polluters that since the environment already is degraded by others, they should have their own license to pollute. Now we don't like to look at clear-cuts and power lines any more than the next guy does. However, we've also learned over the decades that clear-cuts grow out remarkably rapidly to the point that their view is not as jarring as that of a fresh clear-cut; relative to a fresh clear-cut, turbines are forever. Furthermore, we've been indoctrinated that a clear-cut simply models the natural phenomenon of a lightning-caused burn, so looking at a clear-cut induces a warm and fuzzy feeling inside. As for power lines and towers, they do not project nearly as far into the sky as wind turbines will; and they do not move. The lines they trace in the sky are much thinner than a wind tower. Their color tends to blend with the background; the bright white of wind towers is intended explicitly to be seen. Most of them do not occupy ridge lines.

(3) The visual-impact meat of the Draft EIS is contained in the marvelous set of photo simulations of representative views of the proposed wind farm. This dataset has one advantage and one disadvantage compared to the parallel presentation of the simulation data in the Whistling Ridge website put up by Broughton/SDS. The accompanying cartoon versions of the pictures greatly improve one's interpretation of the photos. On the other hand, the Draft EIS includes and discusses only 13 of the views, whereas the website shows 21 different views. [Neither presentation accounts for the missing views numbered 6 and 9 in the series, stimulating inevitable speculation about what those perspectives showed.]

The creator and editor of such a photo dataset have tremendous power over the impressions it fosters, through selection of the exact scenes photographed and through selection of the subset of photos to be analyzed. There is some sign of both kinds of biasing in the complete dataset and in

the Draft EIS. For example, the images of views #7 (Mill A), #17 (Providence Hospital), #20 (OR 35), and #21 (Kollock-Knapp and Scoggins Roads) include foreground (power lines, buildings, or trees) which tends to obscure and de-emphasize the wind-farm view. Selection of a different viewing spot in the same vicinity would have increased dramatically the subjective impression of visual impact. The Mill A case is especially obvious, because the Draft EIS commentary employs the considerable baseline visual pollution of a power line in the foreground to decrease the significance of scenery degradation by the wind farm. Now most views of Whistling Ridge from the Mill A community do not include power lines or towers in the foreground. A photo simulation from a more typical Mill A front yard would have to lead to a conclusion of large to extreme, not “low to moderate”, Viewer Sensitivity. This biased scene selection must be particularly galling to Mill A residents because this community undoubtedly would feel the greatest impact of visual and sound pollution by the Whistling Ridge Project.

The editor of the May 2010 Draft EIS also chose not to present and analyze views #2 (Strawberry Mountain), #21 (Kollock-Knapp and Scoggins Roads), and #22 (Cook-Underwood and King Roads), even though these images, available on the Whistling Ridge Project website, show some of the greatest wind-farm visual impacts in the entire dataset. These examples reinforce the impression that the sponsors of the EIS already know what conclusions they want to reach.

Visual Pollution: How Much Is Too Much?

Despite any bias which might have influenced design and analysis of the photo-simulation dataset, the May 10 Draft EIS concludes that 7 of the 13 views analyzed showed “moderate” Viewer Sensitivity; 5 showed “low-to-moderate” or “moderate-to-low” Viewer Sensitivity; only one, #19 (Columbia River Highway) showed “low” Viewer Sensitivity. Obviously these findings are not expected to define the bounds of view degradation which the wind farm might cause throughout the affected area; for example, there are no views from within structures through windows facing Whistling Ridge, from the Columbia River itself or from within the Mark Hatfield Wilderness. [The framing of a scene by a window can induce a particularly strong version of the moon illusion, and in any case eliminates a lot of visual background which might de-emphasize a wind-farm image.] Instead, these are representative findings from which one can infer that the turbines would

impact to varying degrees the views from a large fraction of the local land and water surface, in all directions.

The Draft EIS concludes that degradation of Visual Resources is not significant enough to affect the acceptability of the Whistling Ridge Energy Project, despite the fact that the US Congress has designated this area one of great scenic value; apparently “moderate” impact is not a serious concern. A poll of area inhabitants on both sides of the Columbia (especially the older ones) probably would show that many of them treasure their views of the River and the Cascades as much as they do the outdoor activities which also draw many to settle in the area. How much Viewer Sensitivity would one have to show in order to conclude that wind-project visual pollution might suffice to sink this project? The Draft EIS does not discuss a threshold level of visual pollution, avoiding any need to defend such an evaluation and rendering completely arbitrary any decision on this point. Hence, all a critic can do is to invoke the Golden Rule. How much Viewer Sensitivity of visual pollution seen from your front yard would it take for **you** to conclude that the impact is unacceptable? When is “moderate” not enough?

How should the WEFSEC react to this concern in a way which does not sink all wind-farm proposals? Simply keep wind farms away from areas generally recognized as having extreme scenic value. This criterion leaves much of central and eastern Washington still suitable for wind farms.

Sound Pollution

Why I use the term, “sound pollution”, rather than “noise pollution”, will become evident in a moment. The Draft EIS section on Noise is so detailed, technical, and data-driven that my first impression was to drop an original concern that this might be a crucial environmental issue, at least for the residents of Mill A and Willard, the communities most impacted by the entire proposed array of about 50 wind turbines. However, this reaction was reversed by the section’s discussion of the “beats” which can be heard as a result of positive and negative interference within a group of turbines, of low-level periodic sounds from the passage of each turbine’s rotor blades past the wind tower. These beats can be louder than the point-source noise and can contain rhythmic complexity not present in the latter.

My basic concern is the mental phenomenon of the “dripping faucet”, or “ticking clock”. Sometimes, especially at night, our sensitivity to tiny sounds is enhanced [probable adaptive value: detection of predators creeping through the underbrush]. Once awakened, the mind can so focus on intermittent sound, fainter than ambient noise, that sleep becomes impossible. Some irregularity or complexity in a periodic faint sound probably enhances the attentional effect that awakens us; having become sensitized to an intermittent sound, the mind keeps waiting for the next event. This form of auditory alertness is hard to overcome voluntarily. Indeed, efforts to overcome it often seem to amplify the offending sound.

Here we have an aural phenomenon which audio engineers would dismiss as insignificant because the physical magnitude of the triggering noise is so low, in both absolute and relative terms. Furthermore, it varies widely among individuals and even for a given individual on different nights, probably depending in large part on other sources of discomfort which disrupt deep sleep. Finally, if it arises from audio interference among nearby wind towers, it will vary widely among different residences in a single community. However, the resulting sleep deprivation can devastate human physical and mental health. I experienced the phenomenon recently with a motel-room electric clock, cleverly designed to emit an artificial ticking sound with a one-second period. I had to unplug the clock to get back to sleep. My wife, normally much more sensitive to sleep interruption than I, slept through the whole episode and claimed the next morning not to hear the ticking (which, indeed, was much less evident to me in daylight).

If the WEFSEC needs any more prompting to take sound pollution seriously, it should check out an article in the July 31, 2010 edition of the NY Times Online by William Yardley (“Turbines Too Loud for You? Here, Take \$5000”). It describes the difficulty Oregon citizens near Ione, OR have had with wind-tower noise, aggravated by the absence of an effective enforcement mechanism for state noise laws. Washington State should not allow residents’ lives to be blighted by nearby new wind developments – what amounts to an arbitrary and often uncompensated taking. If necessary, new wind developments in Washington should be placed on hold until the nature of sound pollution is more fully understood and rules are established to protect the neighbors of wind farms.

How should the WEFSEC react to this concern in a way which does not sink all wind-farm proposals? Start by avoiding sites close to

communities and preference sites where there is no serious objection from the neighbors. These conditions probably are met for many wind farms on agricultural land in central and eastern Washington, where population density is very low and the few wind-farm neighbors welcome the compensation for site leases. More technical evaluation of wind-turbine “beat” acoustics also is advisable, especially to determine for sure whether there is any reason for concern in the areas of Willard and Mill A with maximum population density, on the order of a mile distant from the wind farm. It also would be valuable to know how wind direction and velocity affect propagation of this kind of sound, as Willard and Mill A are upwind during the most common wind conditions.

Environmental Justice

The section of the May 2010 Draft EIS on environmental justice is completely inadequate. The section starts by correctly stating that federal regulation requires that an EIS consider disproportionate impacts on ethnic minorities and low-income populations. It then proceeds to ignore the low-income part of the criterion and dismiss the possibility of environmental injustice because no significant minority populations exist in the vicinity of the proposed project. The separate Socioeconomic section treats the entire three-county area affected in any way by the project, ignoring the unevenness of income distribution (and project impact) across the area.

However, it is clear that Willard and Mill A will feel any environmental impact of the Whistling Ridge Project much more than any other community or neighborhood, thanks to a combination of nearness to the turbines, exposure to the largest number of turbines, dependence on the road needed to supply the construction site, and population density. Furthermore, it is quite likely that an economic study of Mill A and Willard would show that these communities qualify for low-income designation. In fact, at least one such survey has been done for a local utility district; the sampled fraction of the Mill A population was found to be low-income relative to the average for Skamania County, itself low-income by state standards. The WEFSEC needs to conduct an economic survey of the entire Willard and Mill A populations.

Placed in a broader socio-economic context, if Willard or Mill A qualifies as a low-income community, the economic imbalance of this project would be spectacular. The holding company backing the Whistling Ridge project is owned by the richest family in the Gorge. The real impetus

for the project is not any passion for green energy, but the need for SDS/Broughton, by far the largest private land-holder in the Gorge, to get some decent economic return from its large unproductive acreage. The richest folks around could end up feeding on the environmental discomfort of some of the least well-off ones. Because it owns the proposed wind-farm site, it does not even have to offer locals any financial compensation.

I do not want to be misinterpreted here. There is nothing wrong with economic success or the accrual of family wealth and political influence over decades of living and working in the area, in a trajectory which has included considerable public service and philanthropy as well. Many Gorge residents owe their livelihood and, to some degree, their quality of life to the Stevenson family. SDS/Broughton may have evolved to the status of “too big to fail”, as far as the local economy goes. Counterbalancing this corporate economic and political power, Washington State (through the agency of the WEFSEC) is the major entity with the power and mandate to assure that an economically disadvantaged subset of the population does not pay the principal price for rescuing SDS/Broughton from any current economic difficulties or unwise investment decisions.

Impact of the Construction Process

The Draft EIS concentrates on the effects of the completed project. Its treatment of the impact of the construction process on the surrounding communities, especially the economically disadvantaged communities of Mill A and Willard, is inadequate. The construction process would require the trucking of a very large number of very large loads to the wind-farm site, over narrow, winding Cook-Underwood Road, which the residents of Mill A, Willard, and Underwood use to get to work, school, shopping, and public services. The same route is used by outsiders to get to work at the Willard fisheries facility. It is quite likely that segments of the affected road would be closed (in both directions) to non-construction traffic as wind-tower components move over them. The traffic obstruction would extend beyond the Cook-Underwood Road. The trucks must get to the Cook-Underwood Road from I84 (probably via Boardman) or from a Bingen staging area supplied by river barge or train. So many truckloads are needed to complete a project of this magnitude that the disruption could go on for a long time. Some local residents live close enough to the economic edge that many months of impaired transportation could spell financial disaster for them.

The special transportation requirements of this project are so extreme that the EIS should be revised to include a detailed quantitative breakdown which allows the public to understand how intensively (and for how long) public use of the Cook-Underwood Road and the affected section of WA14 will be reduced: how many loads per day, how many loads (and days) total, how much closure time is needed for each load over each critical segment of the route. The current version of Section 3.11 of the Draft EIS suggests that local road closures will not exceed 20 minutes at a time and that traffic disruption from component shipping will last no more than 3 months. However, no supporting data are provided for these estimates.

A complete EIS also would need to make clear (a) what hours of the day would be used for component movement over roads [presumably night-time transport would be ruled out by noise regulations in Underwood]; and (b) how large the backups in local traffic could be during component transit. The public also needs to know (a) whether (or where) traffic in both directions would have to be stopped as a truck passed; and (b) whether empty trucks, themselves quite large, also would require the halting of oncoming traffic.

The traffic issue is just one more example of what is wrong about siting a wind farm so close to population centers, aggravated in this case by the marginal state of the affected local arterials. This problem would be much less serious for a wind farm located in the wide open spaces of central and eastern Washington.

No NIMBY Here; Need for Statewide or Region-wide Planning

A significant part of the well financed propaganda campaign in favor of the Whistling Ridge Energy Project has been the claim that opponents represent well-off locals who refuse to accept any environmental burden to go with their enjoyment of a high standard of living: chardonnay liberals. The term, "Not In My Back Yard", or NIMBY, often is used to tar opponents with an image of affluent self-indulgence.

The image simply does not work here, and not just because project opponents in Willard and Mill A do not meet any American standard of being "well off". It also ignores the fact that a majority of project opponents live outside the area, simply because the Gorge population is rather small. People all over the country and the world care deeply about the Gorge and

would hate to see such massive man-made structures as windmills degrade its scenery. Establishment of the CRGNSA made clear that the Gorge is not “my” backyard or the domain exclusively of its residents; it is the nation’s and even the world’s backyard. In asking the WEFSEC to keep this perception in mind, critics of the Whistling Ridge Energy Project are serving a public interest. Finally, “NIMBY” does not apply in this case because in many parts of the Northwest, largely in the under-populated rural center and east, hosting a wind farm is not thought by the locals to impose environmental costs. The scenery is not distinguished and is so completely agricultural that there barely are any remnants of the original natural landscape and plantscape. The rural population is so dispersed that wind farms can be sited well away from any communities. Why should the WEFSEC approve a facility in an area where there is strong opposition and reasonable concern about environmental impacts, when there is so much publicly acceptable acreage, also close to electric transmission lines, elsewhere in the state?

An inescapable consequence of the current politicking is that the WEFSEC should develop a pro-active energy plan, preferably in collaboration with the appropriate Oregon governmental agency, instead of reacting to each separate siting proposal as though it existed in isolation. The whole process could become a lot less adversarial and political, and do a much better job of meeting state/regional needs, if all reasonable sites for various forms of electricity generation were identified and prioritized. Energy planning would include (1) energy demand projections over time and space and (2) capacity estimates for acceptable sites, in order to understand how much environmental compromise might be needed over time. Planning should be regional rather than state-by-state, simply because demand for electricity generated anywhere in this area is distributed across at least two states.

Planning also should test scenarios for the maturation of large-scale photovoltaic electricity generation. Continuation of the recent and ongoing increase in solar-panel manufacturing capacity and reduction in solar-panel price should create a situation soon (on the time scale of wind-project lifetime) in which photovoltaic electricity generation is fully competitive with wind generation. Photovoltaic farms, perfect for the large amount of agriculturally underproductive or unproductive land in central and eastern Washington and Oregon, would avoid or minimize both the long-distance visual pollution and the potential sound pollution of wind farms. They are

silent. They do not have to occupy ridgelines. They will not trigger the moon illusion. Even with automated tracking, solar panels do not move at a perceptible rate. They do not have to possess long-range visibility in order to protect aircraft. Wind power almost certainly is a transitional technology, fated to give way to photovoltaic generation in the long haul, if only (but not just only) because the easily distributed nature of photovoltaic generation eliminates any need for additional transmission capacity.

Integrated, long-term, energy planning also is the only way for the WEFSEC to avoid authorizing so many local wind projects that the scenery along the entire Gorge is irrevocably disrupted by an army of wind towers. Once you have approved a pioneering project like Whistling Ridge, it becomes difficult to deny the next one without risking legal attack on the grounds that you are behaving arbitrarily and politically. However, with a fully researched and vetted state or regional plan in place, the objective grounds for supporting or rejecting any future proposal become clear in advance.

Long-term energy planning also is the best way to silence the current rash of *ad hominem* and false attack ads which accuse project opponents of being against green energy. An implicit message of such ads is that any state politician or agency supporting a go-slow approach also will be accused of being against green energy. It is very hard for even dedicated and competent public servants to make the best choices for the region when they risk political attack if they buck the bucks.

Of course there will be political conservatives and individual developers who will challenge energy planning, or indeed any governmental limitation on what they do on their own property. These same people do not seem to object to the federal and state green-energy subsidies currently needed to render their projects profitable, and probably will resist moves to reduce/eliminate the subsidies as energy prices rise and equipment prices fall, even though the subsidies clearly are intended only to lubricate the transition to green power in a political environment which still favors fossil fuels and nuclear energy even more.

Need for Technical Input from Cognitive Psychologists

One recurring theme of the preceding analysis is that modern perceptual psychology, a vital and rapidly evolving field, can inform our

understanding of environmental impacts. At least in the cases of view and sound pollution, the analytical treatments in the May 2010 Draft EIS simply ignore accepted scientific wisdom, much of it not even that new. Such an omission, of course, increases the legal vulnerability of the environmental-assessment process.

As part of its need to de-politicize environmental assessment, the WEFSEC should commission a panel of consultants trained in contemporary psychology to seek consensus positions on relevant cognitive issues like those raised here.

Acknowledgment

These comments have benefited from the insights of Randall C. Nelson, Underwood WA, Barbara Robinson, Rowena OR, and my wife, Dell Rhodes. However, one should not infer that they necessarily agree completely with what is written above.

Re: Comments on solar storms and their effects on the power grid and transmission lines—and the inadequacy of information on the subject in the Whistling Ridge DEIS

Dear EFSEC and BPA,

I am greatly concerned that there is not a section in the DEIS that give us information on transmission lines and how they are susceptible to solar storms. There is enough literature and data widely available, see my References #1 and #2, below that could have been used to fill this information gap in the DEIS.

The more transmission lines are built, the greater their exposure to solar storms. If BPA is (and we all know that they are) proposing to build more and more transmission lines in our region, and if these lines are bigger than existing infrastructure, I think that should be part and parcel of this DEIS discussion. More transmission lines vulnerable to solar storms put us all at risk of blackouts.

I don't know enough technical details about this issue but I would like to know more and I think the DEIS should contain this information and answer questions about power grid vulnerabilities. **The DEIS does not contain this information. Therefore, the DEIS is incomplete.**

Sincerely,

/e-signature/Mary J. Repar

Blackouts

Power Grid

Pipelines

Water

The US power grid is a complex electrical apparatus that has well-known sensitivities to space weather disturbances. Recent changes in its design and utilization have significantly reduced its operating margins to supply us with on-demand electricity. This means there is less flexibility available with which to deal with power shortages and blackouts.

Space weather events can damage equipment over wide geographic regions so that recovery delays become substantially longer and more costly.

The 23rd Cycle - Chapter 4 - Describes in detail the state of the US power grid, and the forces which are driving it to be far more vulnerable to solar storms than at any time in the past.

"As North America has evolved into a unified power-sharing network of regions, each buying and selling a diminishing asset, US domestic power has become more vulnerable to solar storms buffeting the power grid in the more fragile northern-tier states and Canada. So long as one region continues to have a surplus at a time when another region needs a hundred megawatts, power is 'wheeled' through 1000-mile power lines to keep supply and demand balanced across the grid. In 1972, a typical utility might need to conduct only a few of these electromagnetic transactions each week. Now, it is common

for thousands to be carried out, often by computer, in much the same way that stocks are traded on Wall Street...

The electrical power grid is composed of many elements, and you can think of it as a set of rivers flowing overhead. Large rivers carry the electricity from distant generation stations (Dams, Hydroelectric Facilities and Nuclear Plants) on supply lines of 138,000 volts or higher. These are carried as three cables (2 'hot' and one defining the 'ground' in a 3-phase system) suspended atop 100-foot tall towers that you will see out in many rural areas. These supply cables terminate at regional substations where the high voltages are converted into lower voltages from 69,000 volts to 13,800 volts. These lines then enter your neighborhoods atop your local telephone poles where a neighborhood transformer steps this voltage down to 220 and supplies a dozen or so individual houses.

When space weather disturbances cause 'Geomagnetically Induced Currents', these GICs can enter a transformer through its Earth ground connection. The added DC current to the transformer causes the relationship between the AC voltage and current to change at the source of the electricity, not just where it is delivered to your electrical appliance. Because of the way that GIC currents affect the transformer, it only takes a hundred amperes of GIC current or less to cause a transformer to overload during one-half of its 60-cycle operation. As the transformer switches 60 times a second between being saturated and unsaturated, the normal hum of a transformer becomes a raucous, crackling whine. Regions of opposed magnetism as big as your fist in the core steel plates crash about and vibrate the 100-ton transformer nearly as big as a house in a process that physicists call magnetostriction.

The impact that magnetostriction has upon specific transformers is that it generates hot spots inside the transformer where temperatures can increase very rapidly to hundreds of degrees in only a few minutes. Temperature spikes like these can persist for the duration of the magnetic storm which, itself, can last for hours at a time. During the March 1989 storm, a transformer at a nuclear plant in New Jersey was damaged beyond repair as its insulation gave way after years of cumulative GIC damage. Allegheny Power happened to be monitoring a transformer that they knew to be flaky. When the next geomagnetic storm hit in 1992. They saw the transformer reply in minutes, and send temperatures in part of its tank to more than 340 F (171 C). Other transformers have spiked fevers as high as 750 F (400 C). Insulation damage is a cumulative process over the course of many GICs, and it is easy to see how cumulative solar storm and geomagnetic effects were overlooked in the past.

Outright transformer failures are much more frequent in geographic regions where GICs are common. The Northeastern US with the highest rate of detected geomagnetic activity led the pack with 60% more failures. Not only that, but the average working lifetimes of transformers is also shorter in regions with greater geomagnetic storm activity. The rise and fall of these transformer failures even follows a solar activity pattern of roughly 11 years.

If your power plant is located over a rock stratum with low resistance, any geomagnetic disturbance will cause a bigger change in the voltages it induces in your local ground, and the bigger this change in ground voltage, the stronger will be the GIC currents that flow into your transformers. Typical daily GICs can run at about 5-10 amperes, but severe geomagnetic storms can cause 100-200 amperes to flow.

A conservative estimate of the damage done by GICs to transformers by Minnesota Power and Electric was \$100 million during a solar-maximum period. This includes the replacement of damaged transformers, and the impact of shortened operating lifetimes due to GIC activity.

Large transformers cost \$10 million, and can require a year or more to replace if spares are not available. During a transformer failure, an affected utility company will have to purchase replacement power from other utilities for as much as \$400,000 per day or more. Oak Ridge National Laboratories, meanwhile, estimated that a solar storm event only slightly stronger than the one that caused the Quebec blackout in 1989 would have involved the Northeast United States in a cascading blackout. The experts figured that about \$6 billion in damages and lost wages would have resulted from such a widespread involvement. The North American Electric Reliability Council (NAERC) placed the March 1989 and October 1991 storm events in a category equivalent to Hurricane Hugo or the 1989 Loma Prieta Earthquake in San Francisco. But, many consultants for the power industry dispute NAERC's estimate saying that it is much too low. The \$6 billion may not properly include collateral impacts such as lost wages and productivity, spoiled food and a myriad of other human costs that could easily run the losses into the tens of billions of dollars."

Congressional Testimony (See Reference #2 at the end of this document) - On October 30, 2003 the House of Representatives, Subcommittee on Environment, Technology and Standards convened a session 'What is Space Weather and who should forecast it?'. The following is an excerpt of the testimony by John Kappenman, Manager, Applied Power Systems, Metatech Corporation:

"While electricity customers receive power from the local distribution system (typical operating voltage of 15kV with step down to 120/240 volt), the backbone of the system is the high voltage transmission network. The primary AC transmission network voltages in the U.S. are at 230kV, 345kV, 500kV and 765kV. These transmission lines and their associated transformers serve as the long distance heavy hauling arteries of electricity production in the U.S. A single 765kV transmission line can carry over 2000 MW of power, nearly 200 times what a typical 15kV distribution line which is the overhead line commonly used for residential distribution. Space Weather or geomagnetic disturbances directly attack this same high voltage transmission circulatory system and because both have continental footprints, these disturbances can rapidly erode reliability of these infrastructures and can therefore threaten widespread blackout for extreme disturbance events. The U.S. electric power grid is the world's most extensive, Figure 1 provides a map of the approximate location of the nearly 80,000 miles of 345kV, 500kV and 765kV transmission lines in the contiguous U.S....

In spite of the best efforts, failures still can occur; for example, a lightning strike can still cause on occasion a high voltage transmission line to trip. Very high winds, for example, due to a tornado can cause the failure of a line or several lines on a common corridor. However, most of these events generally occur in isolation and power grids are operated at all times to withstand the largest creditable single contingency failure without causing a cascading collapse of the network itself. Space Weather differs from ordinary weather in that it has a big footprint and attacks the system across many points simultaneously, causing at times of severe events multi-point failures on the network that can threaten the integrity of the network. Therefore, geomagnetic storms may be one of the most important hazards and is certainly the least understood threat that could be posed to the reliable operation of these networks...

There were several noteworthy cases of transformer internal heating associated with the March 13, 1989 storm in the U.S. mid- Atlantic Region. In one case at the Salem Nuclear plant in southern New Jersey, the internal heating was so severe that complete failure of the transformer resulted. Figure 7 provides a few pictures of the transformer and internal winding damage (conductor melting and insulation burns) due to the GIC exposure. In this case the entire nuclear plant was unable to operate until the large 500kV 1200MVA transformer was replaced. Fortunately a spare from a canceled nuclear plant in Washington State was available and restoration of the plant occurred in 40 days. Transformers of this type are of custom design and in most cases new replacement transformers of this type generally take up to a year for delivery. Failures of key apparatus, such as this, raise concerns about the ability to rapidly restore power in a region once a blackout and failure has occurred...

We are looking at the potential of blackouts that could exceed even that of the very large blackout that occurred just a few months ago [August 14, 2003]. And there is no part of the U.S. power grid that is immune to this. It is just a matter of where does this intense phenomenon geographically lay down? How big is the footprint? And we know these footprints can be very, very large. And literally, we could impact over 100 million population in the worst case scenarios."

2002-Department of Energy - National Transmission Grid Study "Over the past 10 years, competition has been introduced into wholesale electricity markets with the goal of reducing costs to consumers. Today, wholesale electricity sales save consumers nearly \$13 billion annually. However, the Nation's outdated transmission system was not designed to support today's regional, competitive electricity markets. Investment in the transmission system has not kept pace with the growth in generation and the increasing demand for electricity. Transmission bottlenecks threaten reliability and cost consumers hundreds of millions of dollars each year. "

The Changing Structure of the Electrical Power Power Grid ca 2000 - This study by the Department of Energy describes the impact that deregulation will have on the operation of the Grid.

National Security Telecommunications Advisory Committee - Provides a detailed assessment of the many risks that our power grid faces. "The Electric Power Risk Assessment" subgroup found no evidence of power outages attributed to deliberate electronic intrusion into utility control systems. The greatest risk facing the electric power infrastructure of the United States remains physical damage and destruction. Compared to the threat posed by natural disasters and physical attacks on electric power infrastructure elements, electronic intrusion represents an emerging, but still relatively minor, threat. However, changes within the electric power industry and in technology are increasing the risk posed by electronic intrusion. "

2004 - Penn State Study of Power Grid Failure - The team's topological analysis of the grid structure reveals that, although the system has been designed to withstand the random loss of generators or substations, its integrity may depend on protecting a few key elements.

"Our analysis indicates that major disruption can result from loss of as few as two percent of the grid's substations," says Albert, whose research team includes Istvan Albert, research associate in the Bioinformatics Consulting Center at Penn State, and Gary L. Nakarado at the National Renewable Energy Laboratory.

One implication of the research is that identification of strategic points in the grid system can enhance defense against interruptions, whether by equipment failure, natural disasters or human activity. Major blackouts caused by failures in the grid, such as the one that affected the northeastern part of the country during the summer of 2003, incur tremendous economic, public-health and security risks.

The study, titled "Structural Vulnerability of the North American Power Grid," was published in a recent issue of the journal *Physical Review E*. The researchers constructed a model of the entire transmission grid with over 14,000 "nodes," including generators, transmission substations, and distribution substations, and over 19,000 "edges," corresponding to the high-voltage transmission lines that carry power between the nodes. They measured the importance of each substation node based on its "load," or the number of shortest paths between other nodes that pass through it.

Blackouts

Electrical power blackouts and 'sags' cost the US about \$80 billion every year in lost services, industrial capacity and Gross Domestic Product. Blackouts caused by space weather events are potentially more devastating than a major hurricane landfall. The space weather 'Storm of the Century' could cause hardships more severe than anything we have thus far experienced.

Congressional Testimony - On October 30, 2003 the House of Representatives, Subcommittee on Environment, Technology and Standards convened a session 'What is Space Weather and who should forecast it?'. The following is an excerpt of the testimony by John Kappenman, Manager, Applied Power Systems, Metatech Corporation: " Some of the first reports of operational impacts to power systems date back to the early 1940's

and the level of impacts have been progressively become more frequent and significant as growth and development of technology has occurred in this infrastructure. In more contemporary times, major power system impacts in the U.S. have occurred in storms in 1957, 1958, 1968, 1970, 1972, 1974, 1979, 1982, 1983, and 1989 and several times in 1991. Smaller scale impacts can and do occur even more frequently; these include anomalous operating events that may result in the unexpected tripping of a key element of the system or **even permanent damage to apparatus such as large power transformers...** [my bold emphasis]

The most important of these impacts was the **storm-caused chain of events resulted in the blackout of the Hydro-Quebec power system.** At 2:42 am EST, all operations across Quebec, Canada were normal. At 2:43 am EST, a large impulse in the Earth's magnetic field erupted along the U.S./ Canadian border. GICs immediately started to flow in the southern portions of the Hydro-Quebec grid. In reaction to the GIC, voltage on the network began to sag as the storm increased in magnitude; automatic voltage compensating devices in the network rapidly turned "on" to correct this voltage imbalance. Unfortunately these compensators themselves were vulnerable to the harmonics generated in the network's transformers, and mis-operation of relays to protect these devices caused the entire fleet of 7 compensators on the network to shut down within 60 seconds of the beginning of the storm impulse. When the compensators shut down, the network collapse followed within a matter of seconds, **putting over 6 million inhabitants of the province in the dark.** Going from normal conditions to a complete province-wide blackout occurred in an elapsed time of just 90 seconds. The power system operators had no time to understand what was happening, let alone to take any meaningful human action to intervene and save the grid...

While power grid reliability concerns are of paramount importance, the long duration of the storm and associated GICs in transformers on the network **caused internal transformer heating to the point of failure.** There were several noteworthy cases of transformer internal heating associated with the March 13, 1989 storm in the U.S. mid-Atlantic Region. **In one case at the Salem Nuclear plant in southern New Jersey, the internal heating was so severe that complete failure of the transformer resulted...**

However, just empirical evidence alone suggests that power grids in North America that were challenged to collapse for storms of 400 to 600 nT/min over a decade ago, are not likely to survive the plausible but rare disturbances of 2000 to 5000 nT/min that long-term observational evidence indicates have occurred before and therefore may be likely to occur again...

All mass transit systems shutdown as they depend on electricity for many of their functions. Traffic signal systems on most major streets and highways stopped and as a result most major thoroughfares became the equivalent of 8 lane parking lots in the early hours of the blackout. Only a few major power facilities are continuously manned, and since blackouts are possible at any hour, the odds are that 75 percent of the time the normal utility day crews are not on the job when these events occur. Attempting to recall

workers that are trapped on the wrong side of these transportation snares is highly problematic...

Because of the possible large geographic laydown of a severe storm event and resulting power grid collapse, **the ability to provide meaningful emergency aid and response to an impacted population that may be in excess of 100 million people will be a difficult challenge.** Potable water and replenishment of foods may need to come from boundary regions that are unaffected and these unaffected regions could be very remote to portions of the impacted U.S. population centers. As previously suggested adverse terrestrial weather conditions could cause further complications in restoration and resupply logistics."

Lawrence Berkeley Labs Study, In 2005, Kristina Hamachi-LaCommare and Joe Eto for the U.S. Department of Energy's Office of Electric Transmission and Distribution completed a study of the costs to the US from a variety of chronic electrical 'sags' and short-term losses of service. - "The study estimates the total cost to the U.S. of power interruptions at about \$80 billion per year. Of this, \$57 billion (73 percent) is from losses in the commercial sector and \$20 billion (25 percent) in the industrial sector. "The reason for the commercial sector's high share of these cost is the large number of commercial sector customers, which includes small as well as large businesses, and the high cost per outage per customer,"

August 14, 2003 Blackout - ICF Consulting produced an assessment of the economic impact of this recent electrical blackout that affected 50 million people in 8 states . "Specifically, for this analysis, we assume that the initial outage of 61,800 MW lasted for 4 hours and then half of that was restored, with the other half (30,900 MW) being the shortfall for another 10 hours. Given that the next announcement from NERC was issued approximately 18 hours after the start of the outage, we assume that another one-half of the unserved 30,900 MW was restored after 14 hours and the remaining loss of 15,450 MW lasted for the subsequent 4 hours. This gives a total of 18 hours for the first phase of the blackout. Using similar arguments for the remaining period of the blackout, we assume more than 13,000 MW of customer load was lost for another 14 hours after which 6,600 MW was the shortfall for another 10 hours. Finally, on the third day of this blackout, 2,000 MW was the loss for 20 hours and another 1,000 MW was the shortfall for the final 10 hours of this blackout. This gives a total outage period of 72 hours. Using this scenario and the average electricity price for the affected region from August 2002, the economic cost of this outage is estimated to be between \$7 and \$10 billion for the national economy. "

Investigation of August 2003 Blackout - The North American Energy Reliability Council conducted an investigation of how the blackout happened, and its detailed impacts. A space weather storm would share many elements in common with this event, except that the electrical equipment damage would be far more wide spread. Their findings are summarized in **Section 5** of this document.

The following blackouts are not known to have been caused by space weather:

September 23, 2002, - A massive power failure disrupted central Chile, including the capital city of Santiago. Some 3,500 passengers had to be rescued from stalled Metro trains in Santiago.

April 29, 2003, a power failure hit the airport in Melbourne, Australia, disrupting operations for 90 minutes.

November 24, 2002 - Buenos Aires and La Plata, Argentina, were hit by a huge power failure.

January 31, 2003 - An 'unusual' power failure hits Cambridge, Ontario.

August 6, 2003 - Buenos Aires was hit again by another sudden blackout . Power company officials blamed that outage on the collapse of three power lines

August 18, 2003 - 4.5 million people in Georgia lost electricity; the Tblisi metro ground to a halt and the water supply was cut off.

August 23, 2003 - Finland's capital Helsinki and suburbs, including the international airport at Vantaa, were blacked out. Saturday evening's revelers at Helsinki's Linnanmäki amusement park had to be rescued when the blackout left them dangling in rides in midair. Even Radio Suomi, which relies on emergency generators, went off the air when both its generators and backup battery power failed.

August 28, 2003 - the BBC reported that at the height of London's evening rush hour, a massive power outage struck the city and southeast England. 1800 trains stopped, including 60 percent of the London Underground, an event that Britain's Network Rail called "unprecedented."

September 1, 2003 - At 10 o'clock the city and five other Malaysian states were struck by a massive blackout. Workers in the Petronas Towers, the world's tallest buildings, were trapped in elevators and with signal lights out, traffic in downtown Kuala Lumpur ground to a virtual halt.

September 2, 2003 - Cancun, Mexico, which was swarming with tourists and advance teams for the following week's World Trade Organization meeting, also found itself plunged into a blackout. The power failure struck Quintana Roo state on the Yucatan peninsula and two neighboring states. Power was out for six hours and affected 3 million people.

September 23, 2003 - Eastern Denmark and southern Sweden, including the cities of Copenhagen and Malmo, lost power in what was described as a "very unusual" blackout. Four million people were affected, including passengers stranded on board trains and at Copenhagen's busy international airport. Factories on the island of Zealand and in southern Sweden stopped production and the Oresund Bridge linking Denmark to Sweden was closed to traffic. [International Herald Tribune]

September 28, 2003, - A massive power failure struck Italy, leaving 57 million people without electricity. A simultaneous blackout plunged Geneva, Switzerland, into darkness. The blackout cut off electricity to Vatican City and Pope John Paul II had to rely on emergency generators to power amplifiers in order to deliver his Sunday sermon. Thirty-thousand passengers were stranded on trains throughout the country. The blackout was later blamed on a tree hitting a high voltage transmission line in Switzerland.

SUBCOMMITTEE ON ENVIRONMENT, TECHNOLOGY, AND STANDARDS
COMMITTEE ON SCIENCE

U.S. HOUSE OF REPRESENTATIVES

What Is Space Weather and

Who Should Forecast It?

thursday, october 30, 2003

10:00 a.m.-12:00 p.m.

2318 rayburn house office building

Purpose

On October 30, 2003 at 10:00 a.m., the House Science Committee's Subcommittee on Environment, Technology and Standards will hold a hearing to examine the space weather activities at the National Oceanic and Atmospheric Administration's (NOAA) Space Environment Center. The Space Environment Center (SEC) provides real-time monitoring and forecasting of solar and geophysical events. These events can: cause damage to communication satellites, electric transmission lines and electric transformers; interfere in ground-based communications with airline pilots; be fatal to astronauts on space flights and in the International Space Station; and potentially harm airplane passengers flying polar routes. SEC forecasts are used by the U.S. military, the National Aeronautics and Space Administration (NASA), NOAA itself, and by the industries mentioned above. For example, just last Wednesday (October 22), the SEC released two-day advanced warnings about an unusually large solar storm, which allowed electrical utilities, airlines, and spacecraft managers to take preventive action to minimize disruption of service due to the storm. (See attachment.)

The Air Force Weather Agency works closely with NOAA's SEC on the collection of space weather data through satellite and ground-based sensors and provides warnings tailored for specific military needs. The Air Force relies on the SEC for data analysis and overall forecasting. The Air Force and NOAA each contribute to the cost of sensors to

monitor space weather, and NASA provides many of the satellites on which the sensors are carried.

In the House Fiscal Year (FY) 2004 Commerce, Justice and State (CJS) appropriations bill, SEC funding levels are below the Administration's request. The Senate CJS Appropriations Committee report includes the suggestion that the Air Force or NASA should take on the duties of predicting space weather and contains no funding for SEC. Thus, budget constraints could force the closure or reduction of these vital and unique services provided by NOAA's SEC. The Subcommittee wants to better understand the potential impact of the loss of SEC services.

The Subcommittee plans to explore several overarching questions, including:

1. Why do we need to understand and forecast space weather events?
2. What unique capabilities and expertise does NOAA's SEC provide? To what extent could the Air Force or NASA perform these duties?
3. What are the implications of closure or reduced activities of NOAA's SEC to the government and private sector?

Witnesses:

Dr. Ernest Hildner, Director, Space Environment Center, National Oceanic and Atmospheric Administration (NOAA), Boulder, Colorado. Dr. Hildner will provide an overview of the SEC, the services it provides and its collaborations with other federal agencies.

Col. Charles L. Benson, Jr., Commander, Air Force Weather Agency, Offutt Air Force Base, Nebraska. Colonel Benson will explain the mission of Air Force Space Weather Operations Center and the way the Air Force and NOAA work together on space weather prediction.

Dr. John M. Grunsfeld, Chief Scientist, National Aeronautics and Space Administration (NASA). Dr. Grunsfeld will discuss the effects of space weather on NASA operations.

Mr. John Kappenman, Manager, Applied Power Systems, Metatech Corporation, Duluth, Minnesota. Mr. Kappenman will discuss the effects of space weather events on electric power grid systems and how the loss of NOAA's SEC would affect this industry. Mr. Kappenman was formerly with Minnesota Power.

Captain Hank Krakowski, Vice President of Corporate Safety, Quality Assurance, and Security, United Airlines, Chicago, Illinois. Captain Krakowski will discuss how space weather events affect the airline industry, including air traffic control communications and human health concerns. He also will discuss how the loss of NOAA's SEC would affect United Airlines operations.

Dr. Robert Hedinger, Executive Vice President, Loral Skynet, Bedminster, New Jersey. Dr. Hedinger will explain the implications of space weather events for communications satellites and how the loss of NOAA's SEC would affect the commercial satellite sector.

Background

What Is Space Weather?

Space weather refers to conditions on the sun and in the solar wind, which can cause disturbances in the outer layers of the Earth's atmosphere. Highly energized particles from the sun disrupt the upper layers of the Earth's atmosphere, causing geomagnetic storms that result in increased radiation and rapid changes in the direction and intensity of the Earth's magnetic field. These conditions can influence the performance and reliability of space-borne and ground-based technological systems and can endanger human life or health. Government and private sector organizations concerned with communications, satellite operations, electric power grids, human space flight, and navigation use space weather information.

History of NOAA's Space Environment Center

NOAA's Space Environment Center (SEC), located in Boulder, Colorado, began in the 1940's as a program to study short-wave radio propagation at the National Bureau of Standards (now known as the National Institute of Standards and Technology, or NIST). As the SEC expanded its scope to study the effects of solar weather on the Earth's atmosphere, the center moved into the Office of Oceanic and Atmospheric Research in NOAA, where it is currently located. The SEC consists of three divisions: research and development, space weather operations, and systems. The SEC has 54 NOAA staff and two Air Force liaisons in its Boulder office. In a 2002 report, the National Academy Sciences, called the work of the SEC "crucial."

NOAA's SEC collects, provides, and archives space environment data from its polar-orbiting and geostationary satellites, from other federal agencies, and through international data exchange. Forecasters at SEC provide space weather forecasts and warnings to users in government and industry and to the general public, while the Air Force and private sector users take these forecasts and tailor them for their organizations' specific needs. SEC's space weather operations division is the national and international warning center for disturbances in the space environment that can affect people and equipment. The effects of these disturbances are described in more detail below. The research and development division is home to the leading experts in space weather. They conduct research in solar-terrestrial physics, develop techniques for forecasting solar and geophysical disturbances, provide real-time monitoring and forecasting of solar and geophysical events, and prepare data to be archived by NOAA's National Geophysical Data Center.

Air Force Space Forecast Center

NOAA's SEC works closely with the U.S. Air Force's Space Forecast Center at Offutt Air Force Base in Nebraska, which provides space weather forecast services to U.S. military customers. The total budget for Air Force space weather efforts was \$15.3 million in FY 2003. The Air Force provides two personnel who work at the SEC to ensure that this vital space weather information is fed smoothly to the Air Force, which then tailors it for military purposes. For example, NOAA's SEC may issue a warning that a geomagnetic storm will occur in the Earth's atmosphere at a certain time. The Air Force will use this information to make recommendations about military satellites that should be turned or powered down, or military operations that should be suspended until the storm passes.

NASA Operations

NASA requires information about space weather to make decisions regarding the space shuttle and International Space Station (ISS) operations. For example, astronauts conducting space walks could be killed if they were exposed to high levels of radiation. Additionally, astronauts inside the ISS may have to take special precautions during a solar storm. In fulfilling its research mission, NASA flies many of the sensors used to collect space weather data on its research satellites. National Space Weather Program (NSWP)

Previous reviews of the space weather program have concluded that NOAA should continue to run the civilian space weather forecasting operation.

For example, in 1997, an interagency working group developed “The National Space Weather Program Implementation Plan,” under which NOAA was to continue to run civilian space weather programs and the Air Force was to continue to run such programs for the military. The interagency group included NOAA, the National Science Foundation, the Department of Defense, NASA, the Department of Energy, the Department of the Interior, and the Department of Transportation.

Similarly, in its 2002 report, “The Sun to the Earth—and Beyond:

A Decadal Research Strategy in Solar and Space Physics,” the National Academy of Sciences recommended that NOAA not only continue to forecast space weather but that NOAA should do more to coordinate the development of the sensors that are used to make its forecasts. Specifically, the Academy recommended that NOAA and NASA initiate a plan to transition solar monitoring sensors from their current location primarily on research satellites to operational satellite programs.

The SEC Budget Situation

The Space Environment Center is funded through NOAA’s Office of Oceanic and Atmospheric Research (OAR). In FY 2003, the SEC received \$5.2 million (a reduction of \$2 million below FY 2002 levels). For FY 2004, the Administration requested \$8 million for NOAA’s SEC. At this time, the FY 2004 appropriations process is ongoing in Congress. The House Commerce, Justice, State (CJS) bill, passed in July, provides \$5.2 million for the SEC (same level as FY 2003). The Senate CJS bill, reported out by the full committee, recommends no funding for SEC and suggests that the Air Force or NASA should assume the responsibility of forecasting space weather. Funding for some of the sensors and satellites that provide data to the SEC is already provided by other agencies, such as NASA and the Air Force, but NOAA’s SEC is the national center for data collection and forecasting of space weather events.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

Why Do We Need Space Weather Forecasts From NOAA’s SEC?

Electric Power Grids

The first recorded evidence of space weather effects on technology was in 1859, when a major failure of telegraph systems in New England and Europe coincided with a large solar flare. More recently, on March 13, 1989, geomagnetically induced currents in Canadian transmission lines set off a cascade of broken circuits,

causing loss of power for the entire Hydro-Quebec power grid. The blackout affected six million customers and cost Hydro-Quebec more than \$10 million.

In 1998, a similar geomagnetic storm was headed for Earth. This time, thanks to data from new sensors and improved forecast models, NOAA's SEC forecasters were able to alert electric power customers 40 minutes before the storm hit the Earth. In response, electric power utilities diverted power and increased safety margins on certain parts of the grid to avoid stress on the power system.

Satellite Operations

In addition to electric power grid operations, human activities dependent on satellites are affected by space weather. This includes everything from communications to satellite-television. Research done at NOAA's SEC has helped provide the government and other satellite operators with data on storms to help understand whether a failed satellite was due to mechanical problems or space weather. Additionally, the satellite industry uses space weather forecasts to determine the timing of rocket launches to avoid sending a multi-million dollar satellite into orbit at the peak of a solar storm.

Communications Satellites

Solar storms cause disturbances in the Earth's ionosphere that can affect the orbital path of low-orbit spacecraft, creating operational and tracking problems and sometimes shortening the useful life of a satellite. For example, in May 1998 loss of telephone pager service to 45 million customers was caused by a solar storm. During the Gulf War in 1991 military forces reported high frequency radio communications interruptions due to ionization storms, and in January 1994 an extended period of high electron levels caused failure of two Canadian communications satellites, which interrupted telephone, television, and radio service for several hours.

Airline Industry

Airlines are concerned about space weather because it can disrupt satellite and ground-based communication systems, which allow air traffic controllers to talk directly to pilots. Federal regulations require airlines to maintain communication capability with their aircraft at all times. Additionally, navigation systems can be affected by space weather events. Finally, because of the curvature of the Earth, planes flying from North America to Asia generally make flights over the North Pole, where passengers can be susceptible to higher doses of solar radiation than traditional non-polar flights. United Airlines reports that for the 21-month period from January 2002 through September 2003 there were approximately 140 flights that were or could have been affected by space weather events.

Questions for Witnesses

Dr. Ernest Hildner, Director, Space Environment Center, National Oceanic and Atmospheric Administration (NOAA)

1. Please provide an overview of NOAA's Space Environment Center (SEC). What research programs are performed at the center? What operational services are provided by the center?
2. Please describe the different types of solar weather events and specifically explain the time it takes for them to travel to the Earth. What is the lead-time we currently

have for reacting to or mitigating the effects of solar weather? Please provide historical examples of when space weather events have affected human activities.

3. Who are the users of SEC products and information?

4. Please describe the relationship between the SEC, NASA, and the Air Force Weather Agency, including a specific explanation of the role of each agency in understanding and predicting space weather.

5. If the FY04 final appropriation for the SEC was the \$5.2 million recommended in the House bill, what would be the impact on SEC services?

Col. Charles L. Benson, Jr., Commander, Air Force Weather Agency

1. Please provide an overview of the Air Force Space Weather Services provided through the Air Force Weather Agency.

2. Please describe the relationship between NOAA's Space Environment Center (SEC), NASA, and the Air Force Weather Agency, including a specific explanation of the role of each agency in understanding and predicting space weather.

3. Who are the users of Air Force space weather products and information?

4. Are there any technical barriers to the Air Force Weather Agency taking on the duties of the SEC if it were no longer funded through NOAA? Given that the Air Force's capabilities are designed for military purposes, how would you have to adapt your practices to provide SEC-like services to the civilian sector?

5. What would be the impacts on the Air Force and overall military operations if SEC no longer existed? Please provide specific examples when possible.

Dr. John M. Grunsfeld, Chief Scientist, National Aeronautics and Space Administration (NASA)

1. Please provide an overview of how space weather can affect NASA operations, including examples of historical events that have caused problems.

2. How does NASA use data and products from NOAA's Space Environment Center (SEC)? In general, how much lead time do you need to make decisions for mitigating the effects of space weather?

3. How would you compare our knowledge today of the impacts of space weather on NASA operations to what we knew five years ago, and to what we expect to know five years from now?

4. What would be the impact to NASA if SEC were no longer able to provide its space weather forecasts to you? Please provide specific examples when possible.

5. Are there any technical barriers to NASA taking on the duties of the SEC if it were no longer funded through NOAA? Given that NASA's mission is research oriented, how would you have to adapt your practices to provide SEC operational services?

Mr. John Kappenman, Manager, Applied Power Systems, Metatech

Corporation

1. Please provide an overview of how space weather can affect electric power grid systems, including examples of historical events that have caused problems.
2. How does your organization use data and products from NOAA's Space Environment Center (SEC)? In general, how much lead time do you need to make decisions for mitigating the effects of space weather?
3. How would you compare our knowledge today of the impacts of space weather on electric power grid systems to what we knew five years ago, and to what we expect to know five years from now?
4. What would be the impact to your organization and the electric power grid industry if SEC were no longer able to provide its space weather forecasts to you? Please provide specific examples when possible.

Captain Hank Krakowski, Vice President of Corporate Safety, Quality

Assurance and Security, United Airlines

1. Please provide an overview of how space weather can affect airline operations, including examples of historical events that have caused problems.
2. How does your organization use data and products from NOAA's Space Environment Center (SEC)? In general, how much lead time do you need to make decisions for mitigating the effects of space weather?
3. How would you compare our knowledge today of the impacts of space weather on airline operations to what we knew five years ago, and to what we expect to know five years from now?
4. What would be the impact to your organization if SEC were no longer able to provide its space weather forecasts? Please provide specific examples when possible.

Dr. Robert Hedinger, Executive Vice President, Loral Skynet

1. Please provide an overview of how space weather can affect satellite operations, including examples of historical events that have caused problems.
2. How does your organization use data and products from NOAA's Space Environment Center (SEC)? In general, how much lead time do you need to make decisions for mitigating the effects of space weather?
3. How would you compare our knowledge today of the impacts of space weather on satellite operations to what we knew five years ago, and to what we expect to know five years from now?
4. What would be the impact to your organization if SEC were no longer able to provide its space weather forecasts? Please provide specific examples when possible.

Chairman Ehlers. This hearing will come to order. Good morning. Welcome to the oversight hearing entitled: "What Is Space Weather and Who Should Forecast It?" And if you don't know what it is, you can go out and look outside and you will get some idea of what space weather is. Well, I wanted to make it clear, since I have been asked this, that the solar storm that is currently underway did not start the fires in California.

As a physicist, I must admit that when we began to plan for this hearing last month, I did not think it would conjure much attention outside of the scientific community. However, thanks to Divine Intervention, we now have major solar storm activity to coincide with the hearing. We certainly hope that the lights will stay on and our webcast capabilities will not be diminished during the course of this hearing.

The purpose of the hearing is to examine the National Oceanic and Atmospheric Administration's, better known as NOAA, Space Environment Center. This center, abbreviated SEC, but not to be confused with buying and selling stocks, provides real-time monitoring and forecasting of solar storms. The SEC is located with other NOAA labs in Boulder, Colorado in the District of Mr. Udall, the Subcommittee Ranking Member sitting directly to my right.

Many of us may think of solar eruptions as a curiosity or as the source of the beautiful Aurora Borealis often observed by residents in the northern U.S. However, as highlighted by recent media attention, these solar events can have serious repercussions for Earth-based technological systems. They cause geomagnetic storms in the Earth's atmosphere that can disrupt communication systems, cause surges on electric power grids, and be harmful to airline passengers and astronauts. NOAA's SEC provides vital space weather forecasts for civilian industries concerned with these effects. Additionally, SEC forecasts are used by the Air Force to provide tailored recommendations for military users concerned with space weather. For example, I believe the current space storm was predicted a good two days before it began.

Despite its important role in protecting the Nation's technological systems from geomagnetic storms, some here in Congress have proposed to reduce or eliminate funding for NOAA's SEC. In the House fiscal year 2004 appropriations bill for NOAA, SEC funding levels are 35 percent below the Administration's request of \$8 million. Of even greater concern, the Senate Appropriations Committee bill contains no funding for SEC and includes the suggestion, without any justification, that the Air Force or the National Aeronautics and Space Administration, better known as NASA, should take on the duties of predicting space weather.

Today, we will hear from representatives of NOAA, the Air Force, and NASA about the roles of each agency in monitoring and forecasting space weather. Then we will hear from representatives of three industries that rely on SEC forecasts: the electric power grid industry, the airline industry, and the communications satellite industry. These experts will help us to better understand the impact of space weather on the Earth and its surroundings and to examine the question of who should be responsible for forecasting it.

Before we hear from our Ranking Member and our witnesses, I wanted to show a short movie clip of the most recent solar flare to set the mood for today's hearing. So we will now show that. I am not quite sure how that is going to show up in the transcript of the hearing, but we will take a quick look.

[Video]

Chairman Ehlers. Thank you very much. If I might mention yesterday, just out of curiosity, I went to the site, the solar site, and looked at one of the images. I took my little ruler and measured the diameter of the sun and the size of the flare compared to the sun. Then did a quick mental calculation. I can't guarantee this is

accurate, and I probably shouldn't even say it, but my quick mental calculation indicated that the size of the flare, as apparent from that particular picture, was approximately 60 Earth diameters. That gives some startling idea of the scale of this. If the Earth had been there, it would have been an insignificant dot compared to the size of the flare. And that indicates the strength of the storms that we deal with.

Before I will recognize my Ranking Member, I also want to mention that we are going to have problems with the House schedule today. I understand that we are likely to have a vote in approximately 20 minutes, and unfortunately, we are very Pavlovian here; when the bells ring, we go vote. We will simply have to suspend the hearing while we go vote. We may well be interrupted by other votes later, but we will try to proceed as expeditiously as we can.

The Chair now recognizes Mark Udall, the Ranking Minority Member on the Environment, Technology, and Standards Subcommittee for his opening statement.

[The prepared statement of Chairman Ehlers follows:]

Prepared Statement of Chairman Vernon J. Ehlers

Good morning! Welcome to this oversight hearing entitled, "What Is Space Weather and Who Should Forecast It?" As a physicist, I must admit that, when we began to plan for this hearing last month, I did not think it would garner much attention outside the scientific community. However, thanks to divine intervention, we now have major solar storm activity to coincide with the hearing. We hope the lights will stay on, and our webcast capabilities will not be impacted.

The purpose of the hearing is to examine the National Oceanic and Atmospheric Administration's (better known as NOAA) Space Environment Center. This center, abbreviated SEC, provides real-time monitoring and forecasting of solar storms. The SEC is located with other NOAA labs in Boulder, Colorado, in the district of Mr. Udall, the Subcommittee Ranking Member.

Many of us may think of solar eruptions as a curiosity, or as the source of the beautiful Aurora Borealis often observed by residents in the northern U.S. However, as highlighted by recent media attention, these solar events can have serious repercussions for Earth-based technological systems. They cause geomagnetic storms in the Earth's atmosphere that can disrupt communication systems, cause surges on electric power grids, and be harmful to airline passengers and astronauts. NOAA's SEC provides vital space weather forecasts for civilian industries concerned with these effects. Additionally, SEC forecasts are used by the Air Force to provide tailored recommendations for military users concerned with space weather.

Despite its important role in protecting the Nation's technological systems from geomagnetic storms, some here in Congress have proposed to reduce or eliminate funding for NOAA's SEC. In the House Fiscal Year 2004 appropriations bill for NOAA, SEC funding levels are 35 percent below the Administration's request of eight million dollars. Of even greater concern, the Senate Appropriations Committee bill contains no funding for SEC and includes the suggestion, without any justification, that the Air Force or NASA should take on the duties of predicting space weather.

Today we will hear from representatives of NOAA, the Air Force and NASA about the roles of each agency in monitoring and forecasting space weather. Then we will hear from representatives of three industries that rely on SEC forecasts—the electric power grid industry, the airline industry, and the communications satellite industry. These experts will help us to better understand the impact of space weather on the Earth and to examine the question of who should be responsible for forecasting it.

Mr. Udall. Thank you, Mr. Chairman. Good morning to the panel and all of you who have assembled here to attend this important hearing. I want to begin by thanking the Chairman for holding this hearing. And of course, I have to thank him, also, for his impeccable timing. He managed to arrange for the sun spot activity last week to occur and then the solar flare this week has really given us a firsthand understanding of the importance of space weather and the need for the space weather forecasting services provided by NOAA's Space Environment Center, the SEC. And I would think, Mr. Chairman, this SEC is at least as important as the other SEC, particularly over the long-term as we have learned more about space weather.

Sunspots, geomagnetic storms, and solar flares, the phenomena of space weather, used to be a topic solely in the province of space scientists. While we have experienced the effects of these phenomena in the past, we had no ability to monitor or forecast these storms or to anticipate their likely effects. Some of you here know about the large solar flare that was generated in 1859, September of 1859, which shorted out telegraph wires in the U.S. and in Europe. And caused numerous fires.

Today, because of the importance of communications, electricity, and transportation to our daily lives, a similar storm would have devastating impacts in the absence of space weather forecasting. Satellites, transformers and transmission lines, and the billion dollar infrastructure that supports these essential services, are all vulnerable to space weather events. The SEC's forecasts enable government and private sector operators to take actions to minimize disruptions in service and damage to critical infrastructure.

The SEC's annual budget, really of a mere \$8 million, seems modest when we evaluate it in the context of the Nation's investment in space weather monitoring and research and in comparison to the billions of dollars of infrastructure and services that are vulnerable to space weather events.

After investing millions of dollars and many years of research on space weather, we are now able to monitor solar storms and forecast their nature and intensity. Eliminating the SEC or drastically cutting its budget does not save money; it actually wastes taxpayer investments in research by cutting off the service that is currently delivering real benefits. Cutting the SEC's budget reverses, in my opinion, and I believe the opinion of many people here and people around the country, our progress in space weather forecasting, putting billions of dollars of infrastructure and services at risk.

This committee, in my opinion, should endorse the Administration's fiscal year 2004 budget request enthusiastically for those reasons. We should also continue to support research to improve space weather forecasting and to expand our knowledge of space weather and its potential impacts.

While the space weather forecasting discipline is still in its infancy, we still—it is no less essential than terrestrial weather forecasting. If we do not continue to invest in space weather forecasting, we will not only enjoy gazing at the Northern Lights, but we will risk experiencing widespread blackouts. Let us keep the lights on, the planes flying, and the communications flowing by fully investing in the Space Environment Center and its vital research and forecasting activities.

Mr. Chairman, I am also aware of a number of people with interests in space weather who wish to contribute to the record for this hearing. Therefore, I would ask unanimous consent that the record for this hearing be open—held open for 10 days to enable trade groups, private citizens, academics, and industry representatives to submit material to the record.

Chairman Ehlers. So ordered.

Mr. Udall. Thank you, Mr. Chairman.

In conclusion, the witnesses we have here today will help us to better understand the phenomena and potential impacts of space weather events on our government activities and on our economy. We have an excellent panel of witnesses for our hearing today. I want to thank you all for taking your time to appear before the Subcommittee this morning, and I do look forward to your testimony.

With that, Mr. Chairman, I would yield back any time I have remaining.

[The prepared statement of Mr. Udall follows:]

Prepared Statement of Representative Mark Udall

Good morning.

First, I would like to express my thanks to the Chairman for holding this hearing and to congratulate him on his timing. I don't know how you managed to arrange for the sun spot activity last week, Mr. Chairman, but the solar flare that reached Earth this past week illustrates the importance of space weather and the need for the space weather forecasting services provided by NOAA's Space Environment Center (SEC).

Sun spots, geomagnetic storms, and solar flares—the phenomena of space weather—used to be a topic solely in the province of space scientists. While we have experienced the effects of these phenomena in the past, we had no ability to monitor or forecast these storms or to anticipate their likely effects. For example, a large solar flare generated in September of 1859 shorted out telegraph wires in the U.S. and in Europe causing numerous fires.

Today, because of the importance of communications, electricity, and transportation to our daily lives, a similar storm would have devastating impacts in the absence of space weather forecasting. Satellites, transformers, and transmission lines—and the billion dollar infrastructure that supports these essential services are all vulnerable to space weather events. The SEC's forecasts enable government and private sector operators to take actions to minimize disruptions in service and damage to critical infrastructure.

The SEC's annual budget of \$8 million seems modest when we evaluate it in the context of the Nation's investment in space weather monitoring and research and in

comparison to the billions of dollars of infrastructure and services that are vulnerable to space weather events.

After investing millions of dollars and many years of research on space weather, we are now able to monitor solar storms and forecast their nature and intensity. Eliminating the SEC or drastically cutting its budget does not save money. It wastes taxpayer investments in research by cutting off the service that is currently delivering real benefits. Cutting the SEC's budget reverses our progress in space weather forecasting, putting billions of dollars of infrastructure and services at risk.

This Committee should endorse the Administration's FY04 budget request, enthusiastically. We should continue to support research to improve space weather forecasting and to expand our knowledge of space weather and its potential impacts.

While space weather forecasting is still in its infancy, it is no less essential than terrestrial weather forecasting. If we do not continue to invest in space weather forecasting, we will not only enjoy gazing at the Northern lights, but we will also risk experiencing widespread blackouts. Let's keep the lights on, the planes flying and communications flowing by fully funding the Space Environment Center and its vital research and forecasting activities.

Mr. Chairman, I am also aware of a number of people with interests in space weather who wish to contribute to the record for this hearing. Therefore, I ask unanimous consent that the record for this hearing be held open for ten days to enable trade groups, private citizens, academics and industry representatives to submit material to the record.

The witnesses we have here today will help us to better understand the phenomena and potential impacts of space weather events on our governmental activities and on our economy. We have an excellent panel of witnesses for our hearing today. I thank you all for appearing before the Subcommittee this morning and I look forward to your testimony.

Chairman Ehlers. All right. If there is no objection, all additional opening statements submitted by the Subcommittee Members will be added to the record. Without objection, so ordered.

At this time, I would like to introduce our witnesses. We will begin with a special introduction by our Ranking Member, Mr. Udall.

Mr. Udall. Thank you, Mr. Chairman.

I want to take this time to acknowledge Dr. Hildner, who is here from my hometown of Boulder. Dr. Hildner is the Director of NOAA's Space Environment Center, the SEC, we have been mentioning. It is located in Boulder, as I mentioned. Dr. Hildner is a solar physicist who has worked for the High Altitude Observatory at NCAR, which is also based in Colorado, and at NASA's Marshall Space Flight Center in Alabama where he was the head of its Solar Physics Branch. He was an experimental scientist for Skylab and the Solar Maximum Mission during the 1970's. Dr. Hildner's scientific specialty is coronal and interplanetary physics about which he has published dozens of papers. Last year, the National Academy of Sciences called the work of the SEC "crucial." Under Dr. Hildner's steady watch, the Center continues to do its

crucial work very well, though recent budget cuts have made his job, and the jobs of NOAA's SEC staff more difficult.

I look forward to hearing from Dr. Hildner today as he helps us understand the importance of the Space Environment Center.

Welcome, Dr. Hildner.

Chairman Ehlers. And with that background, he can tell me later whether my mental calculation was correct.

Next, it is my pleasure to introduce Colonel Charles L. Benson, Junior. He is the Commander of the Air Force Weather Agency at Offutt Air Force Base in Nebraska. Following him is Dr. John M. Grunsfeld, Chief Scientist of the National Aeronautics and Space Administration, better known, of course, by its acronym, NASA. The next witness to be introduced by the honorable gentleman from Minnesota, Mr. Gutknecht.

Mr. Gutknecht. Well, thank you, Chairman Ehlers.

And I just want to welcome the panel. And Chairman Ehlers and I have had the opportunity to go out and visit the NOAA center out in Boulder, and we were duly impressed with the work that is done.

But it is my honor today to introduce John Kappenman from Metatech Corporation in Duluth, Minnesota. For those of you who have never had the chance to go to Duluth, Minnesota, it is one of the most beautiful cities, not only in Minnesota, but, I think, in the country. And if you don't get a chance to go to Duluth and visit the city, or go fishing in the beautiful waters of Lake Superior, at least you can go to my website and you can see a very large lake trout, which I caught there about two months ago. And I am very proud of that picture. And it is on the front page of my website.

For the past 27 years, Mr. Kappenman has researched electronic power system impacts caused by widespread geomagnetic field disturbances due to space weather. Since 1997, he has been employed with Metatech Corporation where he has advised folks worldwide on how to protect technology and power grid systems.

We all look forward to your testimony, and we welcome you here to Washington.

Chairman Ehlers. Thank you, Mr. Gutknecht.

I now understand the reason for the low lake levels in the Great Lake system: you are taking all of the fish out of them.

Next, it is my pleasure to introduce Captain Hank Krakowski. He is the Vice President of Corporate Safety, Quality Assurance, and Security for United Airlines located in Chicago, Illinois. And our final witness is Dr. Robert Hedinger. He is the Executive Vice President of Loral Skynet out of Bedminster, New Jersey.

As our witnesses should know, I presume you have been briefed, testimony is limited to five minutes each, particularly with a large panel like this, so we ask that you honor that request. And the little device here will show green for the first four minutes, yellow for the next minute, and then it turns red and all sorts of bad things happen. So we request that you try to keep it to five minutes each.

We will start with Dr. Hildner.

STATEMENT OF DR. ERNEST HILDNER, DIRECTOR, SPACE ENVIRONMENT
CENTER, NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

Dr. Hildner. Good morning, Chairman Ehlers and Members of the Subcommittee. And thank you, Mr. Udall, for your kind introduction. As Director of the National Oceanic and Atmospheric Administration Space Environment Center, I am pleased to join these other witnesses and you today for the hearing on SEC's role in providing operational space weather information to the United States. We believe that NOAA is the proper home for the Nation's space weather service.

The extensive media coverage of recent radiation and geomagnetic storms clearly illustrates the Nation's need for accurate, reliable, and timely space weather forecasting. The effects of space weather, as you have already indicated, are far ranging. We know that airlines, the International Space Station, nuclear power plants, and at least one satellite were affected by the recent solar and space weather events. NOAA's SEC is the central focus of information for these kinds of events.

[Slide]

The next figure shows that—sorry. I am in control here, I think.

The next figure in the upper left shows the number of web accesses to our site. And that spike, over the last several days, reaches almost ten million hits on our website per day. Even before the recent activity and the media attention, customers hit our website over 500,000 times a day, and that is that lower part on the left. This figure also shows several of the NOAA products used by radio communicators, by airlines, by satellite operators, and the various alerts and warning products issued by SEC in the last week in the upper right. That figure, which is too small to see, actually tells you how many times we sent out alerts and warnings to our customers for our various products.

The recent media coverage of effects show there is a direct correlation between space weather and the U.S. economy. The direct global economic impact of space weather has been estimated very conservatively at \$200 million per year. It is clear that the adverse conditions in the space environment can disrupt communications, navigation, air travel, national electric power distribution grids, and satellite operations. Improved space weather information will assure safety, reliability, and national security, as my colleagues today will discuss the benefits of space weather forecasting for their work.

However, I would like to highlight some important points about SEC, and one of those is the funding issue that has already been eluded to. I would be remiss if I didn't ask for your assistance. As you stated, the President's budget recommends \$8.3 million for SEC in fiscal year 2004. The House Appropriations Committee has recommended \$5.3 million, fully \$3 million below the President's request, and the Senate Appropriations Committee has zeroed out funding entirely.

If either level below the President's request is enacted, there will be dramatic consequences for SEC and for the vital services that it provides. In response to the necessary staff reductions, NOAA will be faced with the choice of eliminating SEC's research and development activities or its services. If the R&D is cut, NOAA will not be able to improve products, models, and data streams needed by our customers. On the other hand, cutting services means that our customers will only receive data: no value added forecasts, no warnings, no alerts. Either choice means our effectiveness as a partner to other government agencies, such as NASA and the Air Force, will drop.

I need to emphasize that zeroing out SEC's budget will eliminate the one source of official U.S. space weather alerts, warnings, and forecasts. Space weather is defined by the National Space Weather Program as: "Conditions on the sun and in the solar wind, magnetosphere, ionosphere, and thermosphere that can influence the performance and reliability of space-borne and ground-based technological systems and can endanger human life or health."

SEC monitors, predicts, and forecasts conditions in the space environment and provides critical data, space weather data, to a variety of government and commercial customers. SEC also conducts research into phenomena affecting the space environment.

[Slide]

As the next figure indicates, space weather begins to—
space weather begins at the sun, and this animation shows the brightening of the sun, if you can run the movie, please----

[Video]

At the time of a flare, the spray of swift energetic particles and a cloud of solar atmosphere depart the sun. When it arrives at Earth, it causes a geomagnetic storm, much as what happened on Wednesday morning this week.

SEC provides services, conducts research and development, and builds and maintains the computer systems, which support the Center's work. SEC's efforts are focused on areas where advanced applications can be brought to bear. We continually monitor. We continually monitor Earth's space environment with displays and software driven by the approximately 1,400 data sets that we receive everyday. The forecasters synthesize current data, climatological statistics, and relevant research results to formulate our daily predictions of solar and geophysical activity.

The future of SEC's vital role in conducting and coordinating research in its applications was discussed, as mentioned earlier, in a recent National Research Council report, a Decadal Research Strategy in Solar and Space Physics. In this report, the NRC recommended that NOAA assume full responsibility for space-based solar wind measurements and it should expand its facilities for integrating data into space weather models.

It looks like my time is up, so let me, in conclusion, say that the Space Environment Center is the Nation's unique civilian provider of critical, real-time information and forecasts on space weather that affect the United States' economic, national, and homeland security. We want to remain in that role.

Thank you, Mr. Chairman and Members of the Subcommittee, for this opportunity to testify on this extremely important matter to NOAA and the Nation. And I would be happy to answer any questions.

[The prepared statement of Dr. Hildner follows:]

Prepared Statement of Ernest Hildner

Thank you, Mr. Chairman and Members of the Subcommittee, for the opportunity to testify before you regarding the National Oceanic and Atmospheric Administration's (NOAA) activities at the Space Environment Center (SEC). I am Ernest Hildner, Director of the SEC and responsible for day-to-day management and long-term planning of the

Center. Space, from the Sun to Earth's upper atmosphere, is a strategic and economic frontier. This unique environment influences a multitude of human activities, and its understanding presents numerous scientific challenges. NOAA's SEC has a central role in conducting and coordinating research to understand the space environment to improve space weather services, and in providing critical operational space weather services for NOAA and the Nation. SEC strives to understand and predict the state of the space environment by accumulating data, running models, applying forecaster insight, conducting applied research, and utilizing research and data obtained externally to make operational forecasts of the space environment. Today I will provide an overview of space weather, of SEC and the services it provides, the budgetary and science challenges facing SEC, how SEC collaborates with other agencies, and the value of space weather forecasting and research. I am pleased to have the chance to discuss these topics today.

SPACE WEATHER

“Space weather” refers to conditions on the sun and in the solar wind, magnetosphere, ionosphere, and thermosphere that can influence the performance and reliability of space-borne and ground-based technological systems and can endanger human life or health. Adverse conditions in the space environment can cause disruption of satellite operations, communications, navigation, and electric power distribution grids, leading to a variety of socio-economic losses. National Space Weather Program Strategic Plan, FCM-P30-1995.

The Earth lies 150 million kilometers, or 93 million miles, from the Sun, but it is immersed in the extended solar atmosphere. Our magnetic field resists the continual outflow of ionized gas from the Sun, protecting us here at the surface. However, the Earth and its field represent an obstacle to the solar outflow. As a result, the geomagnetic field is compressed on the sunward side of Earth and drawn out away from the Sun to make a comet-shaped cavity. As shown in the artist's sketch below, the size of the boundary between Earth's dominion and the Sun's varies with the pressure exerted by the Sun's outflow.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

Space weather storms are spawned by a variety of changes in solar outputs. First, the light from the Sun, at wavelengths both longer and shorter than the visible, can brighten abruptly. This light travels to Earth and affects the near-Earth environment just as we discern that a solar event has occurred. The photons from a solar flare produce a radio blackout, at some frequencies, by changing the character of the dayside ionosphere and upsetting the delicate balance between the Sun's otherwise nearly constant output and Earth's ability to receive and ingest it.

Solar energetic particles comprise a second type of solar emission. These particles, predominantly protons, the nuclei of hydrogen atoms, are accelerated in coronal mass ejections and solar flares. They travel from the Sun slower than the speed of light, arriving near Earth as soon as tens of minutes after the solar eruption, the more energetic particles usually arriving first. The transit from sun to Earth may be slowed if the intervening magnetic fields do not provide easy Sun-to-Earth connection; then the

particles' arrival may be delayed many tens of hours. A major rise in energetic particle flux is commonly referred to as a radiation storm.

A third type of solar emission that has strong space weather impacts is magnetized plasma. When the continually evolving solar magnetic fields abruptly restructure themselves over a broad area, a portion of the outer solar atmosphere, the corona, can be ejected violently into space. These coronal mass ejections, clouds of ionized gas (solar plasma) and their embedded magnetic fields, fly away from the Sun at 400-1000 kilometers/second (1-2 million miles per hour). If Earth happens to be in the way, when the cloud strikes Earth's magnetic field 2 to 4 days later, then our geomagnetic field is compressed and may be eroded, resulting in a geomagnetic storm.

The following diagram depicts the times scales associated with these three types of space weather events.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

The diagram illustrates the lead time between the occurrence of the parent event at the Sun and the terrestrial response; as well as the watches, warnings, and alerts issued by SEC. Thus, space weather has several kinds of storms much as meteorological weather has storms as different as tornadoes, blizzards, and hurricanes. A particular type of space weather storm has significant impacts on particular technologies so some customers are impacted by one type of space weather storm but not by another.

For example, strong x-ray bursts have a serious impact on high frequency (HF) communications on the dayside of Earth. ARINC, a provider of air traffic communications capabilities to commercial airline flights over the North Atlantic, ensures the safety of the movements of airplanes in flight with communications to the cockpit. They need to know when the HF communications are being affected due to natural conditions (space weather) or due to some equipment failure, and advise aircraft of appropriate frequencies to use. The United States Coast Guard is alerted by SEC staff during these same types of episodes as its LORAN navigation system will be unable to provide the required accuracy to its users during solar flare events. LORAN is intentionally made unavailable during these disturbed space weather conditions.

During bursts of solar energetic particles, the second type of space weather storm, the potential for biological damage due to elevated solar radiation increases. The NASA Space Radiation Analysis Group is responsible for assuring that humans in space not receive anything beyond the lowest reasonable radiation dose. They will advise the Flight Surgeon at NASA's Johnson Space Center to alter the activity plan for the crew if those activities involve leaving the space craft (for an extra-vehicular activity, or EVA), or suggest moving the crew to the most highly protected area of the Space Shuttle or International Space Station during the space weather radiation storm. NASA requires forecasts and specifications of radiation that affects both humans and equipment in space.

Another witness will discuss the effects of radiation storms and communications degradation on the airline industry.

Satellites in orbit and during the launch are at risk from radiation storms, and I am pleased to see that you have a witness to discuss those effects of space weather as well.

The third type of space weather storm, caused by the interaction between the onrushing magnetized plasma from the Sun and Earth's own magnetic field, is particularly menacing. This geomagnetic storm can be thought of as the space weather version of a strong hurricane, as it has very widespread impacts across a large number of systems and users. Somewhat like hurricane clouds are monitored from satellites, this plasma cloud can be seen as it leaves the Sun and it is probed internally as it is about to make "Earthfall."

When a coronal mass ejection occurs, forecasters at SEC analyze the direction of the ejectum to determine whether it is Earth-bound and estimate the kinetic energy associated with the event. As it takes a few days for the cloud to reach Earth, there is time for users to take preventive or mitigating action. One of today's witnesses will discuss the effects of geomagnetic storms on the electric power grid.

SEC has been called upon to help investigate possible environmental causes for disasters. The recently active Shuttle Columbia Accident Investigation Board asked for testimony to rule out the possibility that a radiation storm could have affected the Shuttle's computers during reentry. More recently, there were inquiries whether the electrical blackout of the Northeast on August 14, 2003, was caused by a space weather geomagnetic storm. SEC saw no evidence that it was. Ironically, however, as the grid was being brought back up to capacity, on August 18 there was a strong geomagnetic storm that hampered the ability of the operators to return to normalcy.

Another system impacted during geomagnetic storms is the Wide Area Augmentation System (WAAS) of the Federal Aviation Administration, designed for aircraft navigation en route. The WAAS technology relies on the use of the Global Positioning System (GPS), and GPS accuracy is adversely affected during geomagnetic storms. In the current solar cycle, the space weather storm of July 14-15, 2000, was by many measures the most serious. During this storm, the "Test-bed" WAAS was unable to determine the position of a receiver on an airplane to the accuracy required; as a result of the storm, slight changes were made to the WAAS model based on data received during that solar activity.

The Space Weather Operations group at SEC issues alerts, warnings, and watches of space weather storms, on a 24/7 basis. Warnings of all three types of space weather storms are issued when there is high probability of occurrence. Warnings for radiation and magnetic storms are aided by the ability to detect the incoming solar wind from a satellite one million miles upstream, the Advanced Composition Explorer (ACE). This sentinel allows for a few minutes advance notice of radiation storms, and up to one hour lead time for magnetic storms. However, it does not offer any benefit for radio blackouts.

Space weather events such as radio blackouts, radiation storms, and geomagnetic have affected various technologies and systems in sometimes spectacular ways. During the last solar cycle, a geomagnetic storm caused the Hydro-Quebec power grid to black out on March 13, 1989, leaving six million without electricity for nine hours. The big storms of March 1989 and July 2000 sent engineers back to their drawing boards hoping to design better systems to lessen the damage. A space weather radiation storm in August 1972 could have been even more damaging, possibly lethal. This event occurred between the lunar flights of Apollo 16 (April 16, 1972) and Apollo 17 (December 16, 1972). Biologists have calculated that the radiation received by astronauts, had they been on the

moon at the time of the storm, would have caused a quick death. Good luck averted a disaster.

The frequency of occurrence of space weather storms, and the possible consequences of the storms, are indicated in the NOAA Space Weather Scales document attached to this testimony and available on SEC's website at <http://www.sec.noaa.gov>.

SEC OVERVIEW

What we now call "space weather" began to affect widely used technology during World War II, disrupting the newly developed communication and radar systems. After the War, the Central Radio Propagation Laboratory was set up in the National Bureau of Standards in Boulder, Colorado, coalescing federal activities dealing with space weather. A portion of this unit, by then named the Environmental and Solar Data Service, was folded into the Environmental Science Services Agency (ESSA) when it was formed in the 1960s. Daily forecasting of the space environment for the public commenced in 1965. ESSA was rolled into NOAA when NOAA was formed in 1970, and the SEC is the result.

NOAA's mission "To understand and predict changes in the Earth's environment. . .to meet our nation's economic, social, and environmental needs" includes space weather. Just as NOAA's tropospheric weather service does for its customers, NOAA's space weather service monitors and predicts conditions in the space environment for its customers. SEC carries out its role as the Nation's official source of space weather alerts and warnings under various legislative mandates, statutory authorities, and Department of Commerce Reorganization Plans that gave the authority to monitor and predict the space environment to NOAA. Currently, SEC is both a research laboratory in NOAA's Office of Oceanic and Atmospheric Research (OAR) and one of the National Weather Service's (NWS) National Centers for Environmental Prediction. SEC's products are distributed via e-mail, its Web site, the NWS Family of Services, time and frequency standards radio stations WWV and WWVH, and the NOAA Weather Wire; pager service to notify customers when SEC issues an alert is available from a commercial provider.

SEC is also a member of the International Space Environment Service (ISES), which has 12 Regional Warning Centers around the world to take observations and provide services of regional interest. Daily, the regional centers share their data and tentative predictions with SEC, which synthesizes the information and, as the World Warning Agency, issues the global forecast of space weather conditions. ISES traces its parentage to the International Council of Scientific Unions; its Regional Warning Centers are funded by their host countries.

NOAA's space weather service is analogous to its tropospheric weather service, and both antedate the formation of NOAA itself. Both serve civilian government, public, and industrial users, and both have links to military and academic partners. For both services, NOAA was deemed to be the proper home. Using NOAA's and others' sensors, the SEC continually monitors and daily forecasts Earth's space environment and provides accurate, reliable, and useful solar-terrestrial information to their customers. SEC acquires, interprets, synthesizes, and disseminates monitoring information to serve the

Nation's need to reduce adverse effects of solar-terrestrial disturbances on human activities. It prepares and disseminates forecasts and alerts of conditions in the space environment. SEC conducts research into phenomena affecting the Sun-Earth environment including the emission of electromagnetic radiation and particles from the Sun, the transmission of solar energy to Earth via solar wind, and the interactions between the solar wind and Earth's magnetic field, ionosphere, and atmosphere. It conducts research and development in solar-terrestrial physics and in techniques to improve monitoring and forecasting, prepares high-quality data for national archives, and uses its expertise to advise and educate those affected by variations in the space environment. When events warrant, watches, warnings, and alerts are issued for the use of operators whose systems may be adversely affected by space weather storms. These user groups are private, commercial, government, and military operators, concerned with electric power distribution, high-frequency radio communications, satellite operations, astronaut protection, radio navigation, and national security.

The SEC, however, faces a number of challenges to meeting the needs of the user groups mentioned above. These challenges include budgetary challenges, particularly the potential of cuts in the President's budget request for SEC in the FY 2004 appropriations bills; and, scientific challenges.

The President requested \$8.291 million total for the SEC in FY 2004. However, the House Appropriations Committee has recommended FY04 funding of \$5.298 million for SEC, while the Senate Appropriations Committee zeroed out funding for SEC. If the House Committee level of \$5.298 is enacted, there will be dramatic consequences for SEC and the vital services that it provides. The House mark of \$5.298 million would support staffing of only about 25 FTEs, down from the 53 FTEs requested in the President's budget. In the short-term, most non-labor SEC costs are fixed.

Downsizing to the House Appropriation's Committee's recommended level, NOAA and SEC would attempt to preserve, as much as possible, the Nation's investment in the current space weather monitoring network by continuing to acquire, ingest, process, disseminate, and provide to archives the copious data with breaking the continuity of 30 years worth of measurements. This activity currently consumes about half of SEC's budget. Therefore, the shortfall created by an appropriation of \$5.3 million would be borne either by research and development or by operations. NOAA and SEC will be forced to choose between the least undesirable of two options described below. In either case, SEC's data handling capability for ingest, processing, and archive would degrade. Eighty percent of Air Force alerts are driven by data provided only by SEC. The space weather data ingest and distribution network, identified by Homeland Security as a part of the Nation's Critical Infrastructure, would face imminent failure. For example, under each option, irreplaceable coverage gaps in real-time Solar Wind data would result, as satellite tracking shrinks, reducing alerts of geomagnetic storms affecting communications and GPS accuracy.

In the first reduction option, NOAA would eliminate SEC's research and development while continuing operational services with no improvement. Verification of and technique development to use Solar X-ray Imager (SXI) data would cease. When operational, the SXI takes images of the sun once a minute, providing additional data needed to more accurately forecast and alert users to space weather events. The Global

Assimilation of Ionospheric Measurements (GAIM) model currently being developed would not become available to civilian users. This model will provide global specification and forecasts of the ionosphere in 3-dimensions, where presently only in-situ measurements and climatological models are available. NOAA participation in the National Space Weather Program will cease. SEC will not be able to provide improvements to products and models supporting airlines, power companies, navigation, and other critical services. NOAA will be unable to transition into operations the physics based models developed at national centers and universities by NSF, NASA, and DOD-supported scientists. In addition, SEC's website, the primary customer interface for the distribution of space weather data and information will not be improved and recovery from failure will be difficult.

In the second option, NOAA would eliminate SEC's operational space weather services while continuing research and development against the day that (improved) services can resume. NOAA would cease to issue official U.S. space weather alerts, warnings, and forecasts, information that is currently not provided by any other source. Unfortunately, reducing the current suite of products one-by-one saves very little until the last product is terminated. The infrastructure to support one product supports all, so there is little savings in reducing the number of products. Joint operations with the U.S. Air Force would stop, including providing back-up to the U.S. Air Force's classified space weather support to our armed services. Products supporting airlines, power companies, navigation, and other services and industries would not be prepared, issued, and updated. As noted for research and development, the SEC website would degrade and be prone to complete failure. Real-time operational data systems would be decommissioned.

SEC has several scientific challenges before it. An exciting effort is its work with academic and DOD partners to assimilate data into numerical models, similar to the significant assimilation challenge faced by the meteorological modeling community. The challenge combines computational science and physical understanding of the space environment and will lead to improvements in both. With successful "4-D data assimilation," the model outputs (space weather maps) will be more accurate and more skillful, therefore more useful to users of the services. SEC is working to ensure that space environment monitors designed for GOES and POES satellites provide useful and reliable data on every satellite. Researchers at SEC consult on and write requirements for space weather sensors and, when appropriate, on requirements for the satellites.

SEC has three Divisions; one for services; a second for research and development; and, a third to develop and maintain the computer systems which support the Center's work. The Research and Development Division derives its goals and targets from the needs of the Space Weather Operations Division. In turn, the space weather services products improve from the application of R&D. Having R&D and operational services in one Center encourages more frequent and more effective interaction and collaboration among the scientists, forecasters, and specialists at SEC. While forecasts, alerts, and warnings are routine for quiet and mildly unsettled solar conditions, when activity becomes intense, forecasters consult with the Center's research Ph.D.s about the forecast. This is because there are not yet good "rules of thumb" for how to deal with these situations, and the best expertise must be brought to bear on aspects of the problem. In addition, the pace of innovation and change is still very rapid in space weather, with researchers at SEC and

elsewhere playing a major role in developing models that, if they could be transitioned swiftly into operations, would bring us progressively closer to the goal of physics-based, numerical space weather predictions.

The Research and Development Division is grounded in understanding the fundamental physical processes governing the regime from the solar surface, through the interplanetary medium, into the magnetospheric-ionospheric regions, and ending in Earth's upper atmosphere. These processes determine the climatology and nature of disturbances in the solar atmosphere, in Earth's magnetic field, in the ionosphere, in the charged particle populations at satellite orbits, and in the atmospheric density at high altitudes (including low-Earth orbit). SEC's research, technique development and new sensor implementation are focused on areas where advanced applications can be brought to bear to improve space weather services. The staff has expertise spanning from solar physics to Earth's upper atmosphere and maintains close collaborations throughout the larger research community. They publish regularly in scientific journals, and work directly with the SEC Space Weather Operations and the Systems Division to develop state-of-the-art capabilities for the SEC forecast center. The group develops analysis tools for working with data from a variety of spacecraft, including the NOAA geosynchronous and polar orbiters, and spacecraft in the solar wind. Data access is provided through customized data-analysis routines and individualized displays. In addition to enhancing the utility and value of the primary data through research and analysis, the group explores sources of new data and improved monitoring to support Space Weather Operations. The group leads in the development of techniques to process and interpret both ground-based and space-based solar imagery, and has special expertise in solar X-ray imaging.

The Space Weather Operations Division is the Nation's official source of space weather alerts and warnings. The services center is staffed 24/7 with an operations specialist and, for ten hours a day, a forecaster. They continually monitor Earth's space environment with displays and software driven by the approximately 1400 data streams received each day. Forecasters synthesize current data, climatological statistics, and relevant research results to formulate their daily predictions of solar and geophysical activity. Operations specialists ensure data integrity and timeliness; verify event validity and issue Alerts, Watches, and Warnings; and update announcements on the Geophysical Alert Broadcasts over radio station WWV and WWVH.

The Systems Division is responsible for: IT system architecture; computer security; developing or acquiring, and maintaining, the computer hardware and software to routinely ingest data; populating the data bases; the hardware and software for disseminating data and products to customers and to the archive; and providing computer configuration control and redundancy for operational reliability. In addition, Systems Division personnel provide system administration and support to internal users, while responding to IT directives from the NOAA and OAR Chief Information Officers, and working with administrators of the several local Internet services. The Division operates the receiving antennas at the prime and back-up Boulder sites, and has personnel on-call at all times to attend to hardware and software failures which affect the functions of the forecast center.

SEC performs a vital role for the Nation in conducting and coordinating research and its application. The recent National Research Council report—A Decadal Research

Strategy in Solar and Space Physics (2003), recommended that NOAA should assume full responsibility for space-based solar wind measurements, expand its facilities for integrating data into space weather models, and, with NASA, should plan to transition research instrumentation into operations. As discussed in the National Space Weather Program Implementation Plan (2000), interagency programs cannot succeed in meeting the Nation's needs without NOAA SEC observations, research, model development, and transition to operations. And, as emphasized in the Department of Defense's (DOD) National Security Space Architect Study (2000), NOAA's current and planned activities are essential to meet DOD's space weather needs.

In addition to the SEC's activities, it should be noted that three line organizations play roles in the NOAA Space Weather Program:

National Environmental Satellite, Data, and Information Service (NESDIS), National Weather Service (NWS), and Office of Oceanic and Atmospheric Research (OAR), with some interest and support from the National Ocean Service. They cover the gamut of space weather activities from setting requirements for future space environment monitoring sensors and spacecraft, to monitoring the development of the sensors for flight on the Geostationary Operational Environmental Satellites (GOES) or Polar Operational Environmental Satellites (POES), to tracking and downloading data from NOAA and non-NOAA satellites, to processing and distributing the data, and finally to archiving the data. Many of these activities are contained within and are an integral part of NOAA's major programs, such as the GOES and POES programs, so that only the Space Environment Center (OAR) and part of the National Geophysical Data Center (NGDC) in NESDIS are clearly identified budget structures tied directly to NOAA's space weather program. The requirements process also identifies observations needed in addition to the GOES and POES programs and programmatic plans are made for these platforms as well. NGDC is the sole archive of routine monitoring data of the space environment recorded on GOES, on POES, and on DOD's Defense Meteorological Satellite Program satellites. It is also the sole archive of space environment monitoring data recorded at DOD ground-based solar and ionospheric stations. As noted below, NOAA also works closely with other federal agencies and nations to obtain available real-time space weather data enabling more accurate and timely space weather services for the Nation.

COLLABORATION WITH PARTNERS

SEC works with a variety of partners to accomplish its mission. Internally, cooperative ventures abound as graduate students, post-doctoral students, visiting scientists, Cooperative Institute fellows from the University of Colorado, and contractors all contribute to the effort at the Center. Additionally, SEC works with the Cooperative Institute for Research in Environmental Sciences, a NOAA Joint Institute.

SEC works closely with colleagues across government agencies and academia, in the U.S. and internationally, to understand the space environment and apply research results. Collaboration requires a great deal of coordination within the U.S. and internationally. Within the U.S. Government, the Office of the Federal Coordinator for Meteorology provides a mechanism for space weather coordination, including development and

implementation of the National Space Weather Program (NWSP). The National Aeronautics and Space Administration (NASA), the National Science Foundation (NSF), and the Departments of Defense (DOD), Interior (DOI), Energy (DOE), Commerce (DOC), and Transportation (DOT) are participants in the NWSP, which recognizes common interests in space weather observing and forecasting. Aware of the need for prudent employment of available resources and the avoidance of duplication in providing these services and support for agency mission responsibilities, the cooperating departments have sought to satisfy the need for a common service and research program under the NWSP. The NWSP's Implementation Plan sets out the expected data, research, and services contribution from each participating agency.

To provide its specification and forecast services, SEC works most closely with the U.S. Air Force Weather Agency's forecast center in Omaha, which provides services to U.S. military customers. NOAA civilians and uniformed NOAA Corps and U.S. Air Force personnel together staff the joint services center in Boulder. NOAA and USAF share their data without charge to each other, and confer every day before the daily forecasts are issued by the two agencies to their respective clients. The SEC provides centralized space weather support to non-DOD government users, such as NASA, and to the general public, such as the commercial airline industry. SEC operates and maintains a national real-time space weather database to accept and integrate observational data, to provide operational support and services in the space and geophysical environment, to provide services to public users in support of the national economy, and to serve as the U.S. Government focal point for international data exchange programs. The USAF provides unique and classified support to all DOD users. The Space Weather Operations Center (SPACEWOC) at the Air Force Weather Agency (AFWA) serves as the DOD focal point for space weather forecasting support and services. The USAF maintains a worldwide network of both ground-based and space-based observing networks to provide accurate, reliable, and timely support to military communications, surveillance, and warning systems. To avoid duplication, the two agencies share responsibilities to produce certain space weather databases, warning, and forecast products of mutual interest and benefit to each other. AFWA and SEC provide cooperative support and backup for each other in accordance with existing agreements.

NOAA procures, operates, and maintains the Space Environment Laboratory Data Acquisition System (SELDADS) as the national system for collection, integration, and distribution of solar-geophysical data received in real-time from ground-based observatories and satellite sensors. Collection, processing, monitoring, and storage of the data occurs continuously around the clock. Displays and interactive analyses of the data are used by SEC to provide alerts, forecasts, and data summaries to a user community consisting of industrial and research organizations and Government agencies in the United States and abroad.

The collaboration among space weather service providers and those who fund their research is closely coordinated and mutually beneficial. NASA and DOD conduct critical research and development activities that NOAA assesses and incorporates, as needed, onto its civil operations spacecraft. NASA's upcoming Living with a Star set of missions and their accompanying data and research are oriented toward improving space weather monitoring and improving techniques for understanding space weather effects and the inference of the physical processes that shape the space weather environment. These are

important because they enable the production of new physical models for improved predictability of the space weather environment and its evolution. The space industry also provides expertise to assist in various projects. Increasingly, collaborations with the private sector and foreign remote sensing operators provide data and information that NOAA and other government agencies such as the USDA, DOE, and DOI use to implement their respective missions.

SEC also works actively with partners in industry and other users on specific projects to identify research and forecast needs. For example, SEC has one active Cooperative Research and Development

Agreement with Federal Data Corporation (FDC) to develop a model of the wavelength-dependent changing solar brightness for customers interested in ionospheric changes and heating of the terrestrial atmosphere. NASA's Marshall Space Flight Center (MSFC) and SEC scientists, with others, issue and update the world consensus forecasts of the 11-year cycle of solar activity for the benefit of NOAA, NASA, DOD, and others; this is the forecast used by NOAA, NASA, DOD, and the international community for mission planning. Spaceweather.com, a website fostered and supported by MSFC, makes heavy use of SEC's data and products. The website exhibits data gathered from SEC. SEC is first in the site's list of "essential" links.

SEC also co-sponsors Space Weather Week annually with other government agencies such as the Air Force Research Laboratory, NSF Division of Atmospheric Science, and NASA Sun-Earth Connection Program. This event brings hundreds of users, researchers, vendors, government agencies, and industry representatives together in a lively dialog about space weather. Discussion focuses on recent solar and geomagnetic activity, specific space weather impacts, and our scientific understanding of this activity. The conference program highlights space weather impacts in several areas of the environment including ionospheric disturbances, satellite drag, auroral currents, geomagnetic storms and their solar drivers, radiation belts, and solar energetic particles. The conference registration fee covers almost the entire cost of the conference. The rest of the conference expenses are covered by NSF, specifically some costs for invited speakers, students, special guests and support for international partners to attend. SEC, the DOD Air Force Research Lab and NASA all assist with the planning of Space Weather Week, and representatives from industries impacted by space weather including those from electric power, commercial airlines, satellite operations, and navigation/communications are among frequent participants and contributors. The attached spreadsheet highlights comments SEC has received from users about impacts of space weather on their efforts.

VALUE OF SPACE WEATHER FORECASTING AND RESEARCH

In the last few years, there has been a large increase in society's need for space weather information, as geomagnetic storms and solar disturbances can impact a wide array of sectors and industries ranging from transportation to electricity generation. SEC's website receives on average more than 500,000 hits per day from commercial and public users. This number can triple during severe space weather events. SEC forecasts and research helps support a wide array of needs including

the U.S. power grid infrastructure, commercial airline industry, Global Positioning System or GPS, NASA human space flight activities, satellite launch and operations, and U.S. Air Force operational activities.

The direct global economic impact of space weather has been estimated at about \$200 million per year. A one percent gain in continuity and availability of GPS information, which can be disrupted by space weather events, would be worth \$180 million per year. DOD alone spends \$500 million each year to mitigate space weather effects. In 1989, a space weather storm caused such significant orbital decays that the Air Force Space Command lost track of 1,300 of the 8,000 objects orbiting in space that it was tracking. In addition to the potential harm radiation from a space weather event can cause astronauts and sensitive electrical equipment in space, these rapid changes in flight paths of space debris could be potentially harmful should they intersect with the paths of astronauts or satellites in space. In March 1989, seven geostationary satellites had to make 177 orbital adjustments in two days, more than normally made in a year. Such wear reduces the satellites' useful lifespan. Destruction of AT&T's Telestar satellite by a severe weather event in 1997 disrupted TV networks and part of the U.S. earthquake monitoring network, and forced renegotiation of the sale of Telestar, resulting in a drop of \$234 million in value. Submarine, continental cables, and parts of fiber optic cable systems have all been known to fail or be overloaded as a result of space weather.

Geomagnetically-induced currents can disrupt or wipe out electrical systems through power surges that cause network supply disruptions, transformer damage, and wear-and-tear on other components. As we apparently witnessed this summer during the blackout in the north, a single failure in the power grid can escalate into cascading damages and outages. Oak Ridge National Laboratory estimates that a blackout in the Northeast caused by geomagnetic storms could result in a \$3-6 billion loss in Gross Domestic Product (GDP). A geomagnetic storm in 1989 caused \$13.2 million in damage to power systems operators in Quebec, and another \$27 million to power operators in New Jersey. In addition, the disruption creates additional impacts for power customers who lose electricity. After 1989, Hydro-Quebec spent \$1.2 billion on capacitors to prevent potential space weather disruptions. A current, induced by severe space weather, in a liquefied gas pipeline that ignited when two trains passed over it is the suspected cause of an accident that killed over 500. Preventative measures, based on early forecasts from the SEC and its partners, can help mitigate the need for such costly alternatives as shielding power lines. One recent estimate suggested that the use of good forecasts by the power industry could save the U.S. \$365 million per year, averaged over the solar cycle.

Not only do we depend more heavily on systems that can be adversely impacted by space weather, new systems and new modes of operation using old systems vulnerable to space weather have proliferated. Satellites are becoming smaller and cheaper because of reduced component size and increased computer speeds. Economic competition drives the need to reduce shielding and redundancy, but these changes leave satellites more vulnerable to space weather disturbances. U.S. airlines are offering passengers the convenience of non-stop flights over the North Pole to Asian destinations; these flights (and research flights in Antarctica) sometimes experience air traffic control difficulties due to space weather. During a March 2001 space weather storm, 25 flights were rerouted to avoid the Poles because of the increased radiation risk.

National policy and defense planning have resulted in increased reliance on the use of commercial systems to gather information and move it between the United States and troops and ships in hot spots around the world. However, experiences during severe conditions of the last solar cycle indicates that some users may experience performance failures and degraded results during times of high solar and ionospheric activity. The nation is also placing large numbers of astronauts into radiation-vulnerable orbits for unprecedented periods of time during the assembly and operation of the International Space Station. Our increased need for improved space weather information to insure safety, reliability, and defense are inevitable outcomes of our growing use of space-weather-sensitive systems.

SEC has been keeping up with the changes, responding to new customer needs, research breakthroughs, and the changing face of space weather services. Among several successes, it has transitioned physics-based numerical models into the operational space weather service. It was possible to use the first of these university-developed models only when real-time solar wind data from upstream of Earth became available to drive them. Now forecasters get numerical guidance, much as meteorological forecasters do. Model output can be disseminated to provide customers with the space weather analogs of meteorological weather maps, showing event locations and intensities of computed fronts and boundaries. SEC has designed website to make it user-friendly for a range of audiences, from electricity producers to teachers and the media.

A solar x-ray imager on GOES-12 was made operational in 2003, funded as a USAF-NASA-NOAA partnership, and has provided images of the solar corona at a rate of once per minute. Images are able to show visible coronal changes that signal events on the Sun which will later cause space weather storms. This imager is the first of its kind, and it shows more capability in imaging the Sun for forecasting purposes than any solar imager to date. Automating the extraction of information from these images and incorporating the information into specification and forecast algorithms is already shedding light into the causes of solar wind and eruption events hazarding Earth. However, on the morning of September 2, 2003, the GOES-12 SXI instrument automatically transferred into an instrument safe (non-operational) mode. Two attempts were made to raise instrument voltages to their normal operating levels, but both attempts failed. Development of plans to return the SXI to limited operations is underway.

SEC is also active in developing products and services for the next generation air transport system. Working with both the commercial airlines and the FAA, SEC is formulating new products to serve airline operations of the future. That future is certain to include higher flying and trans-polar air routes as each allows for a faster more profitable trip. Particular issues that are impacted by space weather are navigation, radio communication, and radiation to the passengers and crew. Recent work with the FAA's User Needs Analysis Team (UNAT) has led to the implementation of SEC alerts and warnings into the operational planning for commercial airlines on trans-polar routes. Specifically, communications from air to ground, and the management of the radiation environment are points of concerns for the FAA. SEC has worked to supply the appropriate real-time information to be used by aircraft dispatchers.

CONCLUSION

In conclusion, Mr. Chairman and Members of the Subcommittee, NOAA is pleased to have had the opportunity to provide you an overview of space weather and SEC, our collaborative activities with our partners, and the value of space weather forecasting and research. We look forward to continuing our efforts to provide a critical service for our nation by providing cutting-edge research and forecasts in the space weather arena. I would be happy to answer any questions you may have.

Chairman Ehlers. Colonel Benson.

STATEMENT OF COLONEL CHARLES L. BENSON, COMMANDER, AIR FORCE WEATHER AGENCY

Colonel Benson. Good morning. I am honored to appear before you today to address this committee on a matter critical to our nation: space weather. I am also pleased to be joined by this distinguished panel of witnesses, including my partner to my right in operational space weather services, Dr. Hildner, Director of the Space Environment Center, otherwise known as SEC, National Oceanic and Atmospheric Administration.

The Air Force Weather Agency, known as AFWA, and SEC operate complementary space weather forecast centers. Over the last several decades in which the Air Force and NOAA have analyzed and forecast space weather for operational users, we have learned a valuable lesson: space weather is complex and costly. Our solution has been to leverage each other's resources, capabilities, and expertise, achieving efficiency by concentrating on those things we each do best. In simplest terms, AFWA is responsible for military and national intelligence support. SEC supports civilian and commercial users.

At AFWA, our focus has been on providing military war fighters and DOD decision-makers with mission-tailored space weather impact products. AFWA is the sole operational space weather support organization in the Department of Defense. To maintain our close working relationship, **AFWA has staffed a** small contingent of Air Force weather personnel at SEC in Boulder, Colorado since 1972. This operating location acts as a liaison to coordinate data sharing, forecast collaboration, and to develop new forecast techniques. Daily coordination is also accomplished through multiple teleconferences, which assures agreement on joint space weather forecast products.

Another great advantage of our close working relationship with SEC is cost sharing opportunities. For example, the Air Force funded \$18 million to develop the Solar X-ray Imager Sensor, now operational on a NOAA satellite. This new sensor now provides critical data to both forecast centers.

Lastly, AFWA relies on real-time data relay and processing, partial backup, and expertise and experience from SEC to provide DOD operators with high quality space weather analysis, forecasts, and warnings.

AFWA aggressively reviewed the space weather operations performed at SEC to determine if AFWA could assume their support responsibilities if the proposed funding cuts are realized. Our initial evaluation shows that there would be many significant challenges transitioning the data ingest, space weather models, applications, and computer and communication infrastructures. Meeting these challenges would be both time-consuming and very costly. In particular, the space weather research and technology transition expertise at SEC would take years to rebuild at AFWA. Furthermore, there are

security, policy, and resource issues of great concern, approval to operate and connect to military networks, Armed Forces Title 10 responsibilities providing services to commercial interests, and both manpower and operating fund limitations.

Our Nation is becoming increasingly dependent on space technology. Although the science of space weather is still in its infancy, it has been compared to the meteorological capability of this country in the 1950's, we are on the verge of improved capabilities from new models and data sources, which will provide more accurate space weather services. SEC is at the forefront of this movement. The Nation's investment in space weather capabilities will yield great future dividends, just as the investment in terrestrial weather 50 years ago is paying off today in the Nation's ability to anticipate extreme weather and then mitigate its effects.

The synergy of the two complementary space weather forecast centers at SEC and AFWA have proven to be a national asset to the security and prosperity of the United States. We urge this committee to advocate for a healthy and stable SEC so this critical capability for military and civilian users will continue into the future.

I look forward to addressing all of your questions later.

[The prepared statement of Colonel Benson follows:]

Prepared Statement of Colonel Charles L. Benson, Jr.

Introduction

I am honored to appear before you today to address this committee on a matter critical to our nation: space weather. I am also pleased to be joined today by one of my partners in operational space weather services, Dr. Ernest Hildner, Director of the Space Environment Center (SEC), National Oceanic and Atmospheric Administration (NOAA).

Overview of Air Force Space Weather Services

The Air Force Weather Agency (AFWA) has the sole responsibility to provide military space weather services to all Department of Defense (DOD) agencies and units, as well as to the National Intelligence Community. Our mission is two-fold: to collect space weather data from DOD ground- and space-based sensors; and to provide environmental battlespace awareness through mission-tailored analyses, forecasts, and warnings of mission-impacting space weather to operators, warfighters, planners and decision-makers from command level down to individual units. To accomplish our mission, AFWA operates the Space Weather Operations Center, or Space WOC, the Nation's only military space weather analysis and forecast center, located at Offutt Air Force Base, Nebraska. We also operate a global network of optical and radio solar observatories, and maintain an intercontinental network of space weather sensors feeding data to the Space WOC. AFWA employs sixty-four (64) military and contractor personnel at the Space WOC and other locations, including thirty (30) personnel stationed at the solar observatories around the world. In addition to the personnel costs, AFWA committed \$10.9 million dollars in Fiscal Year 2003 to operate, upgrade and improve the Space WOC and solar observatories, and to collect data from DOD ground- and space-based sensor networks. AFWA is dedicated to providing warfighters a complete situational awareness of the battlespace in which they operate. This enables the warfighters to

maximize their effectiveness while minimizing the risk to life, resources and mission impacts introduced by the natural space environment.

Users of Air Force Space Weather Products and Information

Users of AFWA's space weather services include every branch of service--Army, Air Force, Navy, Marine Corps and Coast Guard--and the National Intelligence Community, from leadership and senior decision makers to specific individual units. Success in every modern military operation depends upon at least one of the following space weather-impacted capabilities: long-distance radio or satellite communications for command and control, precision navigation and timing from Global Positioning System (GPS) signals, over-the-horizon or tactical radars, high-altitude manned aerial reconnaissance, orbiting spacecraft and sensors, and strategic space launch. AFWA provides analyses and forecasts of space weather impacts on these capabilities to DOD and National Intelligence Community leadership and operators. The National Oceanographic and Atmospheric Administration (NOAA) Space Environment Center (SEC) is a major user of Air Force space weather data. AFWA provides this data in accordance with collaborative partnering agreements to facilitate its space weather support to the commercial and civilian communities.

Relationship Between AFWA, SEC, and NASA

AFWA and SEC are partners in providing space weather service to the Nation. Each has clearly defined roles and responsibilities, leveraging the capabilities of the other to realize significant cost and resource savings. In simplest terms, AFWA is responsible for military and national intelligence support--SEC supports civilian and commercial users. The Air Force divides space weather services into five basic steps: (1) observe, measure, and collect space weather data, (2) analyze the data, (3) specify and forecast the space environment, (4) tailor analyses and forecasts to meet individual user needs, and (5) integrate space weather information to users' decision and execution processes. AFWA's primary focus on information tailoring and integration are the two steps providing the greatest benefit and value to the warfighter. SEC emphasizes characterization and forecasting the natural space environment.

AFWA relies on SEC in three crucial areas to accomplish our space weather mission: 1) unique data, analyses and forecasts provided by SEC; 2) partial backup capability; and 3) SEC's unique space weather experience and expertise. The Space WOC relies on ground- and space based magnetometer data provided through SEC to analyze, warn and forecast global geomagnetic activity important to the national intelligence agencies and to the North American Aerospace Defense Command (NORAD). AFWA also depends on alerts of geomagnetic activity from NOAA satellites and solar activity forecasts provided by SEC to warn and forecast impacts to specific military communications links. As identified in the National Space Weather Program Implementation Plan, the AFWA and SEC forecast centers provide limited back-up operations for each other in the event of computer equipment or communication outages. Current back-up consists of telephone notification of observed space weather events. Space WOC and SEC coordinate on forecasts and engage in multiple daily space weather teleconferences. These

teleconferences inject valuable insight into the science and art of space weather forecasting and allow AFWA to leverage the vast knowledge and experience of SEC scientists.

AFWA reciprocates in our partnership with SEC by sharing unique DOD space weather data and Air Force forecasts of geomagnetic activity. SEC utilizes solar images and radiographs from the solar observatories, particle data from sensors aboard military satellites, and ground-based DOD instruments in their operations. In addition, every six hours the Space WOC produces a forecast of geomagnetic activity from SEC supplied data. SEC in-turn uses these forecasts in the production of their products and services.

To facilitate and promote our close working relationship, AFWA established Operating Location-P (OL-P) co-located with SEC at Boulder, Colorado. OL-P personnel act as liaisons between SEC and AFWA, coordinate back-up policy and procedures between the two organizations, augment SEC forecaster manning, interact with researchers, ensure smooth and continuous data flow between both forecast centers, assist SEC researchers in establishing new data sources and ground data systems, and take part in developing new space weather forecast techniques benefiting both organizations. The complementary nature of the two missions allows both NOAA and the Air Force to realize cost sharing advantages to acquire needed data. SEC provides the Advanced Composition Explorer real-time tracking data to AFWA. The Air Force paid \$18 million to develop the Solar X-ray Imager now operational aboard one of the NOAA Geostationary Operational Environmental Satellites. Additionally, AFWA pays the National Aeronautics and Space Administration (NASA) Jet Propulsion Laboratory (JPL) for ground-based space weather data from a global network of GPS receivers.

AFWA taking on the duties of SEC

Air Force Weather Agency aggressively reviewed the space weather operations performed at SEC to determine if AFWA could assume their support responsibilities if proposed funding cuts are realized. Our initial evaluation shows that there are many significant technical challenges transitioning the data ingest, space weather models and applications, and computer and communication infrastructures from SEC to the Space WOC. Meeting these challenges will be both time consuming and costly. Additionally, there are many critical issues and important policy considerations that would have to be addressed prior to assuming any commercial space weather services at AFWA. These include Armed Forces Title 10 responsibilities, security and accreditation affecting AFWA's approval to operate and connect to DOD communication networks, as well as significant manpower and funding resource issues. In particular, SEC's expertise and experience in satellite-based space weather measurements from NOAA spacecraft, and its one-of-a-kind space weather modeling applications, would be very difficult to reproduce at AFWA. The space weather research and technology transition expertise resident at SEC would take years to build at AFWA.

Impacts on Air Force and Military Ops

There would be an immediate and severe impact on military operations if the Space Environment Center no longer existed. Air Force Weather Agency's ability to

characterize and forecast the space environment would be dramatically reduced, impacting space situational awareness, satellite and radio communications, space control, precision navigation and strike, high-altitude flight and space operations. Additionally, the loss of a back-up capability for the Space WOC would have serious implication on the AFWA continuity of operations plan. The loss of SEC expertise and decades of experience would likely decrease AFWA's space weather characterization and forecast accuracies. The closure of SEC would also result in a decrease in the rapid transition of new techniques and data sources into space weather forecast operations.

Summary

Over the last several decades in which the Air Force and NOAA have analyzed and forecasted the space environment for operational users, we have learned a valuable lesson: space weather is a complex and costly undertaking. Our solution has been to leverage each other's resources; achieving efficiency by concentrating on those things we each do best. Our nation is becoming increasingly dependent on space technology. Although the science of space weather is still in its infancy—which some have compared to the meteorological capability of this country in the 1950's—we are on the verge of improved capabilities from new models and data sources that will provide more accurate space weather services. SEC is at the forefront of this movement. The Nation's investment in space weather capabilities will yield great future dividends, just as the investment in terrestrial weather fifty years ago is paying off today. The synergy of the two complementary space weather forecast centers at SEC and AFWA has proven to be a national asset to the security and prosperity of the United States. One does not have to look very far to see that the United States is not the only "game in town" when it comes to the exploitation of the space environment. We urge this committee to advocate for a healthy and stable SEC so that this critical capability for military and civilian users will continue into the future.

Chairman Ehlers. Thank you.

Dr. Grunsfeld.

STATEMENT OF DR. JOHN M. GRUNSFELD, CHIEF SCIENTIST, NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

Dr. Grunsfeld. Thank you.

Mr. Chairman, Members of the Subcommittee, thank you very much for the opportunity for NASA to testify before you today regarding the importance of space weather forecasting provided by the National Oceanic and Atmospheric Administration Space Environment Center and its impact on NASA programs.

Providing space weather data is an important operational service and has a wide range of customers both within the United States Government and in the private sector. My testimony today will focus on how NASA uses these critical data. I will speak to you both from a position as NASA's Chief Scientist, but also as a member of the Astronaut Corps, the group of folks who are most directly exposed to the effects of space weather,

and I should add, those few individuals who have ventured beyond 8,000 meters in altitude on Planet Earth.

Solar wind conditions, solar flares, coronal mass ejections, and subsequent geomagnetic activity, commonly referred to as “space weather,” affect many more areas of NASA’s activities than most people realize. Space weather can have significant adverse impacts on human health, spacecraft operations by increasing the intensity of the near-Earth radiation environment, the increased atmospheric drag on satellites, disrupting their orientation, reducing their lifetime, degrading UHF and high frequency communications, and the operation of the Global Positioning System signals that we use in our spacecraft. These effect the health of our astronauts in orbit, space engineering and research equipment, orbital altitude for spacecraft such as the Hubble Space Telescope, and ultimately, we use this information to design our spacecraft.

NASA’s space and earth science missions routinely employ real-time forecasts from the NOAA SEC to make decisions regarding data collection, spacecraft operation, and even rocket launches. We use this information in the case of anomalies in spacecraft to determine whether it was space weather related or an engineering cause, and this is an important part of our activities to make sure that we maximize the scientific output of our resources.

The Chandra X-Ray Observatory and the recently launched Space Infrared Telescope Facility both use the SEC resources, observations of solar wind conditions and geomagnetic activity, as critical to their real-time input for spacecraft operations. In fact, in the recent solar activity, we have taken advantage of SEC observations to modify our planning for those scientific spacecraft.

At the NASA Johnson Space Center, the Space Radiation Analysis Group uses data provided by the SEC to determine the radiation environment in which NASA’s crewed spacecraft will operate. NOAA has supplied space weather monitoring and forecasting information to NASA for every human space flight mission since Apollo 8. This information affects operational decisions, when to launch a particular mission, and when we would do space walking activities or extra-vehicular activities. Because of this—the information that the SEC provides, we can plan our missions and activities in such a way to minimize the radiation exposure received by astronauts on our vehicles.

Minimizing radiation exposure for Shuttle and International Space Station crews is imperative. NASA has sought the advice of the National Council on Radiation Protection and Measurements concerning radiation exposure limits for our astronauts and uses this advice in setting dosage limits. We are also guided by a principle that we call: “As Low as Reasonably Achievable.” Without the data provided by the SEC, NASA would have to reassess its operations to protect against exposure to radiation events occurring without warning. And I should add that during this recent solar activity, we have changed some of our operational procedures based on SEC data to ensure the safety of our astronauts and the International Space Station.

Losing the SEC forecast that supports space flight missions would be like living along a coastal area without any hurricane forecasting capability. You would know the hurricane hit you, but you would have no advanced warning, no ability to take preventive actions, and no idea how strong it would be or how long it would last.

NASA has a long history of cooperation with SEC and its predecessor organizations at NOAA. The partnership has enabled SEC to expand its capabilities to support human space flight missions. We have supported the expansion of SEC services and functionality, specifically in data processing, so that they continue to support our Shuttle and ISS missions.

It is not within NASA's mandate as a research and development agency to provide the operational forecasting services currently provided by the SEC. In addition, the technical capacity, budget, and expertise required to perform this activity could not transition to NASA without impacting our ongoing space flight research and operations. The NOAA SEC has a unique complement of people, experience, and resources that allows it to provide a high level of service to the space weather customers. There are no other sources, either domestic or foreign, that can provide this type of support. The capability to monitor and forecast this environment should well remain with the agency that has the mission and the proven expertise to respond to all of these customers.

Thank you.

Dr. Grunsfeld.

STATEMENT OF DR. JOHN M. GRUNSFELD, CHIEF SCIENTIST, NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

Dr. Grunsfeld. Thank you.

Mr. Chairman, Members of the Subcommittee, thank you very much for the opportunity for NASA to testify before you today regarding the importance of space weather forecasting provided by the National Oceanic and Atmospheric Administration Space Environment Center and its impact on NASA programs.

Providing space weather data is an important operational service and has a wide range of customers both within the United States Government and in the private sector. My testimony today will focus on how NASA uses these critical data. I will speak to you both from a position as NASA's Chief Scientist, but also as a member of the Astronaut Corps, the group of folks who are most directly exposed to the effects of space weather, and I should add, those few individuals who have ventured beyond 8,000 meters in altitude on Planet Earth.

Solar wind conditions, solar flares, coronal mass ejections, and subsequent geomagnetic activity, commonly referred to as "space weather," affect many more areas of NASA's activities than most people realize. Space weather can have significant adverse impacts on human health, spacecraft operations by increasing the intensity of the near-Earth radiation environment, the increased atmospheric drag on satellites, disrupting their orientation, reducing their lifetime, degrading UHF and high frequency communications, and the operation of the Global Positioning System signals that we use in our spacecraft. These effect the health of our astronauts in orbit, space engineering and research equipment, orbital altitude for spacecraft such as the Hubble Space Telescope, and ultimately, we use this information to design our spacecraft.

NASA's space and earth science missions routinely employ real-time forecasts from the NOAA SEC to make decisions regarding data collection, spacecraft operation, and even rocket launches. We use this information in the case of anomalies in spacecraft to determine whether it was space weather related or an engineering cause, and this is an important part of our activities to make sure that we maximize the scientific output of our resources.

The Chandra X-Ray Observatory and the recently launched Space Infrared Telescope Facility both use the SEC resources, observations of solar wind conditions and geomagnetic activity, as critical to their real-time input for spacecraft operations. In fact, in the recent solar activity, we have taken advantage of SEC observations to modify our planning for those scientific spacecraft.

At the NASA Johnson Space Center, the Space Radiation Analysis Group uses data provided by the SEC to determine the radiation environment in which NASA's crewed spacecraft will operate. NOAA has supplied space weather monitoring and forecasting information to NASA for every human space flight mission since Apollo 8. This information affects operational decisions, when to launch a particular mission, and when we would do space walking activities or extra-vehicular activities. Because of this—the information that the SEC provides, we can plan our missions and activities in such a way to minimize the radiation exposure received by astronauts on our vehicles.

Minimizing radiation exposure for Shuttle and International Space Station crews is imperative. NASA has sought the advice of the National Council on Radiation Protection and Measurements concerning radiation exposure limits for our astronauts and uses this advice in setting dosage limits. We are also guided by a principle that we call: "As Low as Reasonably Achievable." Without the data provided by the SEC, NASA would have to reassess its operations to protect against exposure to radiation events occurring without warning. And I should add that during this recent solar activity, we have changed some of our operational procedures based on SEC data to ensure the safety of our astronauts and the International Space Station.

Losing the SEC forecast that supports space flight missions would be like living along a coastal area without any hurricane forecasting capability. You would know the hurricane hit you, but you would have no advanced warning, no ability to take preventive actions, and no idea how strong it would be or how long it would last.

NASA has a long history of cooperation with SEC and its predecessor organizations at NOAA. The partnership has enabled SEC to expand its capabilities to support human space flight missions. We have supported the expansion of SEC services and functionality, specifically in data processing, so that they continue to support our Shuttle and ISS missions.

It is not within NASA's mandate as a research and development agency to provide the operational forecasting services currently provided by the SEC. In addition, the technical capacity, budget, and expertise required to perform this activity could not transition to NASA without impacting our ongoing space flight research and operations. The NOAA SEC has a unique complement of people, experience, and resources that allows it to provide a high level of service to the space weather customers. There are no other sources, either domestic or foreign, that can provide this type of support. The capability

to monitor and forecast this environment should well remain with the agency that has the mission and the proven expertise to respond to all of these customers.

Thank you.

[The prepared statement of Dr. Grunsfeld follows:]

Prepared Statement of John M. Grunsfeld

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to testify before you today regarding the importance of space weather forecasting provided by the National Oceanic and Atmospheric Administration (NOAA) Space Environment Center (SEC) and its impact on NASA's programs. Providing space weather data is an important operational service, and it has a wide range of customers, both within the United States Government and in the private sector. My testimony today will focus on how NASA uses these critical data. I will speak to you from my perspective both as NASA's Chief Scientist, and as a member of the astronaut corps—the group of people most directly exposed to the effects of space weather.

Solar wind conditions, solar flares, coronal mass ejections (CMEs), solar extreme ultraviolet emissions, and subsequent geomagnetic activity, commonly referred to as “space weather,” affect many more areas of NASA operations and programs than most people realize. Space weather can have significant adverse effects on human health and spacecraft operations by increasing the intensity of the near-Earth radiation environment, increasing atmospheric drag, disrupting satellite orientation, and degrading UHF and HF communications and Global Positioning System (GPS) signals. These affect the health of our astronauts in orbit, space engineering and research equipment functionality, orbital attitude for spacecraft such as the Hubble Space Telescope, and ultimately, the way we design spacecraft.

NASA's Space and Earth Science missions routinely employ real-time forecasts from the NOAA SEC to make decisions regarding data collection, spacecraft operations, and rocket launches. NASA engineers and researchers use near, real-time SEC forecasts to analyze instrument and spacecraft anomalies, and separate cause and effect in the highly modulated environment of space. During solar-induced changes to the near-Earth radiation environment, NASA's in-space research instrumentation can become saturated by solar energetic particles, which can lead to anomalies. This has happened numerous times during the recent maximum phase of the solar cycle. One example comes from the Earth Science Mission Operations (ESMO) Project. The ESMO uses data provided by the NOAA SEC to determine whether spacecraft anomalies are the result of system malfunctions or space weather events. Being able to determine quickly that an anomaly was caused by space weather allows ESMO to avoid lengthy equipment shutdowns while engineers search for a cause. NOAA SEC is the only operational source for accurate, real-time information on the near-Earth space radiation environment. NASA uses the lessons learned from these experiences and the database of radiation measurements gathered by SEC to design spacecraft with more robust systems that can withstand space weather events.

The Chandra X-Ray Observatory and the recently launched Space Infrared Telescope Facility both use the SEC observations of solar wind conditions and geomagnetic activity

as a critical input to their real-time models of the Earth's radiation environment. These models allow us to adjust our operations to mitigate sensor degradation and data loss. The result is that NASA is able to ensure optimal scientific return from these two flagship missions. The SEC observations are also crucial to NASA-funded research exploring the Sun-Earth connection. The Sun affects the entire solar system, including all scientific data collection satellites.

At the NASA Johnson Space Center, the Space Radiation Analysis Group (SRAG) uses data provided by the SEC to determine the radiation environment in which NASA's crewed spacecraft will operate. NOAA has supplied space weather monitoring and forecasting information to NASA for every human space flight mission since Apollo 8. This information affects operational decisions, such as when to launch a particular Shuttle mission and when extra-vehicular activities (EVAs) can be safely conducted. Because of the information that the SEC provides, we can plan missions and on-orbit activities in such a way as to minimize the radiation exposure received by our astronauts and our vehicles.

Minimizing radiation exposure for Shuttle and International Space Station crews is imperative. NASA has sought the advice of the National Council on Radiation Protection and Measurements concerning radiation exposure limits for our astronauts, and uses this advice in setting radiation dosage limits. NASA's radiation protection efforts are further guided by the ALARA (As Low as Reasonably Achievable) principle. Without the data provided by SEC, NASA would have to reassess its operations to protect against exposure to radiation events occurring without warning.

Losing the SEC forecast that support space flight missions would be like living along a coastal area without any hurricane forecasting capability. You would know when the hurricane hit you, but you would have no advanced warning, no ability to take preventive actions, and no idea how strong it would be or how long it would last. The risk that radiation poses to our spacecraft and astronauts is borne out by past examples. For instance, in 1989 significant solar events impacted both the Space Shuttle and the Mir space station, along with other uncrewed spacecraft. In the spring of 1989, a solar flare, solar particle event, and a geomagnetic storm doubled the daily radiation dose for the Mir crew for two days, with elevated levels lasting for two weeks. The solar events increased atmospheric drag during the first day of STS-29. NORAD lost track of several space objects for time periods varying from days to weeks. Several satellites lost attitude control, while others tumbled. These space weather events also brought the northeastern United States' power grid close to collapse. In the fall of 1989, a second series of solar particle events again raised the dose of the Mir crew and damaged satellite solar arrays.

The information provided by SEC is critical to NASA today as we operate the ISS until the Space Shuttle returns to flight. NASA has some monitoring capability on the ISS that we rely upon to gauge the safety of the ISS environment for the crew. Although we have tools that allow us to measure the radiation exposure of the crew and vehicle on a periodic basis, we cannot monitor it constantly. This equipment was designed as a back-up to the radiation monitoring and forecasting data provided by SEC, which allow flight controllers to notify the crew of increased radiation exposure levels. The SEC provides NASA with critical real-time monitoring and forecasting of the radiation environment around the Earth. We use this information along with on board

instrumentation to assess the ISS radiation environment. In the current solar event, SEC forecasts gave us sufficient warning of a proton flux event to allow the ISS crew to shelter in areas of the ISS which provide more shielding protection from radiation.

NASA has a long history of cooperation with SEC and its predecessor organizations at NOAA. That partnership has enabled SEC to expand its capabilities to support human space flight missions. In the 1960s, NASA funded the development of the Solar Particle Alert Network (SPAN) to support the Apollo missions. NASA also supported the expansion of SEC services to support our Skylab missions. Most recently, we have helped SEC to modernize and add functionality to its data processing systems so that they can continue to support our Shuttle and ISS missions.

Building on the information and analysis provided by SEC, we have expanded our understanding of the impact of space weather on NASA's operations, and our ability to predict and respond to significant events. It is only in the past decade that we have realized that geomagnetic activity can enhance the outer electron belt, and increase radiation exposure for astronauts performing EVAs. During the same period, we have learned the importance of CMEs with regard to solar flares in producing large proton events that can pose health risks to astronauts on orbit. NASA's Solar and Heliospheric Observatory (SOHO) has revolutionized our understanding of CMEs, providing real-time images of CMEs coming toward Earth. Perhaps most significantly, in the last several years, we have discovered definitive evidence of the magnitude and frequency of very large solar particle events over the past 400 years. These events were significantly larger than anything we have witnessed since humans started flying in space. It is likely that we will see a recurrence of solar particle events of a similar magnitude.

It is not within NASA's mandate as a research and development agency to provide the operational forecasting services currently provided by the SEC. In addition, the technical capacity, budget and expertise required to perform this activity could not transition to NASA without impacting our other ongoing space flight operations and research. The NOAA SEC has a unique complement of people, experience, and resources that allows it to provide a high level of service to its space weather customers. There are no other sources, either domestic or foreign, that can provide this type of support. As the United States continues to expand its reliance on space-based assets such as GPS, cellular communications, and digital satellite technology, the importance of understanding the space weather environment becomes even more critical. The capability to monitor and forecast this environment should remain with the agency that has the mission and the proven expertise to respond to all of these customers.

I sincerely appreciate the forum that the Subcommittee provided today to highlight the importance of space weather forecasting, and I look forward to the opportunity to respond to your questions.

Chairman Ehlers. And I thank you.

And I apologize for the bells ringing. We have not one, not two, but three votes on the Floor. I would estimate it will take us approximately a half an hour total. So we will recess at this point at the call of the Chair and return as soon as possible after the third vote. And I apologize to you for the interruption. The Committee is in recess.

[Recess.]

Chairman Ehlers. The Committee will come to order. I apologize that it took longer. The—we are having some political problems, which I know is very hard for you to believe. But we are hoping to pass the supplemental appropriation today, and there are some very strong feelings on both sides, so we have had some delay motions and votes.

We will proceed now with Mr. Kappenman.

STATEMENT OF MR. JOHN G. KAPPENMAN, MANAGER, APPLIED POWER SYSTEMS, METATECH CORPORATION

Mr. Kappenman. Thank you, Mr. Chairman and Committee Members.

I am here to represent the viewpoint of the **electric power industry and the important threat that geomagnetic storms pose to this critical national infrastructure and the importance of the Space Environment Center forecasting and forecasting services that are rendered to the power industry for this important threat.**

You have posed a number of very important questions. I will try and briefly cover the highlights of those, although I do provide more detail in the prepared testimony. The first question is the historic impacts of these large storms. And I will give you a very brief overview of a storm that occurred about 14 years ago, and in fact, was the last geomagnetic super storm that occurred and the nature of the impacts that were felt in North America on the power grid for that storm.

If we can start an animation here.

[Video]

This is just showing you 20 minutes of what I would call very bad space weather that day. And the important feature of this type of weather is that it is unlike terrestrial weather. You are seeing sudden onsets, planetary, continental impacts and—of that moving at phenomenal rates of speed.

Power systems are built to withstand certain types of weather, mostly terrestrial weather, but that is very regionally confined when it is severe. This sort of severe weather has, truly, a continental footprint, and that presents a very unique challenge to operations of power grids. In fact, the next slide here—I will start up an animation.

[Video]

These are the impacts that were observed by the U.S. power grid or North American power grid coincident with that previous 20 minutes of bad space weather. And in the case of Quebec itself, the entire province experienced a blackout from this brief period of activity. And in fact, the power system operators that day—this was the worst day of your life if you are a power system operator, because things happen so quickly. You have very little time to intervene. In the case of Hydro Quebec, they went from normal operating conditions to complete province-wide blackout in 92 seconds: no time to even assess what was going on, let alone try and do any sort of meaningful human intervention. Later on that day, if we will start up this animation, the storm got even more intense.

[Video]

And as you can see, it was well down into and across the entire U.S. for this 40-minute duration shown here. This storm lasted in excess of a day. And I am just showing you a few of the highlights from this activity. If we can go for—here we go.

[Video]

If we start up this animation, for that previous storm activity, this is what was observed in the U.S. as far as important power system operating anomalies. We barely hung on to the system in retrospect, the postmortems. Everybody agrees. We came very, very close to experiencing a very—potentially very widespread power system collapse that could have occurred in the U.S. that day.

The second question you posed, forecasts and how are they used. The short answer, power grids certainly do have operational procedures that they put in place in times of geomagnetic storms. They have both prepared actions that they do from advanced forecasts as well as actions that they do from nowcasts and updates on a continuous basis. These are provided, of course, from SEC or from commercial providers, like my company, that depend greatly on SEC data to provide even more detailed forecasts of what could occur.

The nature of recent discoveries was also asked. We certainly have learned a lot about the threat that is posed to the U.S. power grid infrastructure by space weather over the past few years. We certainly, and I imagine your constituents know, that—post-August 14 of this year that there is an awareness that there has been a decline in power grid infrastructure and investment. And that has done nothing but increase our vulnerability to space weather since that March '89 storm.

We know, also, that storms can be, perhaps, three to ten times larger in magnitude than what occurred in March '89 and that large U.S. blackouts are possible.

[Slide]

This is just one of many scenarios that we have studied for regions that could be blacked out. We are looking at the potential of blackouts that could exceed even that of the very large blackout that occurred just a few months ago. And there is no part of the U.S. power grid that is immune to this. It is just a matter of where does this intense phenomenon geographically lay down? How big is the footprint? And we know these footprints can be very, very large. And literally, we could impact over 100 million population in the worst case scenarios.

If there is no Center, clearly this would degrade the ability to counter some of the important impacts.

Thank you.

[The prepared statement of Mr. Kappenman follows:]

Prepared Statement of John G. Kappenman

The Vulnerability of the U.S. Electric Power Grid to Space Weather and
the Role of Space Weather Forecasting

I am grateful for the Committee's kind invitation to offer testimony today on "What Is Space Weather and Who Should Forecast It?" as the answer to this important question

has many possible implications and places the Nation at an important crossroad. It is only fitting that we carefully consider the future path that is in the best interests of the Nation. And as I hope to emphasize in my testimony, these space weather concerns, especially in regards to impacts on electric power grids, may pose important homeland security and energy security concerns and should be considered in your deliberations.

BACKGROUND

For the past 27 years, I have been an active researcher and observer of electric power system impacts caused by the widespread geomagnetic field disturbances due to Space Weather. For some 22 years, these activities occurred while I was employed in the electric power industry itself. I not only lead research investigations funded by my employer, but also efforts funded by the Electric Power Research Institute. My areas of responsibility involved the design and development of the high voltage transmission network and one of our pressing concerns was the unique problems posed by the natural phenomena of Space Weather. This was a problem that we recognized was of a growing and evolving nature as our industry continued to grow in size and technological sophistication. I particularly became engaged with the NOAA-SEC in the aftermath of the great geomagnetic storm of March 13-14, 1989, a storm which produced historic impacts to the operations of power grids in the U.S. and around the world. I was part of an electric power industry group that advocated the efforts such as the ACE satellite and resulting solar wind monitoring that have greatly improved the Nation's capability to provide accurate short-term forecasts of severe geomagnetic storm events.

Since 1997, I have subsequently been employed with the Metatech Corporation and a part of what we now do is heavily involved with Space Weather and impacts on technology systems, particularly large power grids. Our company has, in fact, been involved in the vulnerability and risk assessment for the power grids in England and Wales, Norway, Sweden and portions of Japan. Metatech also provides continuous space weather forecasting services for the company that operates the electric power grid for England and Wales. Since May 2002, Metatech has been providing similar vulnerability and risk assessments for the U.S. electric power grid to the Commission to Assess the Threat to the United States from Electromagnetic Pulse (EMP Commission). The EMP Commission was established by Congress under the provisions of the Floyd D. Spence Defense Authorization Act of 2001, Public Law 106-398, Title XIV. The EMP Commission was chartered to conduct a study of the potential consequences of a high altitude nuclear detonation on the domestic and military infrastructure and to issue a report containing its findings and recommendations to the Congress, the Secretary of Defense, and the Director, FEMA. While the charter of this commission involved intentional electromagnetic attack on the U.S. infrastructures primarily from a high altitude nuclear burst, the MHD (or magneto hydro dynamic) portion of this electromagnetic attack can be remarkably similar to the electromagnetic disturbance caused by the natural phenomena of Space Weather. As a result the Commission wisely investigated the plausible impacts due to severe geomagnetic storms on the U.S. electric power infrastructure. The Commission has also closely coordinated with the NERC (North American Electric Reliability Council) and their Critical Infrastructure Protection Advisory Group (CIPAG). This group has been continuously and fully vetted on the findings of the Commission directed investigations. While the Commission is not

scheduled to report their findings back to Congress until approximately March of 2004, they have encouraged Metatech to freely share with the scientific community the investigation results related to severe geomagnetic storm events. As a result, as part of my prepared testimony, I will also provide the significant portions of these findings. However, at this point, I should caution that these reports will only be the opinion of Metatech as the Commission has not completed deliberations and will not formally issue findings until early next year.

In these diverse and various capacities, it has been my privilege to work with the NOAA-SEC for many years as an end-user of their forecast services, a bulk data user and, in some degrees, a competitor to the SEC. In all cases we have developed a close partnership with this agency and its staff, a relationship that has clearly allowed for key advances in improving the geomagnetic storm forecasting capability for the electric power industry.

Space Weather, Impacts to Electric Power Systems and the Importance of

Forecasting Services

The Committee has posed four questions which are designed to probe the topic area of Space Weather Forecasting Services and their importance to the reliability of the Nation's electric power grid. I shall attempt to answer these through examples of historic events, examination of developing trends and operational procedures, and efforts that have been made to model and extrapolate implications for severe storm scenarios.

Question 1. Please provide an overview of how space weather can affect electric power grid systems, including examples of historical events that have caused problems.

Space Weather is associated with ejection of charged particles from the Sun, which after colliding with the Earth's magnetosphere will produce significant disturbances in the normally quiescent geomagnetic field at the Earth's surface. These disturbances have caused catastrophic impacts to technology systems in the past (e.g., the power blackout in Quebec in March 1989). More importantly, as detailed examinations have been undertaken concerning the interaction of geomagnetic storm environments with power grids and similar infrastructures, the realization has developed that these infrastructures are becoming more vulnerable to disruption from electromagnetic interactions for a wide variety of reasons. This trend line suggests that even more severe impacts can occur in the future for reoccurrences of large storms.

An Overview of the U.S. Electric Power Grid

While electricity customers receive power from the local distribution system (typical operating voltage of 15kV with step down to 120/240 volt), the backbone of the system is the high voltage transmission network. The primary AC transmission network voltages in the U.S. are at 230kV, 345kV, 500kV and 765kV. These transmission lines and their associated transformers serve as the long distance heavy hauling arteries of electricity production in the U.S. A single 765kV transmission line can carry over 2000 MW of power, nearly 200 times what a typical 15kV distribution line which is the overhead line commonly used for residential distribution. Space Weather or geomagnetic disturbances directly attack this same high voltage transmission circulatory system and because both

have continental footprints, these disturbances can rapidly erode reliability of these infrastructures and can therefore threaten widespread blackout for extreme disturbance events. The U.S. electric power grid is the world's most extensive, Figure 1 provides a map of the approximate location of the nearly 80,000 miles of 345kV, 500kV and 765kV transmission lines in the contiguous U.S.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

These geographically wide spread assets are also fully exposed to the extremes of the terrestrial environments. Because these assets are the critical backbone of the system, utility company engineers have taken great care to engineer for robust capabilities of these assets to withstand most of the severe wind, lightning and ice loading exposures. For example, while many of the low voltage local distribution feeders can fail due to tree damage during hurricanes, these same hurricane events rarely threaten the integrity of the high voltage grid itself. While extensive attention has been paid to these assets for terrestrial weather exposures, a multitude of design decisions has inadvertently and significantly increased the power grid exposure and vulnerability to space weather environments, as will be discussed in later sections of this testimony. There are “no shortages” of challenges that these systems face. In addition to the terrestrial weather challenges, power company operators face even more ominous threats from the recent realization of physical and cyber terrorism. In spite of the best efforts, failures still can occur; for example, a lightning strike can still cause on occasion a high voltage transmission line to trip. Very high winds, for example, due to a tornado can cause the failure of a line or several lines on a common corridor. However, most of these events generally occur in isolation and power grids are operated at all times to withstand the largest creditable single contingency failure without causing a cascading collapse of the network itself. Space Weather differs from ordinary weather in that it has a big footprint and attacks the system across many points simultaneously, causing at times of severe events multi-point failures on the network that can threaten the integrity of the network. Therefore, geomagnetic storms may be one of the most important hazards and is certainly the least understood threat that could be posed to the reliable operation of these networks.

The transmission lines and substations are all geographically remote and unstaffed facilities. They are difficult to fully monitor and cannot be continuously patrolled. The bulk of the protection of these facilities are done via autonomous relays that continuously sense for disturbance conditions and operate as quickly as 70 msec to trip off or isolate an asset that is sensed as an operating outside of acceptable parameters to protect the integrity of the network as a whole. Real-time data from a limited number of monitoring points is brought back to one of the more than 150 continuously-staffed control centers used to operate the transmission infrastructure in the U.S. There operators continually assess network conditions and make needed adjustments to keep all flows and voltages within prescribed boundaries and limits. Further they are responsible to dispatch generation (in many cases within a market-based supply system) to perfectly balance the production and demand for electric energy. The limited amount of real-time data makes it a challenge to fully assess the many possible threats that can occur to these remote assets. The remotely monitored data is not at all times unambiguous and can lead to differing interpretations. Therefore it is not easy to determine the nature of a threat from this alarm

level information alone. In most control centers, the real-time data is typically augmented with continuous high quality terrestrial weather information, as regional storms and climatic events can be one of the most frequent sources of operational anomalies on the network. The power industry is just now getting to the point of being introduced to the same paradigm in regards to high quality space weather data and the benefits it could offer in improving situational assessments.

The Electric Power Infrastructure and Its Sensitivity to Disturbance

Levels

While more details will be provided later, a brief overview of how these geomagnetic disturbance environments actually interact with large regional power grids indicates the complex nature of the threat. When these disturbances occur they result in slowly varying (1-1000 seconds) changes in the geomagnetic fields that can have very large geographic footprints. These magnetic field disturbances will induce electric fields in the Earth over these same large regions. Across the U.S., complex topologies of long distance transmission lines have been built. These grids include transformers at generating plants and substations that have grounded neutrals. These transformer neutrals provide a path from the network to ground for these slowly varying electric fields (less than 1 Hz) to induce a current flow through the network phase wires and transformers.

These currents (known as geomagnetically-induced currents—GICs) are generally on the order of 10's to 100's of amperes during a geomagnetic storm. Though these quasi-DC currents are small compared to the normal AC current flows in the network, they have very large impacts upon the operation of transformers in the network. Under normal conditions, even the largest transformer requires only a few amperes of AC excitation current to energize its magnetic circuit, which provides the transformation from one operating voltage to another. GIC, when present, also acts as an excitation current for these magnetic circuits, therefore GIC levels of only 1 to 10 amperes can initiate magnetic core saturation in an exposed transformer. This transformer saturation from just a few amperes of GIC in modern transformers can cause increased and highly distorted AC current flows of as much as several hundred amperes leading to overloading and voltage regulation problems throughout the network.

Power networks for decades have been operated using what is termed an “N-1” operation criteria. That is, the system must always be operated to withstand the next credible disturbance contingency without causing a cascading collapse of the system as a whole. Therefore, when a single-point failure occurs, the system may need to be rapidly adjusted to be positioned to survive the next possible contingency. Space Weather disturbances have already been shown to cause near simultaneous multi-point failures in power system infrastructures, allowing little or no time for meaningful human interventions. The onset of severe geomagnetic field disturbances can be both sudden and have continental footprints, placing stresses broadly across power grid infrastructures.

When a transformer saturates, it can produce a number of simultaneous and undesired impacts to the grid. If the spatial coverage of the disturbance is large, many transformers (hundreds to thousands) will be simultaneously saturated. The principal concern to network reliability is due to increased reactive power demands from transformers that can

cause voltage regulation problems, a situation that can rapidly escalate into a grid-wide voltage collapse. But a nearly equal concern arises from collateral impacts stemming from highly distorted waveforms (rich in harmonics) from saturated transformers that are injected into the network. As previously mentioned protective relays continuously sense these now distorted signals. These distortions can cause a mis-operation of an exposed relay causing it to operate to isolate a key element of the network. When these relay mis-operations occur in-mass because of the big footprint of a storm, the protection systems can rapidly destroy the integrity of the network that the relays were intended to protect. In addition, individual transformers may be damaged from overheating due to this unusual mode of operation, which can result in long-term outages to key transformers in the network.

The threats to the infrastructure from geomagnetic storms include the possibility of widespread power blackouts, damage to expensive and difficult to replace transformers, and damage to equipment connected to the grid. As a result, an important aspect of concern is the time required to replace damaged transformers and to fully restore the operation of the power grid.

Historic Storm Events and Power System Impacts

The rate of change of the magnetic field is a major factor in creating electric fields in the Earth and thereby inducing quasi-dc GIC current flow in the power transmission network. Therefore an important means of classifying the severity of a disturbance can be made by noting the dB/dt or rate-of-change of the geomagnetic field (usually measured in units of nanotesla per minute or nT/min). The larger this dB/dt environment becomes, the larger the resultant levels of GIC and levels of operational impact upon exposed power grids.

Some of the first reports of operational impacts to power systems date back to the early 1940's and the level of impacts have been progressively become more frequent and significant as growth and development of technology has occurred in this infrastructure. In more contemporary times, major power system impacts in the U.S. have occurred in storms in 1957, 1958, 1968, 1970, 1972, 1974, 1979, 1982, 1983, and 1989 and several times in 1991. Smaller scale impacts can and do occur even more frequently; these include anomalous operating events that may result in the unexpected tripping of a key element of the system or even permanent damage to apparatus such as large power transformers.

In order to understand the far reaching impacts of large geomagnetic storms, the disturbance impacts in particular of the great storm of March 13-14, 1989 are reviewed in some detail. The most important of these impacts was the storm-caused chain of events resulted in the blackout of the Hydro-Quebec power system. At 2:42 am EST, all operations across Quebec, Canada were normal. At 2:43 am EST, a large impulse in the Earth's magnetic field erupted along the U.S./ Canadian border. GICs immediately started to flow in the southern portions of the Hydro-Quebec grid. In reaction to the GIC, voltage on the network began to sag as the storm increased in magnitude; automatic voltage compensating devices in the network rapidly turned "on" to correct this voltage imbalance. Unfortunately these compensators themselves were vulnerable to the harmonics generated in the network's transformers, and mis-operation of relays to protect

these devices caused the entire fleet of 7 compensators on the network to shut down within 60 seconds of the beginning of the storm impulse. When the compensators shut down, the network collapse followed within a matter of seconds, putting over 6 million inhabitants of the province in the dark. Going from normal conditions to a complete province-wide blackout occurred in an elapsed time of just 90 seconds. The power system operators had no time to understand what was happening, let alone to take any meaningful human action to intervene and save the grid. In comparison, the August 14, 2003 blackout covering large portions of the U.S. and Canada evolved over a period of time in excess of 90 minutes. Figure 2 provides a four minute sequence of maps showing the onset of observed geomagnetic field disturbance conditions that caused the Hydro-Quebec blackout.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

Over the next 24 hours, five additional magnetic disturbances propagated across the continent and nearly toppled power systems from the Midwest to the mid-Atlantic regions of the U.S. The North American Reliability Council (NERC), in their post analysis, attributed 200 significant anomalies across the continent to this one storm. Figure 3 illustrates the geographic breadth of power system problems during one of the five substorm time periods on March 13, 1989 across the North American grid. Figure 4 provides a depiction of the geographic extent of the geomagnetic field disturbance conditions across North America at time 22:00UT, that triggered the events shown in Figure 3. As illustrated, at this time intense geomagnetic field disturbances extended into mid-latitude portions of North America and essentially across the entire U.S.

For further reference, a list of the NERC reported power system operating anomalies due to this storm is provided in Exhibit 1. The North American Electric Reliability Council, at that time, would annually review significant system disturbances and provided a report on the most important of these system disturbances, in order to share information and insights on the disturbances and what lessons may be gained from these experiences. The 1989 System Disturbances report included discussions on the San Francisco Bay Area Earthquake, the impacts of Hurricane Hugo, and several other disturbances, most of which were tied to extreme environment disturbances. This report also provided a detailed discussion of the March 13-14, 1989 Geomagnetic Superstorm, which entailed 50 percent of the entire 67 page NERC report. This Exhibit from that report provides an indication of the wide spread impacts that were observed across the continental power grid.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

As previously mentioned, the best means of characterizing the geomagnetic field disturbance environment as it relates to GIC impacts on power grids is by the rate-of-change or dB/dt in nT/min. Figure 5 provides a plot of the dB/dt (or RGI—Regional GIC Index) observed at the Ottawa observatory which would have broadly characterized the

intensity of the disturbance over the general New York, New England regions and neighboring portions of southern Ontario and Quebec in Canada.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

As shown, the disturbance intensity that triggered the Hydro-Quebec collapse at 2:45 EST was at an intensity of 480 nT/min. Over the time interval of power system events shown in Figure 3, the peak dB/dt disturbance intensities observed in various other locations across the U.S. are provided in Figure 6. As shown, many of these disturbances were initiated by disturbance intensities that generally ranged between 300 and 600 nT/min.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

While power grid reliability concerns are of paramount importance, the long duration of the storm and associated GICs in transformers on the network caused internal transformer heating to the point of failure. There were several noteworthy cases of transformer internal heating associated with the March 13, 1989 storm in the U.S. mid-Atlantic Region. In one case at the Salem Nuclear plant in southern New Jersey, the internal heating was so severe that complete failure of the transformer resulted. Figure 7 provides a few pictures of the transformer and internal winding damage (conductor melting and insulation burns) due to the GIC exposure. In this case the entire nuclear plant was unable to operate until the large 500kV 1200MVA transformer was replaced. Fortunately a spare from a canceled nuclear plant in Washington State was available and restoration of the plant occurred in 40 days. Transformers of this type are of custom design and in most cases new replacement transformers of this type generally take up to a year for delivery. Failures of key apparatus, such as this, raise concerns about the ability to rapidly restore power in a region once a blackout and failure has occurred.

Question 2. LHow does your organization use data and products from NOAA's Space Environment Center (SEC)? In general, how much lead time do you need to make decisions for mitigating the effects of space weather?

As I had previously discussed, I have had considerable experience both as an electric power industry user of data and products from the NOAA Space Environment Center as well as a provider of geomagnetic storm forecast services to electric power industry end-users. Therefore, if the Committee will allow me, I will attempt to answer this question from both points of perspective.

Electric Power Industry Application of Forecast Services

Some of the formative research and investigation of problems due to GIC in the power industry was undertaken by my colleague and mentor Professor Vernon D. Albertson at the University of Minnesota starting in the late 1960's. As a result of this work, formal arrangements were made to disseminate geomagnetic storm information provided by the U.S. government (the SEC or forerunner in that era) through established communication means used to make coordinated adjustments in power grid frequency regulation for

purposes of time error correction. AEP at that time acted as the official point of contact for these notifications from NOAA as noted in this circa 1987 NERC document provided in Exhibit 2. The March 1989 storm was the first storm to precipitate a large-scale blackout and very nearly threatened even wider scale problems across the U.S. This unprecedented level of impacts caused renewed emphasis on updating and revising operational procedures to better contend with the unknowns of the disturbance environments. In fact, several example procedures for power pools heavily impacted by the March 1989 storm were published by NERC in the 1989 Disturbances Report as shown in Exhibit 3. These procedures and the regions they encompass include the NPCC, PJM, WAPA, and the Allegheny Power Service Corporation.

Overtime, these procedures have been continuously updated and current examples are provided for the PJM, NPCC, WSCC and even an updated reference document by the NERC as recent as July 17, 2003 and contemporaneous with the EMP Commission efforts to vet the NERC on U.S. Electric Power Grid vulnerabilities to large geomagnetic disturbances. These examples are provided as Exhibits 4 to 7. These procedures describe some of the actions that operators would undertake to better prepare the system to contend with the anticipated stress caused by a storm. Even in the immediate aftermath of the March 1989 storm, the power industry came to recognize the need for predictive forecast warnings of these important storm events. In July 1990 the NERC Board of Trustees issued a position statement advocating forecast technologies that could provide approximately an hour advance notice of the occurrence of important storm events (see Exhibit 8).

Metatech and Other Commercially-Provided Forecasting Services for the

Electric Power Industry

Because the NOAA-SEC provides only a broad and generic level of service to end-users of space weather forecasts, these services are not well formatted to extrapolate the possible and plausible impacts that may result to complex technology systems such as electric power grids. As a result, a need has developed and is being successfully filled by the private sector to provide highly specialized forecast services to these complex end-users. At present this service sector is in a state of infancy, but is generally developing much along the model of the medical services community. In this case, the NOAA-SEC forecasts are the equivalent of the general practitioner, for those end-users who have good space weather health (or at least suffer no serious space weather problems); this service may be quite adequate. However for end-users that have serious space weather health concerns, a more specialized care or level of service may be warranted and in most cases can be readily provided by firms such as ours that have specialized capabilities for these unique and complex problems. That being said, it should also be emphasized that end-user lack of awareness of potential space weather problems is a serious challenge that both the SEC and commercial providers must overcome. Exhibit 9 is a technical paper which provides some commentary and overview on the type of specialized services that our company can and does provide to the electric power industry. The relevant portions of this paper discussing these forecast services start on approximately page 23 of the Exhibit. Metatech provides notifications that range from several days in advance based upon solar observations to short-term forecasts that can be on average an hour in advance

driven by solar wind observations. We also provide continuous real-time observations as well to verify impacts that are being caused by a storm occurrence. We work extensively and very closely with our clients on their complex needs. These efforts can entail hardening their system from a design perspective, to training of system operators to operationally prepare their system to better respond to anticipated and observed storm related stresses.

Even with these commercial capabilities, the NOAA-SEC provides some of the key data sources that become the input data that are used to drive these sophisticated forecast systems and services. Of necessity, the relationship between NOAA-SEC and the Commercial Providers is one that is highly symbiotic; it is that the Commercial Providers greatly depend on the SEC for high quality data and data interpretations, while the SEC looks to the commercial specialists to provide the more specialized services that heavily impacted users may need. Therefore, the loss of the NOAA-SEC would have the almost immediate impact of causing the crumbling of much of the forecasting services capability of the Nation.

Question 3. How would you compare our knowledge today of the impacts of space weather on electric power grid systems to what we knew five years ago, and to what we expect to know five years from now?

New York ISO CEO William J. Museler in the aftermath of the August 14, 2003 Blackout, "the blackout could have damaged the power plants or transmission lines," "Had that kind of damage occurred, it could have taken days, weeks, or even months to restore. . . This protection (meaning normal operation of relays that shut down the components on the grid) shortened the restoration process considerably."

Advances in Understanding of Space Weather Impacts to Power Systems Over the Past Five Years

There have been significant new findings and ever evolving understanding of the many facets of the complex space weather environment dynamics and the manner in which this impacts the operation of electric power grids. Mitigation of the impacts of these storms will depend heavily on forecast assessments of the onset, severity and regional manifestations of these storms and it is fair to say that much has also been achieved in this regard. While we can be proud of our accomplishments, there remains many unresolved space weather paradoxes of storm evolution and the manner in which they can degrade operations of infrastructures. In particular to the electric power grids, the major achievements can be summarized as follows, with supporting exhibits that elaborate further on many of these main items.

- <bullet> Integrated and detailed modeling of both complex geomagnetic disturbance environment and complex power grid topologies. These advances have allowed for extensive forensic analysis of historically important geomagnetic storms and their impacts on power grids.

<bullet> Improved understanding, as described above, has allowed us to develop much more accurate and detailed quantification of the areas of risk and vulnerability that Space Weather may pose to the U.S. power grid infrastructure. Surprisingly, we are now discovering that risks from storms are not just limited to high latitude located power grids, locations normally associated with auroral observations. New understandings indicate that highly developed power grids at all latitudes may be impacted by various space weather disturbance processes in the U.S. and around the world that were unknown to us just a few years ago.

<bullet> These models and environment interaction understandings have also allowed the power industry to understand other aspects of evolving power grid vulnerability to the space weather environment that were not fully understood heretofore. The studies, which are part of the findings from the EMP Commission investigations, indicate that over the past several decades, various design decisions and growth of the power grid infrastructure has caused growing vulnerability to geomagnetic storms. In short, over the past 50 years, the size of the power grid has grown by nearly tenfold, and has also grown in sophistication such that it now presents a larger, effective antenna to electromagnetically couple with geomagnetic storm disturbances. This has the affect of amplifying storm-caused disturbances in modern power systems. This vulnerability increase is not just limited to improved coupling due to larger grid size but also due to other related infrastructure design decisions, as more fully described in a recent article in Exhibit 9. The industry is also facing growing vulnerability to space weather events due to operational impacts that are occurring from deregulation and transitioning to market-based operation of the power grid. The recent blackout of August 14, 2003 highlighted many of the infrastructure and power market operational concerns. These concerns include continued large growth in electric power demand in the face of diminishing growth in the transmission network infrastructure needed for delivery of power. As a result, power pools such as PJM report for example in year 2000, the pool experienced a total of 3830 hours transmission network constraint operation.\1\ In other words, 44 percent of the year power flows on the transmission system were at or very near maximum levels. These congestion problems only worsened in 2001 as the hours of congestion of the real-time market increased to 4823 hours (55 percent of the year).\2\ This heavy loading is another way of saying that the system is stressed to the safe operating limits and therefore unable to readily counter or safely absorb added stress to these same assets that could occur due to large geomagnetic storms. A recent article, Exhibit 10, provides a more detailed commentary on “What’s Wrong with the Electric Grid.” While it does not speak to the subject of space weather, it concisely describes the added burdens on today’s transmission network infrastructure, the same portion of the infrastructure impacted by space weather events.

\1\ PJM Interconnection State of the Market Report 2000, June 2001

\2\ PJM Interconnection State of the Market Report 2001, June 2002

<bullet> The same efforts to evaluate impacts and risks of today’s infrastructures have also allowed us to examine the plausible risks that could result from historically large storms that have not yet been experienced by today’s power grid infrastructure. These

studies were an especially important focus of the EMP Commission investigations that have been underway for the past 18 months. The results indicate that major power grid operational impact threats loom due to these low probability, but very large storm events. For instance, we have examined in detail the specifics of the March 1989 super storm and as previously discussed witnessed unprecedented power system impacts for storm intensities that reached levels of approximately 300 to 600 nT/min. However, the investigation of very large storms have made us newly aware that storm intensities over many of these same U.S. regions could be as much as 4 to 10 times larger. This increase in storm intensity causes a nearly proportional increase in resulting stress to power grid operations. These storms also have a footprint that can simultaneously threaten large geographic regions and can therefore plausibly trigger even larger regions of grid collapse than what occurred on August 14, 2003. Exhibit 12 is a brief opinion article that discusses the context of the events leading up to the August 14, 2003 blackout and how such a scenario could in the future be triggered by a space weather storm. Exhibit 13 provides a more detailed summary of investigations undertaken on the U.S. power grid for impacts caused by very large geomagnetic storm events. As shown in this series of studies, disturbance impacts to power grid operations could plausibly be 3 to 10 times larger in the U.S. than those experienced in the March 1989 super storm. This paper shows one of many possible scenarios for how a large storm could unfold. As illustrated in Figure 8, a large region of power system collapse is projected for severe geomagnetic disturbance scenarios. Depending on the morphology of the geomagnetic disturbance, it would be conceivable that a power blackout could readily impact areas and populations larger than those of the recent August 14, 2003 blackout.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

While these complex models have been rigorously tested and validated, this is an exceedingly complex task with uncertainties that can easily be as much as a factor of two. However, just empirical evidence alone suggests that power grids in North America that were challenged to collapse for storms of 400 to 600 nT/min over a decade ago, are not likely to survive the plausible but rare disturbances of 2000 to 5000 nT/min that long-term observational evidence indicates have occurred before and therefore may be likely to occur again.

Because large power system catastrophes due to Space Weather are not a zero probability event and because of the large-scale consequences of a major power grid blackout, I am compelled to, add some commentary on the potential societal and economic impacts of such an event should it ever re-occur. The August 14, 2003 event provides a good case study; the utilities and various municipal organizations should be commended for the rapid and orderly restoration efforts that occurred. However, we should also acknowledge that in many respects this blackout occurred during highly optimal conditions that were somewhat taken for granted and should not be counted upon in future blackouts. For example, an outage on January 14 rather than August 14 could have meant coincident cold weather conditions. Under these conditions, breakers and equipment at substations and power plants can be enormously more difficult to re-energize when they become cold. This can translate into the possibility of significantly delayed restorations. Geomagnetic storms as previously discussed can also permanently

damage key transformers on the grid, which further burdens the restoration process. For that matter, these conditions could rapidly cause serious public health and safety concerns, in that people trapped in regions such as New York City would not have the option of a “Night in Central Park Experience” and perhaps not be able to easily find adequate shelter from the elements. The time of day when the outage occurred was also a significant advantage, in that the bulk of the utility company day crews were still available and able to be readily dispatched to perform restoration functions. In major cities, the blackout essentially brought to a halt most transportation systems.

All mass transit systems shutdown as they depend on electricity for many of their functions. Traffic signal systems on most major streets and highways stopped and as a result most major thoroughfares became the equivalent of 8 lane parking lots in the early hours of the blackout. Only a few major power facilities are continuously manned, and since blackouts are possible at any hour, the odds are that 75 percent of the time the normal utility day crews are not on the job when these events occur. Attempting to recall workers that are trapped on the wrong side of these transportation snares is highly problematic.

In many respects, the loss of power supply returns much of our society to a pre-industrial era, because the loss of power supply rapidly cascaded into many other infrastructures. For example, water and sewage plants and transportation systems generally shutdown across the affected regions, even some 911 emergency systems and communication systems were impacted. Power grids are arguably the most important of the critical infrastructures because most of the other critical infrastructures are so highly interdependent on reliable power supply from the grid. It is clearer now that the technology age has increased our reliance on electric power. Figure 9 shows a chart plotting the primary interdependency links that exist between electric power and other critical infrastructures and services such as water, transportation, telecommunications and fuel supplies. As this illustrates, electric power supply is central to the sustained operation of most of the Nation's other critical infrastructures.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

Only a small portion of these infrastructure facilities have emergency on-site generation of sufficient capacity that allows them to continue operation in the face of a blackout event. Water treatment and pumping require enormous amounts of electric power and as result very few of these systems have redundant power supply options. Loss of pumping in time will lead to drop of city water pressure, as storage tanks and reservoirs cannot be recharged for residential distribution. In large high-rise buildings, city supply water pressure needs to be supplemented with electric pumps to lift water to upper floors for water distribution. Therefore within a matter of a few hours potable water distribution in many locations can become a serious concern. Perishable foods are generally at risk of complete loss within 12 hours or less. As previously discussed, transportation of all types was seriously impacted. Even automobiles and trucks could only operate within the range of the fuel in their tank at the time, because nearly all refueling operations from underground storage tanks require restoration of electric power supply.

Most affected regions were restored within approximately 24-36 hours after the blackout. As described in hearings on October 20 before the House Financial and Banking Infrastructure Committee, the major telecommunications (not counting wireless-cellular phone systems) and interdependent financial systems were able to maintain many functions. However, this was due to backup generation at a few critical hubs, which generally have around 72 hours of available fuel. Therefore power grid outages of longer durations would be highly problematic in that refueling may be logistically impossible in all situations. W.A. Abernathy, the Assistant Secretary for Financial Institutions, cautioned in his testimony that our financial institutions primarily operate on the principle of confidence, “confidence that financial transactions will be carried out, that checks will clear, that bills will be paid, that investments will be made, that insurance promises will be kept. The confidence provided by financial institutions and their services play a big part in helping to cope with the trauma of disaster.” An event which causes the eventual cessation of these functions, even for a short time, in key financial centers could have potential for wide spread consequences to the economy.

Because of the possible large geographic laydown of a severe storm event and resulting power grid collapse, the ability to provide meaningful emergency aid and response to an impacted population that may be in excess of 100 million people will be a difficult challenge. Potable water and replenishment of foods may need to come from boundary regions that are unaffected and these unaffected regions could be very remote to portions of the impacted U.S. population centers. As previously suggested adverse terrestrial weather conditions could cause further complications in restoration and re-supply logistics.

Space Weather and Power System Understandings--The Future

Given the surprising and potentially enormous implications of recent power system threats due to space weather, it is difficult to accurately predict what the future may bring. However, the future of space weather is being shaped, in fact, by activities that are underway today. Much good work is underway to continue efforts such as described here to further understand and evaluate the potential impacts of large storm events. While having the ability to accurately assess threats to these infrastructures is an important accomplishment, the real payoff of this capability is in the application of this knowledge towards engineering solutions that reduce the risks. In order to protect against the effects from severe geomagnetic storms, several approaches may need to be used. In terms of the entire grid itself, remedial measures to reduce GIC levels may be needed, such as installation of supplemental transformer neutral ground resistors to reduce GIC flows and undo this unintended geomagnetic antenna that has developed as the industry has built the present day high voltage transmission grid in the U.S. Grid operational measures can be better evaluated and tested for the multitude of scenarios and procedures enhanced to prevent severe voltage regulation problems in order to preserve the integrity of the network as a whole. This means that additional generation capacity and fast acting voltage compensating reserves should be available and/or loads should be rapidly removed from the system. This requires advanced information and contingency planning by the power utilities. With the aid of continuous solar wind monitoring, it is possible to reliably predict the onset of a storm 30 to 45 minutes in advance. This is due to the

availability of real-time satellite data and modeling capabilities that are now within the state-of-the-art. These capabilities are reasonably expected to further improve within the next five years, but only as long as the Nation maintains a commitment to gather the observational data and disseminate it for the forecast models that can use it.

Question 4. What would be the impact to your organization and the electric power grid industry if the SEC were no longer able to provide its space weather forecasts to you? Please provide specific examples when possible.

In response to this question, let me first speak to the impacts upon the power industry should the SEC or the Nation's space weather forecast capability cease to exist. As previously discussed, the power industry has been aware of the potential for some large impacts due to storms and as recent discoveries indicate, these threats have the potential to be even more ominous in their implications than previously understood. It is also clear that the vulnerability that presently exists has evolved due to long-term trends and that these trends because they involve embedded designs to billions of dollars in assets cannot be undone overnight. The most effective mitigation strategy in the short-term and perhaps in the long-term is improved situational awareness for operators of these systems from evolving space weather disturbances and then attempting to counter some of the impacts by providing more robust operational postures in anticipation of storm-caused impacts.

In the era prior to solar wind monitoring and the advances in improved solar activity monitoring, storm events would often blindside operators with sudden onsets. Unlike most terrestrial weather, these events develop suddenly once the threatening inputs from solar activity arrive at the Earth. The loss of these capabilities would return us to the 1980's, where all that existed in many respects was a monitoring service and storm information for the most part arrived after-the-fact and therefore could not be usefully utilized to avoid significant operational impacts, rather the information just confirmed for operators what caused any impacts and only marginally better prepared them for additional impacts from the same storm. Therefore, power grids would have to rely almost exclusively on their own power grid monitors for the first signs of possible storm impacts. However, these would be a poor substitute in most respects and would create a number of operator uncertainties and paradoxes. The operators would not be able to receive advance notice of severe impacts that appear with sudden onsets. For storm events that have slower evolution, it would take some time to determine if operating anomalies are due to a geomagnetic storm or some other event. Once they determine that it is a geomagnetic storm then it would be necessary to be overly cautious and restrictive for many additional hours of small storm activity because it would be difficult to know if a larger storm development is possible. In the aftermath of the Hydro-Quebec collapse, the operators of that system based operational procedures on observations of local activity. In 1991, they spent nearly 10 percent of the year in geomagnetic storm operating posture and as a result reduced substantially their ability to transfer large blocks of power across their network and export it outside their system. In today's more volatile electric energy markets, such operating postures could produce substantial added hours of constricted operation of networks and have immediate cost impacts on real-time electric energy markets. An example of this type of energy market cost impact can be illustrated by a storm on July 15, 2000 and the response of the power, market when the PJM power

pool declared a storm emergency. On July 15, 2000, the PJM declared an SMD emergency beginning at 15:30 and declared an end to the SMD emergency at time 21:07, resulting in a period of 6 hours of emergency conditions in which PJM follows prescribed procedures for network conservative operation as described in Sections 3-1 to 3-5 of the PJM Operations Manual. During this 6 hour period, the real-time price increased approximately \$40/MWH on average. Under conservative operation, the operation of the power network biases towards security and reliability of the network as a whole rather than just economic dispatch. As a result, transfers across the network can be significantly reduced, leading to re-dispatch of generation and cost increases in the real-time market due to less optimal economics in the dispatch of generation in this security mode of operation. Even though this storm event occurred under light load and highly favorable market conditions, the cumulative real-time market cost increase totaled \$900,000. Storm assessment uncertainties can extend longer than necessary operation of the network in these restricted market conditions and add even more to these cost impacts. During some periods of the day, energy cost increases can be much more severe and total costs could be even higher as a result. Of course, the economic and societal costs of large scale failures in the U.S. power grid overwhelm all other cost concerns and forecast efforts provided to prevent that scenario from being realized should be of paramount concern.

Metatech is dependent for many of the forecast products we supply upon reliable, high-cadence and high quality data from the SEC as needed inputs into the models and forecast systems we operate. In response to cessation of the SEC functions, we would have to significantly alter and as a result diminish the quality of some of the services we could provide. In addition, I would suspect that some commercial providers may choose to simply exit the business in response and others that might have been willing to enter the business will instead decide not to do so. Further, it would be unlikely at this time that any commercial provider would decide to enter the market to shoulder the heavy burden of launching satellites and setting up and coordinating various world observatories needed to provide important data inputs. In short, the customers, no matter who the provider, would have fewer options available to them and would receive an overall lower quality of service. Lacking any official government agency responsible for space weather forecasting, a likely development at times will be the equivalent of a “Tower of Babel,” where information is widely scattered amongst a large number of government, military, and international observation sites and each speaking in a differing tongue as to their interpretation and not one of them having complete enough information to develop a useful “Big Picture” of the unfolding space weather events.

Even the idea of a successor agency being handed the responsibility that currently resides with the SEC has a number of potential impact consequences. No matter how dedicated the new responsible agency, there will be unavoidable losses in the transition. Any new organization would need to successfully overcome the added start-up hurdles before even considering how best to meet the challenges of forecasting a difficult space weather environment. Since our company has commercial responsibilities similar to the associated activities that the SEC must perform to deliver their products, I can certainly state that an operation such as this has many high maintenance and expensive tasks. This includes such unglamorous but vital back office and field tasks such as data collection, quality control of the data and, finally, timely data dissemination. These all need the

continuity of an experienced and capable staff of unsung heroes to assure the high level of reliability and availability that has been provided by the SEC. These systems, of course, need to work in harmony with the derived products and forecast services that are the more familiar face of the SEC. As I have emphasized previously in my testimony, the space weather disturbances we are attempting to forecast can have amazingly rapid onsets and can manifest as a diverse variety of consequences to large geographic regions. Therefore forecast staff needs to be highly trained and experienced so they can quickly assess and judge, as there is no time for hesitancy and uncertainty. Further all this needs to be done on a continuous 24 hour by 7-day per week basis, as the Sun never sets on the Nation's threats from Space Weather disturbances. As you can surmise, setting up a new function such as this is not a matter of buying a few servers, installing some shrink-wrap, and parking some people in front of a monitor. Nearly every function that is done involves much in the way of custom systems and a high degree of specialized human "know how." Therefore the loss of the highly trained and experienced staff would be an unfortunate loss of investment by the Nation and setback our collective capabilities in space weather forecasting.

In conclusion I would also like to offer a perspective on the long-term needs that should further be considered by this committee in supporting our nation's efforts to better mitigate concerns arising from space weather events. For example, the degree of deterioration in the reliability of the electric power grid has been a topic of considerable discussion, post August 14, 2003. It is now evident that uncertainty in long-term restructuring, and lack of transmission infrastructure investment were significant factors contributing to the events of that day. Yet no matter how maligned, this infrastructure is still capable of operating through "single-point" failures. In contrast, our nation's most important space weather monitoring assets have no redundancy in case of failure. A loss, for example, of the NASA-ACE solar wind monitoring satellite (at the vital L1 position in space) would largely deprive the Nation of the ability to perform high quality short-term forecasting of geomagnetic storms. The end of lifetime for ACE is rapidly approaching and still no formal plans exist by any government agency in the world for a replacement satellite. Other examples also exist for various other observation assets that supply needed data inputs to our space weather forecast systems. Our grasp on the ability to perform these vital functions can be lost at any moment in time and we may not be able to recover for a number of years in some cases. Therefore I would also like to urge the Committee to consider these future "heavy lifting" responsibilities in sustaining and improving our nation's space weather infrastructure, once we get past this current SEC funding crisis.

Chairman Ehlers. Thank you very much.

Next, Captain Krakowski.

**STATEMENT OF CAPTAIN HENRY P. (HANK) KRAKOWSKI, VICE PRESIDENT
OF CORPORATE SAFETY, QUALITY ASSURANCE, AND SECURITY, UNITED
AIRLINES**

Captain Krakowski. Chairman Ehlers, Ranking Member Udall, and Members of the Committee, on behalf of United Airlines, we would like to thank you for the opportunity

to submit testimony with the direct bearing on flight safety, public health, and commercial efficiency. In addition to my 25 years as a United Airlines pilot, I am also responsible for safety, security, and operational quality at our company.

Mr. Chairman, if you flew from Grand Rapids, Michigan to Beijing or Hong Kong six years ago, it would have taken nearly a day, connecting over at least two cities. Today, through the pioneering efforts of United Airlines in cooperation with other agencies and countries, we can now fly from Grand Rapids to these and other Asian cities in just 16 hours with one flow through Chicago. This is possible because of our ability to fly over the North Pole, Russia, and China. In fact, State Department officials involved in recent talks in China enjoyed the convenience and efficiencies of these very flights.

Safety is always our number one priority at United Airlines. Toward that end, while polar routing provides a tremendous advantage of time and convenience for our customers, everyone on these flights could be exposed to potential safety risks that did not exist when flying at the lower latitudes. Information we receive from the Space Environment Center operated by NOAA ensures that United Airlines can take timely action to mitigate the risks associated with an occasional solar activity, which can disrupt communication, navigation, and even impact crew member and customer health.

During such a solar activity, our company policy dictates that United restricts flights from certain routes and altitudes. If we are made aware of a threatening activity prior to a flight, United will not hesitate to fly at lower altitudes or latitudes or even incur a costly fuel stop in Japan or China.

United is one of the few airlines which maintains an in-house meteorology department that works with our dispatchers and our flight crews to provide a safe, comfortable flight. We are proud of our excellent reputation in forecasting safety threats.

The solar environment, however, is so unique that it requires specially trained forecasters and specific technology not available within the commercial sector. The SEC is our only link to that environment.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

As this chart depicts, we blend the information from SEC right into our flight planning process on both a daily and hourly basis. The SEC provides United with daily forecasting, monitoring, and, most importantly, immediate alerts, some of which can affect flight operations in as short as 10 minutes. We can demonstrate that the current process works exceedingly well.

In our five years of flying over the North Pole, United has found the need to alter flight plans on an average of two to three times per month. In some cases, when the event is severe, as we have recently experienced, we will alter flights sometimes already in the air.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

The current chart depicts an event which occurred on October 24, our flight 895 between Chicago and Hong Kong, was planning to fly the polar route. We replanned the

route away from the North Pole due to an R3 solar event. This routing took an additional 30 minutes of time. We had to burn 3,000 extra gallons of gas, and it cost United Airlines \$10,000 to operate—more to operate that given flight. We do this regularly, if needed.

Mr. Chairman, United works with numerous government agencies from the FAA to the TSA. NOAA and the SEC distinguish themselves, in our opinion, by being an exceptionally transparent and customer-oriented partner with the airlines. I have personally visited the SEC in Boulder and can attest to the talent and professionalism of their staff. We are concerned that a reduction in funding could damage this important source of real-time safety information for our company. We also are concerned that transferring the operation to another federal agency could cause a disruption, degradation, or even filtering of information.

We urge you to support this program and seriously consider the ramifications associated with the change of oversight. We operate polar flights every day. A degradation of performance of this entity would cause us to become overly conservative in our flight planning, which would be costly. In our view, this is a program not in need of a fix. In our view, it is actually a program of American tax dollars at its best for the protection of United States citizens.

Again, thank you for allowing me to testify, and I do look forward to any questions you may have.

[The prepared statement of Captain Krakowski follows:]

Prepared Statement of Captain Henry P. (Hank) Krakowski

Chairman Ehlers, Ranking Member Udall and Members of the Committee, on behalf of United Airlines, thank you for the opportunity to submit testimony concerning a subject that has direct bearing on flight safety, public health and commercial efficiency. In addition to my 25 years as a United pilot, I am also responsible for Safety, Security and Operational Quality at our company.

Mr. Chairman, if you flew from a city such as Grand Rapids, Michigan to Hong Kong or Beijing six years ago, the journey would connect through at least two cities and take nearly a full day to complete. Today, through the pioneering efforts of United Airlines in cooperation with multiple countries and agencies, one can fly from Grand Rapids to these and other Asian cities in just 16 hours with only one connection over Chicago. This is possible by flying directly over the North Pole, Russia and China. In fact, State Department officials involved in recent talks with China enjoyed the convenience and efficiency of these very flights on United between Chicago and Beijing.

Safety is always our number one priority at United Airlines. Toward that end, while polar routing provides a tremendous advantage of time and convenience to our customers, everyone on these flights could be exposed to potential safety risks that did not exist when flying at lower latitudes. Information we receive from the Space Environment Center (SEC), operated by the National Oceanic Atmospheric Administration (NOAA), ensures that United Airlines can take timely action to mitigate

any risks associated with occasional solar storm activity that can disrupt communication, navigation and impact passenger and crew member health.

During such solar activity, our company policy dictates that United restrict flights from certain routes and altitudes. If we are made aware of threatening activity prior to the flight, United will not hesitate to fly at lower altitudes and latitudes or incur a very costly fuel stop.

United is one of the few airlines that maintain an in-house meteorology department that works with our dispatchers and crews to provide a safer and more comfortable flight. We are proud of our excellent reputation in forecasting flight safety threats.

The solar environment, however, is so unique that it requires specially trained forecasters and specific technology not available within the commercial sector. The Space Environment Center the only link to this environment. We blend the information received from the SEC into the flight planning process daily and even hourly. The SEC provides United with daily forecasting, monitoring and, most important, immediate alerts some of which can affect flight operations in as little as 10 minutes. We can demonstrate that this process works exceedingly well.

In our five years of polar flying experience, United has found the need to alter flight plans two or three times per month. In some cases, when an event is severe, we will alter flights already in the air.

Please take a look at the chart that we have provided for the Committee's reference. As recently as last week, on October 24th, United flight 895 from Chicago to Hong Kong planned to fly a polar route. The flight was re-planned, however, on a more southerly route due to a R3 magnitude solar event. This routing took 30 extra minutes and used 3,000 gallons of extra fuel for a total added cost to the company of \$10,000 for that flight.

<GRAPHIC(S) NOT AVAILABLE IN TIFF FORMAT>

Mr. Chairman, United works with numerous government agencies from the FAA to the TSA. NOAA and the Space Environment Center distinguish themselves by being an exceptionally transparent, customer-oriented partner with the airlines. I have personally visited the SEC in Boulder and can attest to the talent and professionalism of this organization and their people. We are concerned that a reduction in funding could damage this important source of real-time safety information for our airline. We are also concerned that transferring operation of the SEC to another federal agency could result in a disruption, degradation or filtering of critical information.

We urge you to support this program and seriously consider the ramifications associated with a change in program oversight. We operate polar flights each and every day. A degradation of performance in this program would cause us to become overly conservative in our flight planning. In our view, this program is not an example of a government program that is broken and in search of a fix. Quite to the contrary, our work in cooperation with the SEC exemplifies the use of American tax dollars at its best for the protection of U.S. citizens.

Again, thank you for allowing me to testify before the Committee. I look forward to any questions you may have.

Chairman Ehlers. Well, as one would--might expect from a pilot, you are finished with two seconds to spare, so your ETA calculation was very good.

Dr. Hedinger.

STATEMENT OF DR. ROBERT A. HEDINGER, EXECUTIVE VICE PRESIDENT,
LORAL SKYNET, LORAL SPACE AND COMMUNICATIONS LTD.

Dr. Hedinger. Thank you, Mr. Chairman.

My name is Robert Hedinger. I am an executive vice president with Loral Skynet, a communications satellite service provider, and also a division of Loral Space and Communications. I am pleased to appear before your Subcommittee to discuss the effects of space weather on communication satellites and the vital role played by NOAA's Space Environment Center.

I would also like to mention that the Satellite Industry Association has also developed a record for this committee, which I would like to attach to our record, as well.

Chairman Ehlers. Without objection, so ordered.

Dr. Hedinger. Okay. Thank you.

I would like to provide the Subcommittee with some background on the economic importance of the U.S. satellite industry and then address specific questions included in your letter of invitation. Additional supporting material has been provided in the attachments to my record.

Let me begin by pointing out the significant commercial investment and critical telecommunication services that are at risk resulting from space weather effects. As the attached charts in the record will demonstrate, \$49.8 billion of revenue was generated and \$12.1 billion of investments were made in 2002 in this industry. And these figures are expected to grow over the next 10 years. Critical commercial satellite applications that are provided on this infrastructure include: direct to home entertainment video and audio services, nationwide services; broadcast and cable television, all of the networks have satellite distribution networks; radio and audio distribution; satellite news gathering; the collection of critical news events from events that are occurring across the country; paging services; location and tracking services; rural and remote access services for telephony, data, and Internet; critical services for remote education and telemedicine; data communications to hundreds of thousands of locations used by the retail industry for such applications as point of sale terminals, credit card processing, and inventory tracking.

I would now like to address, in more detail, the questions that you had addressed in your invitation.

The first question: "How does space weather affect satellite communications?" Temporary and/or permanent damage to on-board equipment resulting from electrostatic discharges, the space—the surface of the spacecraft can be

charged with the large amounts of charged particles in the environment and then discharged, causing an electrical spark, which can damage equipment. Performance degradations and service outages due to particle events, in particular, electrical sensors, which are used for maintaining pointing accuracy of the spacecraft, can be—can experience a similar effect to fog as a result of having high-energy particles around the sensors. Altitude control and pointing errors due to magnetic field variations. Certain spacecraft rely on a strong magnetic field to target the spacecraft to keep it aligned. When a geomagnetic storm occurs, the magnetic field fluctuates and sometimes can become quite weak and not be strong enough to drive the momentum of the spacecraft. So these are some of the major impacts that space weather has on the satellites.

The next question is: “How do satellite operators use the data that is provided by NOAA?” I see I am running short on time. I would love to go through a long list. There is a lot of this information in the document, but to cut it short, we can prepare ourselves for a lot of events that could be detrimental to the spacecraft ahead of time. We take precautionary measures. We may set up a reconfiguration of the spacecraft that, instead of having automated commands, we send manual commands to the spacecraft. Because of the environmental changes that take place, they could mask some true events that are occurring and cause satellites to go into a mode which is undesirable.

The third question you asked was: “What has happened in the last five years? What do we expect in the next five years?” Over the last five years, we have certainly gotten more data, but more importantly, we have had access to that data in a much more rapid and user-friendly environment as a result of the NOAA SEC approach to distributing this information to the commercial satellite industry. The next five years, we know that there is continuing research that needs to be done. In specific—specifically, we would love to have additional forecasts that can be specific about orbital locations and the impacts on very specific satellites.

The fourth question: “What would we do without it?” We couldn’t live without this data. We need this data. It is absolutely critical for our operations.

In summary, Mr. Chairman, the functions that NOAA SEC performs to model, predict, and send out alerts on space weather has been, and continues to be, critical to commercial satellite operators. NOAA SEC has provided excellent service to communication satellite operators. It is critical to the commercial satellite industry that NOAA SEC continue providing these services without disruption.

Thank you, Mr. Chairman.

[The prepared statement of Dr. Hedinger follows:]

Prepared Statement of Robert A. Hedinger

Mr. Chairman and Members of the Subcommittee, my name is Robert Hedinger, I am an Executive Vice President with Loral Skynet, a communications satellite service provider, and a division Loral Space and Communications Ltd. I am pleased to appear before your Subcommittee to discuss the effects of space weather on communications satellites and the vital role played by NOAA’s Space Environment Center.

I would like to provide the Subcommittee with some background on the economic importance of the U.S. satellite industry and then address the specific questions included in your letter of invitation.

Additional supporting material has been provided in the three attachments.

Let me begin by pointing out that significant commercial investment and critical telecommunications services are at risk resulting from space weather effects. As the attached charts in Appendix A demonstrate, \$49.8 billion of revenue was generated and \$12.1 billion of investments were made in 2002 in this industry and these figures are expected to grow in the next ten years.

Critical Commercial Satellite Applications include;

- <bullet> Direct to Home Entertainment Video and Audio Services

- <bullet> Broadcast and Cable TV

- <bullet> Radio and Audio Distribution

- <bullet> Satellite News Gathering

- <bullet> Paging Services

- <bullet> Location and Tracking Services

- <bullet> Rural and Remote Access Service for Telephone, Data and Internet

- <bullet> Critical Services for Remote Education and Telemedicine

- <bullet> Data communications to hundreds of thousands of locations used by the retail industry for such applications as point of sale terminals (credit card processing) and inventory tracking.

Answers to Questions Asked in the Letter of Invitation

To address your first question, space weather can affect satellite operations in the following ways:

- <bullet> Temporary and/or permanent damage to on-board equipment resulting from electrostatic discharges

- <bullet> Performance degradations and services outages due to particle events

- <bullet> Attitude control and pointing errors due to magnetic field variations

Additional information and examples are provided in Appendix B.

To address your second question, satellite operators use data and products from NOAA's Space Environment Center (SEC) in the following ways:

<bullet> By being prepared, the Satellite Control Centers (SCC) operated by Loral and other service providers can reduce the amount of service outage time by focusing on the corrective action more quickly (avoiding some of the initial troubleshooting).

<bullet> By communicating these events to our customers, Loral can provide them the ability to plan around potential problems.

<bullet> By activity scheduling, Satellite Control Centers can avoid sensitive maneuvers and housekeeping functions during peak storm activity.

<bullet> In some instances, SEC data is used in real-time to determine the cause of observed anomalies. Using the SEC data the SCC is able to determine if a reconfiguration of the spacecraft is warranted, or if the storm is small enough that we can maintain the current configurations.

<bullet> As part of the due diligence that is performed after every spacecraft anomaly, the SEC data is also analyzed. This is done to see if there is a link between the solar environment and the anomalous condition.

<bullet> Loral also uses the archive data from the SEC during the spacecraft design and analysis activities.

Additional information and examples are provided in the Appendix B.

To address your third question, five years ago there was less information available and the data format was difficult to work with (fax, paper copies, etc). This has improved significantly over the last five years to allow better access to the available information. Data is now available online and viewable at an individual engineers terminal.

In the next five years we expect to see a more reliable early warning system, a continuing improvement in the knowledge of the space environment through improved detectors and analysis tools for better spacecraft designs, and improvements in dynamic modeling for specific orbit locations.

Additional information is provided in Appendix B

To address your fourth question, the impacts to Loral and other commercial satellite operators of not being able to access the SEC services would be severe. Without the SEC information, satellite operators would not be able to cancel maneuvers based on solar environment levels and consequently we would not be able to avoid potential damage to

the spacecraft. Service outages would also occur more often and be longer in duration. Spacecraft design quality would be compromised without access to current and accurate Space Weather Data.

In summary:

<bullet> The functions that NOAA SEC performs to model, predict, and send out alerts on space weather has been and continues to be critical to Commercial Satellite Operators.

<bullet> NOAA SEC has provided excellent services to Commercial Satellite Operators.

<bullet> It is critical to the Commercial Satellite Industry for NOAA SEC to continue providing these services without disruption.

APPENDIX B

Answers to Specific Questions Concerning Space Weather

Question 1

Please provide an overview of how space weather can affect satellite operations, including examples of historical events that have caused problems.

Charging Effects

Space weather affects the way the spacecraft body (or internal components) is charged. The spacecraft can only hold so much charge before it reaches a threshold for discharge. During extreme charging environments, this discharge occurs spontaneously and it is called an Electro Static Discharge (ESD) event. As an ESD event potentially contains a large amount of energy, it can be very hazardous to the spacecraft.

Spacecrafts have had major component failures that have been directly related to specific ESD events. On some spacecraft, several ESD events of the same type have occurred. These events have gradually weakened circuitry leading eventually to equipment failure. In addition, ESD events have lead to temporary upset of the spacecraft configuration. All of these events have led to customer outages until the operators have had time to reset the operational configuration using redundant equipment. Imagine if such an event happens during the Super Bowl or World Series. Until a switch over to a redundant transmission path happens, it can affect the TV Broadcasters by causing millions of dollars lost in advertising revenue and a set tens of millions of viewers.

Loral has experienced ESD events on several of their own spacecraft as well as spacecraft supplied to customers. Critical pieces of equipment have been lost due directly to ESD events including momentum wheels, and heaters/thermistors. We have had power equipment, earth sensors, payload units and telemetry and command equipment change operational state. We have had an accumulation of ESD events causing failure of solar array circuits. All of these events have the potential of temporarily or permanently reducing commercial communication or weather service to customers.

Immediate Particle Events

Sudden increase of protons and electrons caused by a storm can cause immediate problems that are not related to charging. The biggest concern here is in partially blinding sensor equipment. On most commercial spacecraft this problem is limited to the instrumentation responsible for determining pointing (earth sensors, star sensors, etc). During a big storm, these sensors do not operate to their full efficiency as they are partially blinded by much noise. Loral has seen attitude control system trips due to this type of particle induced noise. These trips normally result in loss of pointing control (or reduced pointing control) in at least one axis. If the error grows beyond our tolerance, service is affected.

Magnetic Events

Some spacecraft use the Earth's magnetic field for control of pointing. These spacecraft have electro-magnets on board. These magnets interact with the Earth's magnetic field putting a torque on the spacecraft. The magnets on the spacecraft are activated as needed to control pointing. During solar storms that affect Earth's magnetic field, these spacecraft often have trouble maintaining pointing control. Without a strong magnetic field for the magnets to interact with, their efficiency is reduced greatly. During these times it is required to change the spacecraft's actuators from magnetics to thrusters in order to maintain service.

Question 2

How does your organization use data and products from NOAA's Space Environment Center (SEC)? In general, how much lead time do you need to make decisions for mitigating the effects of space weather?

Preparatory

In a perfect world, one week lead time would be desirable. If we had forecast data for the next week, this could be worked into our weekly activity plan. As this is not currently available, we utilize the data as it is available. Some of the warnings for the smaller storms only provide a few hours of notice. These we use in a real time manner when executing activities. Warnings for potentially large storm normally give a day or two to prepare. As these are the potentially more devastating storms, Loral uses this information as described in the following three sections.

Internal Advisements

Due to increased problems during solar storms as well as the potential necessity to run specialized procedures, Loral utilizes the SEC warnings to prepare. When a warning comes out that meets Loral's criteria for potential problems, internal advisements are issued. These advisements serve to prepare the Satellite Control Centers for any of these potential non-standard operations. By being prepared, the Satellite Control Centers can reduce the amount of service outage time by focusing on the corrective action more quickly (avoiding some of the initial troubleshooting).

The SEC site is monitored in real time 24x7. As events such as earth sensor glitches or attitude error hold off are encountered, the controllers in Loral's Satellite Control Center perform analysis to determine the next step. This analysis utilizes both spacecraft telemetry as well as the real time data from the SEC site. It is important to understand the current state of the spacecraft as well as the expected growth (or diminish) of the storm's strength before taking action.

External Communications

Loral performs external communications to its customers (called a code Orange) when space weather predicts reach predetermined values. This allows our customers to plan for potential spacecraft problems. By communicating these events to our customers, Loral provides them the ability to plan around potential problems. This provides them the ability to increase their service reliability.

Activity Scheduling

On some spacecraft, we have found a susceptibility to particular failures if certain events are performed during elevated levels of solar activity. In these cases, we check the solar forecast prior to scheduling the events in order to determine the likeliness of being able to execute them. We also check the space weather again just prior to execution of these events before proceeding in order to avoid problems.

An example of this is a spacecraft that has a change of state in the solar array drive electronics every time we perform a maneuver with elevated solar activity. As the problem involves an illegal state within the control electronics, we have been warned by the manufacturer to limit the number of times that this phenomenon occurs. The worry is that if we let it fail too often, we will weaken the path such that we will not be able to return the state back to normal. Without access to solar weather data, we would not be able to control this.

Another example of this also involves maneuver execution. Prior to performing a maneuver, Loral uses the SEC site to determine whether there is an expected proton event pending. As these types of storms tend to cause problems for the Earth sensing equipment, it is important to keep the spacecraft's attitude quiet during one of these events. If a maneuver were performed during one of these events multiple problems could be encountered. These problems include difficulty in calibrating the attitude fine control sensors, excessive attitude control firings or even potential attitude safety system trips.

Real-Time

In some instances, SEC data is used in real-time to determine the cause of issues. Examples of these are multiple earth sensor glitches or small attitude hold off. All of these have some affect on the pointing of the spacecraft. When these issues occur, the personnel in the SCC check the real-time data on the SEC site to see if there is a link. If the problems are a result of increased solar activity the information is escalated. We create an internal advisement and distribute them. If the activity is of sufficient level escalation will continue to our external customers.

Using the SEC data the SCC is able to determine if a reconfiguration of the spacecraft is warranted, or if the storm is small enough that we can maintain the current configurations. Examples of this reconfiguration are:

If a proton event of sufficient strength is on-going, and expected to continue for sometime, we would disable automatic on-board momentum unloads. As the wheels respond to the increased earth sensor noise, the spacecraft control algorithms mistake this for a buildup of momentum. The spacecraft will then fire thrusters to take care of this momentum. This firing of thrusters should not be occurring as there is no real build up of momentum.

During a magnetic storm, it is very useful to know the expected strength and length of time. This is due to our choices for control methods. For a weaker storm, we could increase the on-board magnetic current to try to compensate. For stronger storms, the increase in on-board magnetic current would not be enough to overcome the weakness in the Earth's magnetic field. In these cases, we need to go to a thruster control mode. These methods will allow for the continued control of roll. As both methods will cause problems with yaw control, it is important to know how long the storm will continue in order to correct the yaw error.

Post Processing

As part of the due diligence that is performed after every spacecraft anomaly, the SEC data is also analyzed. This is done to see if there is a link between the Solar environment and the anomalous condition. On every fish bone analysis Loral has been a part of, the solar environment plays an important part. Often this information has been critical in identifying the space environment as being the cause. This has led to modification of the spacecraft design to improve its immunity to the space environment and to eliminate the particular failure mode.

Loral also uses the archive data from the SEC during the spacecraft design and analysis activities.

Question 3

How would you compare our knowledge today of the impacts of space weather on satellite operations to what we knew five years ago, and to what we expect to know five years from now?

Last five years

During the last five years, we have expanded our understanding of the solar environment greatly. However, the biggest change in the last five years goes beyond what we have learned. The biggest change is in how we utilize it. Five years ago there was less information available (as far as what is being monitored), and it was difficult to work with (fax, paper copies, etc.). This has improved over the last five years to allow better access to the information. Data is now available online and viewable at an individual engineers terminal.

Having this data available has allowed a larger team across the industry to analyze the information to show relations to other events. One example is on one of our spacecraft. If we get a solar storm of sufficient magnitude late in an eclipse season, we often also get a transponder shut off coincident with it.

Having the Solar Environment data available allows us to better understand patterns that might otherwise never be understood.

Next five years

I think the industry push at this point is on two fronts:

- 1) The need for a more reliable early warning system. There has been much individual work on this from many sources. Though the obstacles to overcome are daunting, this would be the single biggest improvement for the next five years.
- 2) The improvement in the knowledge of the space environment. Although we have made great strides in understanding of the space environment, there are still several holes in on knowledge. Improved detectors and analysis tools are needed to provide for better spacecraft designs. Another area of improvement is modeling for specific orbit location. This is a 4D (3 axis with time) modeling to view how the local orbit environment changes with time.

Question 4

What would be the impact to your organization if SEC were no longer able to provide its space weather forecasts? Please provide specific examples when possible.

Impact

The impacts to Loral of not being able to access the SEC would be severe. Many of these have been mentioned in the answers to the previous questions.

One spacecraft whose health would be most adversely affected would be the spacecraft that exhibits an anomaly with its solar array drive electronics. On this spacecraft, when a maneuver is performed during elevated solar activity, the solar array drive electronics switches into an illegal state (stopping the solar array). Each time this has happened, the solar array drive electronics have been commanded back into a normal state successfully.

There is a concern that if this phenomenon were allowed to occur too often, we would be unable to command the solar array drive electronics back into a normal state. Without the SEC information, Loral would not be able to cancel maneuvers based on solar environment levels and consequently we would not be able to avoid this circumstance.

Service outages would also be more often and longer in duration. By having space weather forecast available, Loral is able to prepare in advance for potential situations. For example if a major proton event is expected (or occurring), the spacecraft can be configured to better ignore earth sensor glitches. In addition, the Satellite Control Center (SCC) can be prepared for potential anomalous events associated with the storm. In the case of an earth sensor glitching problem growing to a more serious problem on the spacecraft, the SCC can often reconfigure before any problems affects service. In the case of a magnetics loss of control, the sooner the SCC configures the spacecraft for the solar storm, the lower the attitude error will be.

Another way in which Loral would be affected is the overall spacecraft design quality. Spacecraft Manufacturers use information learned in anomaly investigations to improve their future designs. The better they are able to determine root causes to problems, the better they will be able to improve their designs. The best way to ensure the highest quality root cause analysis is to ensure access to the best data. This includes in-orbit telemetry data, design documents and space weather data. If information on the space environment were not available the spacecraft manufacturer would not be able to consider this in the design and testing of his spacecraft or correlate design improvements on orbit.

Discussion

Chairman Ehlers. And thank you. And thank you to all of the witnesses. Very good testimony.

We will now proceed with questions. And the Chair will ask the first questions. We each have five minutes, and we will— and that includes both the question and your answer, but we won't cut your answer off in mid-sentence, so don't worry about that.

Space Environment Center (SEC) Funding

First, I have a question. I hate to ask yes or no questions, but this is a simple one, and I would like to ask each of you to respond with a yes or no answer. In your opinion, should the Federal Government reduce or eliminate funding for NOAA's Space Environment Center? Dr. Hildner.

Dr. Hildner. My answer is that the funding should not be reduced or eliminated.

Chairman Ehlers. Colonel Benson.

Colonel Benson. No.

Chairman Ehlers. Dr. Grunsfeld.

Dr. Grunsfeld. No.

Chairman Ehlers. Kappenman.

Mr. Kappenman. No.

Chairman Ehlers. Krakowski.

Captain Krakowski. No, sir.

Chairman Ehlers. Hedinger.
Dr. Hedinger. No, sir.
Chairman Ehlers. Thank you.

The Appropriate Organization for Forecasting Space Weather

Second is—I would like to ask another question. Is there a compelling reason why the functions of the SEC should be moved to another agency, without specifying the agency? For example, is NOAA not providing services to you at the expected level or in the useful manner, or do you think some other branch of government would be more effective? Again, we will go reverse this time. Dr. Hedinger.

Dr. Hedinger. I believe the NOAA SEC is the most appropriate place to have this fall.

Chairman Ehlers. Okay. Captain Krakowski.

Captain Krakowski. Mr. Chairman, we believe that this is one of the finest examples of a well-running effort, and we don't see any reason at all to make a change.

Chairman Ehlers. Mr. Kappenman.

Mr. Kappenman. Since I wear both the power industry hat as well as a commercial provider that essentially competes with SEC in some aspects, I would like to answer that we think SEC is the most appropriate agency from both perspectives.

Chairman Ehlers. That reminds me, incidentally, of someone I knew who once questioned the need for NOAA and the National Weather Service said, "I get all of the weather I need from the TV programs." Since you—unfortunately, it was a Congressman, but he lost his next election. But at—from your position as both a user and competitor, that is a very meaningful answer.

Dr. Grunsfeld.

Dr. Grunsfeld. I think that the Space Environment Center and its relationship with NASA and I know for the United States Air Force and NOAA that this is a good example of how government agencies work well together, so I see no compelling reason why we would want to move it.

Chairman Ehlers. Colonel Benson.

Colonel Benson. I—sir, I would see no compelling reason to move the functions.

Chairman Ehlers. And Dr. Hildner, I assume I know your answer, but go ahead.

Dr. Hildner. I think you know NOAA's answer, but let me comment that our partnerships with the other agencies are already so good that I see no compelling reason to move space weather services out of NOAA.

Chairman Ehlers. I—let me just add that—I believe it was Captain Krakowski mentioned another point and that is, although I am sure that one of the military arms of the government could easily do this, there is also the possibility of filtering during a time of national emergency that simply the information would not flow freely. And I think we want to avoid that as well, in spite of their ability to do this.

Another follow-up question on that, and that is, would it make any sense for a non-governmental agency to do this either on a fee-for-service basis, excuse me, or under government contract? And we will go this way again. Dr. Hildner.

Dr. Hildner. Thank you.

We regard space weather as extremely analogous to the meteorological weather service. And so many of the arguments that we apply to the meteorological services and why those should be free to all users I believe apply equally to the space weather service. Let me comment with Mr. Kappenman sitting here that NOAA tends to predict and synthesize the space weather environment, and we leave it to commercial folks, for a fee, to tailor those products to specific systems that are affected by space weather events.

Chairman Ehlers. Colonel Benson.

Colonel Benson. No, sir, I wouldn't be in favor of changing who provides the data and how it is being procured.

Chairman Ehlers. Dr. Grunsfeld.

Dr. Grunsfeld. Well, at NASA, we are very protective of our national assets in space, as I am sure the Air Force is, as well. And we have a very good relationship with the SEC in meeting our needs, and I think we see no reason why we would want to change that.

Chairman Ehlers. Mr. Kappenman.

Mr. Kappenman. I also don't believe that it would be very practical or efficient to transfer this sort of function wholly to a commercial provider.

And if I could just speak a few seconds on the nature of the partnerships that we see developing in the commercial providers of space weather forecasts versus what NOAA does. If we look at NOAA's mission, they are to provide public information. And we actually see the medical industry as being how we are aligning ourselves and forming ourselves. Where NOAA is the general practitioner, handles most of the medical situations, but where you have a very serious space weather health problem from an infrastructure operator standpoint, you should be working with a specialist who can take that NOAA information and also knows how your infrastructure is impacted and work with you very closely on those very serious problems.

Chairman Ehlers. Are you going to change your name from Applied Power to Applied Clinic?

Captain Krakowski.

Captain Krakowski. When I consider the evolution of our navigation systems to become more dependent on satellites, and the FAA is another government agency that we have to work with in our navigation and communication issues, it seems like keeping it within a federal functionality seems right to us.

Chairman Ehlers. Okay. Dr. Hedinger.

Dr. Hedinger. Thank you.

Yes, at this point in time, I think that the services that are provided by NOAA SEC are generally applicable across a very broad environment, which is the right place to have a government service provide it. It spans the commercial

industry, the government industry, and very many other types of functions. Clearly, there are opportunities for some secondary applications that would be in the area of this—that we have just described here. But the functions that NOAA SEC perform would definitely be----

Chairman Ehlers. Thank you for your comments. My time is expired, but I hope you will also, as individuals, express those opinions outside this room with the other Members of Congress who are involved in this situation.

My time is expired. I am pleased to recognize the Ranking Member, Mr. Udall.

SEC Budget Compared to Other Federally Funded Programs

Mr. Udall. Thank you, Mr. Chairman. If I might, I would like to build on your line of questioning and start with the three witnesses who serve in the public sector.

And if I could, I would like to put the SEC's \$8 million budget into context. As I see it, the—that budget is a very small part of the total federal budget for space weather. And Dr. Hildner, if I could start with you and move across, how does the SEC's budget compare with federal funding for the design, development, acquisition, and operation of space and ground-based sensors and for the research that has made space weather possible?

Dr. Hildner. I am reluctant to answer about the details of the expenditures in other agencies, but I believe that it is in the billions—or a billion dollars or so of research and sensor development for—that is applicable to space weather.

Mr. Udall. Colonel Benson.

Colonel Benson. Could you repeat your question, sir?

Mr. Udall. What I was trying to get at is we spend \$8 million for the SEC function, but I wanted to put that in the context of all of the assets that we deploy as well as the research and development that we do in other federal arms.

Colonel Benson. I can't speak for the total amount in the rest of the federal arms, but it is a minute fraction compared to the value of the assets that we have on orbit and that we spend for R&D.

Mr. Udall. Dr. Grunsfeld, before you reply, I just want to welcome you. It is nice to see you again. Dr. Grunsfeld visited Boulder and the Ball Aerospace Company and has done some great work in repairing the Hubble Telescope as a space walker. And he is also a climber, and he fit in that comment about the—that small subset of interested people who ascend high mountains above 8,000 meters who would be subject to space weather events. And we want to take care of those people as well. So welcome, and great to see you here.

Dr. Grunsfeld. Thank you very much. Thank you for that recognition.

The—NASA has, you know, quite a few number of assets. Just in space science alone, I think we have about 30 satellites that are operational right now, including the Hubble Space Telescope, which, I think, was about \$1.6 billion. And so if you look at the \$8 million as a kind of insurance policy, you know, it would be an usually small percentage

compared to any other insurance that anybody would consider. It is, you know, certainly less than a percent.

Mr. Udall. Thank you. And yes, it is great to see you here, and thanks for all that you do.

Private Sector Interaction With the SEC

If I could extend now a set of questions to those of you from the private sector, and your testimony, I think, was very compelling. And I think you have answered this in part, but I want to give you another chance to amplify on your comments. Is your interaction with the SEC a one-way interaction? In other words, do you receive these forecasts or do you—are you also in a position where you are solicited for advice and input from the SEC?

Mr. Kappenman. Clearly, it is a two-way relationship. We depend, of course, very heavily upon the SEC to gather and disseminate data at high quality, high cadence that is needed for these environments. We do have a very successful and healthy interaction on what the important features of the environment are, where we can both serve the Nation and the important infrastructures better through things that we can do better in the space environment fields.

Captain Krakowski. While we use their products on a daily basis, the products themselves are not very useful unless we understand how to use them. And I think one of the greatest interactions of SEC was them opening their doors to us and their arms to have us come out to Boulder and learn all about this phenomena before we started to do this kind of flying. So it is very interactive and we do appreciate their warmth and their ability and willingness to help educate companies like ours on these sorts of issues.

Mr. Udall. Dr. Hedinger.

Dr. Hedinger. Thank you.

Yes. I would like to reiterate that this is a very interactive relationship and a very customer-friendly relationship. The progress that has been made here in the last five years of getting real-time online access to data that we use on a day-to-day basis. In fact, our satellite control center right now is determining how to reconfigure satellites to minimize impacts.

Mr. Udall. Thank you.

SEC Improvements Within the Current Budget

If I could turn back to Dr. Hildner. Dr. Hedinger testified that Loral Skynet expects to see a series of things over the next five years: a more reliable warning system, improvements in knowledge of the space environment, improvements in dynamic modeling for specific orbit locations, and other changes and added products. Do you think NOAA or other partner agencies could supply these improvements if the funding level would remain at the \$5 million proposed point at this time?

Dr. Hildner. No. I could amplify that answer, if you would like.

Mr. Udall. I—no, I think that is perfect.

If I might just get one last question in and to Dr. Hildner

once again. The testimony here, I think, suggests that we ought to be investing more in space weather. I am assuming that the budget, the Administration's budget of \$8 million would maintain current capabilities and provide some funding for improvements. What opportunities would we be missing if we don't invest in additional efforts when it comes to space weather forecasting?

Dr. Hildner. You are absolutely correct that at the President's requested level we would be able to maintain our operations and make modest improvements. But we stand at a confluence of increasing demands, and some of which you have heard about today, and expectations from our customers, and at the same time, a great increase in opportunity. The DOD, NSF, and NASA are spending a great deal of money for research, new sensors, and so forth, which SEC, even at the President's requested budget, will not be able to incorporate into operations. In other words, the Nation's investment in space weather services improvements will not be garnered if SEC continues on at its current level of effort.

Mr. Udall. I thank the panel and the Chairman for his forbearance in extending a little more time to me. This is a very important topic. Thank you again.

Chairman Ehlers. Thank you.

We have a few more questions, and so we will start a second round. I understand Mr. Gutknecht does not—so I will begin with the second round. And I would point out, incidentally, before I do that, that again, I did a quick mental calculation. If you should receive the President's request, which is \$8 million, that comes to just a bit more than three cents per capita in the United States. When you consider that if a commercial satellite went out that was carrying a television program, everyone would spend eight cents to call their TV—cable provider to complain, they would spend more than twice as much as they are spending to maintain the warning system. Sensors Aboard the Aging Advanced Composition Explorer (ACE) Spacecraft

My next question is for Dr. Hildner, Grunsfeld, and Colonel Benson. One of the most vital sensors for providing advanced warning in radiation and magnetic storms is located on, pardon me, NASA's Advanced Composition Explorer, sometimes called the ACE spacecraft. Yet this spacecraft is currently operating beyond its design life and there are no plans to continue collecting this type of solar wind data once ACE ceases to operate. Are NOAA, NASA, and the Air Force planning for a way to continue obtaining this vital data? And we will start with NOAA on this one. Dr. Hildner.

Dr. Hildner. The difficulty with the ACE spacecraft approaching its end of life and the possibility of not getting those enormously important data has been recognized in NOAA. And we are considering requesting the Congress for additional funds to obtain those data.

Chairman Ehlers. Let me just ask, the NPOESS satellites will be going up. It is a joint Air Force/NOAA effort. Could a—could one of these sensors be added to that satellite?

Dr. Hildner. NPOESS will have an improvement in the near-Earth space environment sensors, but because they are in polar orbit near Earth, they do not give us that advanced warning that the ACE satellite does one percent of the way from the Earth toward the sun out in the solar wind.

Chairman Ehlers. One percent, you said, of the distance?

Dr. Hildner. The ACE is stationed at---

Chairman Ehlers. It is about nine million miles?

Dr. Hildner. It is about----

Chairman Ehlers. Fifteen kilometers----

Dr. Hildner. About one million miles. It is 93 million miles to the sun, so one percent----

Chairman Ehlers. Right.

Dr. Hildner [continuing]. Is about one million miles----

Chairman Ehlers. Yeah. Right.

Dr. Hildner [continuing]. Toward the sun from Earth, and that is the place where the Earthward forces and the sunward forces balance and the spacecraft will sit there.

Chairman Ehlers. Yeah.

Colonel Benson.

Colonel Benson. Sir, we rely on the ACE data for the solar wind estimation. The Air Force has just launched, as of two weeks ago, a new block of DMSP satellites, Defense Meteorological Satellite Program. And in this new block of satellites, we have a series of space weather sensors on there. But they are in the low-Earth orbit, and they don't have a package specifically designed to do what the ACE program does.

Chairman Ehlers. Dr. Grunsfeld.

Dr. Grunsfeld. Hopefully the ACE spacecraft will keep

operating beyond its nominal lifetime margin for a good, healthy long time. And the National Academy, in its NRC report, did identify the source of these types of data as being critically important. And so that is something that the Office of Space Science, you know, has in its strategic planning. But as yet, I am not specifically aware, for our research activities, of any plans to replace that capability.

Chairman Ehlers. Is this an expensive satellite?

Dr. Grunsfeld. It is one of our explorer class satellites, and, you know, I am not sure what, in this context, "expensive" is. It is not—you know, it is not in the, you know, great observatory class. It is one of the smaller satellites.

Chairman Ehlers. Yeah. Okay. I—we will have to pursue that in the Committee, and—because I think that is a self-evident thing to do.

Dr. Grunsfeld. And we can provide you with more information about some of the experiments in the pipeline and how they might relate to this.

Chairman Ehlers. All right. I would appreciate that, because it shouldn't be that expensive if it is a single-purpose satellite. It takes—of course, it takes a fair amount of horsepower to get it up that far, but that is something we will pursue.

I have no other questions at the moment. Mr. Udall, do you have----

Vulnerability to Industry From Space Weather Events

Mr. Udall. Thank you, Mr. Chairman. I would like to take this opportunity to direct a couple of questions at the witnesses from the private sector.

Would you say that your organizations operations have become more vulnerable to space weather events over time or is it solely a matter of having gained a better understanding of the link between space weather events and specific problems you encounter during operations? Again, we can start with Mr. Kappenman and move across.

Mr. Kappenman. Yeah. In the prepared testimony, I do cite quite a bit of evidence that the power industry has learned that indicates that we are, because of various design changes, growth of the power grid and so forth, we are unequivocally growing more and more vulnerable to space weather. That being said, we are also learning much about space weather impacts. And we may not know exactly how vulnerable we really are. We know right now we are extremely vulnerable.

Mr. Udall. Um-hum.

Mr. Kappenman. And we also know that it is not going to be easy to become unvulnerable or invulnerable and undo what has essentially transpired through billions of dollars of investment in infrastructure, 50 years or more of development of that infrastructure.

Mr. Udall. Captain Krakowski.

Captain Krakowski. Thank you, sir.

Yeah, we are—five years ago, were it not for the ability

to have airplanes fly over 16 hours, we really could not even entertain dealing with such a risk. But now with the commercial opportunities opening up wider between Asia and the United States and the ability to fly longer range flights with the new technology airplanes coming up, this is somewhat new to us----

Mr. Udall. Um-hum.

Captain Krakowski [continuing]. Which is why we are so interested in it.

The other aspect of it is, well, as we contemplate moving more toward GPS-type navigation systems and away from land-based systems, there is an additional concern of what this kind of weather—solar weather impact would mean to that very critical infrastructure. And I think we are still in the learning mode with some of that.

Mr. Udall. Dr. Hedinger.

Dr. Hedinger. Thank you, Congressman Udall.

I think there are really two areas here. One is just the volume of services that have grown over the last several years. An example is the direct to home market. Now we have approximately 20 million households erect a home receiver. Five years ago, how many was that? But it has changed dramatically, and that continues to grow. But it is just the amount of business that is in space, the amount of business that depends on space for its revenue, so that is becoming more critical.

The other thing is the new technologies that are being developed. With the—there is a move toward on-board processing to be able to provide more efficient communications and more economical access services. An example is the new KA band on-board processing satellites. These are likely to be more sensitive to space weather since there are computer chips, et cetera, on board the spacecraft.

Thank you.

Vulnerability to Federal Agencies From Space Weather Events

Mr. Udall. Perhaps I could ask the government witnesses to comment on this as well, if you would, and again, Dr. Hildner— and I—if I restate the question. Would you say that organizations in the government operations have become more vulnerable to space weather events over time or is it solely a matter of having gained a better understanding of the link between solar weather events and specific problems that we encounter during operations?

Dr. Hildner. I would say it is the former. We have become more vulnerable, and partly because we have become more technological and those technological systems, as we become more dependent upon them, they, in fact, are becoming more vulnerable. And so we are becoming more vulnerable.

Mr. Udall. Colonel Benson.

Colonel Benson. Sir, I would agree with Dr. Hildner. I

think we are more vulnerable as we require—rely more and more on space-based assets. Those vulnerabilities are there for the assets that we have on orbit. Even our Global Positioning System has effects from space weather as far as the errors that are driven by space weather events. So our dependency on GPS has also magnified the impacts of a space weather event on navigation systems.

Mr. Udall. And I—space command based in Colorado, and I was sure that General Lord and others would underline what you had to say about the effects on our space command.

Dr. Grunsfeld.

Dr. Grunsfeld. Well, I think first and foremost, we are

interested in the safety of our crew. And I am very proud to say that, you know, we are coming up on having three years of human international crews living in space all of the time, 365/ 24/7. And so in that respect, we certainly are more vulnerable. In addition, we are kind of a victim of our own success in technology in that the capability of the microchips and the technology that goes into constructing all of the space assets that we have talked about have gotten a lot smaller and more compact and using technology that, in a sense, is more vulnerable to space radiation.

Relationship With the International Community

Mr. Udall. I thank the panel, and I might extend a request to the Chairman, I—we— one area we didn't cover was the relationship we have with the international community and their space weather forecasting capabilities and how we coordinate and whether there would be an effective—if the SEC was to be put out of business or the funding—the necessary funding wasn't in place, but---

Chairman Ehlers. Dr. Hildner, if you would just like to just answer that, comment on that.

Dr. Hildner. I would be happy to. In the interest of time, we had not mentioned our international partnership. There is an outfit called the International Space Environment Service. It has 12 regional warning centers around the world. NOAA's center in Boulder is one of those regional-warning centers. All of those centers exchange data actually through Boulder every day. And then Boulder synthesizes all of that information and puts out the global forecast as the world-warning agency of the International Space Environment Service. Of course, that would all go away if we were eliminated.

The Vital Role and Responsibilities of the SEC

Chairman Ehlers. The gentleman's time is expired. I would just like to conclude this hearing by several comments. First of all, it is obvious to me from your comments, Mr. Udall, that far too much government money is going to Colorado. And probably the SEC should move to Michigan where it would be closer to the Aurora Borealis. You could at least have the pleasure of observing that. More importantly, it is clear from today's hearing that the services that NOAA's SEC provides are unique and vital to our nation and its citizens every day, much more so than people realize, and as we just heard, also important to those of other countries.

Secondly, it is neither within the mandate nor the mission of the Air Force or NASA to take on these crucial responsibilities. And it is my opinion that a transfer of this sort, at this time, would require significant expenditures on the part of the Federal Government and certainly above the \$8 million sought by the Administration for the SEC. It would also be very disruptive to the entire program.

So I believe that it is certainly advisable that this committee go on record as preserving the SEC precisely where it is. There is no reason to change it. "If it ain't broke, don't fix it," as the old saying goes, and so let us keep it going. And I hope—we will certainly pass this information on to the appropriators in the House and Senate. And I hope that all other interested parties would express that as well.

The fact that we are discussing this precisely as a space storm is occurring, and I understand that Japan has lost—temporarily lost one satellite and is about to lose another, indicates the importance of the work that is being done here.

Before I close, I just simply have a little housekeeping. I, first of all, want to thank you very, very much for your participation. We couldn't have had a better panel, broadly representative of the issue in both the governmental sector and the industry, and I appreciate your time. And above all, I appreciate your wisdom. So thank you for taking the time to be here.

If there is no objection, the record will remain open for additional statements from the Members and the answers to any follow-up questions the Subcommittee may ask of the panelists. And without objection, so ordered. And I would assume you would be willing to respond to questions in writing, should they come up.

Thank you again for your service, and it is my pleasure to declare the hearing adjourned just in time for another vote. The hearing is adjourned.

[Whereupon, at 12:03 p.m., the Subcommittee was adjourned.]

Appendix 1:

Biographies, Financial Disclosures, and Answers to Post-Hearing
Questions

Biography for Ernest Hildner

Dr. Hildner is the Director of NOAA's Space Environment Center. The Center is the Nation's 24-hour-a-day center for alerts, warnings and watches related to space weather. Under his direction, SEC also conducts research and consults on space weather instrument development for NOAA, NASA, and the Air Force.

Dr. Hildner is a solar physicist who has worked for the High Altitude Observatory, NCAR, and at NASA Marshall Space Flight Center as head of its Solar Physics Branch. He was fortunate to be experiment scientist for Skylab and the Solar Maximum Mission during the 70's. His scientific speciality is coronal and interplanetary physics, in which he has published dozens of papers. He co-holds one patent for a variable-magnification x-ray telescope.

In addition to his administrative responsibilities with NOAA, Dr. Hildner is a Co-chair of the Committee on Space Weather for the National Space Weather Program, is a member of the advisory committees for the NOAO National Solar Observatory and NCAR High Altitude Observatory, and serves on review panels for NASA and DOD projects.

Answers to Post-Hearing Questions

Responses by Ernest Hildner, Director, Space Environment Center,
National Oceanic and Atmospheric Administration

Space Environment Center

Q1. In Col. Benson's written testimony it is mentioned twice that the complementary nature of the Air Force Space Weather Operations Center and the SEC allows each agency to realize significant cost savings. What is the dollar amount saved as a result of the Air Force and NOAA collaboration on space weather?

A1. The National space weather enterprise, with complementary service centers in NOAA and U.S. Air Force Weather, depends on a critical shared database with contributions from NOAA and the USAF complementing each other. However, the savings to the Nation go far beyond the collaborating service centers. NOAA would have to replace and pay for a large fraction of the USAF-provided data if USAF no longer provided it. Conversely, USAF would have to pay tens of millions of dollars per year for the sensors and their data now provided by NOAA, should NOAA no longer provide them.

USAF operates the ground-based Solar Environmental Observing
Network of observatories around the world. NOAA has no equivalent data

in the near-term for the data provided by this \$20M per year network.

Additionally, USAF pays the U.S. Geological Survey \$150k per year to help it operate a ground-based magnetometer network so the data can be provided in near real-time to both USAF and NOAA. NOAA's Space Environment Center distributes to the public some products created at U.S. Air Force Weather Agency's center in Omaha; one of these is the immediate, three-hourly estimate of the value of the index characterizing global geomagnetic activity. This index is of great interest to civilian users; NOAA would have to create the product if USAF did not, at an estimated expense of \$2M to port the software. Finally, USAF Space Command flies sensors on the Defense Meteorological Space Program (DMSP) series of spacecraft. The data are archived at NOAA's National Geophysical Data Center and used by Space Environment Center. The model NOAA plans to use to characterize and predict the ionosphere is being developed with USAF funding of about \$10M and will be driven by data from DMSP. NOAA will save the \$10M up-front cost of the model and the annual cost of fabricating and flying the instruments and getting the data because of USAF investments.

In all, we estimate that NOAA would have to spend several tens of millions of dollars per year to sustain the same level of services if USAF dropped from the national collaboration in space weather.

Q2. One of the most vital sensors for providing advanced warning of radiation and magnetic storms is located on NASA's Advanced Composition Explorer spacecraft. Yet, this spacecraft is currently operating beyond its design life and there are no plans to continue collecting this type of solar wind data once ACE ceases to operate. Are NOAA, NASA and/or the Air Force planning for a way to continue obtaining this vital data? If so, please explain the strategy.

A2. Real-time solar wind measurements from upstream of Earth, now obtained from NASA's ACE research spacecraft, are among the most vital data for providing space weather services. The ability to warn of geomagnetic storms approximately an hour in advance is due solely to these data. Delayed solar wind measurements, available from other NASA spacecraft operating in a "store and dump" mode, are of no operational benefit, though they have research value. ACE has already completed its prime research mission, but has been selected by NASA for extended operations, because of new, high-priority scientific goals that can be addressed with this valuable national asset. The spacecraft has enough propellant on board to maintain its new, looser, non-optimal for space weather purposes, orbit around Lagrange Point 1 (L1) until late into the next decade.

ACE has been a unique resource in that it continuously transmits, all day—every day, in near real-time, solar wind and energetic particle data that can be acquired by relatively small ground-based antennas. No other spacecraft can do that; unless the ACE capability for space weather is replaced, when ACE dies NOAA, its partners, industrial space weather service companies, and end users will all lose valuable products and services. Geomagnetic storms are especially important to electric power grid operators and radio communicators (including airlines).

NOAA, NASA and the USAF, will continue to consider options for providing ACE-like data.

Biography for Charles L. Benson, Jr.

Colonel Charles L. Benson, Jr., is commander of the Air Force Weather Agency. He leads over 900 agency members at 20 locations around the world providing centralized weather products and services, including climatological and space weather support, to USAF, U.S. Army, special operations national intelligence community and other DOD activities. He executes a worldwide weather support mission, that provides decision assistance to combat, reconnaissance, command and control, presidential support, treaty verification and airlift missions directed by the Joint Chiefs of Staff, theater commanders, and major command commanders.

Colonel Benson has served as a wing weather officer in Korea; executive assistant to the Commander, Air Weather Service, Scott AFB, IL; and Chief of the Advanced Systems Management Section, Offutt AFB, NE. He has commanded a weather detachment in Kansas and served as a program element monitor in Headquarters USAF's Directorate of Weather. Colonel Benson was assigned to Headquarters USAF's Directorate of Operational Requirements as Chief of Force Enhancement Requirements. He has served as Director of Weather for Headquarters Air Mobility Command's Tanker Airlift Control Center; Chief of Protocol for the Commander in Chief, United States Transportation Command; and Deputy Commander, 60th Support Group, Travis AFB, California.

Prior to his arrival at Offutt AFB, Colonel Benson commanded the United States Air Force Academy's 34th Support Group.

EDUCATION

1977 Bachelor of Science degree in Meteorology, Texas A&M University 1978 Officer Training School, Maxwell Air Force Base, Ala. 1985 Master's degree in Meteorology, St. Louis University 1986 Air Command and Staff College (Correspondence)

1990 Distinguished Graduate, Naval War College's Naval Command & Staff, Naval War College, Newport, R.I.

1991 Master's degree in National Security & Strategic Studies, Naval War College, Newport, R.I.

1995 Air War College, Maxwell Air Force Base, Ala.

ASSIGNMENTS AND DATES

1. September 1978-April 1981, wing weather officer, 463rd Tactical Airlift Wing, Dyess AFB, Texas 2. April 1981-June 1982, wing weather officer, 8th Tactical Fighter Wing, Kunsan Air Base, Korea 3. June 1982-January 1984, executive assistant to the commander, Air Weather Service, Scott Air Force Base, Illinois 4. January 1984-June 1985, student, St. Louis University, St. Louis, Missouri 5. June 1985-October 1987, chief, Advanced Systems Management Section, Air Force Global Weather Central, Offutt Air Force Base, Nebraska 6. October 1987-August 1990, commander, Detachment 23, 9th Weather Squadron, McConnell Air Force Base, Kansas 7. August 1990-December 1991, student, Naval War College, Newport, R.I.

8. December 1991-November 1992, program element monitor, Deputy Chief of Staff for Air and Space Operations, Headquarters U.S. Air Force, Washington, D.C.
9. November 1992-August 1994, chief, Force Enhancement Requirements, Directorate of Operational Requirements, Deputy Chief of Staff for Air and Space Operations, Headquarters U.S. Air Force, Washington, D.C.
10. August 1994-June 1995, student, Air War College, Maxwell Air Force Base, Alabama
11. June 1995-September 1997, director of weather, Tanker Airlift Control Center, Headquarters Air Mobility Command, Scott Air Force Base, Illinois
12. September 1997-August 1998, chief of protocol, U.S. Transportation Command, Scott Air Force Base, Illinois
13. August 1998-April 1999, deputy commander, 60th Support Group, Travis Air Force Base, California
14. April 1999-May 2001, commander, 34th Support Group, U.S. Air Force Academy, Colorado Springs, Colorado
15. May 2001-August 2002, vice commander, Air Force Weather Agency, Offutt Air Force Base, Nebraska
16. August 2002 to Present, commander, Air Force Weather Agency, Offutt AFB, Nebraska

AWARDS AND DECORATIONS

Legion of Merit

Meritorious Service Medal with five oak leaf clusters

Air Force Commendation Medal with one oak leaf cluster

Air Force Achievement Medal

EFFECTIVE DATES OF PROMOTION

Second Lieutenant August 15, 1978

First Lieutenant August 15, 1980

Captain August 15, 1982

Major June 1, 1989

Lieutenant Colonel June 1, 1993

Colonel April 1, 1999

Answers to Post-Hearing Questions
Responses by Colonel Charles L. Benson, Jr., Commander, Air Force
Weather Agency

Questions submitted by Chairman Vernon J. Ehlers

Vital Sensors

Q1. One of the most vital sensors for providing advanced warning of radiation and magnetic storms is located on NASA's Advance Composition Explorer (ACE) spacecraft. Yet, this spacecraft is currently operating beyond its design life and there are no plans to continue collecting this type of solar wind data once ACE ceases to operate. Are NOAA, NASA and/or the Air Force planning for a way to continue obtaining this vital data? If so, please explain the strategy.

A1. Air, Force Weather (AFW) has a requirement for solar wind data, but does not field space-based systems. AFW has advocated for solar wind data and will continue to do so. We continue to advocate for environmental monitoring capabilities and to leverage existing and proposed Air Force Space Command, NASA, and NOAA satellites and sensors. Once ACE ceases to operate, we will be without the data it provides with no other viable alternative system immediately available.

Dollar Amount Saved

Q2. In your written testimony it is mentioned twice that the complementary nature of the Air Force Space Weather Operations Center and the SEC allows each agency to realize significant cost savings. What is the dollars amount saved as a result of the Air Force and NOAA collaboration on space weather?

A2. The estimated annual space weather operations cost savings for the Air Force Weather Agency (AFWA) is \$11.4M. This cost savings is comprised of \$6.8M from leveraging the research and technology transition performed by SEC. Additionally, there would be an up-front cost (significantly greater than the annual operation costs of \$10M)

to initially set up all of SEC's operations and research at AWA, if SEC's mission was transferred to the Air Force.

Biography for John M. Grunsfeld

PERSONAL DATA: Born in Chicago, Illinois. Married to the former Carol E. Schiff. They have two children. John enjoys mountaineering, flying, sailing, bicycling, and music. His father, Ernest A. Grunsfeld III, resides in Highland Park, Illinois. Carol's parents, David and Ruth Schiff, reside in Highland Park, Illinois.

EDUCATION: Graduated from Highland Park High School, Highland Park, Illinois, in 1976; received a Bachelor of science degree in physics from the Massachusetts Institute of Technology in 1980; a Master of science degree and a doctor of philosophy degree in physics from the University of Chicago in 1984 and 1988, respectively.

ORGANIZATIONS: American Astronomical Society. American Alpine Club. Experimental Aircraft Association. Aircraft Owners and Pilot Association.

SPECIAL HONORS: W.D. Grainger Fellow in Experimental Physics, 1988-89. NASA Graduate Student Research Fellow, 1985-87. NASA Space Flight Medals (1995, 1997, 1999, 2002). NASA Exceptional Service Medals (1997, 1998, 2000). NASA Distinguished Service Medal (2002). Distinguished Alumni Award, University of

Chicago. Alumni Service Award, University of Chicago. Komarov Diploma (1995), Korolov Diploma (1999, 2002).

EXPERIENCE: Dr. Grunsfeld's academic positions include that of Visiting Scientist, University of Tokyo/Institute of Space and Astronautical Science (1980-81); Graduate Research Assistant, University of Chicago (1981-85); NASA Graduate Student Fellow, University of Chicago (1985-87); W.D. Grainger Postdoctoral Fellow in Experimental Physics, University of Chicago (1988-89); and Senior Research Fellow, California Institute of Technology (1989-92). Dr. Grunsfeld's research has covered x-ray and gamma-ray astronomy, high-energy cosmic ray studies, and development of new detectors and instrumentation. Dr. Grunsfeld studies binary pulsars and energetic x-ray and gamma ray sources using the NASA Compton Gamma Ray Observatory, x-ray astronomy satellites, radio telescopes, and optical telescopes including the NASA Hubble Space Telescope.

NASA EXPERIENCE: Dr. Grunsfeld was selected by NASA in March 1992, and reported to the Johnson Space Center in August 1992. He completed one year of training and is qualified for flight selection as a mission specialist. Dr. Grunsfeld was initially detailed to the astronaut Office Mission Development Branch and was assigned as the lead for portable computers for use in space. Following his first flight, he led a team of engineers and computer programmers tasked with defining and producing the crew displays for command and control of the International Space Station (ISS). As part of this activity he directed an effort combining the resources of the Mission Control Center (MCC) Display Team and the Space Station Training Facility. The result was the creation of the Common Display Development Facility (CDDF), responsible for the on-board and MCC displays for the ISS, using object-oriented programming techniques. Following his second flight, he was assigned as Chief of the Computer Support Branch in the Astronaut Office supporting Space Shuttle and International Space Station Programs and advanced technology development. Following STS-103, he served as Chief of the Extra-vehicular Activity Branch in the Astronaut Office. Following STS-109 Grunsfeld served as an instructor in the Extra-vehicular Activity Branch, and worked on the Orbital Space Plane, exploration concepts, and technologies for use beyond low earth orbit in the Advanced Programs Branch. He is currently the NASA Chief Scientist detailed to NASA Headquarters. A veteran, of four space flights, STS-67 (1995), STS-81 (1997), STS-103 (1999) and STS-109 (2002), Dr. Grunsfeld has logged over 45 days in space, including 5 space walks totaling 37 hours and 32 minutes.

SPACE FLIGHT EXPERIENCE: STS-67/Astro-2 Endeavour (March 2-18, 1995) was launched from Kennedy Space Center, Florida, and returned to land at Edwards Air Force Base, California. It was the second flight of the Astro observatory, a unique complement of three ultra-violet telescopes. During this record-setting 16-day mission, the crew conducted observations around the clock to study the far ultra-violet spectra of faint astronomical objects and the polarization of ultra-violet light coming from hot stars and distant galaxies. Mission duration was 399 hours and 9 minutes.

STS-81 Atlantis (January 12-22, 1997) was a 10-day mission, the 5th to dock with Russia's Space Station Mir, and the 2nd to exchange U.S. astronauts. The mission also carried the Spacehab double module providing additional mid-deck locker space for secondary experiments. In five days of docked operations more than three tons of food,

water; experiment equipment and samples were moved back and forth between the two spacecraft. Grunsfeld served as the flight engineer on this flight. Following 160 orbits of the Earth the STS-81 mission concluded with a landing on Kennedy Space Center's Runway 33 ending a 3.9 million mile journey. Mission duration was 244 hours, 56 minutes.

STS-103 Discovery (December 19-27, 1999) was an 8-day mission during which the crew successfully installed new gyroscopes and scientific instruments and upgraded systems on the Hubble Space Telescope (HST). Enhancing HST scientific capabilities required three space walks (EVA). Grunsfeld performed two space walks totaling 16 hours and 23 minutes. The STS-103 mission was accomplished in 120 Earth orbits, traveling 3.2 million miles in 191 hours and 11 minutes.

STS-109 Columbia (March 1-12, 2002). STS-109 was the fourth Hubble Space Telescope (HST) servicing mission. The crew of STS-109 successfully upgraded the Hubble Space Telescope installing a new digital camera, a cooling system for the infrared camera, new solar arrays and a new power system. HST servicing and upgrades were accomplished by four crew members during a total of 5 EVAs in 5 consecutive days. Grunsfeld served as the Payload Commander on STS-109 in charge of the space walking activities and the Hubble payload. He also performed 3 space walks totaling 21 hours and 9 minutes, including the installation of the new Power Control Unit. STS-109 orbited the Earth 165 times, and covered 3.9 million miles in over 262 hours.

Answers to Post-Hearing Questions

Responses by John M. Grunsfeld, Chief Scientist, National Aeronautics
and Space Administration

Question submitted by Chairman Vernon J. Ehlers

Q1. One of the most vital sensors for providing advanced warning of radiation and magnetic storms is located on NASA's Advanced Composition Explorer spacecraft. Yet, this spacecraft is currently operating beyond its design life and there are no plans to continue collecting this type of solar wind data once ACE ceases to operate. Are NOAA, NASA and/or the Air Force planning for a way to continue obtaining this vital data? If so, please explain the strategy.

A1. NASA's Advanced Composition Explorer (ACE) was launched in August 1997 from the Kennedy Space Center. It carried six high-resolution sensors and three monitoring instruments to sample low-energy particles of solar origin and high-energy galactic particles with a collecting power 10 to 1,000 times greater than past or planned experiments. In addition, the ACE payload includes a real-time space weather monitoring capability, and NOAA has used this for space weather prediction.

ACE has already completed its prime research mission, and in the 2003 Senior Review process, it was selected for extended operations because of new, high-priority scientific goals that can be addressed with this valuable national asset. The spacecraft has enough propellant on board to maintain an orbit at Lagrange Point 1 (L1) until late into the next decade.

ACE has been somewhat of a unique resource because of the type of solar wind data it collects; therefore, NASA has devised a plan to continue collecting similar solar wind data after ACE ceases to operate. NASA is currently moving the Wind spacecraft into L1 to serve as a “hot” backup to ACE in order to maintain our research capability in the area of solar wind turbulence. The Solar and Heliospheric Observatory (SOHO) will also provide complementary data. NASA believes that these resources will ensure continued research and data collection in this discipline in the event that ACE is no longer able to produce useful scientific research.

Questions submitted by Democratic Members

Q1. Is the ISS currently operating with a waiver due to the lack of functional radiation monitors on board?

A1. No. There are currently several functional radiation monitors on board the International Space Station (ISS), including both Russian and U.S.-provided hardware. There is a waiver in place for the Tissue Equivalent Proportional Counter (TEPC), which is one part of the overall ISS on-orbit radiation monitoring system.

Q1a. Is the fact that the Space Environment Center can provide predictions one of the justifications used to grant the waiver?

A1a. There is no overall waiver granted for radiation monitoring because there is functional equipment currently on orbit. The TEPC waiver was presented and approved at the 10 March 2003 ISS Vehicle Control Board. During the discussions regarding the waiver, continued availability of space weather warnings, alerts, and real-time data on solar proton fluxes from the Space Environment Center (SEC) were mentioned as an additional rationale for why it was acceptable to continue without the TEPC.

Q1b. Is NASA currently depending on the SEC in order to provide direction to the ISS crew about radiation protection actions?

A1b. Yes. Real-time data provided by the SEC are the primary information used in developing recommendations to the flight control team. This team directs the crew to take appropriate actions to minimize their radiation exposure.

Q1c. Did the Space and Life Sciences Directorate highlight the “potential that ground-tracked radiation and forecasting from satellites will be reduced or eliminated in FY 2004 (NOAA)” as a concern in their Stage Ops Readiness Rev. meeting on Sept. 24, 2003, while preparing for the launch of the current ISS crew?

A1c. Yes. The Johnson Space Center (JSC) Space and Life Science Directorate (SLSD) highlighted the potential risk posed by the loss of SEC data in the September 24, 2003 SORR discussions and in the October 2, 2003 Flight Readiness Review (FRR).

Q1d. When does the waiver expire?

A1d. The waiver for the ISS TEPC expired October 31, 2003 and is in the process of being extended to April 2004.

Q2. Is the failure of the TEPC one of the elements that led to the recommendation by two managers responsible for monitoring the ISS environmental systems not to launch the current crew to ISS?

A2. The lack of a functional on-orbit TEPC was one element of the overall degradation of on-orbit real-time environmental monitoring on ISS that raised concerns.

Q2a. Was their ultimate decision to agree to go ahead with the launch based on plans to launch a replacement TEPC aboard Progress Flight 14? When is that launch scheduled to occur?

A2a. Yes. Launching a TEPC on ISS Flight 14P (Progress M-49) was one of the specific items cited in the exception to the ISS Flight 7S (Soyuz TMA-3) CoFR. At the time of the CoFR, 13P was scheduled for launch in November 2003 and 14P was scheduled to launch in January 2004. Since that time, the launch of 13P has moved to no earlier than late January 2004. As a result, NASA has requested that the TEPC be manifested on 13P. The manifest for 13P is still under review.

Q2b. Was the TEPC replacement originally scheduled to fly aboard Progress 12, but removed because it cost too much to certify it to fly on a Russian vehicle?

A2b. The original schedule envisioned launching the TEPC in Nov. 2003 on ISS Flight 13P. However, work on recertifying the TEPC for launch was delayed for several months because of funding issues. Because of this delay, the JSC Engineering Directorate determined that the hardware could not be ready for delivery in time for ISS Flight 13P, so TEPC was moved to ISS Flight 14P. When the 14P Progress missions slipped, NASA requested that the TEPC be manifested on ISS Flight 13P (January 2004). The manifest for ISS Flight 13P is currently under review. This TEPC required additional certification to meet Russian launch requirements (Progress launch vibration test), as well as some additional testing to allow operation in the Russian segment of the ISS (i.e., Russian power qualification).

Q2c. Is it important to have the TEPC installed aboard the ISS no later than January to calibrate it as the Sun approaches the minimum activity levels of its 11-year cycle?

A2c. Ideally, in order to be prepared for the earliest potential maximum crew exposure to solar radiation, the TEPC should be on orbit by April 2004. This date is driven by the following considerations: during the last solar cycle, the time of maximum crew exposure preceded the point of actual solar minimum by nine months; SEC's current projection of future solar activity levels places solar minimum sometime between January 2006 and July 2007. Using January 2006 as the earliest possible date for solar minimum, the point of maximum crew exposure would be nine months earlier—or April 2005. If the TEPC is on orbit by April 2004, NASA will be able to collect data for at least one year prior to the point of maximum crew exposure; this will allow us to develop a baseline of performance for the TEPC on orbit, as well as to track the exposure rise to solar minimum.

Biography for John G. Kappenman

Education

Graduated with High Honors from South Dakota State University in 1976 with a Bachelor of Science degree in Electrical Engineering. Member of Eta Kappa Nu, Tau Beta Pi, and Phi Kappa Phi Honor Societies.

Professional Experience

1998-Present Metatech Corp, Joined firm in Senior Management Position as Division Manager of Applied Power Solutions Division. He directs the development of products, services, and consulting that are provided to clientele world-wide and primarily focusing on Geomagnetic Disturbances & Space Weather, Lightning, and substation and power system engineering and related specialty products.

1977-1998 Minnesota Power Held a number of professional positions in the organization, 1978-1980 Special Studies Engineer, 1981-1994 Supervisor of Transmission Planning Department, Responsible for Development and Conceptual Design in excess of \$100 million in Transmission Construction Projects. 1994-1998 Manager of Transmission Power Engineering Department. Responsible for Substation and Control Engineering Functions and associated Technology Transfer.

1995-1998 University Minnesota-Duluth Dept. of Electrical & Computer Engineering—Instructor for Senior Technical Elective Courses in Power Systems and Senior Seminar.

Other Professional Activities; Faculty Member of the Electromagnetic Transients Program extension courses held at the University of Minnesota in 1982 and at the University of Wisconsin in 1984. Faculty member for the EMTP courses at the University of Minnesota Extension Program since July 1990. He has served as Chairman of the Industry Advisory Board for the University of Minnesota Center for Electric Energy. He has served on a National Academy of Sciences Panel on the National Geomagnetic Initiative. In March 1997, he was invited by the Presidents Commission on Critical Infrastructure Protection to brief the Commission on the “The Impact of Space Weather on Power Systems and their Operation.” He is also a member of the Organizing Committee for the NATO Advanced Science Institutes Conference on Space Weather Hazards being held in June 2000 in Crete. Mr. Kappenman has also served as a member of the Science Advisory Panel in July 2000 to the NOAA Space Environment Center. He was on the Scientific Organizing Committee of the NATO Advanced Research Workshop on Effects of Space Weather on Technology Infrastructure (ESPRIT) held in Rhodes in March 2003. He is a member of the Editorial Advisory Committee to the AGU International Journal of Space Weather. He is one of the founders and current Chairperson of the Commercial Space Weather Interest Group.

He has been an active researcher in power delivery technologies and his primary engineering contribution has been his research work on magnetic storms and their disruptive effects on electric power systems. He is leading a design team to develop forecasting and mitigation techniques. He has also been a collaborator with EPRI and Global Atmospheric on the development and application of the Fault Analysis and Lightning Location System that will allow economic Location-Centered mitigation of

lightning to transmission networks, work for which he has been granted a U.S. Patent. He is also one holds a U.S. Patent for his design of this device. He has been a principle investigator on a number of EPRI research projects on these and other subjects.

Mr. Kappenman is one of the principle investigators under contract with the Commission to Assess the Threat to the United States from Electromagnetic Pulse (EMP Commission). The EMP Commission was established by Congress under the provisions of the Floyd D. Spence Defense Authorization Act of 2001, Public Law 106-398, Title XIV. The EMP Commission was chartered to conduct a study of the potential consequences of a high altitude nuclear detonation on the domestic and military infrastructure and to issue a report containing its findings and recommendations to the Congress, the Secretary of Defense, and the Director, FEMA.

Engineering, Scientific and Professional Societies

He is a Senior Member of the Institute of Electrical and Electronics Engineers and the Power Engineering Society, and has served as the Chairman of the Transmission and Distribution Committee (1994-1996). He is also a member of the following IEEE Working Groups: GIC and Power System Effects, Flexible AC Transmission, and Lightning Performance of Transmission Lines and Distribution Lines. He is a member of the American Geophysics Union. Registered as Professional Engineer in the State of Minnesota, License #25100.

Honors and Awards

He is a recipient of the IEEE Walter Fee Outstanding Young Engineer Award. The Westinghouse Nikola Tesla Engineering Award, two IEEE PES Prize Paper Awards and twice awarded EPRI Innovator Awards.

Biography for Henry P. (Hank) Krakowski

Vice President—Corporate Safety, Security & Quality Assurance

United Airlines

Named to this position in November 2001, Captain Krakowski is responsible for corporate Safety, Security and Quality Assurance. These responsibilities cover all flight, operational, computer and maintenance functions, including emergency response. His organization is based in Chicago and has both Safety, Security and QA personnel worldwide.

Hank joined United as a pilot in 1978 and has served as Director of Flight Crew Planning and most recently as Director—Flight Operations Control. He was in charge of Flight Operations at United’s Operations Control Center on September 11th 2001. In addition to his officer duties Hank also flies the Boeing 737 out of O’Hare.

A native of Evanston, Illinois, Hank holds a Master’s degree in Business & Management and a Bachelor’s degree in mechanical engineering from St. Louis University. Hank has served as chairman of communications and national spokesman for the Air Line Pilots Association.

Active in numerous aspects of aviation, he is also a rated Flight Dispatcher and practicing Aircraft Mechanic. In addition to rebuilding two aircraft, Hank has been an

airshow pilot with the Chicago based Lima Lima aerobatic demonstration flight team. He lives in Deerfield, IL.

Biography for Robert A. Hedinger

Dr. Robert Hedinger, Executive Vice President at Loral Skynet, U.S.A, is responsible for Sales, Marketing and Client Services. He joined AT&T Bell Laboratories in 1978 as a Satellite Systems Engineer responsible for Satellite System Design, Satellite Transmission Planning, and International Technical Regulatory Matters. He led marketing and sales for AT&T SKYNET Satellite Services from 1991 to 1993. He led Business Development efforts for AT&T and subsequently for Loral SKYNET from 1993 through 2002. Since then he has been responsible for Sales, Marketing, and Client Services. Dr. Hedinger participated in ITU activities since 1980. He chaired the U.S. delegation to CCIR Study Group 4 for three years and participated as a U.S. delegate to three WRCs. He participated as Vice Chairman of U.S. Delegation to WARC ORB'88.

Dr. Hedinger received his Ph.D. in Physics from the University of Cincinnati, Cincinnati, Ohio in 1975.

What Is Space Weather? Why Is It Important?

The Sun is a variable star. Its magnetic field varies on a time scale from seconds to decades. The origins of solar variability are still poorly understood, but it causes the Sun

to produce vast explosions (flares and coronal mass ejections) and streams of ionized gas (the solar wind). The space environment, in which the entire Solar System exists, is controlled and modulated by these outpourings from the Sun. This variation in the space environment is called “space weather.”

Fortunately, the Earth has a magnetic field and atmosphere that partially protects us from the daily changes in geospace conditions. However, some of these effects do make their way into the Earth system and can damage our spacecraft and endanger the health and safety of our astronauts. Here on Earth, they can affect technologies vital to our civilization such as degrading communications, disrupting electrical power transmission, increasing corrosion rates in oil pipelines, increasing the radiation doses received by passengers and crew on some commercial airliners, and decreasing the accuracy of GPS.

The future of space exploration beyond the immediate Earth environment (i.e., beyond the protection of the Earth’s natural shields) is intimately linked to the necessity of understanding space weather. If we are to send astronauts to Mars or set up a permanent base on the Moon, for example, then understanding these phenomena and being able to predict them will be vital to ensuring our explorers’ safety.

Our Needs for Space Weather Data and Forecasts

Lockheed Martin Space Systems Company has a major stake in space weather. All of our space-related programs use space weather data in the planning, design, and operation of new orbital systems. Radiation dosage, communications quality, navigation and position measurement, surveillance, and mission life are concerns related to space weather in preparing reliable and successful space projects for the U.S. government. One of many possible examples: our Astronautics group (Denver, Colorado) uses SEC space weather forecasts to help scheduling the launches of Atlas and Titan rockets.

Our Advanced Technology Center in Palo Alto, California, works on a wide variety of space weather programs including building instruments for solar monitoring from the NOAA GOES spacecraft and the NASA Living With A Star (LWS) and Solar Terrestrial Probe programs. They research space weather phenomena originating from the Sun and model their direct effects in geospace. They have used the predictions from the NOAA SEC since the launch of the Solar Maximum Mission in 1980 to help optimize the scientific return from some of their solar missions.

Roles of Government, Academia and Industry in Space Weather

NSF, in collaboration with NOAA, DOD, NASA, and several other agencies, produced a study identifying the urgent need for a coordinated approach to space weather. This led to the National Space Weather Initiative. A part of this program was designed to improve the observations and research of space weather in the science community. This effort was spearheaded by NASA and NSF; which defined the outstanding theoretical and observational problems that need to be addressed. This led to the LWS program at NASA and comprehensive modeling projects at NSF.

Academia is important to the ongoing development of space weather because much of the ground-breaking research goes on at universities. While much of this research is of

purely scientific interest, some of it leads directly to models and visualization techniques that are applicable to space weather forecasting. The NOAA SEC is responsible for being familiar with these advances and how they might best be applied to forecasting.

Because the NASA charter focuses on science rather than operational monitoring of phenomena like space weather, the task of gathering long-term space weather data fell to NOAA, hence the inclusion of space weather instruments on NPOESS and GOES-R. NOAA also takes the discoveries made by NASA and NSF research that are specifically relevant to space weather forecasting and turns them into the appropriate data products on which the space weather user community depends.

The SEC has acted as the interface between the space weather science and user communities. For example, they have organized a very successful series of annual meetings, Space Weather Week, which bring these different space weather communities (researchers, modelers, commercial suppliers, and users) together to help understand each other's capabilities and requirements. Without this vital role of the SEC, space weather forecasting would be many years behind where it is today.

Industry provides the capability to build the instruments, spacecraft, and ground systems for NASA research programs and uses that experience to supply the necessary high-reliability monitoring systems for NOAA. The aerospace industry is also one of the many users of NOAA's space weather products.

Other government agencies (e.g., DOD, FAA, and DOE) are major users of NOAA space weather forecasts. They help define the observational requirements and data products that they want from the SEC. There is a marked rise in the number of companies whose business can be affected by space weather; these include the increase in commercial usage of GPS, cell phones, and the need for power grids to run nearer to capacity limits. This upsurge in the need for space weather products has resulted in a growing number of small businesses from all over the United States that provide space weather products specifically tailored to single-end-user needs. These companies rely entirely on the data and forecasts from the SEC.

Future Applications of Space Weather

The continuity and fidelity of the current space weather data and forecasting capabilities provided by NOAA SEC is vital. We should also consider what is needed in the future. Our investment and reliance on space technology are growing, and we need to respond to this by increasing our capability to forecast the operational environment of these ever more sophisticated and expensive space assets. To keep pace with these advances and new priorities, we believe that the SEC needs to grow steadily over the next few years.

Recently there has been increasing scientific interest in the potential link between space weather effects and climate change. It has been estimated that 30 to 50 percent of the recent climate change could be attributable to changes in the Sun. If this link is demonstrated to exist, as many scientists think it will, and the mechanisms are understood so that the space weather input to our climate can be modeled to accurately predict future

climate change, then the solar and geospace data, processed and archived by NOAA, will be of huge economic importance to the Nation's long-term planning of water and land usage. Consequently, we cannot afford to lose or disperse the core of space weather expertise currently resident at the SEC in Boulder, Colorado.

Conclusions

The stage of development of space weather at present is very similar to that of meteorological forecasting more than 40 years ago. The data are sparse and incomplete, and the forecasts are not as accurate in the long-term as some of the users would like. The increase in data acquisition capability represented by the new NPOESS and GOES-R space weather instruments, plus the influx of new data from the current GOES Solar X-ray Imager series, will result in a significant increase in our capability to forecast space weather effects more accurately over a longer period. To take full advantage of this upsurge in space weather data and demand for more forecast products, we need a growing capability at the NOAA SEC, not a reduced one.

Prepared Statement of Dr. W. Kent Tobiska
President and Chief Scientist
Space Environment Technologies
1676 Palisades Drive
Pacific Palisades, CA 90272-2111

The shorter-term variable impact of the Sun's photons, solar wind particles, and interplanetary magnetic field upon the Earth's environment that can adversely affect technological systems is colloquially known as space weather. It includes, for example, the effects of solar coronal mass ejections, solar flares and irradiances, solar and galactic energetic particles, as well as the solar wind, all of which affect Earth's magnetospheric particles and fields, geomagnetic and electrodynamical conditions, radiation belts, aurorae, ionosphere, and the neutral thermosphere and mesosphere.

The U.S. activity to understand, then mitigate, space weather risks is programmatically directed by the interagency National Space Weather Program (NSWP) and summarized in its NSWP Implementation Plan [2000]. That document describes a goal to improve our understanding of the physics underlying space weather and its effects upon terrestrial systems. A major step toward achievement of that goal is the ongoing development of operational space weather systems which link models and data to provide a seamless energy-effect characterization from the Sun to the Earth. The NOAA Space Environment Center is the key agency providing the raw information necessary for inputs into these systems and the continued support by NOAA SEC to space weather users is of critical importance in our technology-based society.

In relation to space weather's effects upon the ionosphere, there are challenges to space- and ground-systems that result from electric field disturbances, irregularities, and scintillation. Space and ground operational systems that are affected by ionospheric space weather include telecommunications, Global Positioning System (GPS) navigation, and radar surveillance. As an example, solar coronal mass ejections produce highly variable and energetic particles embedded in the solar wind while large solar flares produce elevated fluxes of ultraviolet (UV) and extreme ultraviolet (EUV) photons. Both sources can be a major cause of terrestrial ionospheric perturbations at low- and high-latitudes. They drive the ionosphere to unstable states resulting in the emergence of irregularities and rapid total electron content (TEC) changes.

Trans-ionospheric radio communications and GPS navigation systems are particularly affected by these irregularities. The ionosphere's ability to reflect high frequency (HF) radio signals is affected and conditions are created where HF radio propagation is not feasible when signal amplitude and phase scintillations are degraded. For GPS navigation systems users in perturbed ionospheric regions, the timing of GPS signals becomes significantly and adversely degraded, translating directly into location inaccuracy and even signal unavailability.

Ionospheric perturbed conditions can be recognized and specified in real-time or predicted through linkages of models and data streams such as those provided by NOAA SEC. Linked systems must be based upon multi-spectral observations of the Sun, solar wind measurements by satellites between the Earth and Sun, as well as by measurements from radar and GPS/TEC networks. Models of the solar wind, solar irradiances, the neutral thermosphere, thermospheric winds, joule heating, particle precipitation, substorms, the electric field, and the ionosphere provide climatological estimates of non-measured present and predicted parameters. Data provided by NOAA SEC are continuously used by these models.

Space Environment Technologies, a company that provides advanced space weather products and services for government and aerospace customers, supports NOAA Space Environment Center in a common effort to develop operational ionospheric forecast systems that will detect and predict the conditions leading to dynamic ionospheric changes. Such systems will provide global-to-local specifications of recent history, current epoch, and 72-hour forecast ionospheric and neutral density profiles, TEC, plasma drifts, neutral winds, and temperatures. Geophysical changes will be captured and/or predicted (modeled) at their relevant time scales using data assimilation techniques. Linked physics-based and empirical models that will provide thermospheric, solar, electric field, particle, and magnetic field parameters will enable reliable forecasts and will mitigate risks from space weather to our technological systems.

Comments of the Electric Power Research Institute (EPRI)

EPRI is a non-profit corporation formed by U.S. electric utilities in 1972 as the Electric Power Research Institute to manage a national, public/private collaborative research program on behalf of EPRI members, their customers, and society. Today, EPRI has over 1,000 members consisting of government-owned utilities (both federal and non-federal), rural electric cooperative associations, investor-owned utilities,

Independent and Affiliated Transmissions Companies (ITC and ATC), Independent System Operators (ISOs), and Regional Transmission Operators (RTOs), foreign (international) utilities, independent power producers, and governmental agencies engaged in funding electricity-related research and development.

EPRI has gained a worldwide reputation for excellence and credibility in scientific research and technology development related to electricity. As a tax-exempt scientific organization under Internal Revenue Code Section 501 © (3), EPRI makes its research results available through its technology transfer program, including publication of reports, licensing of intellectual property, and sponsoring seminars and conferences.

INTRODUCTION

Moderate and local disturbances in the power grid as a result of solar storms were seen from time to time, but was not fully understood that the possible damage could be serious until the storm of March 31, 1989. As a result of this storm, the Province of Quebec suffered a complete blackout and major equipment damage occurred in the northern United States. Since that event, the industry has been aware of the potential harm and has become more careful about noting Space Environment Center (SEC) alerts and responding to them.

The Northeast Blackout of August 14, 2003 was a reminder that the power grid is dynamic and that the necessary operational balance must be maintained with some care. Solar storms represent another disturbing influence which can unsettle the system if we are not careful. The alerts of the Space Environment Center provide critical information used by many utilities to gauge how to plan their operations during times of expected stress.

How likely is it that we will see a repeat storm of severity equal to that of March 13, 1989? We have since experienced a half of a sunspot cycle and not seen a comparable storm impact the earth. On the other hand there are compelling reasons to expect that our system is becoming more susceptible, rather than less, to the same disturbance.

Several trends combine to this so:

Deregulation has increased the purchase of power from more remote locations and thereby increased the long distance flows of power over the grid. Longer lines are more vulnerable to disruption from solar storms.

The relative loading of lines and transformers compared with their ratings have increased as load has grown faster than new installations. Equipment used near its limits of temperature and magnetic flux can be more easily pushed into failure from solar storms.

The use of microprocessors in electric energy consuming devices and appliances is rising dramatically. As a result, US business and industry is increasingly demanding more reliable, digital quality electrical supply. Microprocessor-based devices are more prone to disturbance and to misinterpretation of noisy signals that are likely to result from the effects of solar storms on the power grid.

Against the unknown probability of a recurrence (admittedly not a high probability) there must be balanced the projected cost of a widespread outage. This cost could be very

high indeed. In the United States, the region of highest risk runs from the Canadian border down to the middle of the country. Because the Magnetic North Pole is displaced somewhat towards the eastern U.S., the region of highest risk does not extend as far south into California as it does into Virginia. By coincidence, the recent Mid-West/Northeast Blackout of August 14 and 15, 2003 can serve as a reasonable model of what might happen from the recurrence of a high magnitude solar storm in the eastern U.S.

We value the alerts issued by the Center to our industry. Many utilities curtail elective maintenance operations and take steps to distribute their generation more evenly on the basis of these alerts. Several utilities have combined under the leadership of EPRI to pool readings of solar induced currents in real time so we can better assess the current status of any ongoing event.

We value the studies the Center makes of the solar wind and the evidence and data it is accumulating that will one day give us a much better understanding of phenomena we only observe today. It would be of great value if one day the Center was able to predict further into the future and with more certainty what to expect from the solar flows.

We value the studies of solar phenomena, the drivers of all the effects we experience. Understanding here may be further away, but could be even more valuable for predicting releases many days into the future.

It is not clear that any other public or private organizations have the budget or interest to pursue such long-term matters. The solar phenomena influence industries as diverse as communications, oil and gas pipelines and the electric power industry. The U.S. military has an interest in the matter of solar disturbances, which can disrupt GPD systems and indirectly impact them through loss of electric power.

Prepared Statement of Timothy L. Killeen

Director

National Center for Atmospheric Research

I wish to thank Chairman Ehlers, Ranking Member Udall, and Members of the Subcommittee on Environment, Technology and Standards for holding the October 30 Subcommittee hearing, What Is Space Weather and Who Should Forecast It? Space Weather is a relatively new, but critical area of scientific research and operations that may not be understood or appreciated by many in a manner that captures the field's importance to the Nation's security and technological preeminence in the world. You are doing the country a great service by examining the state of the science and recent questions that have been raised by Congress about who should forecast space weather and provide warnings about threats from solar storms. I write this not only from my position as director of the National Center for Atmospheric Research (NCAR), but as principal investigator of an instrument on the, (TIMED) satellite. A major goal of TIMED is to improve our ability to predict and understand Space Weather.

I would like to address the work and positioning of the Space Environment Center (SEC) of the National Oceanic and Atmospheric Administration (NOAA), the main topics of the October 30 hearing. I have experience working with the scientists of SEC

and was quite concerned to see the FY 2004 marks and language in both the House and Senate NOAA bills regarding the Center. The President's request for SEC provided it with a \$3 million increase over FY 2003. As I am sure you are well aware, the House mark eliminated this increase, keeping the account flat. Worse, the Senate zeroed SEC out and included the following language in the committee report: The "Atmospheric" in NOAA does not extend to the astral. Absolutely no funds are provided for solar observation. Such activities are rightly the bailiwick of the National Aeronautics and Space Administration and the Air Force.

The atmospheric sciences community is fully aware of the requirement in both the House and Senate bills to review NOAA research operations. Such a review will, I believe, strengthen those operations and provide long-term benefits to the country. However, the language of the Senate bill in particular seems to criticize research activities within NOAA across the board and single out SEC as an inappropriate NOAA function. This approach seems to me likely to be of significant harm to the Nation's scientific endeavors.

SEC has made many extraordinary basic and applied research contributions that have been described in detail by SEC Director Hildner in his testimony. These include the real-time monitoring and forecasting of solar events such as radiation storms that can damage satellites and electrical grids. The Center provides forecasts and real-time data that enable the prediction of solar effects on the Earth's magnetosphere, ionosphere, and upper atmosphere. These effects include enhancements of the radiation belts, ionospheric interference with communication and navigation systems, and changes in the orbits of satellites. SEC is the undisputed world leader in space weather forecasting, and its services are of significant value to commercial, military, and research endeavors conducted in near-Earth space.

In cooperation with the U.S. Air Force, SEC operates the Space Weather Operations Center, which serves as the national early warning center for space disturbances that can affect people and equipment working in the space environment. Research satellites such as the Hubble Space Telescope as well as communications and surveillance satellites are protected by the Center's activities, as are astronauts on the Space Station. Additional SEC activities include the prediction of solar influences on the Earth's magnetosphere, ionosphere and thermosphere. SEC predicts energetic particle fluxes in the Earth's ring current of geomagnetically trapped ions and electrons, ionospheric disturbances and their effect on radio communication, and thermospheric densities that affect satellite drag. The skill and knowledge to be able to provide these assessments are not easy to come by, taking years of experience to develop. Also taking much skill and experience to develop are effective ways in which to provide end users with information needed for operational purposes. SEC does an excellent job on both fronts.

The geophysical indices SEC provides are used by a wide number of scientific researchers, students, postdoctoral students, and the general public. They are employed in models of the upper atmosphere, ionosphere, and magnetosphere, and are important for operational studies. Disrupting SEC at this time would have a negative impact on studies involved with NSF-sponsored programs such as Coupling, Energetics and Dynamics of Atmospheric Regions (CEDAR), Geospace Environment Modeling (GEM), and Solar,

Heliospheric, and INterplanetary Environment (SHINE), as well as satellite studies of NASA and the DOD.

Space weather basic and applied research at SEC provides critical support to the operational forecasting and data services. SEC maintains active collaborations with the National Center for Atmospheric Research, the University of Colorado, Boston University, and many other institutions engaged in the extensive and challenging endeavor of obtaining a full and detailed physical understanding of the processes that drive solar activity, solar particle and electromagnetic radiation, changes in the solar wind and magnetic field, and the response of the magnetosphere-ionosphere-thermosphere system to those changes. In particular, SEC is a national leader in developing numerical models of the solar wind and the ionosphere, and data assimilation techniques applied to the upper atmosphere. Research at SEC is of very high quality and, I believe, is an irreplaceable component of current multi-institutional projects to create the next generation of coupled Sun-to-Earth numerical modeling systems for space weather forecasting.

As stated above, language in the Senate budget for FY04 implies that SEC functions should be transferred to NASA or to the Department of Defense (DOD). I have close working knowledge of the programs of NASA and believe that it is an agency that is not equipped to provide support for continuous (“24x7”) data and forecast services, having other priorities more critical to its core mission. Therefore, I do not believe that NASA would provide an appropriate home for SEC operational activities in the near-term. DOD could conceivably manage the operational arm, but would not be an appropriate home for the research activities conducted at SEC. In addition, DOD’s primary responsibility is military defense of the Nation. In times of war or other military emergency, it is conceivable that DOD operations would be classified and would pertain only to military matters. In this situation, response to civilian concerns relating to solar geomagnetic and radiation storms would likely be of lower priority.

I am sure that you are aware of the recently released National Research Council (NRC) decadal study on research strategy in solar and space physics titled, *The Sun to the Earth—and Beyond*. In this document, the eminent members of eight Blue Ribbon panels, committees, and boards strongly endorse SEC and recommend throughout that NOAA, NASA, DOD, and the National Science Foundation collaborate to lead the military and civilian effort to continue and to expand solar and space research, research applications, the acquisition of real-time data, and technology development.

A recommendation on page 14 of the NRC report states that “NOAA should assume responsibility for the continuance of space-based measurement such as solar wind data. . . .” This is a recommendation by numerous experts in the field. Absolutely nowhere in this document is there a recommendation that NOAA extricate itself from solar and space weather work because it is inappropriate to its mission. To the contrary, recommendations throughout elucidate the critical role that NOAA plays among the four involved agencies.

Though constrained by limited budgets SEC has done excellent work within NOAA and I believe it makes sense for it to continue to reside there. NOAA’s mission reads in part, “To understand and predict changes in the Earth’s environment. . .to meet our

nation's economic, social, and environmental needs." The Sun makes life on Earth possible and causes tremendous environmental changes. To better understand the Sun's behavior is to better understand Earth's environment. To understand the threats of solar geomagnetic and radiation storms and warn of their possible impacts contributes to meeting our nation's economic, social, and environmental needs. In my opinion, SEC's work is an integral part of the NOAA mission.

I understand that NOAA leadership is considering the transfer of SEC (should it survive the FY 2004 Appropriations process) from the Office of Oceanic and Atmospheric Research (OAR) to the National Weather Service (NWS). Transfer of SEC to NWS could strengthen its operational mandate, and provide a programmatic environment appropriate to its national mission. I would have some concern, though, that the critical, basic research side of the Center could become undervalued within the overwhelmingly operational environment of NWS. The two sides of SEC are symbiotic and not readily separated without seriously compromising the forecasting side. As has been stated before, operations are only as strong as the research and research applications behind them. To diminish one is to weaken or cause stagnation in the other. I would like to urge the Committee to seek assurances from NOAA leadership that, if SEC is transferred from OAR to NWS, the research side of the laboratory will receive continued support within NWS, or will be maintained elsewhere within NOAA with a close working relationship to the operational side.

In closing, I would like to note that NOAA/SEC is the undisputed world leader in space weather forecasting. SEC has an effective balance of research and operational staff in the area of solar-terrestrial physics and an ideal scientific culture for the purpose of forecasting. To create such a balance and culture at any other U.S. institution would be difficult, time-consuming, and expensive.

SEC could, in principle, be transferred to another agency, but that would require unnecessary expenditures, disruptions, and a short-term (if not long-term) downgrading in the quality of forecasting. Space weather forecasting is of immense importance to this technologically advanced nation; it should be carried out at NOAA, the culture of which supports forecasting with a strong scientific basis.

Mr. Chairman, in your leadership role with the Committee, and as a fellow physicist, I hope you will appreciate the value to the country of protecting SEC's research and operational role within NOAA, the importance of which was illustrated well during the very recent solar storms that erupted in the Earth's direction. I thank you and Mr. Udall for the opportunity to submit this written testimony and I appreciate your attention to this important matter.

Prepared Statement of Bruce Mahone

Space Weather Funding in Jeopardy

As a result of a Washington funding dispute, the Space Environment Center (SEC) in Boulder, Colorado, might have to close its doors in the coming months.

Funding for the Center has been reduced by the U.S. House of Representatives and cut entirely by the Senate. This could have a devastating impact on the U.S. airline industry, U.S. astronauts, the U.S. power distribution grid, worldwide navigation of all types, and U.S. military exercises.

The SEC is jointly operated by the Commerce Department's National Oceanographic and Atmospheric Administration (NOAA) and the U.S. Air Force.

Although other government entities collect data on space weather, no other facility serves as a focal point for aggregating and disseminating the full range of space weather information currently available. And no other office serves such a broad range of customers with its data—NASA, FAA, NOAA, DOD, and the private sector.

If the type of data provided by SEC were no longer available nationwide, some or all of the following effects could be expected:

Harmful radiation to airline passengers. Commercial airlines and high-altitude business jets flying polar routes during intense solar flares are subject to radiation doses as injurious to humans as the low-level radiation from a nuclear blast. This is the equivalent of 100 chest x-rays and would lead to increased cancer rates among crew and passengers. Without space weather information, aircraft operators do not know when to change direction to slower, yet safer non-polar routes.

Deadly radiation to astronauts. Astronauts venturing outside the Space Shuttle or International Space Station during intense solar activity are subject to dangerously high levels of radiation.

Loss of electrical power grids. For economic reasons, many portions of our nation's power grid regularly operate at peak capacity. If faced with a voltage spike induced by a magnetic storm, many nodes on the grid cannot handle the surge and would fail. When alerted that a magnetic storm is coming, however, grid operators can reduce the amount of electricity flowing through the grid, allowing "space" for the coming voltage spike and thus avoid system failure.

Critical navigational errors. Solar events and magnetic storms can interrupt or degrade navigation signals from Long Range Navigation (LORAN) systems and Global Positioning Systems (GPS). This can lead to navigation system failures or, even worse, false position readings. Navigators notified of such intense space weather can switch to backup navigation systems, thus avoiding misdirected vehicles and potential crashes.

Military effects. Electromagnetic signals caused by solar emissions influence high frequency communications, satellite ultra-high frequency communications, and GPS navigation signals. They also increase interference or false returns to sunward and/or poleward looking radars. Those who track satellites and other objects in orbit can potentially lose their targets because of these changes in the atmosphere caused by space weather.

Some in Congress are concerned that NOAA should stick to its core mission of tracking weather within Earth's atmosphere and not concern itself with weather patterns in space. Space weather, however, does ultimately enter Earth's atmosphere and (as noted above) affects systems on the ground.

Others are concerned that SEC funding comes from a portion of NOAA's budget designated for scientific research rather than for operational forecasting. This is not, however, inconsistent with SEC's work. Forecasting space weather and using the forecasts in real time is still in its infancy. It is a field that has proved very helpful in numerous ways, but one that is still in need of extensive research.

The view of the aerospace industry is that the Space Environment Center is not "broken" so there is no reason to "fix" it by moving its function to NASA, DOD, or another agency. And curtailing the services provided by SEC is not an option, particularly considering the hazardous threat environment in which we find ourselves. Keeping our nation safe, secure, and economically viable requires every bit of critical information available. And a major component of that information is space weather.

AIA is taking an active role with its Space Council and legislative staff to ensure that SEC funding is restored. The amount of funding the office requires (roughly \$5-8 million per year) is very modest compared to the benefits received from the products it offers for the good of our nation.

BEFORE THE STATE OF WASHINGTON
ENERGY FACILITY SITE EVALUATION COUNCIL

In the Matter of)	
Application No. 2009-01)	Public Comment Meeting
WHISTLING RIDGE ENERGY, LLC.)	On Draft EIS
WHISTLING RIDGE ENERGY PROJECT)	Pages 1 - 86
_____)	

A Public Meeting in the above matter was held on Wednesday, June 16, 2010, at the Underwood Community Center, 951 Schoolhouse Road in Underwood, Washington at 6:30 p.m., before the Energy Facility Site Evaluation Council Members.

* * * * *

CHAIR LUCE: Good evening. My name is Jim Luce.

I'm the Chair of the Washington State Energy Facility Site Evaluation Council, and we are here tonight to receive public comment on the Draft Environmental Impact Statement for the Whistling Ridge Energy Project. Tonight is June 16, 2010. We are gathered at the Underwood Community Center in Underwood, Washington. I want to thank all of you for coming to this meeting because I know it's a night meeting, and that takes you away from other priorities in your life.

I'll begin by introducing fellow Council Members that are with us here tonight, and I'll ask Council Members and staff from my right to introduce themselves beginning

Draft Copy

1 with Mr. Posner, Stephen Posner. It's all right to give
2 your name. All right. Next to him is Al Wright, our
3 manager for the Energy Siting Council. Next to him is Bob
4 Wallis, our Administrative Law Judge. Next to him is Kyle
5 Crews. Kyle represents us. He's with the Attorney
6 General's Office.

7 MS. McDONALD: Mary McDonald with the Department
8 of Natural Resources.

9 CHAIR LUCE: And Jeff Tayer with the Department of
10 Fish and Wildlife, Dick Fryhling with the Department of
11 Commerce. I've introduced myself already. On my left is
12 Andrew Montano. Andrew is the Environmental Protection
13 Specialist for the Bonneville Power Administration which you
14 are aware we're doing this as a joint environmental impact
15 statement together with Bonneville.

16 To Andrew's left, go ahead.

17 MR. MOSS: I'm Dennis Moss with the Utilities and
18 Transportation Commission.

19 CHAIR LUCE: To Dennis's left is Judy Wilson.
20 She's representing Skamania County.

21 So I'm going to ask Andrew to introduce the
22 Bonneville people that are with him tonight.

23 MR. MONTANO: Good evening and thanks for coming.
24 My name is Andrew Montana, and with me I have Susan Offerdal
25 who is an environmental protection specialist and Heidi

1 Helwig who is our public affairs specialist who is also
2 available to answer any questions.

3 CHAIR LUCE: Thank you. A few comments about
4 tonight's meeting. As you know, tonight's meeting is to
5 receive comments on specific issues addressed in the Draft
6 EIS. That's specific issues. It's not general views,
7 although we appreciate everybody has them regarding such
8 things as energy policy, alternative energy resources, the
9 applicant, the proponents. Issues in the environmental
10 impact statement is what we're here about tonight.

11 Due to the adjudicative proceedings that are
12 occurring concurrently at the same time as review of the
13 Draft EIS Council Members including myself are unable to
14 talk with any of you. Under different circumstances if this
15 was not an adjudication, we would be glad to talk to you.
16 We like to talk to people, we like to answer questions, but
17 the ground rules for the adjudicative proceeding do not
18 allow us to do that so please understand.

19 If you do have questions about EFSEC or the
20 Bonneville process direct them to Al, Al Wright or to
21 Andrew. Andrew is not part of this adjudicatory process so
22 he can be on the receiving end of your questions.

23 Now I'm going to briefly summarize this project.
24 On March 10, 2009, Whistling Ridge Energy, LLC, a Washington
25 limited liability company, submitted an application for site

1 certification to the Energy Facility Site Evaluation Council
2 to construct and operate the Whistling Ridge Energy Project,
3 a 75-megawatt electrical wind generation facility. The
4 proposed project would be located about seven miles north of
5 the city of White Salmon in Skamania County, Washington.
6 The proposed project site is privately owned land currently
7 used for commercial timber harvest. Up to 50 wind turbines
8 ranging in size of 1.2 to 2.5 megawatts and up to 426 feet
9 tall would be installed for the project. The project also
10 includes an operating and maintenance facility, a electrical
11 substation -- that's Bonneville's part -- underground
12 collector lines and systems, access roads, and other
13 ancillary facilities.

14 A revised application was submitted on October 12,
15 2009 which changed site access by removing the use of a
16 forest service road located within the Columbia River Gorge
17 National Scenic Area.

18 Last month the Draft Environmental Impact
19 Statement was issued directed by ESFEC and BPA. The EIS has
20 been prepared consistent with the requirements of SEPA and
21 NEPA. Because the State of Washington has a primary role in
22 siting of this facility the DEIS follows the format
23 contained in WAC 197-11 as adopted by EFSEC through WAC
24 463-47.

25 We will accept written comments tonight or

1 comments may be submitted by mail to EFSEC or Bonneville.
2 We will share comments. To be considered written comments,
3 comments must be postmarked by July 19, 2010. Please submit
4 your written comments to our EFSEC staff person seated at
5 the sign-up table that you have with you tonight.

6 Tammy, are you back there? Everybody turn around
7 and look at Tammy. Tammy is in charge of written comments.
8 Say hello Tammy.

9 MS. TALBURT: Hello.

10 CHAIR LUCE: And Kayce is back there. Is Kayce
11 back there with you? Kayce is here, trusty assistant.

12 So give your written comments if you have them
13 with you to those staff members tonight. If you have any
14 questions about EFSEC's review process, again talk to EFSEC
15 staff, Stephen Posner, Al Wright, or you can contact Bruce
16 Marvin, Counsel for the Environment.

17 Mr. Marvin, are you in the audience? Mr. Marvin
18 is not in the audience this evening. Mr. Marvin can be
19 reached. We will provide his e-mail address and phone
20 number. He is the State Assistant Attorney General
21 appointed to represent the public and its interest in
22 protecting the quality of the environment. I want to stress
23 he looks at the environmental issues from a state-wide
24 perspective, not individual issues that each one of you may
25 or may not have with the project. So it's a state-wide

1 perspective that he brings to the table.

2 Tonight's comments are part of the Council's SEPA
3 process, and Shaun is here with the court reporter machine.
4 So I am going ask everyone to be silent when someone is
5 speaking so we can hear what they're saying and Shaun can
6 hear what they're seeing and get it down.

7 If you need to come and go during the meeting
8 please do so as quietly as possible. Now sometimes I'm
9 guilty of something which is and it's on. My cell phone is
10 on and it's now going off. Would you please check your cell
11 phone and make sure that they're off. We love ring tones,
12 but we don't need to hear them this evening, at least not
13 during the hearing.

14 When making a comment be as specific as possible
15 about which section of the EIS that you're addressing, and
16 if you inadvertently start drifting away from the subject of
17 tonight's meeting, I'll ask you to refocus your comment.
18 We've got a lot of people here tonight, and so we're going
19 to have the three-minute rule. It's basically you say what
20 you're going to say in an elevator ride. We will have
21 Mr. Stephen Posner keeping time and he will be giving a
22 one-minute warning. Again if you submit these comments in
23 writing, they will be read by the Council. We read
24 everything we get, and often it's a great deal of reading,
25 but that's part of our job.

1 If there are those among you who want to
2 consolidate your time, that is if there are five of you
3 speaking to a specific issue, you could get together and 5
4 times 3 is 15. Now, that's another way to do it, and that's
5 perfectly reasonable. If you do that, then I would ask you
6 to provide me the names of who's going to do the
7 consolidation so we can strike those other names that are
8 not speaking off of the list. I can see that that might be
9 helpful to some people already.

10 So please be respectful. No applause, no negative
11 comments. Everybody deserves respect. You can speak at
12 tonight's meeting or tomorrow night's meeting but do not
13 speak to the same subject matter twice, please. If you feel
14 the need to speak tomorrow night, you will be given the
15 chance to do so, but you will come at the end of the line.
16 And hopefully and I trust everybody in good faith would only
17 speak if they have brand new information that they couldn't
18 otherwise present in writing or orally.

19 If you have written comments, as I've said please
20 submit them to Tammy. Don't read them into the record.
21 Standing before us and reading extensive comments is not
22 making them anymore important to the Council. They will be
23 made part of the record. If it turns out that you agree
24 with somebody -- I think I said that already -- please state
25 your agreement with the person or consolidate your time.

1 I'll call three speakers at a time. We have two
2 chairs behind the podium. Do we have two chairs behind the
3 podium? I don't think we do, but anyway we'll work that
4 out. I'll call three people in any case and two can be in
5 the ready room. Everybody will have a chance to speak, and
6 when you come forward to give your comment please state your
7 full name, spell your last name, give your mailing address,
8 and if you've brought written materials again Tammy is in
9 the back and she is at the sign-up table.

10 So now we will hear oral comments, and we will
11 begin with Mr. Rex Johnston, Klickitat County Commissioner,
12 on the firing line Peggy Bryan, and Frank Backus.

13 Mr. Commissioner.

14 COMMENTS BY REX JOHNSTON

15 Council Members, Ladies and Gentlemen, my name is
16 Rex Johnston J-o-h-n-s-t-o-n. I'm a Klickitat County
17 Commissioner from Western District 1. I'm here this evening
18 --

19 CHAIR LUCE: Could we have a live mic?

20 MR. JOHNSTON: Is that better?

21 (Audience says yes.)

22 MR. JOHNSTON: Shall I Start over?

23 CHAIR LUCE: Yes.

24 MR. JOHNSTON: Council Members, Ladies and
25 Gentlemen, my name is Rex Johnston. I'm a Klickitat County

1 Commissioner, District 1. I'm here this evening in support
2 of SDS's Whistling Ridge Energy Project. This is a time of
3 energy crisis not only with the United States but around the
4 world where the demand for energy is on the rise. There are
5 also many problems associated with production of energy.
6 The current oil spill in the Gulf and the timer by
7 environmental groups to remove hydroelectric dams are just a
8 couple examples.

9 Wind energy appears to be a vital form of
10 alternative energy, especially here in the Columbia Gorge
11 where we have both wind to produce energy and the
12 infrastructure to conduct it already in place. The EIS for
13 the Whistling Ridge Energy Project has properly analyzed the
14 environmental impacts; therefore, the project should be
15 approved. The scenic area boundary is the boundary. No
16 authority to condition projects outside the boundary based
17 on visual effects exists. This is a critically important
18 principle for economic development opportunities in the
19 Gorge counties. If this principle is not upheld it sets a
20 precedence for conditioning all projects in urban exempt
21 areas and beyond.

22 In Klickitat County the wind energy industry has
23 been a fantastic partner for the county. It has provided
24 income for struggling farmers and ranchers while also
25 providing much needed income for the county itself. In this

1 time of economic downturn we hope that the wind energy
2 industry will help Skamania County as well. Now more than
3 ever is the time for advancing clean energy. I hope we can
4 all get behind this project and help this through. Thank
5 you very much.

6 CHAIR LUCE: Thank you very much.

7 Ms. Bryan.

8 COMMENTS BY PEGGY BRYAN

9 My name is Peggy Bryan. I live at [REDACTED]
10 [REDACTED] Carson, Washington.

11 On behalf of the board of directors of the
12 Skamania County Economic Development Council I would like to
13 restate the strongest possible support for approval of the
14 proposed Whistling Ridge Energy Project. We have reviewed
15 the Draft EIS and believe that it is objective,
16 comprehensive, accurate, and authoritative. The Draft EIS
17 has not provided any reasons to justify opposition to the
18 project.

19 The Draft EIS found no significant impact on
20 wildlife or bird population, no significant impact on scenic
21 views, no evidence of any negative impact on tourism. The
22 draft concluded that Whistling Ridge is properly sized and
23 can only proceed successfully at its currently proposed size
24 of 75 megawatts.

25 The report confirms the many reasons the EDC

1 supports the project. Apart from the clear benefit of clean
2 renewable energy that substantiates the economic benefits
3 that drive our organization to strong support, the draft EIS
4 found that there will be considerable economic benefits to
5 the tri-county area of Skamania, Klickitat, and Hood River
6 counties. The construction workforce hired to build the
7 wind farm would add 143 workers with a peak of approximately
8 265 workers. There will be an estimated 1.3 million in
9 local non-labor purchases during construction. Annual
10 property tax revenues for the county would increase by
11 \$730,000. The White Salmon School District will receive an
12 estimated \$150,000 annually. Eight to nine new permanent
13 full-time jobs will be created.

14 Of the 1,070,000 acres of Skamania County less
15 three percent could be developed providing tax base and
16 provide economic sustainability to provide the necessary
17 services to the residents, business, and visitors of our
18 county. Due to excessive federal and other public ownership
19 of its land base Skamania County must take advantage of
20 every opportunity it has to grow its tax base.

21 Again, the board of directors of the Skamania
22 County Economic Development Council supports the Whistling
23 Ridge Wind Energy Project not just because it is a sound
24 economic development opportunity, but also because it
25 provides a clean, safe, green renewable energy resource that

1 will provide a better future to generations to come. Thank
2 you.

3 CHAIR LUCE: Thank you.

4 The next speaker will be Frank Backus. I hope I'm
5 pronouncing that right. And on the ready room Rich Potter
6 and Joy Gohl.

7 COMMENTS BY FRANK BACKUS

8 Thank you. My name is Frank Backus. [REDACTED]

9 [REDACTED] and I want to thank
10 the members of the Council and Bonneville Power
11 Administration for having this hearing tonight.

12 I'm in favor of this project. Your environmental
13 impact statement has analyzed this project, and it's found
14 no adverse impacts that would stop this project, not fauna,
15 flora, or scenic value. It's been said that this is a
16 pristine area. Most of the area that is involved in this
17 project is now planted in third growth forest. It's not
18 pristine. It's a working managed forest. I'm going to
19 agree with Mr. Johnston on the boundaries, and you heard my
20 comments on that last year, the Columbia River Gorge
21 boundaries, excuse me.

22 The Washington voters have spoken in this state,
23 and they have mandated every utility in this state to
24 furnish renewable resource, renewable power to their
25 customers. Here's a project that's going to do exactly

1 that. This project is compatible with the forest that it's
2 being proposed in, and it's compatible with the agricultural
3 lands that are nearest to this project. There is no
4 residential zoned lands near this project.

5 This project will have a major role in securing
6 the economy of Skamania County and the SDS family of
7 companies so thank you very much.

8 CHAIR LUCE: Thank you, sir. Next we'll hear from
9 Rich Potter, following that Joy Gohl and Brad Anderson.

10 Sir.

11 COMMENTS BY RICH POTTER

12 My name is Rich Potter, P-o-t-t-e-r, [REDACTED]
13 Underwood, Washington. Thank you for this opportunity,
14 appreciate your time.

15 I'm here to state that I believe that the draft
16 environmental impact statement is comprehensive and complete
17 and that no further analysis is needed.

18 And I just want to state that I support this
19 project because, one, it's green, and everybody here in the
20 room would agree that we need less dependence on petroleum
21 and more green energy; two, because it is in my back yard
22 and because it's going to bring significant economic
23 development and incremental tax income to the county and to
24 the school districts. Thank you.

25 CHAIR LUCE: Thank you, sir. Joy Gohl followed by

1 Brad and Keith brown.

2 COMMENTS BY JOY GOHL

3 My name is Joy Gohl, and I live at [REDACTED]
4 Road, White Salmon, and we have a dot.com business. We do
5 millions of dollars in business relating to the Columbia
6 River Gorge. Now the lady said that the tourism, there is
7 no problem with tourism, but with every client that we book
8 on these expensive seven night Columbia River Gorge cruises
9 we ask, "What do you want to experience?" And they all say
10 natural beauty. You know, where can we find a unique place
11 like this? This is an incredible place. They like to
12 experience wildlife, eagles, whatever, the sea lions, and
13 just see the beautiful scenery and enjoy the history, the
14 Lewis and Clark history. That's what every one of them
15 says. It's not a party cruise. There's no casino. There's
16 no dancing girls. They come to see the Gorge.

17 And so this is a real plight on the view coming up
18 here, and once it gets started, you know, where does it end?
19 And so tourism brings millions and millions of dollars here.
20 You don't see it. You don't even think about it unless
21 you're in a business like mine. But they spend money. They
22 stay afterwards, they rent a car, they drive up to Hood
23 River. If they could, the ships would stop at Hood River
24 again except that the sandbar is out too far and they can't
25 get in. So anyway that's a very real thing.

1 We tend to think that the Gorge belongs to us
2 because we live here. The Gorge was named one of top two
3 tourist places in the United States -- I'm sure all know
4 this -- by National Geographic recently. It's the Columbia
5 River Gorge and Vermont. Those are the top two places, and
6 my clients tell their friends that it's the most fabulous
7 thing. I've heard it over again. They'll do it, they'll
8 repeat it sometimes two or three times. So we have a real
9 treasure here.

10 And, you know, what I don't like about the wind
11 turbines, and I appreciate them being green, but it does
12 kill birds, and I don't know how that can be overlooked,
13 especially the red tail hawks and the eagles, and, you know,
14 birds of prey. They're looking at prey on the ground.
15 There's a lot of birds here to be killed by wind turbines.

16 The real clean energy is solar. I don't know why
17 the solar the latest technology developed in California is
18 being sent to Europe. We don't get it here at all. So I
19 think we need to think bigger, think cleaner, preserve what
20 we have. Thank you.

21 CHAIR LUCE: Thank you.

22 Brad.

23 COMMENTS BY BRAD ANDERSON

24 Good evening, Council. Brad Anderson. I am at
25 [REDACTED] I'm here on

1 behalf of Skamania County Economic Development Council. I'm
2 the Chair of the Economic Development Council. I also used
3 to be a prosecutor for Skamania County and a private
4 attorney with the law firm, regional law firm of Schwabe,
5 Williamson, & Wyatt.

6 I'm here to testify in support of the project but
7 also in support of the Draft Environmental Impact Statement.
8 I haven't read the whole thing, but the conclusion is
9 consistent with what we think is appropriate in this case.
10 And obviously a lot of money, time, and resources have gone
11 into that, and we'd ask you to adopt that, to find that
12 there's not going to be a significant resource.

13 I'm here on a limited purpose. I'm going to try
14 to limit my comments on two things. First of all, is the
15 economic development side. We are a commission made up of
16 volunteers from the private as well as the public sector.
17 Every year we come with a list of those things that we think
18 are the top priority. The last several years this project
19 as well as other alternative energy projects have been at
20 the top of our list so obviously we are supportive of that.

21 We're not stupid. We don't do things that are
22 going to undermine the economics of this community. Folks,
23 our county is hurting. For years when I was the prosecutor
24 I'd lobby for the federal funds. We're losing those federal
25 funds. They're dwindling. So we need alternative sources

1 of revenue in order to support our schools, support our law
2 enforcement, support of courts, everything else. We need
3 this project. We need this and many other projects to
4 substitute for those funds. I mean it's \$971,000 of
5 revenue. We need that. We need that very bad. With regard
6 to the jobs, okay, seven or eight jobs, permanent jobs maybe
7 that doesn't sound like a lot to a larger community, but
8 every job in a small community like Skamania County means a
9 lot. So every job counts.

10 With regard to the -- I also want to comment about
11 the impacts on the tourists. We wouldn't be stupid enough
12 to support something that's going to take away from another
13 factor. That's important and that is the tourist industry
14 here in the Columbia River Gorge. We know the treasure that
15 we have. But when we investigated this, and believe me we
16 have spent a lot of time looking at other communities that
17 have these type of projects, and our investigation and our
18 conclusion show that these things are not a distraction to
19 people coming to your area like the Bonneville Dam.

20 I live in North Bonneville, drive by the
21 Bonneville Dam everyday, and I can tell you there's a ton of
22 visitors that think that's a pretty remarkable facility.
23 The same will be true for rain resources or wind energy
24 projects like windmills. So it's not going to distract.
25 It's going to be another attraction that will bring people

1 to the Columbia River Gorge. We ask that you support this
2 project, that you find that there will not be any adverse
3 impacts to environment and approve this when you finally get
4 to that moment. Thank you.

5 CHAIR LUCE: Thank you, Brad. Keith Brown,
6 followed by Teresa Robbins and David Query.

7 MR. BROWN: There are four of us that are going to
8 consolidate our time, and I'll take the first half and
9 Teresa Robbins will take the second half.

10 CHAIR LUCE: Keith and Teresa. And who are the
11 others?

12 Donnarae Query and Dave Query.

13 CHAIR LUCE: All right.

14 COMMENTS BY KEITH BROWN

15 Okay. I've got a couple of charts that we're
16 going to put up. Before I begin I'm not an expert on wind
17 turbines, but I have taught program evaluation, advanced
18 statistics, and measurement techniques at universities. I
19 was the assistant director at one of the top research and
20 development centers. During the last two years I've spent
21 hundreds of hours researching the probable impact of wind
22 turbine noise. Keith Brown, Ph.D., [REDACTED]
23 Washougal, Washington.

24 The noise portion of this Draft EIS should
25 accurately predict and fully describe potential adverse

1 impacts of the probable and worst-case noise scenarios.
2 This Draft EIS in our opinion fails to do this. Instead it
3 hides behind the outdated noise regulations never intended
4 for wind turbines. It distorts the comparison of the EPA to
5 Washington Noise Guidelines. It ignores guidelines
6 specifically designed to reduce adverse wind turbine noise
7 impacts. It collects inadequate data on current noise
8 levels at homes closest to the proposed industrial site. It
9 uses a computer model too simple to accurately predict noise
10 levels in complex mountainous terrain and varied weather
11 conditions.

12 CHAIR LUCE: Excuse me. Is there something on the
13 chart you want us to see?

14 MR. BROWN: Yes, I'll flip it over in a minute.

15 CHAIR LUCE: Just wanted to make sure.

16 MR. BROWN: The Washington Noise Regulations were
17 written in 1975. That's 35 years ago before industrial wind
18 turbines were considered. This draft ignores the
19 substantial work that has been done since 1996 in developing
20 regulations and guidelines specific to appropriate and
21 ecological siting of wind turbines. The EPA Region 10
22 Guidelines state that an increase of 10 or more decibels
23 over existing background noise will result in significant
24 negative community reaction and would be considered serious
25 warranting close attention. A 10 decibel increase is

1 subjectively heard as an approximate doubling in loudness.

2 Oregon wind turbine complexes just across the
3 river are limited to raise total noise levels to a maximum
4 of 36 decibels, no more than 10 decibels over existing
5 ambient noise background which is typically 26. EPA
6 guidelines limit nighttime levels to 45, and your Draft EIS
7 proposes to allow 50. That's 24 decibels over your measured
8 readings of 26. Really? How can BPA in good conscience
9 apply a more destructive to Washington? Similar guidelines
10 to the Oregon standards exist in countries around the world,
11 including Australia, Denmark, France, Germany, Holland, even
12 the World Health Organization.

13 We provided you in May 2009 the extremely useful
14 recent research and relevant Kamperman James, "How to site
15 Wind Turbines to Prevent Health Risks from Sound" which
16 appears to have been ignored in the preparation of this
17 Draft EIS. It's astonishing that this draft makes no
18 mention of the guidelines designed to specifically reduce
19 the impact of industrial wind turbines. All these
20 guidelines that I've talked about limit maximum noise levels
21 to between 35 and 40 decibels. Decades of extensive
22 experience has determined the type and level of noise
23 produced by wind turbines impacts people differently than
24 other industrial sources.

25 On this chart shows more than 35 percent of people

1 in rural areas experience wind turbine noise of about
2 40 decibels as highly annoying. So you've got highly
3 annoyed about 40 decibels. Thirty-five percent receive that
4 as highly annoying whereas 0 percent of people report high
5 annoyance to aircraft, road traffic, or railways. It would
6 take 70 decibels of aircraft noise and far in excess of 75
7 for road traffic and railway noise to create the same level
8 of annoyance that wind turbines create at 40 decibels. Wind
9 turbines are clearly in a different class of sound impact
10 and require a different standard.

11 We see no additional measurements to the limited
12 measurements taken during icy conditions originally provided
13 by the SDS consultant. These were not even taken at the
14 closest property lines or homes. It's critical to take
15 measurements at the right time in the summer and the right
16 place at the affected homes. Realistic projections in
17 mountainous and irregular terrain require a complex,
18 three-dimensional program rather than the simple
19 two-dimensional program used in the Draft EIS.

20 Your projection analyzes wind speed measured at 10
21 meters height which extensive research shows will
22 underestimate the wind speeds at the hub by a factor of as
23 much as 2.6, and underestimates the wind turbine noise by as
24 much as 15 decibels. During inversions mostly at night this
25 is when there is even greater sleep disturbance.

1 We've thoroughly examined this Draft EIS on noise
2 impact and find it to be totally inadequate. In our opinion
3 it needs to be redone. Thank you for your consideration.

4 CHAIR LUCE: Thank you very much.

5 We've heard from Mr. Brown. Teresa, David, and
6 Donnarae we consolidated all of those so Teresa is the
7 second half.

8 MS. ROBBINS: I'm the second half.

9 CHAIR LUCE: Oh, so you're the second half. So
10 six minutes.

11 COMMENTS BY TERESA ROBBINS

12 Thank you. Teresa Robbins, [REDACTED]
13 Skamania County. So what does all this mean to the people
14 of this community? We offer this recent study conducted by
15 medical doctor Michael A. Nissebaum, "Industrial wind
16 turbines installed in close proximity to human habitation
17 results in sleep disturbance and stress. Wind turbines will
18 over the long term result in serious health effects,
19 cardiovascular disease, chronic feelings of depression,
20 anger, helplessness, and reduced quality of life."

21 He compared a group of exposed individuals,
22 meaning living within 3,500 feet of a ridge line arrangement
23 of 28, 1.5 megawatt wind turbines. By the way, Whistling
24 Ridge would have more and larger turbines. When you compare
25 that group to the nonexposed individuals, meaning living

1 approximately three miles away from the industrial complex,
2 this is what he found. New or worsened chronic sleep
3 deprivation 82 percent is exposed versus 4 percent in the
4 nonexposed group. New chronic headaches 41 percent as
5 opposed to 4 percent in the nonexposed group. Stress,
6 59 percent to 0 percent in the nonexposed. Persistent
7 anger, 77 percent in the exposed group versus 0 percent in
8 the nonexposed. New or worsened depression 33 plus percent,
9 0 percent in the nonexposed group. Perceived reduced
10 quality of life, 95 percent versus 0 percent. There were
11 new prescriptions offered, 26 new prescriptions offered in
12 the exposed as to 4 in the nonexposed group. These were
13 people that were of similar age and similar occupation.
14 This was a controlled study.

15 He states there's absolutely no doubt that people
16 living within 3,500 feet of a ridge line arrangement of
17 turbines in a rural environment will suffer negative
18 effects.

19 The World health Organization says noise levels
20 above 40 decibels have definite health consequences.
21 Results like this are due to the failure of currently
22 practiced preconstruction sound modeling. A recent review
23 of all the relevant published studies done by two unbiased
24 Ph.D. toxicologists at the request of the Minnesota's
25 equivalent to Washington State EFSEC, one quote from the

1 26-page study concluded the most common complaint is
2 annoyance or impact of quality of life. Sleeplessness and
3 headaches are the most common health complaints and are
4 highly correlated but not perfectly correlated with the
5 noise. Complaints are more likely when turbines are visible
6 or when shadow flicker occurs. Most available evidence
7 suggests that reported health affect are related to audible
8 low frequency noise. Complaints appear to rise with
9 increasing outside noise levels above 35 decibels.

10 One of the experts that you cited in the Draft EIS
11 G.P. van den Berg conducted the most comprehensive study of
12 what is causing the increased noise levels experienced by
13 people over and above modeled predictions. "Annoyance with
14 relative height at calculated maximum sound emission levels
15 below 40 decibels where one would not expect strong noise.
16 As wind turbines become taller the discrepancy between real
17 and expected levels grow. Only recently turbines have
18 become so tall that the discrepancy now is intolerable. In
19 quiet night the wind farms will be heard at a distance up to
20 several kilometers, a low pitched thumping sound with a
21 repetition rate of once a second not unlike distant pile
22 driving. A resident living a distance of 2.3 kilometers
23 from the wind farm describes the sound as an endless train."

24 And finally this is your cited expert we're
25 quoting here. "Proponents must accept that wind turbine

1 noise is not always benign and that the noise may affect
2 people, and that the people who are complaining are not
3 always just a nuisance. Please read the entire
4 200-dissertation of Mr. Van den Berg. We have.

5 We continue to be upset and very concerned.

6 CHAIR LUCE: Thank you so much, appreciate your
7 comments all four of you and keep those charts, and better
8 yet if you have copies of them would you please give them to
9 Tammy and also give her copies of your written comments.

10 MR. BROWN: We have much more extensive written
11 comments than we have time for.

12 CHAIR LUCE: All right. Thank you very much.

13 Next up is Mike Eastwick followed by Wirt Maxey,
14 followed by Loreley Brach.

15 COMMENTS BY MIKE EASTWICK

16 Hi, Mike Eastwick, [REDACTED] Underwood. It's
17 E-a-s-t-w-i-c-k. I'm sorry. I didn't get the speaking
18 points from SDS so I have my own to do here.

19 Let's see. Under affected environments, surface
20 water there is no mention of the unmanned stream west and
21 down slope of the A-1 through A-7 turbine group. This
22 stream initiates as a spring and flows year around and
23 eventually opens into the Columbia. In addition, it flows
24 through World Stewardship Nature Preserve Land which will
25 soon be purchased by Columbia Land Trust. Please add this

1 consideration to your study.

2 On the ground water the same unmanned stream
3 mentioned above has been overlooked since it doesn't
4 originate as ground water and springs. Please add that to
5 your study.

6 There's very little discussion on the flashing red
7 lights. My understanding is these are fairly bright and
8 regular flashes. So in addition to the thumping noise that
9 they talked about you also have this very repetitious
10 flashing going on. I think that I've read that this may
11 trigger some health issues so I'd like to see more
12 consideration for that in a study as well.

13 There is no reference to Dr. Pierpont's studies or
14 the other studies that these folks just mentioned on the
15 noise. It's not sufficient to say it's not a problem when
16 scientific studies indicate that there's a need for larger
17 setbacks to avoid these kinds of issues. All the noise
18 documentation is generally positive, educational, and based
19 on county defined ordinances, all of which do not comprehend
20 continuous operation of noise producing machinery. It's
21 also interesting to me that the sheer amount of
22 documentation in the Draft EIS on noise causes me to believe
23 that this can be a problem and really needs more than just
24 an academic dissertation on the topic of sound. The most
25 recent science should be considered in this study.

1 The study did not use the noise level defined by
2 the manufacturer of the proposed towers and the generating
3 station which are larger and noisier than those discussed.
4 It is unacceptable and reckless to conclude the noise would
5 be within limits if you don't think about the actual towers
6 that are going to be used or the worst-case towers that are
7 going to be used and the generating facility and all the
8 cumulative effects of those things at once. Please add that
9 to your study.

10 Regarding land use in the National Scenic Area, we
11 all understand that the regulations, boundaries do not
12 preclude development of this type of project; however, can
13 you honestly say that the visionaries for the National
14 Scenic Area knew that there would be a structure that could
15 be 400 some feet tall, noisy, intrusive could be even
16 created and erected? Can you honestly and with good
17 conscious ignore the basic intent of the National Scenic
18 Area to preserve our nation's natural scenic resources?

19 Most recent studies on bat and raptor deaths
20 caused by wind turbines indicate a significantly higher
21 number than expected. Klickitat County has begun a new
22 study because many new deaths were occurring than were
23 promised by the boilerplate information provided in their
24 EIS. There does not seem to be mention or analysis of the
25 land being designated as deer and elk winter range. I

1 didn't have enough time to get a map from the Fish and
2 Wildlife folks, but I know that the property directly south
3 is designated deer and elk winter range, and I saw no
4 discussion of the impact of this project on that range. I
5 personally would like to understand what's going to happen
6 with the deer and elk.

7 CHAIR LUCE: Could you summarize now and then
8 provide the staff your written comments, please.

9 MR. EASTWICK: Yes. Property values -- just one
10 more point, please. Property values were old studies and
11 were not comparable to the situation here. They all were
12 talking about much more rural situations in land and
13 property values that are much lower than exist here. Okay?
14 So please look at those studies and try to do some
15 comparisons so we can understand the impact to our type of
16 neighborhood.

17 CHAIR LUCE: Thank you.

18 MR. EASTWICK: Thank you.

19 CHAIR LUCE: Mr. Maxey.

20 COMMENTS BY WIRT MAXEY

21 Good evening. My name is Wirt Maxey. I live at
22 [REDACTED]. I'm a semi-retired attorney. I
23 practiced law in the state and the federal courts of south
24 Florida for more than 30 years.

25 (Audience member said we can't hear back here.)

1 MR. MAXEY: Anyway I'm a semi-retired attorney and
2 I practiced law in the state and federal courts in South
3 Florida.

4 (Audience member said I didn't hear your name.)

5 MR. MAXEY: Wirt Maxey. Can you reset the time,
6 please.

7 CHAIR LUCE: Name and address, you got that,
8 Shaun? Okay. Start all over.

9 MR. MAXEY: Reset the time, please.

10 MR. POSNER: Got it.

11 MR. MAXEY: My name is Wirt Maxey. I live at [REDACTED]
12 [REDACTED] I'm a semi-retired attorney. I've
13 practiced law for over 30 years in the state and federal
14 courts of south Florida. My emphasis was on commercial
15 relations and real estate law.

16 I set out initially to study and analyze the DEIS
17 document in detail because I wished to provide this council
18 with thoughtful and reasonable and informed comments. Here
19 it is. It took five to six hours to download it on my laser
20 printer. I burned through three or four toner cartridges
21 which cost about 50 bucks a piece. Including the appendices
22 it weighs over 20 pounds, and I didn't count them, but there
23 is well over a thousand pages. I'm going to say probably
24 closer to 2,000 pages if you count all the appendices which,
25 of course, are very important because that's where the data

1 is.

2 This was first made available to the public May
3 25. That's about three weeks ago. Assuming that an
4 interested party downloaded this document on the day it was
5 available that would give three weeks to read every word in
6 here, study, review it, and analyze highly technical
7 material. Of course, it's doubtful that anyone retrieved it
8 the very first day it was available, and most folks have
9 working family responsibilities which would leave nights and
10 weekends to work their way through this in three weeks. I
11 realize there's another month for written comments.

12 Esteemed Members of the Council, the 14th
13 amendment to the constitution of the United States of
14 America contains something we call the due process clause.
15 The constitution of the state of Washington contains similar
16 provisions. The due process clause requires that interested
17 parties be given reasonable notice and a reasonable
18 opportunity to be heard.

19 I respectfully submit to this Council that it is
20 completely unreasonable to expect the layman or even a
21 trained professional to read a document of this magnitude,
22 to study and understand it, and to be able to make informed
23 comments in three weeks or even three months. I don't
24 expect an answer to this question, but most respectfully
25 have any of the Members of this Council read every word of

1 this? I doubt it.

2 Under the SEPA rules a party forfeits his rights
3 to raise issues if he doesn't raise them in this comment
4 period; yet we are not given anywhere close to adequate time
5 to read, to study, to digest this document and probably hire
6 our own consultants because it is so darn technical. We're
7 not given adequate time to do any of that so that we can
8 raise the issue.

9 The applicant has been working on the document for
10 many years so the appendices go back to 2002, 2003. That's
11 how long the applicant has been working on this, and the
12 working man John G. Public is expected to read and digest
13 this document in a couple of months. I respectfully submit
14 that that is fundamentally, fundamentally unfair.

15 In summary, I would like to formally object to
16 these proceedings on the grounds that I, myself, and other
17 similarly situated parties are being denied reasonable
18 notice and a reasonable opportunity to be heard and
19 therefore are being denied our constitutional right to due
20 process of law. I ask this Council for an order extending
21 the time for written comments for a minimum of 90 to
22 120 days from the current deadline in order to afford the
23 public due process of law. Thank you very much.

24 CHAIR LUCE: Thank you, sir. Appreciate that.
25 Next speaker will be Loreley Brach, followed by Dale Glasgou

1 and Todd Myers.

2 COMMENTS BY LORELEY BRACH

3 My name is Loreley Brach. My address is [REDACTED]
4 [REDACTED] Underwood, Washington. We
5 just moved.

6 I want to ditto what he just said. I tried to
7 download it and I gave up. My husband finally did it for me
8 ending in Chapter 3. I kind of breezed through it, and I'm
9 not even sure it's worth much of my time to review it. It's
10 so deficient.

11 I also want to briefly comment that well accident
12 that's a perfect example of what happens when we pursue
13 energy and disregard the environment. I think that's
14 happening here. A year ago we all presented comments. I
15 know I did. I didn't see anything about any comment I
16 presented in that DEIS, and one of the requirements of these
17 environmental impact statements is that alternatives are
18 presented.

19 And while I didn't see much in alternatives, SDS,
20 Whistling Ridge owns about 80,000 acres in the state of
21 Washington, and they chose these few acres. There's no
22 potential to anywhere else they could have put them that
23 wasn't going to impact the National Scenic Area, that wasn't
24 going to be in people's back yards, that wasn't going to
25 impact people from living off the tourism here?

1 There's also another deficiency in that this
2 applicant insists upon a 70-megawatt connection. What is
3 with the 70-megawatt connection? Why is it so important?
4 Again what's the alternatives? Is there nothing? If
5 there's not, we need to know why. We need to understand
6 this.

7 Okay. And the other thing that's missing is
8 alternative roads. This Whistling Ridge gave one road in
9 its revised application and then gave an alternative called
10 Oslund Road. Well, if you want to come visit Oslund Road,
11 I'll show it to you. It doesn't exist. This road does not
12 go through because it simply does not exist. Now they're
13 required to give viable alternatives. There is no
14 alternative. Little Buck Creek Road why is that not in
15 there? I think we deserve a rationale for that as well.

16 Another thing there's no supporting research
17 commentary to any of these blanket things that they are
18 saying in there. Bats and birds are killed by collision
19 with these turbines. 80 percent of the birds and the bats
20 are being killed by something called barotrauma. Where is
21 that? It's been out for a full year. Why wasn't that
22 included in this?

23 It's deficient. We should do this over. We
24 should give the public an opportunity to comment on a
25 balanced, supported document, and I did notice one other

1 thing in there, some of the cultural information. I guess
2 there's still some consultation with the tribes. It's not
3 complete. This DEIS is very incomplete. Let's start over.
4 Let's do it again. Let's do this right. Let's do it
5 according to the law so we don't have another fiasco like we
6 see in the Gulf of Mexico. Thank you.

7 CHAIR LUCE: Thank you very much.

8 Dale.

9 MR. GLASGOU: Should I disqualify myself because I
10 talked to the honorable representative from the Department
11 of Natural Resources before the meeting?

12 CHAIR LUCE: I don't think you have to disqualify
13 yourself, but I'll ask the Department of Natural Resources
14 not to answer any of your questions. Come up and give us
15 your opinions.

16 COMMENTS BY DALE GLASGOU

17 Well, I've changed my speech and I'll be weighing
18 it. My name is Dale Glasgow and I live at [REDACTED]
19 [REDACTED] And what I'm going
20 to say is slightly different from what you've heard.

21 Two years I got a call from the Department of
22 Natural Resources in California saying you should attend the
23 meeting of the 76 Western Snow Conference being held at the
24 Hood River Inn, and it was an eye opener. The first was the
25 magnitude. There were about 14 federal agencies involved

1 and most of the universities west of the Mississippi River.
2 And the title of the entire talk was population growth and
3 the impact of global warming on the waters off the Northwest
4 and California and the Rockies, the Canadian Rockies. I was
5 approached by the chief water hydrologist of the state of
6 California, and the hydrologist for the Hetch Hetchy
7 Reservoir Project which delivers all the water to San
8 Francisco and to Silicon Valley, and they said we know that
9 the global climate models all seem to agree that the
10 southwest is entering a prolonged drought period, and we
11 need the water from the Northwest. He says 120 million acre
12 feet go over the Bonneville Dam each year. We need 20
13 million acre feet. That's enough for about 20 million
14 families. And he says, "Where are we going to get it?"
15 Well, we know that there are two 2 million volt DC lines
16 from The Dalles, Oregon to the California border, and we can
17 run a pipeline up over the Oregon Plateau down through Lake
18 Albedor and Lake Shasta and we need that power. And we know
19 that there's a lot of wind power in Eastern Oregon and
20 Eastern Washington and we call for that. We need that
21 power.

22 So they also said there were more people in the
23 state of California, 36 million, than all the states of
24 Oregon, Washington, Idaho, Montana, Wyoming, Utah, Nevada,
25 Arizona, North and South Dakota, and so forth. So there's a

1 lot of representatives in Congress, and we will exercise
2 that muster because we have to protect the children of
3 southern California because Lake Mead, Lake Powell will be
4 nearly dry in 10 to 20 years. We have to protect those
5 children, and so they want this power and they know exactly
6 where its at and wind power is one of those. Thank you
7 kindly.

8 CHAIR LUCE: Thank you. Mr. Myers from Wind Works
9 Northwest followed by Jessica Lally, Yakama Nation, and
10 Peter Cornelison.

11 COMMENTS BY TODD MYERS

12 Mr. Chairman, Members of the Council, my name is
13 Todd Myers, and I serve as Executive Director of Wind Works!
14 Northwest which is a wind power advocacy group of about 300
15 supporters state wide. Our address is [REDACTED]
16 Ellensburg, Washington.

17 I have two comments on the DEIS. First is the
18 project alternatives and the second I'll touch on a little
19 bit of the visual impacts.

20 The Draft EIS is I think correct in its assessment
21 that the Whistling Ridge Energy Project is an integrated
22 whole. In other words, a single power plant, not pieces of
23 a whole where some turbines might be limited. The project
24 at 75 megawatts currently is the smallest project actually
25 proposed or operating in Washington State and should be

1 treated as an integrated whole.

2 The economic viability of the project hinges on
3 SDS being able to complete the project as designed. So
4 therefore when people want to sort of pick and choose or
5 remove seven turbines it sort of reminds me of if auto
6 manufacturers said that they're going to sell you 90 percent
7 of the car, you know, except for the transmission. You have
8 to treat it as a whole project. You can't take a little bit
9 back. If you take a little bit back, you're essentially
10 saying that the project goes away.

11 In interest of fair evaluation the proposed
12 project before you must be considered as an integrated whole
13 and given the economies of scale utility demand for
14 renewable power. This project if it's to proceed at all
15 can't be downsized.

16 The second thing I want to direct real quickly is
17 the issue of visual impacts. One area where the document I
18 think does fall short of is assessing the value of the
19 visual amenities the Whistling Ridge currently provides to
20 the Gorge area. The project opponents assert that SDS by
21 building a Wind farm on its property would impact the value
22 of that property, but the concern can only be taken,
23 understood, and fully analyzed if both sides of the coin are
24 examined. It would be helpful in this discussion if the
25 Draft EIS estimated the financial value of the visual

1 amenity that SDS currently provides.

2 So the question is if they're arguing that they're
3 going to lose value in visual amenities from their property,
4 they also admit that they're currently receiving that same
5 amount of value to their property or business, and the
6 question is would they be willing to pay that value right
7 now to keep things as they are? When does a neighbor's
8 property rights extend to everything that he or she can see
9 from their boundaries? It sort of sets up a Yertle the
10 Turtle standard where you're in control of all that you can
11 see.

12 Mr. Chairman, Members of the Council, I commend
13 you and BPA for commissioning an excellent environmental
14 document. I think it provides a rock solid foundation on
15 which to perform your ultimate action on the Whistling Ridge
16 Energy Project.

17 CHAIR LUCE: Thank you.

18 COMMENTS BY JESSICA LALLY

19 My name is Jessica Lally. I'm an archeologist
20 with the Yakama Nation Cultural Resources Program, P.O.
21 [REDACTED] I'm here today on direction by the
22 Roads Irrigation and Lands Committee of the Yakama Nation.
23 Several people tonight have commented on the deficiencies on
24 the Draft EIS, and I am no different.

25 In December of 2009, the cultural resources

1 program did a survey of the project area and generated a
2 report. We found in that report a particular area that is
3 sensitive to the tribe. This has not been included in the
4 draft for consideration and for public review. I'm asking
5 EFSEC and BPA to include this in the Final Draft
6 Environmental Impact Statement and consultation which will
7 be required to resolve the matter. Thank you.

8 CHAIR LUCE: Thank you.

9 Next Peter Cornelison followed by Don Morby and
10 Wally Stevenson.

11 COMMENTS BY PETER CORNELISON

12 My name is Peter Cornelison. I live at [REDACTED]
13 [REDACTED] I'm like to make two points
14 tonight.

15 First of all, and this point has already been
16 made, but I don't think enough emphasis can be -- it needs
17 more emphasis. Basically we have not had adequate time,
18 fair amount of time to read this massive document that the
19 applicants have spent months and years preparing. In
20 addition, it's my understanding this is our only chance to
21 address you orally in terms of making comments. It's not
22 fair. You need to give us another chance to talk to you
23 about this after we've had time to read and reflect on
24 what's been proposed.

25 Secondly, a couple years on the Oregon side of the

1 Gorge a similar project called Cascade Wind was proposed on
2 a place called 7 Mile hill, very visible bluff outside The
3 Dalles. The project would have been highly visible on
4 Highway 14, and I don't know if you're aware of the concept
5 of key viewing areas. That's something we have here in the
6 National Scenic Area. It's certain protected spots. The
7 view shed is important and suppose to be kept pristine. If
8 that project had gone in, it would have decimated the scenic
9 views of that stretch of highway in terms of rotating ten
10 wheels reflective light.

11 Under Oregon's Wind Energy Siting Guidelines,
12 Oregon EFSEC, your counterparts in Oregon, are prohibited
13 from approving projects which will adversely affect the
14 National Scenic Area, even though a project might be located
15 just outside the boundary just as this one is. The
16 application was ultimately withdrawn at least in part due to
17 the impacts on Washington. Protecting the internationally
18 acclaimed views as you heard in the National Scenic Area is
19 a shared responsibility of both states. As a resident of
20 Oregon I sincerely hope that the State of Washington will
21 reciprocate Oregon's effort to protect the integrity of our
22 national treasure. Thank you.

23 CHAIR LUCE: Thank you.

24 Mr. Morby.

25 MR. MORBY: I just want to say I decline to speak

1 at this time to save time and in addition thank you for your
2 support, and I am in support of this project.

3 CHAIR LUCE: Okay. Thank you. Mr. Morby
4 declined. Mr. Stevenson.

5 COMMENTS BY WALLY STEVENSON

6 I am Wally Stevenson. I live at [REDACTED]
7 White Salmon, Washington, and I'm glad to see all you people
8 here and the large crowd that is meeting with us. I just
9 wanted everybody to see that I'm the one that started this
10 whole problem over the years. Luckily we have Jason Spadaro
11 here to do all the work, but we have been buying land here.
12 The first thing we bought was ten acres of land in 1946, and
13 since that time I've had the bug to buy land. We do have
14 approximately 70,000 acres, and it's well handled. We
15 operate on a sustained yield. We do good forestry. We take
16 care of our lands. We are honest, law abiding citizens, and
17 we think that is a good project and it's been well checked
18 over, and we would like to see it go through. Thank you.

19 CHAIR LUCE: Thank you, Mr. Stevenson.

20 Bob Wittenberg followed by John Hardham, followed
21 by Gary Clouse.

22 COMMENTS BY BOB WITTENBERG

23 Good evening, welcome to Underwood. This is my
24 community. My name is Bob Wittenberg, W-i-t-t-e-n-b-e-r-g.
25 I live at [REDACTED] just a little ways up the hill.

1 My particular area of focus is going to be a
2 summary of what folks said where I spend the majority of my
3 time.

4 But the fourth one down is biological resources.
5 I use the phrase project will result in permanent loss of
6 approximately 56 acres of habitat. I would argue that it's
7 a change in habitat. We operate substations for the PUD.
8 Oh, I didn't mention I'm the manager of the PUD, and the PUD
9 commission is in strong support of this and for the most
10 part has authorized my statements. We have substations.
11 Animals live in those substations so I would argue it's not
12 a loss of habitat. It's a change in habitat. Some species
13 will not live in the substation. We try to discourage elk
14 and deer and what have you, but we certainly have mice,
15 birds, bugs, and small squirrels, all sorts of things
16 causing problems.

17 Under the noise issue. This is called the
18 Columbia River Gorge and it's the windsurfing capital of the
19 world for a reason. The wind howls. Two weeks ago we
20 couldn't sleep one night because of the wind howling, not
21 through wind turbines but through trees, through fences,
22 through the eaves of the roof. It's noisy when the wind
23 blows. When the wind doesn't blow, I can hear the tugboats
24 pushing the barges up the river and I can hear the trains.
25 I can hear all the stuff of human activity. All human

1 activity has impacts. Somewhere tonight there's a machine
2 converting one form of energy to electric energy to run this
3 microphone and to run those lights. This meeting has an
4 impact. So the question really becomes how big are these
5 impacts?

6 I also want to comment on the visual resources. I
7 can see things a long way from my house. I can see on good
8 favorable weather conditions when matched with that blue sky
9 I can see the red lights of the wind turbines clear out in
10 Wasco County, a long ways away. Should that affect somehow
11 the right to build that place because I can see it? Heavens
12 no. The other thing I'd say about visual impact, and they
13 use that phrase a lot in here, is it a good impact or a bad
14 impact that? I think they're pretty. I like them.

15 Lastly, at the bottom down there socioeconomics.
16 This proposed project certainly has some beneficial impacts
17 and it has some negative impacts. I would argue that the
18 positive impacts of this project greatly outweigh the
19 negatives, and that this thing is a good EIS, a Draft EIS,
20 and we ought to go for it. Thank you.

21 CHAIR LUCE: Thank you.

22 John Hardham.

23 COMMENTS BY JOHN HARDHAM

24 My name is John Hardham. I am a small business
25 owner here in Underwood, Washington. Spell my last name

1 H-a-r-d-h-a-m. I live at [REDACTED]
2 I've actually lived in Skamania County since 1986. I also
3 represent the Skamania County Economic Development
4 Commission for our district. As a resident of Underwood I
5 would like to state my support for the Whistling Ridge
6 Energy Project. I believe this project will help reach the
7 goal mandated by our voters in our state to make renewable
8 energy the greater part of our state's energy consumption.

9 It will help Skamania County to provide the
10 services that we the residents demand and expect. It will
11 also provide some much needed high paying stable employment
12 for residents of the Columbia River Gorge. I believe that
13 we must as citizens of this planet accept our responsibility
14 to find ways to utilize clean renewable resources to meet
15 our energy demands. As a nation we may have to make some
16 sacrifices that will enable us to exploit the renewable
17 energy resources that are available to us. We can no longer
18 expect the rest of the planet to provide us with cheap
19 energy. We can no longer accept the damages to our planet
20 caused by the continued use of fossil fuels. We must move
21 forward to develop new technologies that reduce our impacts
22 on the environment. So in my view the potential benefits
23 for this project outweigh any detrimental impacts on our
24 region. Thank you.

25 CHAIR LUCE: Thank you sir.

1 Gary Clouse followed by Roger Holen.

2 COMMENTS BY GARY CLOUSE

3 Thank you all for being here, and thank you who
4 have prepared and written, reviewed, edited this EIS for us.
5 I'm here to speak on behalf of the project and in favor of
6 it.

7 My name is Gary Clouse. I live in White Salmon
8 just across the river, from across the White Salmon River
9 from here and about the same elevation as this. I look at
10 the Whistling Ridge out my kitchen window. To save time
11 this evening I would like to endorse the prior two
12 testimonies as being thoughtful and accurate, and I would
13 like to endorse Rex Johnston's opening comments this
14 evening.

15 One more point that I would like to emphasize is
16 that the growth of power demands and electricity demands
17 throughout the Northwest is insatiable. You cannot stop it.
18 You cannot limit it. It won't slow down because the
19 population growth will push it out, and we have no way of
20 producing additional hydroelectric power in any significant
21 quantities in the Northwest. We're going to have to move to
22 alternative powers, alternative power sources, and I endorse
23 this greatly. If you look at the growth rate of the demand
24 at being about two percent per year which it currently is in
25 five years one out of every five electric consumers will

1 have to stop using power either one-fifth of the time or all
2 the time. In 13 years it will be one out of four, in
3 20 years it will be one out of three. So I endorse this
4 project. I think it's an appropriate use of the resource
5 and thank you very much for your time.

6 CHAIR LUCE: Thank you, sir.

7 COMMENTS BY ROGER HOLEN

8 My name is Roger Holen spelled H-o-l-e-n. I live
9 at [REDACTED]

10 My wife and I have owned the Inn of the White
11 Salmon for 17 1/2 years, and it as our judgment that the
12 proposed project will have absolutely no adverse effect on
13 tourism.

14 In fact, in our travels we enjoy watching them.
15 They're majestic, they're fascinating, and my wife refers to
16 them as wind angels. Thank you.

17 CHAIR LUCE: Thank you. I'll start on the next
18 list.

19 Tammy, how many people do we have signed up back
20 there?

21 MS. TALBURT: One more.

22 CHAIR LUCE: One more sheet or one more person?

23 MS. TALBURT: One more person.

24 CHAIR LUCE: Can you bring that forward now at
25 this time. That would be helpful.

1 The next person is Rebecca Stonestreet followed by
2 Scot Bergeron and Bob Hanson.

3 MS. STONESTREET: Scot Bergeron is going to give
4 me his minutes so I have six minutes to talk.

5 CHAIR LUCE: Awesome.

6 COMMENTS BY REBECCA STONESTEET

7 My name is Rebecca Stonestreet,

8 S-t-o-n-e-s-t-r-e-e-t. I live at [REDACTED]

9 Mill A, Washington. Thank you all for being here.

10 I am against the proposal of the Whistling Ridge
11 Project, and I feel that the DEIS does not adequately
12 address all the ramifications and impacts this wind farm
13 will have here in our community. I have two concerns. This
14 draft statement gives an inadequate analysis of the visual
15 impacts this wind farm will have on this incredibly
16 beautiful area. Keeping this place aesthetically beautiful
17 is important to me and to others like Skamania County which
18 states in their website on their welcome page -- this is
19 from Skamania County -- "Our county consists of 1,672 square
20 miles of the most scenic and diverse landscape in the
21 world." That's what Skamania County says.

22 The home page of the Skamania County Economic
23 Development Council states, "Skamania County offers the best
24 of both worlds. It is located in one of the most scenic
25 areas in the Country." That's the Skamania County Economic

1 Development Council. They believe that we live in an
2 absolutely beautiful place. Their website also states,
3 "Skamania County's southern border is located in the
4 Columbia River Gorge National Scenic Area and offers
5 spectacular views."

6 I agree with them. I have common ground with
7 Skamania County. I have common ground with the Skamania
8 County Economic Development Council. I wholeheartedly agree
9 with them. Indeed this is one of the most scenic landscapes
10 in the Country with spectacular views. We have common
11 ground in that we see this area of the world as uniquely
12 beautiful. The industrialization of placing wind towers in
13 the proposed area will ruin this unique area of the world.
14 This project is not in the right place.

15 The environmental impact statement does not
16 adequately analyze the impacts on animals. This impact
17 statement has failed to identify the number of bat species
18 in the area nor has it gone into any in-depth analysis on
19 how bats are killed simply by being in the proximity of the
20 low pressure zone of moving blades. Bats are important
21 animals which help my family's permaculture farm which is
22 located in Mill A.

23 Growing local food is very important. If you
24 don't know that by now you know it now. Growing local food
25 is important which we are doing in Mill A with a

1 permaculture farm. It is important for our community to
2 stay strong and healthy. Our permaculture garden in Mill A
3 is an agricultural system that mimics the relationship found
4 in natural ecology. The bats help us to keep a healthy
5 garden. No real effort has been put forth as to what impact
6 the wind towers would have on the bat population. I am
7 gravely concerned about this impact.

8 However, just because I have stated I am opposed
9 to the Whistling Ridge Wind Project does not necessarily
10 mean I do not support SDS Lumber Company's desire to
11 implement a project that is economically benefitting
12 everyone. There are other things that can be done. We can
13 come up together as a community and create win-win
14 situations economically and environmentally.

15 Some suggestions. Suggest other ways SDS can make
16 money with less environmental impact. I have an idea which
17 I would like to present to SDS officials, and I didn't call
18 Mr. Backus last year because I haven't gotten my
19 presentation together. Anyway I would like to present to
20 the SDS officials a real money making venture with high
21 yield and low environmental impacts which would create much
22 more than just eight to nine jobs in the end. SDS would
23 economically benefit as well as the County with this idea
24 that I have.

25 This is another idea I have. Everyone in the

1 audience please contact your state representative regarding
2 passing the Washington State Bank bill. North Dakota has a
3 state bank and they are out of debt. On March 2, the
4 Washington State House Financial Institution and Insurance
5 Committee held a public hearing in Olympia on House Bill
6 3162 which enables the creation of a Washington State bank.
7 These are out-of-the-box ways of bringing money to the
8 county without impacting environment.

9 The last thing I have to say is for the audience
10 too is to use local currency with the local currency and it
11 would be very beneficial to you. My hope is that this
12 community can come together and create win-win situations
13 for everyone instead of creating enemies of neighbors. It
14 can be done.

15 Scot, do you have anything to add?

16 MR. BERGERON: No, great.

17 CHAIR LUCE: Thank you, appreciate it very much.
18 Bob Hansen followed by No. 27's handwriting reminds me of my
19 own, Elden. I'm going to call on staff to help me, but
20 let's go, Bob.

21 COMMENTS BY BOB HANSEN

22 My name is Bob Hansen, and I live in Lyle,
23 Washington. First, I want to thank the Council for your
24 time and consideration. I am an ardent proponent of
25 renewable energy when it is sensitively located and designed

1 to avoid negative impacts on wildlife and the view shed.

2 My emphasis tonight focuses on our special view
3 shed. Most of us in this room would be opposed to these
4 proposed facilities at the Grand Canyon, at Mount Rainier or
5 at Yellowstone National Park; yet we have an inconvenient
6 event truth. The DEIS ignores the comments and conclusions
7 of agencies with expertise in managing scenic resources
8 including the Forest Service and the National Park Service.
9 According to the National Park Service we believe that it is
10 clear that visual impacts to the Columbia Gorge National
11 Scenic Area and the National Historic Trails will degrade
12 the core scenic and historic landscape values of these
13 resources. We strongly recommend at a minimum removing
14 Turbine Corridors A-1 through A-7 from further project
15 consideration.

16 As a 25-year public employee I am deeply disturbed
17 that these comments from a public agency, the National Parks
18 Service, would somehow be ignored in the DEIS. There is
19 special landscaping in this world, and the Columbia Gorge is
20 one of those. I am an ardent opponent of industrial wind
21 power facilities located so as to adversely impact the
22 Columbia Gorge Scenic Area or view shed just as I am opposed
23 to similar facilities in front of Mount Rainier, in front of
24 Yellowstone National Park, and in front of the Grand Canyon.

25 CHAIR LUCE: Thank you. I'm going to have a go at

1 it. It looks like Elden. I apologize but your handwriting
2 does look like mine.

3 COMMENTS BY ELDEN SCHULTZ

4 My name is Elden Schultz and I live at [REDACTED]
5 [REDACTED]. My house and 99 percent of all others' houses
6 look at Mount Hood or the Gorge. I'm going to say for the
7 project. Skamania County has been going down hill for the
8 last 30 years, and we actually need something positive in
9 this county.

10 CHAIR LUCE: Do we have a Kelly Kreps and followed
11 by David Bacon.

12 COMMENTS BY KELLY KREPS

13 Good evening, Mr. Luce, Council, thank you for
14 your time. My name is Kelly Kreps, K-r-e-p-s. I live at
15 [REDACTED], White Salmon. I am here as spokesman
16 for the families of the Kreps Ranch. My family has been
17 ranching in Western Klickitat County since the early 1880s.
18 We and the generations before us have seen many changes come
19 to this area, from horses to cars and tractors, from
20 lanterns to electricity, from the main industries of fruit
21 and timber, to diversifying also with tourism and
22 recreation. From the 1980s with a few windsurfers to
23 becoming the windsurfing capital of the world. And now with
24 the technology to efficiently harness the wind for
25 electricity that too can be a great thing for these

1 communities.

2 SDS is a landmark company in this area. They have
3 provided livelihoods to hundreds, if not thousands, of
4 families over the years. They have had the courage to grow
5 and expand for the good of those of us who live here. They
6 even keep most of their land open to recreate on. Many of
7 you in this room have probably enjoyed the privilege of
8 either hiking, mountain biking, or hunting on SDS property.
9 Just as there were locals who didn't like to see the
10 colorful sails going back and forth across the Columbia
11 there will be locals who don't like seeing windmills going
12 around in circles. Just as the communities changed,
13 adapted, and grew with the recreation boom, they will
14 change, adapt, and grow with the energy growth.

15 We support and encourage the Whistling Ridge
16 Project. SDS is a good company and a great asset to our
17 communities. It is time for wind energy to move further
18 west. Thank you.

19 CHAIR LUCE: Thank you.

20 Mr. Nathan Baker followed by Robert Matteri
21 followed by Nathan Backer.

22 MR. BAKER: Thank you. I have a question. Would
23 you allow somebody who signed up later in the day to speak
24 in my place who is not able to make it tomorrow?

25 CHAIR LUCE: Somebody other than yourself wishes

1 to speak?

2 MR. BAKER: Kevin Gorman.

3 CHAIR LUCE: So be it. Mr. Gorman.

4 COMMENTS BY KEVIN GORMAN

5 Thank you, Chair Luce. My name is Kevin Gorman.
6 I'm the Executive Director of Friends of the Columbia Gorge.
7 Nathan is our staff attorney. We represent about 5,000
8 members who live in Oregon, Washington, and throughout the
9 Columbia Gorge.

10 Now Friends of the Columbia Gorge is a supporter
11 of renewable energy, but the thing you need to remember is
12 that like any form of development for renewable energy there
13 is a time and there's a place. Right now we all know this
14 is the time, but the question before you is if this is the
15 place. We would argue that this is not the place.

16 Your committee has considered several wind
17 development projects throughout the state of Washington, but
18 the proposal before you today affects far more than local
19 and state levels. This is situated on top of the Columbia
20 River Gorge National Scenic Area so your decision will have
21 national and international ramifications.

22 Now earlier you heard a woman talk about the
23 National Geographic ranking. If you haven't heard about
24 this, I want to just explain. In 2009, National Geographic
25 Traveler ranked 133 destinations around the world to figure

1 out the world's greatest places. The Columbia Gorge tied
2 for No. 6 in the world. It went ahead of every national
3 park in the country. It was ahead of the Serengeti, it was
4 ahead of Tuscany. One judge who did this said the two
5 states have done an incredible job of managing and
6 protecting resources and views. Another said the Gorge
7 benefits from some of the best land preservation programs in
8 the nation in the magnificent natural scenery that's well
9 protected. These judges did not know about this proposal.

10 That's why these high stakes. Someone earlier
11 mentioned that the National Park Service weighed in. They
12 gave very strong comments. Those comments were ignored.
13 The U.S. Forest Service weighed in. They said there is risk
14 of significant impacts to protected scenic resources if the
15 proposed energy project is built as currently planned. The
16 Forest Service also recommends the applicant eliminate
17 turbine locations found to be visible from the scenic key
18 viewing areas to avoid impacts. These comments were
19 ignored, and what we were told in the Draft EIS is there
20 were no impacts.

21 So we ask you to look at this one more time.
22 Consider reasonable alternatives and look at the language
23 from these federal agencies who are mandated to protect this
24 area. Look at what they're saying about the potential
25 impact and make your decision based on those. Thank you.

1 CHAIR LUCE: Thank you, sir.

2 Mr. Robert Matteri.

3 COMMENTS BY ROBERT MATTERI

4 Thank you. I'm Robert Matteri. I'm from
5 Portland, Oregon, [REDACTED] I was raised in
6 Mecca Republic. I'm a physician. I own an in vitro
7 fertilization clinic that employs 50 Oregonians and
8 Washingtonians. I'm a small wood lot owner. I've planted
9 thousands of trees and I'm an environmentalist. I was
10 surprised to find out about this meeting just last week by
11 chance.

12 The Columbia Gorge Scenic Areas are nationally for
13 millions of people in Washington and Oregon. When I Googled
14 the Oregon National Scenic Area I got 600,000 responses.
15 The majority of Oregonians and Washingtonians support green
16 energy, but they do not support destroying the view, the
17 scenic view of our National Scenic Area. It's a matter of
18 numbers. There are millions of people in the
19 Portland-Vancouver area that depend upon this area as a
20 place for beauty and tourism. My little neighborhood of
21 Irvington in Portland has more people than White Salmon has.

22 I disagree with the draft environmental impact
23 position on the economic effect of the Whistling Ridge
24 Project. I believe that Klickitat and Skamania County and
25 White Salmon Economic Development Councils are wrong in the

1 emphasis on future development at the expense of our
2 environment. The future is ecotourism.

3 The future clearly is implying wind turbines built
4 in California or Europe or elsewhere and building wind farms
5 here the best economic development in the Gorge is
6 ecotourism so we must protect that aspect. The right thing
7 for the environment is green energy but in the right place.
8 The wind turbines past The Dalles every thousand meters in
9 the last few years affect the beautiful entrance to the
10 Pacific window that was coming in from the east. The 50
11 turbines at Whistling Ridge will ruin the vista but provide
12 at most two percent of the power of a coal plant. The wind
13 turbines will be 42 stories tall when the blade is at its
14 highest. The biggest building in Portland is only 42
15 stories tall, and to say that this has no visual impact I
16 disagree.

17 Finally, in redoing the draft environmental impact
18 statement I would urge you to not act like the Minerals
19 Management Service of the Interior Department in serving oil
20 companies not us the people. Do not just serve the owners
21 of Whistling Ridge and the economic interest of Klickitat
22 County and Skamania County, but serve the millions of us
23 Washingtonians and Oregonians who live in the metro area. I
24 urge you to listen to the federal scientific body against
25 this proposal, the state of Washington Fish and Wildlife,

1 the U.S. Forest Service, the National Park Service, amongst
2 others, but also listen to the cultural voice of millions of
3 Oregonians and Washingtonians in Portland and Vancouver and
4 other Americans from elsewhere and protect the scenic part
5 in our Gorge. I ask you to do that right thing. Thank you.

6 CHAIR LUCE: Thank you, sir. David Baker followed
7 by Helen Powell.

8 COMMENTS BY DAVID BAKER

9 My name is David C. Baker. I live at [REDACTED]
10 in White Salmon, Washington. I come to you with a
11 commercial tonight to levy up things here and tell you that
12 our family produces the Columbia Gorge map. 70,000 will be
13 out on the streets all through the Gorge, and it helps
14 promote both the Gorge and the livability here. And the
15 reason I mention that is if we don't make a stand it will
16 cost us everything just to get it out as we believe in the
17 Columbia Gorge.

18 What I have to say here tonight is somewhat
19 facetious and it's also very serious. First of all, in
20 business I was acquainted with a book that different parties
21 use. It was called How to Lie With Statistics, and I
22 thought it would be valuable for both sides of this equation
23 to get it and then they would be on a level playing field.

24 To kind of sum up things in a very short form is
25 it appears to me that there are four significant areas both

1 for and against this. Those that oppose speak of the birds
2 and the wildlife, the noise, the view, and the construction
3 problems, the four areas that I've read about and seen the
4 most of.

5 The four on the alternate side of the construction
6 is that the power would bring to us enough power for all
7 practical purposes, supply power for both counties in total
8 kilowatts, and that the revenue derived from it would
9 enhance the tax base significantly, and the jobs and income
10 as number three. And fourth it is important as anything for
11 this whole country is the right to use the property that the
12 Whistling Ridge personnel have responsibility for to produce
13 a product that is of value and profit for them to our
14 community.

15 CHAIR LUCE: Thank you, sir. Appreciate that.
16 Helen Paulus.

17 COMMENTS BY HELEN PAULUS

18 Helen Paulus, [REDACTED] I did not
19 come tonight with comments specifically directed toward the
20 EIS so I will speak just in general.

21 I support this project. I think eight years is
22 long enough. I don't think any EIS is going to be quite
23 adequate for everyone. I live one and a half miles from
24 this proposed project, and I support it, and I thank you for
25 coming to tonight.

1 CHAIR LUCE: Thank you. Herb Hardin followed by
2 Izak Riley followed by Don Stover.

3 COMMENTS BY HERB HARDIN

4 Good evening, Ladies and Gentlemen. My name is
5 Herb Hardin. I live in White Salmon, Washington at [REDACTED]

6 [REDACTED]
7 When this project was first announced, my wife and
8 I took a look at the pictures of the windmills on our
9 Northwest view horizon and we said, "Not in our backward."
10 When we thought about it for a while, decided, well, dirty
11 energy has a price and clean energy also has a price in the
12 environment in many other ways, and we decided that it was
13 time that we got with the world and started paying the price
14 for clean energy. So we are in favor of the project, but
15 tonight is the first time that I have had a chance to read
16 the EIS or at least the part of it that interests me.

17 Page 3-175, paragraph 3.9.3.1, it addresses the
18 avian warning lights on top of these windmills. I was a
19 pilot for 33 years. Anti-collision lights are typically
20 strobe lights that you can see for 20 miles. They're
21 bright. They're intended to get your attention so you don't
22 run into other airplanes or fixed objects in the ground.
23 The EIS is virtually silent on this at that paragraph and
24 page, and I have some real reservations. If you put strobe
25 lights on 50 of those things the nighttime is going to be

1 totally ruined with a line of flashing strobes. Not
2 acceptable, not just to me but to the people who live in
3 Pucker Huddle and up on Strawberry Mountain. Anybody who's
4 within 20 miles you can see it. So I would urge that the
5 EIS take another look at this problem and figure out with
6 the FAA what can be done, including restricted air space
7 above that area so that safe passage with a minimum safe
8 crossing altitude be established so that aircraft will have
9 it marked on their charts not to fly at that area. If those
10 lights can be seen below horizontal, everybody in the Gorge
11 is going to be able to see them. So it's not just a maybe
12 problem. It could be a real problem that needs to be
13 addressed more thoroughly than it is. Other than that, my
14 wife and I support the project.

15 CHAIR LUCE: Thank you.

16 Mr. Izak Riley.

17 COMMENTS BY IZAK RILEY

18 My name is Izak Riley, R-i-l-e-y. I live at [REDACTED]
19 [REDACTED] I'm 26 years old. I was born and raised
20 here in White Salmon. I actually reside in my grandmother's
21 house which I purchased from the family. It has a clear
22 view of Underwood Mountain where the proposed wind energy
23 project is suppose to take place up there.

24 I walk out every morning about sunrise and the sun
25 shines on that mountain, and, you know, it makes me want to

1 get up and go to work in the morning. My first thought is I
2 think I might not want to see something up there like that
3 sticking up in the air, but, you know, being raised around
4 here and seeing the changes and the change in the economy, I
5 think we need to sacrifice a little bit, you know, from view
6 per se to help us out a little bit. We need some help. I
7 could sit there in the morning and watch T.V. and watch oil
8 pumping into the Gulf or I can get up and take a glance up
9 there and see a couple white towers sticking up. That to me
10 is a sense of security. It's not a pocket of landscape per
11 se, but I'd like to see that a lot more than I would like to
12 turn on the news and see oil pumping into the Gulf.

13 So Stevenson's, SDS, they have all but built this
14 community upon stewardship and proper decision making and
15 utilizing our lands around. As far as their track record is
16 concerned, I have yet to see them make a mistake. You know,
17 they're very thorough on any studies. They communicate with
18 the folks in the community here, and if I was a tourist
19 coming up the Gorge, and I looked up and them seen wind
20 turbines, I would commend the community for doing their part
21 in the green energy project and helping out our world.

22 So I support the project, and thank you for your
23 time coming out here to listen to us.

24 CHAIR LUCE: Thank you for coming.

25 Don Stover followed by Arlene Bradford followed by

1 Brian Short.

2 COMMENTS BY DAWN STOVER

3 Hi, my name is Dawn Stover, spelled S-t-o-v-e-r in
4 Victor-e-r. I live at [REDACTED]

5 I've been following the wind issue quite closely for more
6 than 15 years, particularly concerning wildlife interaction.
7 I've visited some projects all over the west, and then I
8 serve on three technical advisory committees for the wind
9 power projects in Klickitat County.

10 I want to focus my comments tonight on cumulative
11 impacts because I believe that's something that got very
12 short tripped in the DEIS. In particular, the DEIS looks at
13 two cumulative impact studies; one of which was done in the
14 in Mid-Atlantic U.S. and really has very little relevance to
15 the project being proposed here. The other of which was to
16 look at projects across the Columbia Plateau Ecoregion and
17 the closest project in there to Whistling Ridge was the Big
18 Horn Project in Klickitat County. All of the others that
19 were reviewed are even farther to the east and have very
20 different habitat than the Whistling Ridge Project, but all
21 basically is arid mostly treeless landscape completely
22 different precipitation regime and habitat, plant, and
23 animal community than we see here for Whistling Ridge.

24 The study also looked at future and nearby
25 projects. In fact, just a total of about 10 wind projects.

1 I want to show you what the real cumulative impacts are.
2 This is a map of Klickitat County, Eastern Klickitat County.
3 All of the colored areas on this map which you can see cover
4 the entire map are wind projects that are either already
5 permitted or proposed, and I'll give that to you later. I
6 also have a map here of all the wind projects in this region
7 along the Columbia River both on the Oregon and Washington
8 side that has applied for connection to the BPA grid, and
9 that consists of at least 46 wind projects, some of which by
10 the way are smaller than Whistling Ridge, most are larger.
11 So we have at least 15 projects in Klickitat County and 46
12 altogether.

13 Now the DEIS says there are no population level
14 impact on wildlife, these projects. There is no evidence
15 whatsoever to substantiate that. There have been no studies
16 of population level impacts, and there's been no safe
17 threshold that's been determined. In fact, of all the
18 studies from our area the preconstruction mortality
19 estimates have not matched the post-construction fatality
20 studies. In Klickitat County where the first study was done
21 at a hundred percent of the turbines at Big Horn it was
22 actually an order magnitude higher, somewhere between 8 and
23 16 times as many raptors were killed unpredicted, and this
24 same company made those predictions, West, Inc., that has
25 done the methodology prediction for this DEIS. We're

1 talking about the incremental impacts here. You can lose
2 one finger, maybe you can lose two fingers and still get by,
3 but once you lose ten fingers, you have a hard time
4 surviving. It's like ripping apart a plane. You need to
5 have them all there. When the last one goes, that's when
6 there's a population level impact.

7 Just want to state one more thing about spotted
8 owls. I got a flyer from SDS in the mail a couple days ago
9 saying there are no owls at this sight. After years of
10 timber harvest there's no suitable habitat for the bird. I
11 think that, you know, what that suggests to me is we need to
12 resource habitat for this particular species. When we look
13 at the damage in the Gulf today, we're not saying let's not
14 go and restore that habitat because the shrimp and the
15 pelicans were already in big trouble down there. What we
16 need to be doing is restoring habitat and saving habitat
17 that matters, and so I'm going to urge you to take another
18 look at those scientific studies. I'll be submitting some
19 more detailed comments about what's wrong with them.

20 There's no independent plan that's been included
21 in this report. All we have are a couple of studies from
22 the consultant hired by the industry, and I think this needs
23 to take a much broader look at the impact that could be
24 sustained by this project.

25 CHAIR LUCE: Thank you very much.

1 Arlene.

2 AUDIENCE MEMBER: She left. I saw her leave.

3 CHAIR LUCE: She saw her leave.

4 Brian Shortt followed by Jamie Tolfree.

5 COMMENTS BY BRIAN SHORTT

6 I think I'd like to start a petition tonight.

7 I'll think about it. My name is Brian Shortt, and my
8 address is [REDACTED], Oregon.

9 Back to that petition, I think we should all in
10 this room have a petition for California that they maximize
11 their solar requirements, they maximum their wind turbine
12 capabilities, dam up every river that they have, or put
13 offshore oil turbine systems together and continue to suck
14 all the oil out. Because if we don't hurry up that process
15 in California so that they can become a sink hole all of us
16 in the Northwest are going to use our natural resources up.
17 We're going to use our dams. We're going to use our wind
18 turbines, solar power. Any alternative energy that we
19 generate here is all going to go down there, and as a result
20 of that we're all going to be sitting here wondering what
21 happen to the landscape.

22 I've been involved in alternative energy since the
23 early '80s, and I've spent the last couple of years trying
24 to understand the benefits of the wind turbines, and I only
25 have a couple of personal comments to make.

1 One is my home would be in the view shed of the
2 red lights that are going to blink at night, and the other
3 side of this when this comes back to part of my rearing
4 during the Magnuson and Jackson period when Magnuson said we
5 need to protect our mountains and we need to protect Puget
6 Sound, one of the things that I see from you as a panel is
7 that you are evaluating the merits of putting wind turbines
8 into the foothills of our Cascade Mountains. Now maybe
9 Klickitat County should be getting credits from all the
10 other counties in the area for being the sort of sacrificial
11 land putting together this wonderful wind turbine program in
12 Klickitat County. I don't think they're being paid enough
13 for it, but I think that you as a group need to seriously
14 consider the siting values.

15 And I've listened to biologists say with almost
16 unanimous consent this doesn't have the merits that it
17 should have, and that we're looking at something that's not
18 on unlike Bonneville in the '30s when we're sitting in
19 essentially a depression and banks were withdrawing
20 themselves and people were walking away from their homes and
21 jobs were down. We are at another period like. That this
22 is probably one of our lowest periods in my life.

23 My life is long enough now that when I drive in my
24 car and I look at the radio, it says I'm listening to
25 oldies. So I have reached an age now where I have a little

1 bit of wisdom and a little bit of experience, not
2 necessarily wise wisdom or wise experience, but I've seen
3 enough things in my life and enough sequence has taken place
4 that we're not doing enough with conservation technologies
5 and we're taking these very crude formats that have been
6 with us for the last hundred years, and if you were in
7 Holland it would be the last 200 years and trying bring
8 these forward as viable producers of alternative energy.

9 My last comment to you I made it once before.
10 It's the only opposition I have to this type of project.
11 Wind turbines do not belong in the foothills of the Cascade
12 Mountain Range. Thank you.

13 CHAIR LUCE: Thank you very much. Next speaker
14 will be Jamie.

15 COMMENTS BY JAMIE TOLFREE

16 Thank you. Thank you, Mr. Luce and Council
17 Members for coming to Underwood in Skamania County. I'm
18 Jamie Tolfree, the County Commissioner of District 3.

19 Hi, Judy, nice to meet you.

20 And I am here as a proponent. This proposed
21 project is in District 3. I am confident that the proposed
22 Whistling Ridge Energy Project as described in the Draft EIS
23 has received thorough analysis of all environmental aspects
24 of the project. Where potential impacts were identified a
25 variety of mitigation measures are offered as remedy. I

1 support the proposed action. It is consistent with Skamania
2 County codes and has been thoroughly evaluated. I urge you
3 to adopt the Draft EIS proposed project so this project can
4 move on expedientially. Thank you very much for your
5 efforts.

6 CHAIR LUCE: Thank you.

7 Doug Charters, Christine Bluestone, and Judy
8 Teitzel.

9 COMMENTS BY DOUG CHARTERS

10 I'm Doug Charters. I live at [REDACTED]
11 White Salmon. My people have been here for over a century
12 on both sides of the family and have seen lots happened in
13 the Gorge for many years, 50 years for myself. I've
14 actually gone and spoken with a lot of folks in this
15 audience on my own and kind of did my own little
16 environmental impact statement. And I can see the Gorge
17 folk's viewpoint on the view and then the wildlife people on
18 the wildlife concerns, and I'm in forestry myself so I can
19 see the forest aspects of this too.

20 The overall analysis of what this project would do
21 is it would be a benefit in changing to a better
22 environmental future on the energy situation for the nation
23 in this small little microcosm of what it is, but as for the
24 view thing looking at it from a distance they kind of remind
25 me of overstory trees the way the hills bounce around. I've

1 gone up to Goldendale and listened to them, and they're
2 really not very noisy. It's like the wind blowing through
3 the trees is kind of what I would describe it as for the
4 noise, you know.

5 Like anybody else I've got concerns. I'm trying
6 to find the middle logical ground of everybody's situation,
7 and overall one thing that I question is color. Do we have
8 to make them white all the time? Can we paint them up to
9 look like trees? Because we do the cell towers like trees.
10 You've got little flash of lights stick out that kind of
11 camouflages them. So if you have them with brown trunks and
12 forest green propellers, you probably wouldn't really see
13 the things.

14 It would be, you know, I kind of when we first put
15 them in Goldendale I thought I had my culture shock, you
16 know, when they first come up and they had a few dozen of
17 them up, but you get used to them after a while. But I
18 always wondered why don't they paint them, you know, more of
19 an amber color or something so they wouldn't be such a thing
20 that would stick out where you would see so much in the
21 visual aspect of it.

22 But in my analysis personally I think, you know,
23 it ought to be approved and go ahead, and you know, the
24 Stevenson's are good people. They work hard. They've
25 managed their land well, and I really think the project

1 would be managed well overall in the long run and we really
2 need the revenue. It's for our schools and it's education.
3 We need our educational dollars.

4 In the forest industry it takes a hundred years to
5 grow a crop of trees to maturity. That's once a century you
6 really have a financial impact out of that land that these
7 turbines will sit on, and in this way you're having an
8 annual financial impact on your schools. You know, so maybe
9 in the perfect world you would never have to levy again to
10 make up for this. I as a child know the suffrage of bad
11 economic times in the school system. We packed our lunch
12 for like five years before we had a hot lunch program.

13 Anyway I appreciate your time and I appreciate all
14 the people that came out for this turnout today.

15 CHAIR LUCE: Thank you.

16 Christine.

17 COMMENTS BY CHRISTINE BLUESTONE

18 Thank you for having me here and listening to my
19 concerns. My name is Christine Bluestone. I live at [REDACTED]
20 [REDACTED], and I'm a gardener, botanist, master
21 gardener, and I believe that this project is just in the
22 wrong place.

23 There's some concerns about what I have heard
24 about studies that have stated that the location of this
25 wind farm is only considered fair for ability to produce

1 maximum wind power for electric production, and another
2 concern I have is the location of access roads for
3 construction and maintenance. How is the traffic from the
4 construction going to affect local residents and local
5 residential traffic? What percent of the tax dollars that
6 we have been told that this project is going to generate is
7 actually going to our community and going to give us a
8 little bit of tax relief that we've been paying in our
9 property taxes? How is the noise from the wind turbines
10 going to affect local residents? That's already been
11 addressed. How is this project going to affect our present
12 tourist industry, scenic valleys? And that's been addressed
13 also. And finally will the power that is generated go to
14 our local community or will it be sold to the highest
15 bidder?

16 CHAIR LUCE: Thank you, Christine.
17 Judy.

18 COMMENTS BY JUDY TEITZEL

19 My name is Judy Teitzel, T-e-i-t-z-e-l. I live at
20 

21 I represent the Port of Skamania County. I would
22 like to express my support for the Whistling Ridge Energy
23 Project and the Draft Environmental Impact Statement. The
24 DEIS statement documents the wind farms provide substantial
25 economic benefits. The Port of Skamania County supports

1 economic development, family wage jobs, and tax revenue.

2 The project predicts a 1.5 million dollar wind
3 farm payroll and annual new property tax revenues of
4 \$731,000 that would help support Skamania County. Not to
5 mention that the President just yesterday, June 15, stated
6 in a speech from his Oval Office that the United States
7 needs to invest in clean energy and the draft environmental
8 impact statement supports this.

9 I would like to see this project by SDS go
10 forward, and I personally am also in support of this
11 project, and I am in a hundred percent agreement with Peggy
12 Bryan's comments. Thank you very much for coming.

13 CHAIR LUCE: Thank you. Chief Johnny Jackson.

14 COMMENTS BY CHIEF JOHNNY JACKSON

15 Good evening, my people. My name is Johnny
16 Jackson. I am one of the real chiefs in this area. I've
17 lived here all my life, born and raised in this part of the
18 country. And I have been up on this place called Whistling
19 Ridge many times here lately, and I have looked at the whole
20 area, and from that I support the wind power going into that
21 area. I travel up and down that highway all the time, and I
22 can't see anything up there. So a lot of times I think
23 about what the people are saying that it's going to ruin the
24 scene of the Gorge and saying that there are things up there
25 that I don't see that's there.

1 People said that before there were things like
2 that in places and I asked them to prove it to me and they
3 couldn't do it because it wasn't there. And I think that
4 Whistling Ridge is a good place for a wind farm because you
5 look today of this growing nation and the world and the
6 people that are coming in from other countries and some in
7 this country. And you look at how far does this electrician
8 power go?

9 Sometimes we're told over the news to kind of cut
10 down on our electricity in the summer or in the winter.
11 This summer when it gets real hot the electricity from this
12 river here is going to be going south because of the heat.
13 A lot of people are going to depend on it and I know I do.
14 And I'm looking at this wind power on this mountain where
15 it's not really visible and you cannot hear it. I think
16 it's a good thing and I think it will really help this
17 nation with our power.

18 I want to say another thing; that if it comes down
19 to it, they're talking about nuclear energy again, and I'd
20 rather have this clean wind power than to have nuclear
21 energy going back up again on this river. Our rivers are in
22 bad shape because of things like that. Like the two
23 companies that went on in this river here. Some of our men
24 paid a great price for something that those companies done,
25 and they have to live with it. Their families have to live

1 with it.

2 This here wind power here is not going to hurt
3 anyone, and it's silent and it's clean, and the water is
4 going to be clean, and it's going to be good for our river
5 besides that. So I'm giving the full support of this wind
6 power facility.

7 CHAIR LUCE: Thank you, Mr. Jackson.

8 Sherry, Meir followed by Paul Smith, followed by
9 Breff McLaughlin.

10 COMMENTS BY SHERRY MEIR

11 Sherry Meir, M-e-i-r, [REDACTED], Hood
12 River, Oregon.

13 I support properly sited alternative energy
14 facility development; however a wind energy facility
15 adjacent to the Columbia River Gorge National Scenic Area is
16 not properly sited. The visual impact of placing 426-foot
17 windmills up towering over this pristine forested national
18 scenic treasure is absolutely unacceptable. In addition to
19 negatively impacting scenic views, destroying forest land to
20 great large scale, industrial development will greatly
21 compromise the sensitive wildlife habitat.

22 Driven by corporate efforts clear choice recently
23 unleashed an unprecedented environmental catastrophe in the
24 Gulf of Mexico. We must prevent any other environmental
25 disasters by choosing to deny construction of the Whistling

1 Ridge Project. Thank you.

2 CHAIR LUCE: Thank you very much.

3 Paul Smith.

4 COMMENTS BY PAUL SMITH

5 Hello, my name is Paul Smith. I live in the west
6 end of Skamania County. I've been there 16 years.

7 It's been stated a couple of times tonight this
8 document is humongous and I haven't had the kind of time to
9 digest it like maybe I don't know a barrage of groups on the
10 proponent's side has been able to have this out in the past
11 year plus or something. We've had three plus weeks to try
12 to look through this so I will be speaking tomorrow night on
13 some different topics. So pardon me if I'm bouncing around
14 because I simply haven't been able to sound the way I'd like
15 to.

16 First off, I would like to thank you for giving us
17 this opportunity. One concern I do have is your group with
18 BPA are the ones that are actually behind this DEIS, and my
19 concern is a little bit are you too close to the tree on
20 being able to actually objectively evaluate this? I notice
21 that it said that on page 1-7 no other fed agencies are
22 defined as cooperating agencies at this. Why not?

23 It sounds like the Forest Service and the National
24 Park Service have some serious concerns; yet those are being
25 conveniently ignored. Key viewing areas, I know that that's

1 been downplayed right away by the proponent's side. Some of
2 these wind turbines could be as high as 426 feet. I have a
3 feeling that most of those 50 are going to be on the high
4 side, not on those potentially smaller ones. Biggest bang
5 for your thought maybe it's the most efficient way. Well,
6 the Space Needle is about 605 feet, and so I can't believe
7 that to have 50 nearly Space Needle sized wind turbines in
8 the Columbia Gorge are not going to be able to be viewed
9 from not just key viewing areas and also at night. When you
10 go out toward The Dalles I-84 or 14 going to Goldendale you
11 see complete red lights.

12 Full-time jobs only seven to eight. That is not
13 exactly economic development. There is no alternatives to
14 this. This is being defined as one of the alternatives.
15 Well, it isn't an alternative. This is a proposal. The
16 only alternative is no action. So technically there are no
17 alternatives; yet it talks as if it is one of the
18 alternatives.

19 Seventy megawatts why is that the key number? Why
20 can't it be less? In this document it basically states that
21 it has to be that in order for this to be viable; yet
22 there's no wiggle room. So I'm a little concerned about
23 that.

24 I would like to reiterate that there definitely
25 needs to be more time for this. I don't know if that's too

1 late for you to be able to expand this, but simply the
2 public has not had enough time to look through this, and
3 it's just not fair. I'm a little concerned about that.

4 On the Oregon side there's a proposal for 300 wind
5 turbines over 30,000 acres and that is an Irish company. So
6 at least this is on the Washington side, but most of the
7 power is going to go to the general system. That's probably
8 going to go down to California like they've talked about
9 earlier. So the power isn't going to be necessarily staying
10 here. So thank you.

11 CHAIR LUCE: Do you have written comments and, if
12 so, would you please --

13 MR. SMITH: Not at this time. I'll hand them in
14 before July 19.

15 CHAIR LUCE: The last speaker that I have is Breff
16 McLaughlin. Is McLaughlin here? He appears to have left.

17 All right. Who else do we have? Two other
18 people? A hand back there. Come on up.

19 COMMENTS BY SALLY NEWELL

20 My name is Sally Newell. I live at [REDACTED]
21 [REDACTED], Underwood, Washington. I did look at the DEIS over at
22 the library. I was disappointed. I felt it was very
23 incomplete. I felt it was poorly done. I felt like we're
24 getting the bum's rush here on this project.

25 The transportation portion of it said that there

1 was not going to be any impact to emergency services up
2 here. Excuse me? When you've got 200 and some trucks
3 coming through at morning rush hour and all throughout the
4 day and then I forget how many in the afternoon, if it's
5 your child choking or your house that's on fire that is
6 going to be an impact. And grant it, it's only for the
7 construction portion of the project, but that, you know,
8 that could be a very serious impact for some folks.

9 Also speaking just to the National Scenic Area
10 part of it, I didn't see anything in that EIS that addressed
11 the amount of grief, heartburn, and frustration that has
12 been experienced by the people living in the National Scenic
13 Area. You're asking them to put their homes behind a tree,
14 paint it brown, and then you're going to string red lights
15 over the ridge tops. I don't think so. I don't think it's
16 fair. I think it's asinine. And for the amount of power
17 that's going to be generated by this thing. No, I don't
18 think so. I just think it's wrong. There has been a lot of
19 money spent by all the governments -- state, federal,
20 county -- to support the National Scenic Area and this will
21 defile it.

22 And I would also point out that the Windy Flats
23 Project in Dallesport the same thing. It's just no one
24 drawing the boundaries for the National Scenic Area could
25 have envisioned Space Needles being perched on the back side

1 of the boundary. It just wasn't something folks were
2 thinking about and I hope that you will. Thank you.

3 CHAIR LUCE: Thank you, Ms. Newell.

4 Is there anybody else who wants to speak tonight?
5 We have one more. All right.

6 COMMENTS BY JOHN LOVELL

7 My name is John Lovell, resident of Bingen,
8 Washington.

9 CHAIR LUCE: Could you spell your last name.

10 MR. LOVELL: L-o-v-e-l-l.

11 CHAIR LUCE: Thank you.

12 MR. LOVELL: I haven't really studied the flow
13 chart in the process, and I know you have a meeting tomorrow
14 night. I would hope there's time where you could actually
15 use your own eyes and ears and drive the Gorge and see what
16 a focal point Underwood Mountain is. I really suggest you
17 drive from Cascade Locks to The Dalles, cross over The
18 Dalles and come back 14. See how that ridge conforms and
19 how these are going to stick up on the back side of that and
20 then go back to your report and see what they say about
21 visual impact. You'll know for yourself.

22 CHAIR LUCE: Thank you. If there is no one else
23 to speak? Is there anyone else to speak this evening?

24 We've got another speaker. I thought you traded your spot?

25 MR. BAKER: We didn't think we'd be able to finish

1 the list. I can speak tomorrow if you like.

2 CHAIR LUCE: Give me your three minutes tonight.

3 COMMENTS BY NATHAN BAKER

4 Okay. Thank you, Mr. Chair, Members of the
5 Council. My name is Nathan Baker. I'm the staff attorney
6 for Friends of the Columbia Gorge. I wanted to stress a few
7 of the things that are different about this project,
8 different from any of the projects that the Council has
9 reviewed to date.

10 This is the only project located within forested
11 habitat, and the potential for impacts are higher in
12 forested habitat than the other projects in Eastern
13 Washington. This is the only project within a designated
14 spotted owl special emphasis area. This is the only project
15 with federal agencies including the U.S. Forest Service and
16 the National Park Service recommending significant
17 modifications to the project. This is the only project that
18 would cause adverse significant impacts in two states, not
19 just Washington but Oregon as well. This is the only
20 project within three miles of the Lewis and Clark National
21 Historic Trail, the Oregon Pioneer National Historic Trail,
22 and the Historic Columbia River Highway. This is the only
23 project surrounded by recreational resources. It's the only
24 project with the high likelihood of affecting cultural
25 resources as we heard from the Yakama Nation earlier

1 tonight. And last but not least it's the only project that
2 would cause significant adverse impacts to a National Scenic
3 Area.

4 Now because this project is different it requires
5 taking a special close look at the impacts. Unfortunately
6 this DEIS doesn't do that. It is fundamentally broad
7 because it ignores and trivializes the impacts of the
8 project.

9 I'd like to echo the statements made earlier
10 tonight that it's difficult for the public to make oral
11 comments tonight and tomorrow night having had less than
12 three weeks to review 1,500 pages of material, and we
13 understand that written comments are allowed another month,
14 but it doesn't make sense to have the comments for oral
15 hearings a month prior to the deadline for written comments.
16 Maybe there was a good reason for that. It hasn't been
17 stated yet, but we would suggest there should be another
18 hearing for oral comments after the public has had time to
19 review the full DEIS and comment intelligently on it.
20 That's all for tonight. Thank you.

21 CHAIR LUCE: Thank you. For those of you who
22 are not aware this Draft Environmental Impact Statement is
23 available on our internet site completely. You don't have
24 to necessarily print it out. You can if you want to, but
25 you can print selected portions of it or read it on the

1 screen.

2 Anyone else wanting to speak tonight?

3 Well, that being the case, this concludes this
4 public meeting. I want to thank Bonneville Power
5 Administration Andrew Montano and the Bonneville Staff, as
6 well as the EFSEC Council Members, but I particularly want
7 to thank you all for coming. Thank you. We are adjourned
8 for the evening.

9 * * * * *

10 (Whereupon, the public meeting was adjourned at
11 8:56 p.m.)

In re: Whistling Ridge Energy Project
Application No. 2009-01

A F F I D A V I T

I, Shaun Linse, CCR, do hereby certify that the foregoing transcript prepared under my direction is a full and complete transcript of proceedings held on June 16, 2010, in Underwood, Washington.

Shaun Linse, CCR 2029

Draft Copy

BEFORE THE STATE OF WASHINGTON
ENERGY FACILITY SITE EVALUATION COUNCIL

In the Matter of)	
Application No. 2009-01)	Public Comment Meeting
WHISTLING RIDGE ENERGY, LLC.)	On Draft EIS
WHISTLING RIDGE ENERGY PROJECT)	Pages 1 - 74
_____)	

A Public Meeting in the above matter was held on Thursday, June 17, 2010, at the Skamania County Fairgrounds, 710 S.W. Rock Creek Drive, Stevenson, Washington at 6:30 p.m., before the Energy Facility Site Evaluation Council Members.

* * * * *

CHAIR LUCE: Good evening. Today is June 17, 2010. This is the Rock Creek Center in Stevenson, Washington, and we are here to take public comments on the Draft Environmental Impact Statement prepared in connection with the Whistling Ridge Energy Project. Everyone can hear me? Everyone can hear me.

My name is Jim Luce and I'm Chair of the Energy Facility Site Evaluation Council, and on behalf of the Council I want to thank you for taking the time to come tonight and participate in the meeting. I apologize, but I do have a script here that I have been instructed to read by my lawyers, and I'm sure you all appreciate that. I'll try and ad lib to get a little humor along the way, but we'll

1 see.

2 We have EFSEC Energy Siting Council Members here
3 tonight, and we'll start down at the left with Dennis Moss.
4 If each one of you can stand and say what agency you
5 represent, that would be helpful.

6 MR. MOSS: My name is Dennis Moss, and I represent
7 Utilities and Transportation Commission.

8 MS. McDONALD: My name is Mary McDonald and I
9 represent the Department of Natural Resources.

10 MR. FRYHLING: My name is Dick Fryhling and I
11 represent the Department of Commerce.

12 CHAIR LUCE: I am Jim Luce, and to my immediate
13 right is --

14 MR. TAYER: Jeff Tayer. I'm with Washington Fish
15 and Wildlife.

16 MS. WILSON: Judy Wilson. I represent Skamania
17 County.

18 CHAIR LUCE: We also have EFSEC Energy Siting
19 Council staff here this evening. We'll begin with
20 Mr. Posner.

21 MR. POSNER: Stephen Posner.

22 MR. WRIGHT: I'm Al.

23 MR. WALLIS: Bob Wallis, Administrative Law Judge.

24 MR. CREWS: Kyle Crews from the Attorney General's
25 Office.

1 CHAIR LUCE: Most importantly over there behind
2 the table Kayce and our good and trusted assistants.

3 You control the lists. Right?

4 MS. TALBURT: I do.

5 CHAIR LUCE: Tammy Talburt controls the lists.
6 She's very important. If you want a copy of the
7 Environmental Impact Statement other than that which is on
8 the website, which it is, you may request a copy, and we
9 will provide a hard copy. So please don't think that you
10 have to burn up your computer and go through all sorts of
11 ribbons to get a copy. So please do that.

12 I also want to introduce on my immediate left
13 Andrew Montano from the Bonneville Power Administration.
14 This is a joint EIS prepared by Bonneville and the Energy
15 Siting Council.

16 Andrew, do you have some people with you tonight?

17 MR. MONTANO: I do. Good evening. Thanks for
18 joining us. I'm Andrew Montano, the Environmental Project
19 Manager for this project. With me tonight I have Susan
20 Offerdahl, the Environmental Protection Specialist, and John
21 Tyler in the back of the room our Public Affairs Specialist.
22 It was brought to my attention tonight that certain people
23 from the meeting last night didn't know that they could ask
24 us questions, ask the Bonneville folks questions. Please if
25 you want to, you can pull myself, Susan, or John aside later

1 after this meeting and ask us any questions you may have.
2 You may also pull Stephen or Al Wright aside, and they can
3 also answer your questions. Thank you.

4 CHAIR LUCE: Just to clarify, the Energy Council
5 Members such as myself and my colleagues are participating
6 in an adjudicatory proceeding that's parallel to this. For
7 that reason we do not talk to members of the public as much
8 as we might like to. So it's something that we've adopted
9 as a policy and as I think as a legal practice is probably
10 pretty sound.

11 By way of preface, the comments tonight are on the
12 Draft Environmental Impact Statement and its issues, not
13 general views. Everybody has particular views about energy
14 policy or alternative energy resources or other issues, and
15 we respect those views, but that's not the purpose of
16 tonight's meeting.

17 The following is a short summary of the project:
18 On March 10, 2009, Whistling Ridge Energy, LLC, a Washington
19 limited liability company, submitted an application for site
20 certification to the Energy Siting Council to construct and
21 operate the Whistling Ridge Energy Project, a 75-megawatt
22 electrical wind generation facility. The proposed project
23 would be located about seven miles north of the City of
24 White Salmon in Skamania County, Washington. The proposed
25 project site is privately owned land currently used for

1 commercial timber parts. Up to 50 wind turbines ranging in
2 size from 1.2 to 2.5 megawatts and up to 426 feet tall would
3 be installed for the project. The project would include an
4 operation and maintenance facility, electrical substation --
5 that's Bonneville -- underground collector lines and
6 systems, access roads and other ancillary facilities.

7 The revised application was submitted on
8 October 12, 2009, which changed site access by removing the
9 use of a forest service road located within the Columbia
10 Gorge National Scenic Area. Last month the Draft
11 Environmental Impact Statement was issued jointly by
12 Bonneville and EFSEC. It has been prepared consistent with
13 the requirements of SEPA and NEPA. Because the State of
14 Washington has a primary role in the siting of this proposed
15 project, the impact statement generally follows the format
16 contained in WAC 197-11 as adopted by EFSEC through WAC
17 463-47.

18 We will be accepting written comments tonight.
19 Also very important, written comments may be sent to us and
20 must be postmarked by July 19. So if you have written
21 comments, please Tammy over here on the right and Kayce will
22 take those comments, and we'll make sure that they get in
23 the official record of proceedings. If you have any
24 questions about EFSEC's application process, Al Wright and
25 Stephen Posner can answer those questions, and you can also

1 contact Bruce Marvin. Bruce, are you here? Bruce, is the
2 Counsel for the Environment.

3 Bruce is a State Assistant Attorney General
4 appointed to represent the public in its interest in
5 protecting the quality of the environment. Bruce, can you
6 stand up? And you stood up. People have recognized you.
7 And would you like to comment in any way this evening?

8 MR. MARVIN: Just that I will be observing and
9 taking notes on the statements that are made today. I will
10 review the written comments that are submitted to EFSEC, and
11 if you have additional information or you'd like to direct
12 comments to me directly, that's fine. I can't promise you
13 one way or the other I'll react to those promises or whether
14 I'll react to them. I'll certainly acknowledge receiving
15 them, but please note that EFSEC is ultimately the people
16 that are going to be making the decision on this. So if you
17 choose to communicate with me, you might also want to copy
18 them and make sure that they get information from you as
19 well. Thank you.

20 CHAIR LUCE: Thanks, Bruce.

21 Members of the Public, while you're making
22 comments tonight please be as specific as possible regarding
23 the section of the Environmental Impact Statement that
24 you're addressing. If you inadvertently start drifting away
25 from the subject of tonight's meeting, which I recognize can

1 happen occasionally, I am going to ask you to refocus your
2 comments specifically on the Draft Environmental Impact
3 Statement.

4 Now, some basic ground rules that I think we all
5 would agree to. Cell phones in the air. Turn it off,
6 please. Check them. We all love ring tones, but I'll show
7 you mine later if you really want to hear it.

8 Be respectful. No applause, no negative comments.
9 Everybody here deserves respect. Please limit your comments
10 to three minutes or less. We have a timekeeper over here,
11 Mr. Stephen Posner. He will be giving a one minute time
12 frame for you. He'll have a little sign he will hold up.

13 If you spoke at last night's meeting, you're at
14 the end of the bus. So that's okay if there's time left
15 over and you want to speak again, you can feel free to do
16 so. I would really, really think if you have new comments
17 as opposed to what you said last night. We got it down with
18 the court reporter so you don't have to repeat yourself.

19 If you have written comments, please don't read
20 them into the record. We do read everything that's sent to
21 us. That's our job, but standing at the microphone and
22 reading long statements really is not helpful to the Council
23 nor you. We will read those statements.

24 If you agree with somebody who has just testified
25 before you, either I like the project or I don't like the

1 project because fill in the blank, just say I agree with the
2 previous speaker or I agree with the speaker that previously
3 spoke on this subject. If there are a number of you
4 supporting a common position and you can agree among
5 yourselves as to one spokesman instead of several, you
6 should feel free to consolidate your time and designate one
7 spokesperson. So hypothetically if there were some
8 advocates for the project and they wanted to get together
9 and say, "There's six of us, we'd like 18 minutes", that
10 would be fine. As converse if there were opponents that
11 felt that way.

12 So we're going to call three speakers at a time.
13 I'm going to have one person at the mic with two on the
14 ready. When you come forward please give us your comments,
15 state your full name, spell it, give us your address, and if
16 you have brought written materials please again provide them
17 to Tammy and Kayce.

18 We will now hear oral comments from those present
19 in the order which people signed up, and our first speaker
20 is Paul Pearce followed by Ann Leuders, and Dave L'Hommedieu
21 I believe, and I apologize for pronunciation. My
22 handwriting is in some cases as the handwriting on these
23 sheets and my ability to read what is on them is likewise
24 handicapped.

25 So yes, sir, Mr. Pearce.

1 there's a very clear delineation between the scenic area
2 boundaries. So when you talk about SEPA review on the
3 scenic level, and then you get a letter from the Forest
4 Service or the Parks Service saying you should look at key
5 viewing areas which are in fact managed under the Scenic Act
6 at things outside of the scenic area, I would just repeat
7 what's been repeated a number of times, and that the fact
8 that activities or uses inconsistent with management
9 directives for the scenic area or special management areas
10 which can be seen or heard these areas shall not of itself
11 preclude such activities or uses up to the boundaries of the
12 Gorge. Our argument would clearly be that that was an
13 intent that was clear on Congress's part, and we would
14 appreciate that you would take that into consideration.

15 I also have a letter from Congressman Brian Baird
16 to the Forest Service, May 20, 2009, and I will give it to
17 your capable staff. But in that letter he calls forth the
18 fact that the Forest Service in his opinion is reaching
19 outside of their area of responsibility, and I also have a
20 letter from both Congressman Hastings and Congressman Baird
21 to the National Parks Service where they say nothing in this
22 section of this title allows you to or allows effects
23 outside the scenic area to be taken into account by these
24 agencies. And as I explained to the Forest Service in
25 meeting just two days ago when you comment as the Forest

1 Service as a federal agency you carry a big pail of water,
2 and I think that it's important for the board to recognize
3 that when they're commenting they're commenting outside of
4 their jurisdiction and I appreciate that.

5 CHAIR LUCE: Thank you. Thank you very much,
6 appreciate your comments, Mr. Pearce.

7 Ann.

8 COMMENTS BY ANN LEUDERS

9 Leuders. I'm at [REDACTED]
10 Washington.

11 CHAIR LUCE: Spelling?

12 MS. LEUDERS: The last name?

13 CHAIR LUCE: Yes, please.

14 MS. LEUDERS: L-e-u-d as in David -e-r-s as in
15 Sam.

16 CHAIR LUCE: Thank you.

17 MS. LEUDERS: I would like to comment on the
18 visual impacts section of the Draft Environmental Impact
19 Statement, and I came prepared with some written notes
20 because I oftentimes forget my train of thought.

21 Basically at this point opponents to this project
22 are asking your Council to sacrifice the economic stability
23 of Skamania for their view. They are opposing it as it's
24 going to be detrimental to tourism which I do not believe to
25 be true, and further they cannot ask Skamania County, I

1 don't feel they can ask Skamania County to survive on
2 tourism alone.

3 Further, they would note that it's a detriment to
4 wildlife. I do not find that the Environmental Impact
5 Statement is clear on that. I think it says maybe. So at
6 this point I would just like to inform the support of this
7 project. SDS has been a great steward of the land. They
8 will continue to be a great steward of the land and
9 furthermore continue to be good for this community.

10 CHAIR LUCE: Thank you. Appreciate your comments.

11 Dave L'Hommedieu and after Dave we'll have Matt
12 Mega and Mr. Truitt.

13 COMMENTS BY DAVE L'HOMMEDIEU

14 My name is Dave L'Hommedieu. I live at [REDACTED]
15 [REDACTED] here in Skamania County. Previous to retiring I worked
16 for 34 years --

17 CHAIR LUCE: Spelling on the last name if you
18 could.

19 MR. L'HOMMEDIEU: Oh, L--H-o-m-m-e-d-i-e-u.

20 CHAIR LUCE: Thank you, sir.

21 MR. L'HOMMEDIEU: That's why you couldn't
22 pronounce it.

23 CHAIR LUCE: You Should see what they do with
24 Luce.

25 MR. L'HOMMEDIEU: Previous to Retiring I worked

1 for 34 years for both the U.S. Forest Service and the Bureau
2 of Indian Affairs as a ranger in Glenwood, Washington. My
3 main duties were timber sale administration, and I can tell
4 you I have reviewed more EIS's than I ever would like to do
5 again, but I'm here and I've done it again. And what I have
6 seen in this project that this EIS it's a fine job. The
7 only thing that I could find that was really wrong or way
8 out of the picture was the complaint about the visuals. Now
9 the visuals that I see and I drove up there, and I can see
10 from I-84 is what I would consider those windmills are way
11 in the background and not much of an impact of anybody
12 coming down I-84.

13 We need this project because it will generate
14 money for the county to run. It will put money into our
15 schools which we need very badly, and we hope that this
16 project goes ahead as proposed. I totally support the
17 project and hopefully we'll use this project to generate
18 electricity for the local area or wherever they send it
19 under the wire until something better comes along. Thank
20 you.

21 CHAIR LUCE: Thank you, sir. Appreciate your
22 comments. Mr. Truitt.

23 MR. TRUITT: You're next.

24 COMMENTS BY MATT MEGA

25 Good evening. My name is Matt Mega. I'm the

1 director of conservation out of Seattle Audubon. Last name
2 is M-e-g-a.

3 Our organization is in the process of reviewing
4 the DEIS. Our board of directors has not made a final
5 decision so these are preliminary comments. We'll have
6 written comments by the 18th. We're also official
7 intervenors in the EFSEC process and we've met with SDS on
8 one occasion to do a site visit.

9 Our primary goal is to ensure a balance between
10 our growing concerns over green energy and not impacting our
11 local bird and wildlife populations. This is not an easy
12 task. As we know birds do get killed by wind turbines. A
13 recent Seattle Times article said about 6,500 birds get
14 killed annually by wind turbines in Washington and Oregon
15 together.

16 So this is hard for a bird organization, but we're
17 looking at the bigger picture. We're looking at green
18 power. We're trying to weigh it and look at those balance
19 issues. So our preliminary comments on the EIS as we know
20 this is the first wind power project in forested landscape.
21 That causes some uncertainties for you. We need to make
22 sure the bird surveys, the collision risk models, all those
23 things address forested landscapes. Currently the
24 guidelines for Washington State that you guys often used for
25 siting and mitigation are really focused on Eastern

1 Washington Habitats so we may need to look at those
2 guidelines and see what needs to be updated and what kind of
3 new things you need to put in.

4 So our concern is really looking at mitigation.
5 The 30-year life of this project and the mitigation impacts
6 we'll be commenting specifically on some of those. We know
7 there's a tech advisory committee that's suppose to be put
8 together. It does not mention Audubon. We would like to
9 see an Audubon representative and other NGOs on there. We
10 also feel that post-mortality studies for two years is not
11 adequate for this new kind of project in a forested
12 landscape so we're looking for longer post-mortality studies
13 and maybe some changes to those.

14 So essentially I'm here to raise, you know,
15 there's some uncertainties. This is a new project in a
16 forested landscape, and your job is tough and we're going to
17 hopefully help out with some comments and make them as
18 constructive as possible.

19 CHAIR LUCE: Thank you, Matt.

20 Mr. Truitt.

21 COMMENTS BY W.D TRUITT

22 Thank you. My name is W.D. Truitt. Last name is
23 T-r-u-i-t-t. I am District 2 Port Commissioner representing
24 the Port of Skamania County, and I've lived in the county
25 more than 50 years.

1 The Port and myself support this project. We're
2 looking at 143 average jobs generated during construction,
3 \$13 million in local purchase during construction,
4 \$1.5 million in annual wind farm payroll, annual new
5 property tax revenue which is very important to the county
6 at \$731,000, \$150,000 annually to the White Salmon School
7 District, and 8 or 9 permanent jobs which is very important
8 to the county.

9 As the gentleman that spoke previous to me
10 mentioned, I've been studying your EIS and some new
11 technology from wind turbines, and there was a lady who
12 spoke last night in Underwood that talked about bats, and
13 they supposedly have developed new technology that takes the
14 vacuum off the back side of the blade or whatever it does.
15 So anyway it doesn't harm bats anymore. Just I learned this
16 in the last couple days. Anyway we're in support of this
17 thing.

18 CHAIR LUCE: Thank you very much, Mr. Truitt.

19 Mr. Canon, Mike Canon Cannon followed by Aaron
20 Leonard followed Tom D-r-a-c-h.

21 Good evening, Mr. Canon.

22 COMMENTS BY MIKE CANON

23 Good evening. My name is Mike Canon and I'm a
24 foreigner. I'm from Klickitat County, and I'm the Director
25 of the Economic Development Department for Klickitat County.

1 The address is [REDACTED] Goldendale and we
2 very much support this Whistling Ridge Energy Project.

3 I felt the thing I could do that would be the most
4 helpful is to explain some of the Klickitat experience.

5 Because of the income that our wind farms are producing for
6 our schools, our hospitals, our library districts, our red
7 funds, and our fire districts, and numbers in cases as much
8 as hundreds of thousands of dollars, in the smaller
9 subdistricts tens of thousands, this is making a difference.

10 Right now we have just a few wind farms that are
11 actually on the tax rolls. The Ebidrolla Wind Farm which is
12 the PTM and the Big Horn 1 and 2 farms. That particular
13 wind farm paid over a million dollars in property tax this
14 year. The Summit Power which is the White Creek Wind Farm
15 paid \$1,011,000. There are others that are going to be on
16 the tax rolls in 2011. Those are the Tuolumne Wind Project
17 known as Windy Point and then there's Windy Flats. And
18 Windy Point these two together represent the largest wind
19 farm in the United States. Then there's another wind farm
20 from PacifiCorp.

21 We have a thousand megawatts in production. That
22 provides household electricity for 500,000 households per
23 year. That's a tremendous amount of energy. We have
24 another 700 megawatts that are permitted and scheduled for
25 construction.

1 What we see as positive about this type of effort
2 for Skamania is that generally benefits these junior taxing
3 districts. It will benefit your county and through all of
4 that revenue it directly benefits your citizens. We found
5 that there was some concern over view shed. Our view shed
6 where these wind farms are not well near as intense as where
7 yours is, but the benefits to people has energized Klickitat
8 County residents in many, many different ways very
9 positively. And they have better schools, they will have
10 better hospitals, and much better fire protection. These
11 are things that we see as positive in the effort to have
12 this green energy, this wind energy in your county. We very
13 much support this project. Thank you.

14 CHAIR LUCE: Thank you, sir.

15 Mr. Leonard.

16 COMMENTS BY AARON LEONARD

17 Aaron Leonard. I'm actually going to choose not
18 to speak in regards to the DEIS at this time because I have
19 not had the opportunity to thoroughly review the document.
20 I would like to say that I'm a long-time Skamania County
21 resident and I'm in full support of this project.

22 CHAIR LUCE: Thank you, sir, appreciate that.

23 Written comments will be accepted until July 19.

24 Dr. Drach.

25 ///

1 COMMENTS BY TOM DRACH

2 Yes, Drach. Before I begin a point of order.
3 Last night you were accepting people to waive their time and
4 allocate it to others. Is that the policy tonight as well?

5 CHAIR LUCE: Yes.

6 MR. DRACH: If so, Vicky Price has indicated that
7 she's willing to advocate her time.

8 CHAIR LUCE: Okay. I'm checking off Vicky and
9 you're up and you've got six minutes.

10 MR. DRACH: Thank You. Good evening, Councilors.
11 My name is Tom Drach, spelled D-r-a-c-h. I'm here
12 representing a nonprofit organization called Save our Scenic
13 Area. Our mailing address is [REDACTED] Underwood,
14 Washington 98651.

15 SOSA as we have been known to be called is a
16 nonprofit that's been formed to have a voice for concerned
17 local citizens regarding this project.

18 There's a few clarifications I would like to start
19 out with in terms of hearing other people's testimony, and I
20 recall Paul Pearce the first speaker tonight had indicated
21 some letters that were going back and forth between some of
22 our U.S. congressmen and senators and state representatives
23 to the U.S. Forest Service in requesting some out of
24 jurisdiction redaction of sort. And you should be aware
25 that there was a response from the U.S. Forest Service that

1 I'm aware of going back to at least one of those individuals
2 reasserting their belief that it was their duty and
3 responsibility to comment on this project and notify your
4 group of what they felt was a concern to them. And, of
5 course, we'll be filing extensive written comments at the
6 end before the deadline occurs in July for the DEIS.

7 Rex Johnston the Klickitat Commissioner, the first
8 speaker from last night, I think erroneously indicated that
9 EFSEC has no conditioning authority over issues of scenic
10 area concerns, and I think he may have been intending to say
11 that the Gorge Commission has no authority to place
12 restrictions on the project outside of the scenic area. But
13 I'd like to encourage you to consider the fact that your
14 group could have authority to impose conditions which not
15 necessarily impact the scenic area, but the view shed
16 analysis that in fact impacts people and economy, etc. etc.

17 Okay. Getting onto specific comments regarding
18 the DEIS, the transportation plan is unclear about the road
19 transportation component on Cook Underwood Road proper when
20 the large loads are going up and down the hill. It's my
21 understanding that these things are extremely large and
22 would probably require a closure of the opposing direction
23 traffic, and, if so, there should be some indication to the
24 local people what that will mean in terms of emergency
25 services and bypasses and precautions to allow emergency

1 situations to pass, etc.

2 In terms of the soil stability analysis, there is
3 a convenient assertion that the landslide hazards and other
4 slope instabilities as identified by the local governing
5 body is the only requirement to list in terms of the DEIS,
6 and I would like to note that Skamania County has failed to
7 comply with the critical areas ordinance that has been
8 mandated by the state upon this county, and it delayed that
9 process. I can't speak to the exact time frame, but it's at
10 least in excess of two to three years. They're just getting
11 to it now so it's very possible that particular areas of
12 concern are not noted because they haven't been
13 legislatively acted on on a local basis.

14 There is a DNR FPA, Department of Natural
15 Resources Forest Practices Application number which I have
16 which we will be submitting in our comments. That does
17 indicate in the A-1 through 7 portion on the eastern slope
18 unstable slopes, high erosion potential, and a high mass
19 wasting potential, and there's a portion of that area that
20 was not logged intentionally because of concerns about
21 stability. So we just want the Council to be aware that you
22 may not be capturing all the important data just by looking
23 at the actions of the local legislative body.

24 Okay. The issue of alternatives I think is
25 dramatically insufficient in the case of this DEIS. The

1 applicant has for the most part said we need 70 megawatts or
2 we can't do the project, and there is no place else to do it
3 and we have to have absolutely every array that we've
4 proposed. And I think that's disingenuous to the process
5 and contrary to SEPA to allow that to stand. I think there
6 needs to be a really hard look at saying this applicant has
7 70,000 plus acres of land in ownership. I find it hard to
8 believe that they can't come up with at least some viable
9 alternatives to compare this application to.

10 My suggestion including a viable alternative is to
11 say, "Hey, look. The maximum capacity of turbines today is
12 2.5 megawatts. If you did that 70 megawatts, that's 30
13 turbines. You could eliminate the first 11, A-1 through 11
14 on this whole procedure and get this project back far enough
15 from the scenic area that a lot of the public's concerns
16 will be mitigated because of that." It's certainly not
17 going to eliminate all the concerns that people have of this
18 project, but that's a very good start that the applicant has
19 not seemed to be interested in, and there should be a
20 justification why that can't occur since that seemingly on
21 the surface seems viable. What is the time like?

22 MR. POSNER: Time is up.

23 MR. DRACH: Okay. Perfect. I'll finish here.

24 Thank you.

25 CHAIR LUCE: Thank you so much for your comments.

1 Appreciate the specificity of your comments to the Draft
2 Environmental Impact Statement.

3 Bob Anderson followed by Wilbur Slockish and David
4 Teitzel.

5 COMMENTS BY BOB ANDERSON

6 Hi, my name is Bob Anderson, [REDACTED] in
7 Skamania County, A-n-d-e-r-s-o-n.

8 I would like to go on record as agreeing with
9 speakers one, two, and three -- Mr. Pearce, Ms. Leuders, and
10 Mr. L'Hommedieu -- with the addition of the support of the
11 project as an important puzzle or piece of the puzzle
12 economically to help our families thrive in the county.
13 Thank you very much.

14 CHAIR LUCE: Thank you, sir.

15 Mr. Slockish.

16 COMMENTS BY WILBUR SLOCKISH

17 First of all, I'd like to say that I support the
18 project because this is the only one that I've ever seen and
19 heard of that doesn't use water. Nuclear power, gas plants,
20 coal fire plants use a lot of water.

21 CHAIR LUCE: Could you give the court reporter the
22 full spelling of your name and your address.

23 MR. SLOCKISH: Okay. Wilbur Slockish,
24 S-l-o-c-k-i-s-h, [REDACTED] Wishram.

25 CHAIR LUCE: Okay. We'll start over. All right.

1 Go ahead. You don't want to talk about nuclear.

2 MR. SLOCKISH: It's no good.

3 CHAIR LUCE: Okay. Got that down.

4 MR. SLOCKISH: Because the waste that it generates
5 comes from our lands, and they don't clean it up very good.
6 It's a health hazard. So I support this wind because of no
7 water usage.

8 And I have a letter here that I would like to read
9 to Andrew Montano from Harry Smiskin, Chairman of Yakama
10 Nation Tribal Council, June 15, 2010. Subject: Whistling
11 Ridge Energy Project: I, the Chairman of the Yakama Nation
12 Tribal Council, am requesting a continuance of 30 days to
13 review and comment on the Whistling Ridge Energy Project.
14 My staff and I have not had the chance to meet on this
15 important matter, and we would like to provide you with our
16 input.

17 So they want 30 days of consultation with you and
18 I was directed by them, the Tribal Council, to say that any
19 documents that have been submitted by the cultural resource
20 project are unofficial because they have not been reviewed
21 by the entire Tribal Council. And Harry Smiskin and Lavina
22 Washine want a written response from you on this 30-day
23 consultation process.

24 CHAIR LUCE: Thank you, Mr. Slockish. I
25 appreciate your comments.

1 David Teitzel followed by Chief Johnny Jackson.

2 COMMENTS BY DAVID TEITZEL

3 Hi, I'm David Teitzel, T-e-i-t-z-e-l, Carson,
4 Washington. I'd like to speak in favor of this wind turbine
5 project on Whistling Ridge. I would like to thank this
6 Council for all the time and effort that they're going to
7 take in getting this put together listening to all these
8 comments and all the reading that they're going to have to
9 do going through this environmental study.

10 I'd also like to thank BPA for the comments that
11 they already came up with and looking over the environmental
12 study.

13 The main importance for Skamania, one of the main
14 importance is, of course, the economic advantages of this in
15 this county. Another one, of course, is the company that's
16 doing this. It's not some outside company. It's not some
17 outfit from some foreign county or some other part of the
18 United States. It's a company home grown right here in
19 Skamania.

20 Broughton Lumber Company has been in existence
21 over 90 years in Skamania County being a good steward to the
22 land that we have, and that's one of the reasons you have a
23 scenic area here is because of the stewardship that
24 Broughton and SDS has provided. SDS has been here nearly
25 65 years, long before this ever became a scenic area. If

1 they hadn't been good stewards of this land there wouldn't
2 be the scenic portion that we have like they and other
3 timber companies, private ownership on the Washington side
4 of this river. For some reason they felt the government has
5 stepped in and have done just about everything they can to
6 squash Skamania. Here is a project that can help remedy
7 this situation. It's very important. Thank you.

8 CHAIR LUCE: Thank you, sir, appreciate your
9 comments.

10 Mr. Jackson.

11 COMMENTS BY JOHNNY JACKSON

12 Good afternoon. My name is Chief Johnny Jackson,
13 J-a-c-k-s-o-n. First of all, I want to say that I fully
14 support this wind power project because I think it's highly
15 needed at what I've been looking at and watched, that I
16 watch on the news.

17 One thing that I'd like to say I don't agree with
18 the people going and interfering and telling people what
19 they can do on their property. It's never been done before,
20 but it's starting to. I'm hearing it done now, especially
21 people that don't live along this river here in this area.
22 And I've heard a lot of things said about what happens when
23 these wind towers are up in the air, and I have made a study
24 of my own by traveling up toward Dufur around that area
25 where those wind towers are, and I went up to Goldendale.

1 I've gone down through the area where these wind towers are,
2 and I've parked there and watched and seen these happen that
3 they were talking about.

4 And they said that it is a great harm to the bird
5 life, the bird areas. Well, when I went up in there, I made
6 two trips up there and studied by parking there and watching
7 and see what that is going to happen. When I parked there
8 and watched, I've seen the buzzards circling above the wind
9 towers and they're even turning, and those buzzards never
10 came near them wind towers. They flew over them, they flew
11 around them, and they drifted off. Also, the crows, I've
12 watched the crows fly around there, and they go around the
13 wind towers. They don't go through them, and this here I
14 don't understand why people can make these kind of
15 accusations on something that they're not really sure of.

16 So I'm bringing this out to let you know that I
17 don't think there's anything wrong with these wind towers
18 being up there, and where these wind towers are going to be
19 they're not going to be bothering anybody.

20 No sound. I'm never heard no sound when I was up
21 under these towers, and I never heard nothing or seen
22 anything.

23 So this is my comment to let you guys know what I
24 feel about this wind farm. I'd rather have that than have
25 anything else like coal burning generators or any of these

1 others or the nuclear waste. When they produce this nuclear
2 waste to operate these generators, then the waste they go
3 and they dump it on some poor communities or some people
4 that don't want it, but they put it there anyway. So that's
5 my comments.

6 CHAIR LUCE: Thank you, sir. I appreciate your
7 comments.

8 Marfa Scheratski followed by Wally Stevenson.

9 MR. STEVENSON: I'm Wally Stevenson. I'm going to
10 pass.

11 CHAIR LUCE: Thank you, sir.

12 COMMENTS BY MARFA SCHERATSKI

13 Hi, I'm Marfa Scheratski from Bonneville Hot
14 Springs. I'm the general manager.

15 CHAIR LUCE: Could you speak up just a little.

16 MS. SCHERATSKI: S-c-h-e-r-a-t-s-k-i. I just want
17 to --

18 CHAIR LUCE: You're representing?

19 MS. SCHERATSKI: Bonneville Hot Springs, tourism.

20 Address is [REDACTED] I
21 just wanted to say that we're in support of this. As it
22 turns out there aren't that many other alternatives, and
23 within this county especially there just doesn't seem to be
24 very many other stimulus packages. So I think this would be
25 a great stimulus for the economy. It will give a lot more

1 jobs that people are definitely in need right now, and we're
2 familiar with the different alternatives to energy because
3 our resort is run by geothermal.

4 We've had nothing but good news come from a lot of
5 our guests. So as far as being aesthetically pleasing or
6 not, I think it's in the eye of the beholder. Some people
7 will look at it and say it's the most beautiful thing
8 they've seen, and then there will be others who no matter
9 whatever they look at they will see something wrong with it.

10 On the most part there are pros and cons to
11 everything and we just wanted to put our two cents and say
12 on the most part I think there's a little more good that
13 will come of this than bad, and I agree with a lot of the
14 stuff that the previous speakers have said in terms of need
15 and support. Thank you.

16 CHAIR LUCE: Thank you very much. Dan Spatz
17 followed by Adrian Bradford followed by Rick Taylor.

18 COMMENTS BY DAN SPATZ

19 Good evening. My name is Dan Spatz, S-p-a-t-z,
20 and I reside at [REDACTED] The Dalles. I've lived
21 in the Columbia Gorge since 1967. Although I've held
22 certain official capacities, I'm speaking tonight solely as
23 a private individual. I'm a landowner and taxpayer in The
24 Dalles and also in the Snowden area of Klickitat County
25 where my property looks toward the Whistling Ridge Project

1 location.

2 I'm here to speak in favor of this project for two
3 reasons. First, global climate change is a reality and
4 renewable energy is part of the solution. As a society we
5 seek to reduce our carbon footprint; yet we often oppose new
6 sources of energy necessary to achieve that goal. If we are
7 to maintain our current standard of living, we will need
8 radically different alternatives to fossil fuels on a grand
9 scale, whether this means wind, solar, geothermal, tidal
10 wave or most likely a combination of all the above in
11 concert with energy efficient design.

12 We build out wind energy in more remote locations
13 and we inevitably in fact need to develop wind power closer
14 to places where people already live such as the proposed
15 project location. I submit that these wind turbines, the
16 proposed turbines are far more attractive than strip coal or
17 tar sands or drilling in the Gulf of Mexico. Wind energy is
18 clean energy, renewable energy, and thus we should support
19 it for that reason alone.

20 Second, I object to the contention that proximity
21 to the National Scenic Area should prove a barrier to this
22 project. The project is located outside of the scenic area
23 boundaries as other speakers noted. The intent of Congress
24 was to enhance economic development and protect the
25 environment within the Columbia Gorge.

1 While we still face the need to precisely define
2 certain scenic area boundaries and achieve the necessary
3 mechanism for modifying those boundaries over time, the
4 intent of Congress was not to restrict development within
5 the current boundary. This principle has been demonstrated
6 in Klickitat and Sherman counties where wind farms have been
7 constructed which are visible from within the National
8 Scenic Area. And I think that's a key point for your
9 consideration here. That's a precedent, and I would
10 encourage you to follow that precedent. So I think that
11 probably concludes my key points. Thank you.

12 CHAIR LUCE: Thank you, appreciate your comments.
13 Adrian Bradford.

14 MR. BRADFORD: I'm going to pass and submit our
15 support in writing.

16 CHAIR LUCE: Thank you, appreciate that.

17 The next speaker is Rick Till.

18 COMMENTS BY RICK TILL

19 Rick Till on behalf of Friends of the Columbia
20 Gorge. Our address is [REDACTED], Portland,
21 Oregon 97204.

22 I wanted to focus on some aspects of the DEIS
23 relating to the no-action alternative and our regional
24 energy system. Throughout the DEIS the applicant presents a
25 false choice between building Whistling Ridge on the one

1 hand and continued reliance on fossil fuel generation on the
2 other hand. For example, on page 3-21 while analyzing
3 impacts to air quality, the DEIS includes this statement:
4 If the no-action alternative is selected the growing
5 electricity needs of the region would continue to be met
6 through a combination of other renewable energy development
7 and a combination of additional fossil fuels. The last part
8 of that sentence is not supported by any evidence, and in
9 fact, it's patently wrong. If the project isn't built our
10 growing electricity needs will be met through conservation,
11 efficiency, and new clean energy development.

12 The DEIS needs to be revised to reflect this
13 reality. The evidence for that is substantial. Recently
14 the Northwest Power Planning Council adopted its sixth power
15 plan. In that plan it calls for meeting new demand with
16 85 percent of new demand with conservation and efficiency
17 measures. The rest of new demand will be met through new
18 renewables. Whistling Ridge is not critical to meeting that
19 demand. We have evidence of that as well.

20 There's the Bright Future report which I will be
21 submitting for the record. Here's a cover just for you guys
22 to see what the front looks like. But the report is
23 prepared by the Northwest Energy Coalition and it forecasts
24 energy supply and how we're going to meet that energy demand
25 and how we're going to meet that up to 2050. It includes

1 factors in loss of Boardman Power Plant so dropping coal, no
2 new nukes, and taking the measures necessary to protect and
3 resource wild salmon runs. That study projects forecast
4 needs of 25,000 average megawatts by 2050. They also
5 analyze the potential energy supply that we have for clean
6 new renewables, and they forecast that at 80,000 average
7 megawatts. So our projected need is about one foot. Our
8 supply is about four feet. We have plenty of surplus
9 potential to develop. Whistling Ridge doesn't need to be
10 built to meet the forecasted need for renewable energy
11 resources.

12 Since I have a couple seconds left I think I want
13 to point out that the Park Service also responded to the
14 letters from the elected representatives. They also
15 concluded that under NEPA that they're required to consult.
16 It's their obligation as far as the environmental review
17 process to provide some input, and similarly SEPA requires
18 that EFSEC consult with agencies with expertise and the
19 resources that are being affected. You did so. You
20 solicited the Forest Services comment. You need to take
21 that into consideration. Thank you very much.

22 CHAIR LUCE: Thank you, sir. Ben Bliss followed
23 by Paul Smith followed by Steve Jones.

24 COMMENTS BY BEN BLISS

25 Good evening, Ladies and Gentlemen. My name is

1 Ben Bliss. I am a third generation resident here. My
2 grandfather worked at the dam for the BPA. My father worked
3 in the timber industry on SDS land. I myself am currently
4 enrolled in the Northwest Renewable Energy Institute in
5 Vancouver, Washington pursuing a career in the wind
6 industry. I'm represented here this evening by several of
7 my schoolmates, if you'd like to stand respectively.
8 They're all here in support of this project.

9 Though I could speak endlessly on this topic
10 because I'm very passionate, I will be very brief. I chose
11 to speak tonight on the issue regarding the fatalities of
12 bats and birds. The migratory birds have been historically
13 effective at circumnavigating these wind farms, and we've
14 known that for many generations. What we have now is the
15 issue of bats, and I can tell you extensive research is
16 being carried out now and it's as simple as reducing the
17 times in which we're running these farms.

18 Bats being very small creatures cannot fly in high
19 wind speeds which are favorable to these wind turbines; thus
20 they're going to be operating at different times. Many
21 farms throughout the nation and globally have compromised
22 with the wildlife and the bats especially. In many places
23 these fatalities have been reduced up to 60 percent simply
24 by compromising when these turbines will be operating and
25 when they will not be.

1 Another very effective science that is being
2 researched right now is the use of radar which has reduced
3 fatality from 40 to 60 percent in many locations which will
4 be applied soon in the new future. Thank you, Ladies and
5 Gentlemen.

6 CHAIR LUCE: Thank you so much.

7 Mr. Smith, Paul Smith.

8 COMMENTS BY PAUL SMITH

9 Hello, my name is Paul Smith, and I live at [REDACTED]
10 [REDACTED], Washougal, Washington at the west end of
11 the county. Thanks for the opportunity to speak tonight.

12 I am opposed to this project as it is written.
13 It's hard for me to believe that the parties who are
14 responsible for drafting this DEIS can be objective and
15 impartial to this proposal. Nothing personal.

16 EFSEC is an agency known for siting energy
17 facilities, and the BPA is an agency which deals with power
18 generation and the distribution of that power. It is your
19 duty to be objective in this matter.

20 This EIS is insufficient in that an appropriate
21 EIS has a list of alternatives. This one only states one
22 action item and mentions throughout the document that it is
23 one of the alternatives. How can the proposed action also
24 be an alternative? The only alternative stated is the
25 no-action alternative. The applicant states that he cannot

1 go below 70 megawatts and is trying to disguise this
2 unwillingness to minimize this project by saying that public
3 utilities seeking to fulfill their RPS requirements need a
4 minimum of this kind of output "to be attractive".

5 In one area it states that the project has to be
6 defined as an integrated whole to be worthwhile; yet in the
7 design mitigation measure under biological resources it
8 states, "Micro siting of turbines and associated facilities
9 would allow any sensitive resources discovered during
10 construction to be avoided." You can't have it both ways.

11 Page 1-7 states, "No other federal agencies have
12 been identified as cooperating agencies for this EIS at this
13 time." Cooperating, hmmm? Is that because National Parks
14 Service and the Forest Service have made concern negative
15 comments about this proposal as it is now written? Also why
16 have the Yakama Nation not been involved in this DEIS when
17 they as a sovereign nation have legitimate cultural resource
18 concerns? Any EIS is required to ensure that there is no
19 impact to cultural resources.

20 On page 1-8 it states that other federal, state,
21 or local agencies also may have permitting or approval
22 authority for the proposed program. Those agencies may use
23 this EIS in order to fulfill NEPA and SEPA and
24 responsibilities. Those agencies have an obligation to the
25 public to do their own due diligence and evaluations, not

1 the kind of proponents potential bias data.

2 This EIS states that the BPA substation would
3 cover 4.25 acres and be sufficient for future installation
4 of equipment if required for future development. What kind
5 of future development? 50 more wind turbines? I am
6 concerned with scope treaty. With the national and state
7 mandates on going green, I can see how once they are in it
8 would be much easier to expand the number of turbines. I
9 don't want to see this project look like the Klickitat
10 projects. People come from all over the world to enjoy the
11 majestic natural vistas the Columbia River Gorge has to
12 offer, not manmade ones. I don't think very many people
13 would like to see wind turbines at Yosemite, Yellowstone, or
14 the Grand Canyon. Neither should they at the National
15 Scenic Area, one of only two in the whole United States of
16 America?

17 This EIS is globally insufficient in the
18 evaluations of wildlife. It does a poor job of covering bat
19 evaluations, lacks significant bird-bat dispersal data, and
20 has no mention of large animal. It is so bold as to state,
21 "For potential impacts of big game species, deer and elk,
22 coordination with WDFW will occur if appropriate. It is a
23 no warning ground for elk."

24 Also what about cougar, bobcat, and coyotes and
25 other game? It states that it will convene a technical

1 advisory committee to evaluate mitigation and monitoring
2 programs for the impact to wildlife and habitat. Why is
3 that not already in place? So this project is proposed at
4 the right time in our local and national energy needs, but
5 it's placed in the wrong place. The Space Needle is around
6 605 feet tall. These turbines could be 426 feet tall.
7 There is no way this project could be defined visually
8 subordinate. If I want to see the Space Needle which also
9 has a blinking red light on top I will go to Seattle. I
10 don't want to see 50 Space Needles from key viewing areas in
11 the Columbia River Gorge. Thank you.

12 CHAIR LUCE: Thank you. Can you provide those
13 written comments you just gave us to our staff, to Tammy.

14 MR. SMITH: Sure. It's a little bit marked up.

15 CHAIR LUCE: All right. That's fine. Thank you,
16 Mr. Smith.

17 Sallie.

18 COMMENTS BY SALLIE T. JONES

19 Sallie T. Jones, [REDACTED] Washougal,
20 Washington, west end of Skamania County. Regardless of the
21 opinions regarding this proposed project, there must be
22 unbiased objective documents that permit public access to
23 information and divide decision makers to their tasks as
24 well. I don't really think this document is satisfactory in
25 that respect. I think -- that's all I'll say for now.

1 Item 1, I wanted to mention during a brief review
2 of the document, I was startled the appearance throughout a
3 distinct bias that had to do with the business needs of the
4 applicant. Right off the bat in Section 1.2.33 a discourse
5 of almost a few pages of text dealt with the business needs.
6 I don't think that's an appropriate discussion to have in
7 any EIS document, and the only information in that section
8 that I thought was relevant was the portion that mentioned
9 the amount of construction jobs. It didn't say temporary
10 construction jobs that would be provided by the project, and
11 the small amount of permanent jobs generated. I guess
12 that's about all on that subject.

13 I had Item 2. In view of the fact that no studies
14 have been conducted in the United States that determine what
15 effect wind turbines have on forest dwelling species of
16 wildlife, it seems somewhat inappropriate and misleading to
17 simply state over and over again as it does in some of the
18 concluding statements that no impacts are anticipated. Some
19 of the comments to that were stacked are nebulous,
20 inaccurate, or contradictory information included in the
21 appendices or in the text proceeding it, and that's part of
22 why I was disappointed in this document. It seems though
23 the attention to detail is not very good, nor very thorough.

24 Page 377 confidently states that operation of the
25 project would result in no further impacts to habitat on the

1 project site despite a statement on page 381 that quote,
2 "Because impact to big game as a result of the wind project
3 operation is limited it is difficult to predict the impacts
4 of the proposed project on wildlife using priority habitat
5 on the proposed project site."

6 More research data on human health in connection
7 with wind turbines is more available than it has ever been
8 before, and another person has made a good study in
9 compilation of that which I think you heard yesterday
10 evening in Underwood so I won't make anymore comment on
11 that.

12 Geologic and soils information is troubling for
13 anyone who has seen the proposed project site which is
14 pretty steep, and this project proposes to disturb a great
15 deal of that. Construction would require blasting, removal
16 of soil. And blasting can disturb fragile habitats not
17 necessarily at the time, but in future times and in long
18 periods of time as well. The soil types present are
19 unstable and probably even the plan mitigation -- am I done?
20 Oh, okay. Thank you. I will submit the rest of my
21 comments.

22 CHAIR LUCE: Please. Thank you very much.

23 Mr. Kahn.

24 COMMENTS BY GARY KAHN

25 Thank you, Mr. Chair, and Members of the Council.

1 My name is Gary Kahn. My address is [REDACTED]
2 Portland, 97286. Kahn is spelled K-a-h-n, and I represent
3 Friends of the Columbia Gorge.

4 Initially I'd like to say that we support
5 Mr. Slockish's request for additional time to review the
6 EIS. The document is very thick. We've had three weeks
7 between its issuance and today. It's simply not enough time
8 for people to review it and offer public comments. We also
9 request there be an additional public hearing later on in
10 the process after people have had a full opportunity to
11 review the EIS.

12 Although we've had only three weeks, we've already
13 noted a number of major flaws in the EIS, and I would like
14 to talk about two of them today. At page 3-194 the DEIS
15 says, "During scoping some commenters expressed concern that
16 project operation would impact the scenic area adversely
17 since turbines would be visible from some key viewing areas
18 inside the scenic area. Analysis of the key viewing areas
19 and viewpoints within the scenic area were sought and
20 analyzed. The presence of the project would cause low to
21 moderate visual impact to viewpoints within the scenic
22 area."

23 There's several problems with this. First, the
24 reference to some commenters is simply unfair and wrong.
25 Hundreds of commenters raised the concerns about the scenic

1 impacts. During scoping 92 percent of the written comments
2 were opposed or had concerns about scenic impacts. Most of
3 them raised this issue. We searched the entire DEIS
4 electronically and this is the only instance where the
5 phrase some commenters is used. The EIS should be very
6 accurate and make it clear that it is most commenters that
7 have raised this concern.

8 Secondly, there have been no analysis of the
9 impacts from a number of the key viewing areas and
10 viewpoints within the scenic area. These include Mitchell
11 Point along the Historic Columbia River Highway which is an
12 important recreational trailhead. There's a process ongoing
13 to restore the scenic highway in that area and create
14 windows in the walls like there is outside of the Hood
15 River. The views from the restored tunnel along this trail
16 would look directly at this project.

17 There is no analysis of the impacts from the
18 Columbia River, another key viewing area. No analysis of
19 the impacts of State Routes 141 and 14 in Washington or
20 Oregon Highway 35 or Tom McCaw Point or Panorama Point in
21 Oregon which was noted in a letter of May 6, 2009 by Daniel
22 Harkenrider, the scenic area manager of the Forest Service.

23 In addition, there should be analysis of the
24 impacts visible from the Buck Creek Trail to Nestor Peak
25 which is due north of the project area. Although this is

1 outside the scenic area it's an important viewpoint and the
2 impacts to this view should be considered. The view of
3 Mount Hood from this area would be blocked by wind turbines.

4 The second issue I'd like to address is the
5 reasonable range of alternatives. NEPA and SEPA require two
6 major points with respect to alternatives. One, there be a
7 reasonable range of alternatives considered; two, that each
8 reasonable alternative be rigorously explored and
9 objectively evaluated. In this DEIS we have two
10 alternatives: one the project, one no action. This flies in
11 the face of NEPA and SEPA requirements, and we believe
12 additional alternatives must be analyzed in either a
13 supplemental DEIS or a new DEIS. It's the only way you can
14 comply with these two laws. Thank you for the opportunity
15 to comment.

16 CHAIR LUCE: Thank you, Mr. Kahn, appreciate your
17 comments.

18 MR. SLOCKISH: Mr. Luce, I want to clarify. I did
19 not say that. I said consultation. I did not say extend
20 the comment period for everybody, just the Tribal Government
21 with respect to him.

22 CHAIR LUCE: You're talking about government to
23 government.

24 MR. SLOCKISH: Yes.

25 CHAIR LUCE: All right. Thank you.

1 MR. KAHN: If I mischaracterized his comments, I
2 apologize.

3 CHAIR LUCE: I'm sure that no harm no foul.

4 Loreley Brach followed by David Bennett followed
5 Harold Gailey.

6 COMMENTS BY LORELEY BRACH

7 Thank you very much. My name is Loreley Brach,
8 and I live in Underwood, Washington. My address is [REDACTED]
9 [REDACTED] I am here today to speak about something a little
10 different. Thank you again for letting me speak up.

11 I'm here today to speak about the data collection
12 in here. You allowed the applicant to hire their own
13 consultants and collect this data, and I'm going to relay a
14 little story to you about some experience I had when I
15 worked for the government, and I worked for a number of
16 different agencies, state, federal doing research. And I
17 was involved in a project.

18 It was a two-year project, and before I left to
19 start a family I completed the whole results, the analysis,
20 everything, turned it in, and never got -- I was the primary
21 author and never got another chance to look at it
22 afterwards. And after some time I went on line and found
23 this document and it was very interesting. A two-year study
24 a large portion of it was missing out of the first year. So
25 I called up the people and I said, "What was wrong? Was

1 there something wrong with my analysis that would cause
2 this?" And the answer was, "We did not agree with the
3 results." That's with the government.

4 Now what do you think a private consultant whose
5 bread and butter is to produce some product for these
6 companies, what do you think they would do to keep their
7 business, their jobs? I really have to question this.
8 These people shouldn't be doing this study for the people to
9 come up with the answers the right ones, ones we can trust.
10 So please I don't agree with this. I'm not even sure if
11 this is allowed by NEPA. If it is, please put it in the
12 document what laws allow this. I would really like to see
13 this. I would like the justification for this. If I'm
14 confused, I'm sure there's a lot of other people.

15 As far as new bat technology, we've been trying to
16 send man to outer space and find other planets to live on.
17 Wind turbines are basically like an airplane blade. You've
18 got to lift, you've got a low pressure zone. I don't see
19 how the technology mentioned really exists or would function
20 in that capacity, and I would like to see the research on
21 that.

22 As far as the economics of this county, you
23 probably noticed that there has been a lot of construction
24 going on. I personally and along with a lot of other people
25 do not believe that this once very wealthy county is really

1 struggling that hard. I think it's a spending problem. It
2 is not a financial problem. We're going to have to come
3 back to what all the other counties have been dealing with
4 more for many years, and that's trying to juggle and find
5 priorities. Skamania County was very wealthy. We have to
6 enter this new reality. Thank you.

7 CHAIR LUCE: Thank you.

8 Mr. Bennett.

9 COMMENTS BY DAVID BENNETT

10 Good evening. My name is David Bennett,
11 B-e-n-n-e-t-t, [REDACTED], Carson, Washington. I
12 think I'm coming from an advocate's position on this matter,
13 but I think everybody is right in the fact that everybody is
14 going to be impacted. If we do nothing, we're impacted
15 economically, socially, jobs, whatever. If the project goes
16 in, there's going to be some impact on the environment to
17 some degree. Your job is find to that balance and hopefully
18 make sure that the data and the science is such that the
19 risks are minimal.

20 But we do need to make some changes. We have to
21 have power or we have to change our ways entirely. We do
22 need jobs. We do need tax bases or we have to start
23 floating bond levies. The job is to find some kind of
24 balance, and I'm not exactly sure how you're going to do
25 that because everybody comes from a very emotional position

1 on this matter. Pro or con, that's it.

2 So I am an advocate for the project. I would like
3 to see it go in for a lot of reasons. It would help balance
4 out a lot of economic things, social things, jobs, and
5 somewhere along the line we're going to have to figure out
6 how to get along because the Gorge belongs to all of us.
7 It's where we live. It's where we make our living, and I'm
8 glad that people on the outside are wanting to defend the
9 beauty of what we have. Again, we've got to find that
10 balance. Thanks.

11 CHAIR LUCE: Thank you, appreciate your comments.

12 Harold Gailey followed by Peter Cornelison.

13 COMMENTS BY HAROLD GAILEY

14 Yes, my name is Harold Gailey. I came prepared to
15 support the project, but in view of time I think I'll just
16 submit written comments.

17 CHAIR LUCE: Thank you, appreciate that.

18 Mr. Cornelison.

19 COMMENTS BY PETER CORNELISON

20 I'm going to start by giving you something to look
21 at.

22 Hello again. My name is Peter Cornelison. I live
23 at [REDACTED], Hood River, Oregon 97031. I am going to
24 repeat myself on one point tonight. That is please give us
25 another chance at this time. Three weeks to review

1 1,500 pages of technical material is totally inadequate.

2 Please give us another hearing.

3 Point 2, this is something that locals, it sort of
4 takes local knowledge to know this, but in Hood River and in
5 Washington there's typically when there's storming from the
6 coast they stop kind of on the ridge line here as you can
7 see and forms a pretty substantial cloud layer. Now
8 oftentimes that cloud layer is right behind Underwood
9 Mountain where these turbines are proposed. My question is
10 what would the impact be on birds and aviation if you don't
11 see these things taller than the tallest building in
12 Portland? That to my knowledge is not covered in the EIS.

13 Point 3, it was stated earlier that a precedent
14 has been set. Turbines can be seen from inside the National
15 Scenic Area area. True on the extreme eastern end from a
16 great distance away. The fact that I talked to you about
17 last night was that turbines, a turbine project that was
18 going to be right on the boundary of the scenic area has
19 been stopped, defeated. This was the one at 7 Mile Hill
20 between The Dalles and Mosier.

21 This will be the first turbine project just
22 outside the boundary of the scenic area and essentially it
23 flouts the intention of the drafters of the Scenic Act. It
24 also would have a major impact on Hood River which derives
25 at least one-third of its business from tourist economy.

1 If you've driven to Goldendale and seen the impact
2 of those turbines up close, the blades spinning, they draw
3 your eye. That's not what people come to Hood River and
4 Washington to experience. If they want that, they can drive
5 another hour to Goldendale. I know you probably don't have
6 to consider Hood River in your impact, it's Oregon, but I
7 ask out of fairness that you do. Thank you.

8 CHAIR LUCE: Thank you, appreciate your comments.

9 Jill Barker followed by Charles Pace and Rob
10 Gilchrist.

11 COMMENTS BY JILL BARKER

12 Good evening. I'm Jill Barker and I live in
13 Mosier, Oregon, and I'm speaking for the Columbia Gorge
14 Audubon Society tonight.

15 Whistling Ridge is not so much about renewable
16 energy development. We all support renewable energy future
17 for our nation, but this simply is the wrong project at the
18 wrong place at the wrong time. The Condit Dam on the White
19 Salmon is going to be removed. Day after day the Condit Dam
20 churns out 8 to 10 megawatts of power, almost of the firm
21 power Whistling Ridge would produce. Should we rethink a
22 facility's removal? No, because it's been determined that
23 salmon recovery is a higher priority than renewable energy
24 from the White Salmon River.

25 So it is with the Columbia Gorge. The Gorge was

1 set aside by Congress as a special place to be preserved and
2 protected for all future generations. No one anticipated
3 the abomination of 500-foot gleaming white towers with
4 rotating blades being located on ridges just outside the
5 National Scenic Area boundaries; otherwise, the lines would
6 have been drawn up differently.

7 If this proposal is permitted along with other
8 proposals in the east Gorge, the iconic landscapes the
9 Scenic Act purports to protect will become subordinate by
10 day to giant towers with rolling blades and by night to
11 flashing red lights. If the Whistling Ridge project is
12 permitted, then it will be time to ask Congress to redraw
13 the boundaries of the scenic area. The incongruity of
14 industrial wind energy projects up and down the Gorge on
15 ridge tops just beyond the scenic area boundary scene flies
16 in the face of the very intent of the Scenic Act itself.

17 A cheerleading flyer sent out by the project
18 proponent asserts that in a single year Whistling Ridge will
19 displace X barrels of oil, X tons of CO₂, and X numbers of
20 cars on the road. This is a cruel hoax. Where is the
21 evidence for such an assertion? In fact, for every megawatt
22 of wind energy developed an offset of fossil fuel fired
23 megawatts has to be developed as wind energy's
24 unpredictability fee stabilizes the electrical grid, and
25 this comes from the Northwest Power Planning Council's own

1 words.

2 With a verging population, negative consumerism,
3 and Wall Street driven cowboy economy, we'll need every
4 barrel of oil, every ton of coal, every cubic foot of gas to
5 keep the economy humming. The best evidence we have for
6 this is the Gulf Oil volcano. Even though the Gulf Coast is
7 a wash of oil threatening their very way of life elected
8 officials have lined up to demand that the moratorium on
9 deep water oil drilling be lifted so that business can go on
10 as usual. Moreover Whistling Ridge developer SDS and its
11 partners were paid 20 million dollars in public money by BPA
12 to not develop a gas fired plant project in Bingen. Where
13 is the concern by SDS for CO2 emissions then? The flyer
14 further asserts there will be no harm to wildlife
15 populations. Can I continue?

16 CHAIR LUCE: Wrap it up, but go ahead.

17 MS. BARKER: There will be no harm to wildlife
18 population. This is also a hoax. The raptor mortality from
19 wind energy projects developed in Klickitat County is ten
20 times what the EIS predicted, and there's an article by
21 Kathy Durbin in the Columbia minutes states that. What went
22 so terribly wrong? Columbia Gorge Audubon releases the cozy
23 relationship between the project proponents and the EIS
24 preparers is what went wrong. Getting a permit opens the
25 spickets to fat state and federal subsidies without which

1 projects like Whistling Ridge would be unprofitable to
2 develop.

3 CHAIR LUCE: Thank you so much. You will leave
4 comments hopefully with staff?

5 MS. BARKER: My husband was going to speak and
6 he'd defer his time to me to finish this.

7 CHAIR LUCE: Your husband is listed as a speaker?

8 MS. BARKER: You signed in?

9 I think he signed in.

10 CHAIR LUCE: All right. Go ahead.

11 MS. BARKER: By comparison wind energy industry
12 makes much of birds killed by plate glass windows, cats, and
13 vehicle grills. But how many eagles or falcons or hawks are
14 killed by these objects? Wind energy is very selective in
15 its bird mortality, and raptors are some of the most
16 threatened bird populations. I would not want to be a
17 raptor trying to negotiate the mid Columbia landscape these
18 days, would you? The U.S. Fish and Wildlife service wants
19 to reintroduce the California Condor to its former range in
20 the Gorge. What a joke.

21 At an initial hearing before EFSEC on Whistling
22 Ridge Wally Stevenson the owner of SDS states that his
23 company has always tried to do the right thing. Columbia
24 Gorge Audubon assumes that this was said to help persuade
25 EFSEC to render a decision favorable to Whistling Ridge. We

1 would like to balance the record with this.

2 Concurrent with establishing a National Scenic
3 Area, Congress designated the lower White Salmon River under
4 the National Wild Scenic River Act. The management area
5 boundary included some SDS property, including lands along
6 Spring Creek and critical areas of salmon spawning once they
7 are reintroduced. The Forest Service offered SDS a land
8 exchange so these lands would not be logged and the values
9 for which the river was designated could be preserved.
10 Apparently SDS was unable to get above the appraised values
11 for their land so the company cut the forest down to include
12 Spring Creek and other areas where hiking trails and picnic
13 areas were planned. Now we ask you was that the right thing
14 to do?

15 Lastly, the Northwest is not short, not short on
16 renewable energy. It's conveniently overlooked by the
17 industrial wind energy proponents, but 10,000 megawatts of
18 high quality renewable energy is churned out daily by the
19 Columbia River Hydro System, and it's come at a high price.
20 Saliva Falls once the Northwest cultural and natural history
21 icon is gone, and the world's greatest natural salmon
22 fishery has been driven to near extinction. The sprawling
23 industrial swathe of wind turbines now stretches along both
24 sides of the Columbia from Maryhill to Walla Walla. These
25 Columbia River landscapes of Lewis and Clark and the Oregon

1 Trail have been disfigured and no longer available to those
2 who aspire to capture the spirit of those storied places.

3 It would seem that the Northwest are selling our
4 souls, our incomparable landscapes to satisfy California's
5 insatiable need for so-called green energy. So SDS and your
6 sidekick Wind Works! Northwest don't tell us that now we
7 need to deface the Columbia Gorge to chase a few more green
8 megawatts. The region has paid its dues. The wind energy
9 industry just like the dam builders will hound out every
10 wind resource to erect their turbines because a pot of money
11 in state and federal subsidies awaits a secured permit. It
12 is up to thoughtful citizens to ensure that some areas are
13 off limits. Prides of NIMBYism can be heard, but let us not
14 be made to feel guilty by renewable energy wants and the
15 wind energy industry and county commissioners who do their
16 bidding for standing up to protect the last best places.
17 We'll comment further on the DEIS.

18 CHAIR LUCE: Thank you very much, appreciate your
19 comments.

20 Mr. Pace.

21 COMMENTS BY CHARLES PACE

22 Thank you. My name is Charles Pace. I live in
23 North Bonneville. I'm a landowner.

24 CHAIR LUCE: You want to give us your address?

25 MR. PACE: [REDACTED]

1 I was going to focus on the weaknesses in the DEIS
2 that I found, but the point is not to support or oppose but
3 rather to strengthen the document, and it's not my -- Al,
4 it's good to see you. I bet you didn't miss me as much as I
5 missed you.

6 The 30-day extension that was requested is
7 appropriate for government-to-government consultation I
8 don't believe it's necessary or even going to contribute to
9 the process to provide that for everyone. In terms of the
10 socioeconomic impacts, I'm a professional economist by
11 training. I find that the Draft EIS falls far short. You
12 need to look at the two-county area. The benefits are
13 significant, but they can't be assumed. You have to do a
14 serious analysis. It has to have detail. In my opinion
15 this is one of the draft's most significant weaknesses. I
16 think it's been raised by either the City of White Salmon or
17 it might have been Klickitat County they pointed that out,
18 and it might have been in the Gorge proceedings. But anyway
19 I remember reading that.

20 3.1.1 the affected environment needs to describe
21 the social and economic baseline, and then from there look
22 at the impacts in section 3.14. Right now that's on page
23 3-35. That's virtually uninformative. So you need to go in
24 there and look at the benefits, the tax revenues, and also
25 recognize that there are going to be impacts on the

1 community infrastructure, governmental services, and so on,
2 but I think just my gut reaction there is that the benefits
3 are going to be significant.

4 Other issues, public safety, global warming, the
5 environmental compliance process also because you are doing
6 a joint one you don't want to ignore BPA's process for
7 interconnection, and I have a concern there because there
8 are water impacts. There are project impacts below
9 projects, and it has to do with the way that we integrate
10 wind into the system. Those are issues that are larger,
11 much larger than this project. For that reason I suggest
12 that you bifurcate the interconnection aspect from the
13 siting facility aspect so that the project can go forward
14 there and not get hung up in questions about how we're going
15 to integrate wind. I'll submit written comments, and it's
16 good to see you again.

17 CHAIR LUCE: Thank you, Mr. Pace.

18 Rob Gilchrist.

19 COMMENTS BY ROB GILCHRIST

20 My name is Rob Gilchrist, G-i-l-c-h-r-i-s-t, and I
21 live at [REDACTED] in Cook, and I have got a couple
22 comments for tonight. My first big concern is the
23 precedence that this project will set. You know, the visual
24 impacts have looked at what this set of windmills will
25 provide, but if this project is allowed to go forward, I

1 share the concerns with others tonight that more projects
2 will be allowed and the National Scenic Area will be more
3 heavily impacted than is what currently proposed.

4 I also find that I did not know that there's only
5 two National Scenic Areas in the entire United States, and
6 it seems like some of the comments in this proposal do not
7 take into account that this is such a short resource for a
8 nation. For example, looking at the housing prices the
9 housing impact of windmills on housing prices was taken
10 across the nation as a whole, and my guess is that in most
11 of those locations housing prices are not largely based on
12 the scenery that surrounds them. My other comment is that
13 one of the main drives to do this is the economic impact,
14 and there's no question that there will be a positive
15 economic impact; however, I don't want the current economic
16 state of our entire country to bias the decision today
17 because certainly the impacts, the negative visual impacts
18 will last much, much longer than our current poor economic
19 state. That is it.

20 CHAIR LUCE: Thank you, sir.

21 Last person we have listed is Crumpacker, John
22 Crumpacker.

23 COMMENTS BY JOHN CRUMPACKER

24 Good evening. My name is John Crumpacker. My
25 address is [REDACTED] Underwood, Washington, and I'm here

1 tonight on behalf of the Skamania Agri-Tourism Association.
2 We're a group of basically businesses that are directly
3 impacted by the project in Underwood, and our position on
4 the project is that we actually support the project. We
5 support it on the condition that it be reconfigured, and
6 that was rejected in the Draft Environmental Impact
7 Statement as not possible so that's what I wanted to
8 address.

9 We support the project on the condition that the
10 seven southerly most A towers which I think are 1 through 7
11 be moved back into the project, and it seems based on most
12 of what's been done both by the applicant and what we've
13 heard from other folks is that those towers probably
14 represent the most significant visual impact of the entire
15 project. So it's a pretty important issue to consider.

16 We basically feel that the conclusion in the Draft
17 Environmental Impact Statement that it can't be reconfigured
18 because it's not economically viable other than as proposed
19 isn't actually the case, and one of the significant issues
20 that you could address in the Draft and the Final
21 Environmental Impact Statement is whether the number of
22 towers less than 50 could produce whatever this threshold is
23 that's truly economically viable. So that's one thing that
24 could be done, and it's really important that be considered
25 and it's not. It's just rejected.

1 The other relates to whether all 50 towers are
2 really necessary, and if you look at the Draft Environmental
3 Impact Statement on 220 and 221, all the conclusions, all
4 the facts that you have before you right now that it's
5 viable only with the full 50 towers as configured with no
6 micro siting or deletion of towers is from the applicant.
7 So I wanted to read quickly a statement from the applicant,
8 and this was made according to Jesse Burkhardt whose the
9 reporter for the Enterprise Newspaper in White Salmon which
10 is one of our local papers. And this statement was made by
11 the president of SDS who's also the president of the
12 Whistling Ridge project, and it was made actually in the
13 room you were in yesterday in front of several hundred
14 people and to quote, "Spadaro said that there would be a
15 maximum of 44 turbines in the development proposal. Our
16 project is 50 megawatts. That's very small in terms of
17 energy development," Spadaro said. It goes on to say that
18 another citizen learned that the energy project would not
19 stop with only 44 turbines, but Spadaro countered that that
20 was not true. Spadaro explained these 44 turbines were the
21 limits to the project.

22 Well, at that point apparently it was economically
23 viable was 44. Our position is that 7 turbines are at issue
24 here. 50 minus must 44 is 6 turbines. Based on the words
25 of the proponent of this project, you should definitely be

1 asking the Draft Environmental Impact Statement authors to
2 include in the Environmental Impact Statement consideration
3 for the reconfiguration of the project which was rejected.
4 Thank you.

5 CHAIR LUCE: Thank you, sir. I appreciate your
6 comments. That concludes the list of people -- well, it
7 does conclude the list of people who signed in. Now if you
8 would like to speak or if we have -- Tammy, do you have
9 other people?

10 MS. TALBURT: I don't, but the lady in the scarf
11 did sign in on the list.

12 CHAIR LUCE: Please come forward and give us your
13 comments. I apologize for having overlooked you.

14 MS. REPAR: Thank you very much. Yes, I do
15 remember signing the purple sheet.

16 CHAIR LUCE: All right.

17 COMMENTS BY MARY REPAR

18 Thank you very much for giving this opportunity to
19 speak. My name is Mary Repar, R-e-p-a-r. I live [REDACTED]
20 [REDACTED], Stevenson, Washington 98648.

21 These are my preliminary comments and let me be
22 blunt, Section 314, page 3264, these are about the
23 cumulative impacts. There seems to be a lot of talk about
24 cumulative impacts but no analyses. The basic refrain
25 throughout the DEIS, especially on the cumulative impact

1 analysis section seems to be bad things happened in the
2 past, bad things will happen in the present, and bad things
3 will happen in the future, but there is no analysis of these
4 bad things happening.

5 The NEPA process says you must use critical
6 analysis in federal projects and this qualifies. I'm going
7 to give you the CEQ's Handbook on considering cumulative
8 effects under the National Environmental Policy Act, and in
9 Table 5.3, page 56, for example, there are analyses for
10 analyzing cumulative effects. For example, trend which
11 would give you to assess the status of a resource, ecosystem
12 and human community over time. It usually results in a
13 graphical projection of past and future conditions. I
14 didn't see that anywhere in the DEIS. Also there's no
15 modeling which would address the cause and effect
16 relationships. Where is it? Why aren't we seeing some of
17 these true analyses with quantifying data? There is no
18 environmental baseline data established. Where is the
19 baseline data?

20 If you render cumulative analyses you need
21 baseline. I want to see that baseline data. I did not see
22 it in the cumulative impacts analysis section. This whole
23 document actually I found it quite inadequate in the
24 sections that I read, and cumulative impacts are my heart's
25 thumping, causing my heart to thump when I read cumulative

1 analysis, and my heart wasn't thumping when I read this.

2 On page 3272, for example, the proponent states
3 past and present line development, timber harvest, and
4 agricultural uses have resulted in a cumulative significant
5 change. Then at the end of this paragraph, well, our
6 development of this proposed action would contribute
7 incrementally. Okay. You had significant change. Now
8 you're going to do incremental. Where is the quantifying
9 data that would give you something to look forward to?

10 Also, I have carrying capacity has not been
11 addressed at all. Where is the special economic impact
12 analysis and social impact analysis for these documents?
13 The CEQ's handbook covers all of that.

14 BPA question. Is this thing going to need a gas
15 plant to supplement it? I've got a series of questions
16 here. But how is BPA going to back the real and potential
17 wind energy production from all of these wind farms?

18 And I'm also submitting three articles, newspaper
19 articles, and one of them states that, let's see, 6,500
20 birds and more than 3,000 birds are annually killed by the
21 wind power turbines currently operating in Oregon and
22 Washington. And lastly, Increased Costs Are Blowing in the
23 Wind by Todd Wynn and Eric Lowe, Cascade Commentaries or
24 Cascade Policy Organization. Wind energy on the Pacific
25 Northwest's electricity grid has increased substantially.

1 Often overlooked are the impact of increasing wind
2 generation on the reliability and affordability of
3 electricity that very well might outweigh any of the
4 promised environmental benefits.

5 I will be submitting many, many, many, many, many
6 more comments on this DEIS. Just I didn't have anymore time
7 to do it. Again I would like to submit the handbook too for
8 your consideration.

9 CHAIR LUCE: Thank you very much. I do apologize.
10 I did overlook you and it was my error and submit the
11 handbook. We do have a copy of it which we utilize, but we
12 always can use an extra one.

13 Are there anymore comments this evening?

14 Yes.

15 COMMENTS BY AARON BABCOCK

16 I grew up here my whole life every summer. I live
17 in Vancouver, Washington now. [REDACTED], [REDACTED]
18 my number.

19 I support the wind farms. I believe the trees is
20 what the major problem is because I believe in the future
21 there will be wild fires if we don't fix the Ecology of the
22 trees which will create a problem for the windmills.
23 They're not thinned well. They're rotting away. I have
24 hunted all through there, and there's plenty of birds
25 because of all the worms that are laying around. So we

1 don't have to worry about the birds. It's about the jobs we
2 have to worry or no one is going to be able to look at
3 anything. We're all going to be up on the sidewalks. But I
4 do security, I'm employed, but people that haven't been
5 working for two years they need a job.

6 A basic remedy for false accusations about the
7 wind turbines would be a security guard or forest ranger to
8 oversee it. You have daily paperwork, court documents on
9 observations, testing the metal, making sure it's durable,
10 it's not aluminum. And if there's any birds going in, it
11 could document it. It's all there right on site, and they
12 could test it everyday, and it's just another job added to
13 the wind turbines. And we could get some real good facts
14 right from the security guard, court documented, and remedy
15 all the paperwork of computers and all of that. Just hire
16 security just to watch the turbines and check the paperwork
17 over here, and it's all remedied.

18 And if the trees are growing good, you won't see
19 the turbines very much because the trees will be growing
20 again. But right now what I see is they're turning brown
21 and they're falling apart. They don't thin them. They're
22 just -- and animals are going away towards those wind farms
23 because there's nothing to eat up there. It's drying out.
24 They're coming down here by the Columbia River on private
25 land. That's why there's hoards of elk and deer right on

1 the Columbia, you know.

2 They just destroyed the lumber industry because
3 environmentalists came in with all their rules and killed
4 jobs. All we need is some good Ecology, you know. Plant
5 ten trees for one tree. Thin the forest so wind can get
6 through there so they grow tall and that's pretty much all I
7 want to say.

8 CHAIR LUCE: Thank you very much.

9 Anybody else? We've got another commenter. We've
10 got two commenter.

11 COMMENTS BY BONNIE WHITE

12 Hi, I didn't plan on speaking here tonight, but if
13 I don't I'm not going to be able to face my granddaughter.

14 CHAIR LUCE: Could you state your name, please.

15 MS. WHITE: My name is Bonnie White and I live in
16 White Salmon. I grew up in Goldendale. I went to
17 Goldendale High School. My mother was the county auditor,
18 my father was the chief of police, and my grandmother was
19 married to the grandson of the founder of Goldendale.

20 I have lived on the west end of Klickitat County
21 for the past 34 years. I'm an artist. People pay me to
22 paint images of the Gorge. I think I live in one of the
23 most beautiful places in the world. Being raised in a
24 political family I know how power and money speaks, and I
25 think that's pretty evident here tonight. You know, it's

1 hard to get up when you have someone who is part of your own
2 community and a major employer in the community and has long
3 arms. It's hard to speak against them. You pay a price for
4 it.

5 The issue here to me goes beyond whether wind
6 power kills bats or birds or global warming. It's about
7 defacing one of our national treasures. This isn't a
8 national park. It's a national scenic area.

9 A couple weeks ago my family had a gathering in
10 Goldendale, and I saw a cousin that I hadn't seen in a long
11 time, and I am involved in a land trust and we own 160 acres
12 out near Hawker Road where one of the wind power projects
13 is. I asked her if she'd ride out with me to look at the
14 project and see. Up until now I haven't had the guts to go
15 out and see if you can really hear what it sounds like, what
16 it really looks like, what it's really like to be there.
17 And we drove out Hawker Road to an area called, a little
18 road called Oaks Flat, and it was devastating. It was
19 absolutely devastating.

20 We couldn't go any further because there was so
21 much -- there were big rocks and mud in the road from the
22 trucks coming in and out. The turbines totally own the
23 landscape. It's like being in the twilight zone, and I'm
24 not exaggerating. It's worse than I imagined. It's worse
25 than I could have imagined. The sound is overwhelming.

1 They're huge.

2 I saw one kestrel in an area that I birded in, and
3 I've counted dozens of raptors in that area. I saw one
4 kestrel. I heard one meadowlark and I could barely hear it.
5 At this time of year because of all the rain the landscape
6 itself there were all kinds of wildflowers blooming all
7 over, and around them were these huge metal objects that the
8 sound it sounds like a continual airplane over you. It just
9 sounds like an airplane, and each time the blades went
10 around it sounded like a freeway, like freeway traffic. It
11 didn't sound like a car. It sounds like freeway traffic.
12 Just vroom, vroom. It was unbelievably devastating.

13 It owns the entire landscape, and, you know, all
14 of these people talk about jobs. What about all the people
15 who no longer have a job because of these turbines?

16 I got lost here. My cousin who just retired from
17 a mill was sporting her new watch. She was really proud of
18 it. She is very different than I am and she was just
19 overwhelmed. She said they've destroyed the Gorge. They've
20 destroyed the Gorge. This is, you know, this is the
21 Columbia Gorge. They have destroyed it, and I was really
22 surprised and I thought about that. And I thought about how
23 we have this Columbia Gorge Scenic Area, and we think of the
24 boundary of the Gorge, but the people come here and see it
25 is the Columbia Gorge. We have destroyed most of the

1 Columbia Gorge.

2 And this is -- I'm asking you to have some sense.
3 You know, sure, people are here for jobs. Some people are
4 here because they get benefits by speaking out for this
5 project, and those who speak against it have nothing to gain
6 except possibly the hope of continuing to have a Columbia
7 River Gorge in an area that is so precious to all of us, an
8 area where my granddaughter will be able to paint, where
9 Wally's daughter will be able to paint, you know. I just
10 ask you to consider the Columbia Gorge. Thank you

11 CHAIR LUCE: Thank you very much for your
12 comments. We have another commenter.

13 COMMENTS BY KELLEY BEAMER

14 Thanks. Good evening. My name is Kelley Beamer.
15 I work with Friends of the Columbia Gorge, [REDACTED]
16 [REDACTED]. Thank you for the
17 opportunity to comment this evening.

18 I'll be brief. I work as a conservation organizer
19 for Friends and interact a lot with our membership that
20 exceeds 5,000 in Oregon, Washington, and throughout the
21 entire United States. As soon as we let our members know
22 about the release of the Draft Environmental Impact
23 Statement I started receiving calls, e-mails, and visits to
24 the office with people who were frustrated with the amount
25 of time. Again I'm reiterating something you've heard

1 already. But just based on my interactions with supporters
2 and people who care deeply about getting involved with this
3 process there was a lot of frustration. So I would
4 reiterate the request to (a) extend the comment period and
5 (b) to hold an additional public hearing.

6 I also want to address one part of this visual
7 impact analysis involving the key viewing areas. The Draft
8 Environmental Impact Statement looked at specific static
9 points. There are specific key viewing areas such as the
10 Historic Columbia River Highway I-84 that are entire
11 stretches of the key viewing area, and I would ask that the
12 analysis be shifted from just specific points on those to an
13 analysis of what the experience is along that entire key
14 viewing area I-84 or Historic Columbia Highway of Columbia
15 River, for instance.

16 Lastly, I just want you to realize that the
17 project that you are all spending this time reviewing and
18 hearing comments about as you know is unlike any other
19 project that has been proposed because of its proximity to a
20 National Scenic Area. Congress has voted time and time
21 again to recognize this area as an outstanding natural
22 treasure that is valuable to our country. It did it when it
23 voted to pass the National Scenic Area Act, when it passed
24 the Ice Age Pledge National Geologic Trail just in 2008, the
25 Lewis and Clark National Historic Trail, The Pacific Crest

1 National Scenic Trail. Those are just a few.

2 So the decision that you pass on to Governor
3 Gregoire will impact future generations as it's been said.
4 We hear time and time again about people's experience
5 visiting the Gorge. This is a very, very special area that
6 should be protected for future generations and a decision
7 will impact future generations. Thank you for the
8 opportunity to comment.

9 CHAIR LUCE: Thank you. Do we have any other
10 comments? Going once, going twice?

11 All right. I think we've had all the commenters
12 this evening. We do appreciate all of your coming here and
13 the respect that you have shown each other. This is a very
14 controversial issue in this community and in the state of
15 Washington with respect to the siting of this project as
16 many other projects are. We will carefully consider all of
17 the comments we have heard orally. We will read and
18 carefully consider all of the comments in writing. We are
19 cognizant of the fact that some of you have asked for
20 additional time.

21 I want to take this opportunity to thank staff,
22 the Energy Facility Site Evaluation staff for setting up not
23 only this meeting but the meeting last evening. I think it
24 went very well. So kudos to the staff for really a first
25 rate job, and I look forward to reading the comments that

1 you're providing and hearing you at additional meetings that
2 the Council may hold on this matter.

3 Thank you to Bonneville so much, Mr. Montana and
4 Bonneville staff, and the meeting is concluded for this
5 evening. Thank you.

6 * * * * *

9043.1

IN REPLY REFER TO:

ER09/423, 10/492

March 17, 2011

Andrew M. Montaña
Environment Project Manager
Bonneville Power Administration—KEC-4
P.O. Box 3621
Portland, Oregon 97208

Dear Mr. Montaña:

On July 19, 2010, the Department of the Interior (Department) provided comments on the Whistling Ridge Wind Energy Project (Project). Prior to that submission, the National Park Service (NPS) - one of the Department's component bureaus - had provided comments on the Project on May 18, 2009. The purpose of this letter is to clarify these earlier comment letters.

The comments contained in the May 19, 2009, and July 19, 2010, letters were made pursuant to the National Environmental Policy Act, 42 U.S.C. §§ 4321-4370f. Under 40 C.F.R. Part 1503, Federal agencies with special expertise are required to comment on the proposed actions of other Federal agencies. Because the NPS-administered Lewis and Clark National Historic Trail (Trail) passes through a corridor near the Project, we provided comments concerning potential environmental and scenic impacts to the Trail. The specific comments regarding turbine string A1-A7 were offered as a recommended way to mitigate visual impacts to the Trail. In making these comments, it was not the intent of the NPS or the Department to impose a permitting condition on the Project. The Department notes that the permittee has planned an overall reduction to the number of turbines that will be installed, as well as a reduction along the ridgeline within the southern end of the Project.

Thank you for the opportunity to provide this clarification. The Department continues to support the environmentally-responsible development of renewable energy sources on public and private land and does not oppose the Project. Moving forward, we look forward to working with the applicant and the Bonneville Power Administration on this Project. If you have questions regarding this letter, please contact me at (503) 326-2489.

Sincerely,

Allison O'Brien
Acting Regional Environmental Officer
