This report describes research sponsored by EPRI.

This document was compiled from knowledge gained through collaborative research performed by EPRI between 2009 and 2019, that focused on developing and testing communication protocols to facilitate open access to behind-the-meter devices. The knowledge gained through research was made possible through contributions from technical leaders across many different utilities, national laboratories, member organizations, standard development organizations, manufacturers and service providers including, but not limited to the following:

| | |
|-------------------------------------|---|
| Utilities | Bonneville Power Administration (BPA) Duke Energy Electric Power Board (EPB) Hawaiian Electric Company Hydro One Jackson EMC McMinnville Electric System (MES) Oglethorpe Power Portland General Electric (PGE) Southern Company Tennessee Valley Authority (TVA) |
| National Labs | Oak Ridge National Laboratory (ORNL) Pacific Northwest National Laboratory (PNNL) National Renewable Energy Laboratory (NREL) Lawrence Berkeley National Laboratory (Berkeley Lab) |
| Member Organizations | OpenADR Alliance Northwest Energy Efficiency Alliance (NEEA) Consortium of Energy Efficiency (CEE) |
| Standards Development Organizations | Consumer Technology Association (CTA) Air-Conditioning, Heating, and Refrigeration Institute (AHRI) |
| Manufacturers | AO Smith Siemens Pentair Emerson IslandAire |
| Service Providers | Nebland LLC SkyCentrics e-Radio |

This publication is a corporate document that should be cited in the literature in the following manner:

Communication Protocol Mapping Guide 1.0, OpenADR 2.0 to ANSI/CTA-2045-A: Requirements for Exchanging Information Between OpenADR 2.0 Clients and ANSI/CTA-2045 Technologies. EPRI, Palo Alto, CA: 2019. 3002008854.

ABSTRACT

The intent of this publication is to provide the industry with a standardized approach to exchanging information between two different open communication standards, OpenADR 2.0 and ANSI/CTA-2045-A. The document defines how a specific set of messages from one standard are mapped to the other (i.e. protocol map). The map included herein was implemented and field tested with behind-the-meter (BTM) loads in systems designed to provide services to the grid. The systems were comprised of the following actors (1) an OpenADR 2.0 certified demand response management system, (2) an ANSI/CTA-2045 communication module with an embedded certified OpenADR 2.0 client and (3) different types of BTM loads that were preconfigured to respond to information exchanged through a native ANSI/CTA-2045-A port. The responses of each BTM load was made predictable by requiring manufacturers to support a specific set of ANSI/CTA-2045-A messages. The set of ANSI/CTA-2045-A messages that BTM loads were required to support (included in Section 4.0 of this report) was used to determine the core set of messages include in the map, The mapping requirements and other information included in this document are intended to enable (1) manufacturers to embed “grid service” functionality into off-the shelf products, (2) consumers to directly access or manage access (i.e. utility, aggregator or third-party service provider) to information or functions embedded into their own devices to manage energy or demand BTM or provide services to the grid across the meter and (3) utilities, aggregators or any third-party to design and deploy systems with components that could be interchanged with those produced by manufacturers other than the original.

GLOSSARY OF TERMS

Actor – Representative name assigned to each of the subcomponents of a system that contribute to the output of a system. Example actors are humans, machines, or applications.

Application – Software program designed to provide a specific service.

Behind-the-meter (BTM) – Term used to describe resources physically located within the customer’s premises.

Compliance – Conformance to a specific set of rules or requirements. This term is typically used in reference to standards and is used to signify that a technology or service meets the rules or requirements defined in a specific standard.

CTA – Consumer Technology Association

CTA-2045 Communication Module or Universal Communication Module (UCM) – A communication module that complies with the ANSI/CTA-2045-A standard under the form factor classification of either AC or DC.

Demand Response Management Application (DRMA) – An application designed to manage the aggregate services provided by resources.

Demand Response Management System (DRMS) – A DRMA and components required to support aggregate demand response services.

DRMS Operator – Human that interfaces with the DRMS through a graphical user interface that enables the DRMS and Human to exchange information.

Functional Requirement – A requirement defines the contribution of an actor within a system or the system itself. Functional requirements define specific functions or behaviors of actors within a system or the system.

Grid Service – Functions or behaviors of a device that could provide a benefit to the public.

GUI (Graphical User Interface), HMI (Human-Machine Interface), or H2M (Human-to-Machine) – These acronyms are used to represent an interface that enables humans and machines to share information.

Interface – Communications interfaces represent a pathway by which information is exchanged between actors. The interface is a pathway that conforms to a specific set of rules that must be supported by all actors that are required to exchange information.

Interoperability – The capability of two or more actors or systems to be connected to one another and exchange and process information in a predictable way without having to make any modifications to the involved actors.

M2M (Machine-to-Machine) Interface – Pathway over which information is shared between two machines.

Machine – Device that consumes, generates, or stores energy.

Non-Functional Requirement – A requirement that defines the qualities of a system, such as security, maintainability, and scalability, that can be used to judge how well the system operates and evolves.

OpenADR 2.0 – Open Automated Demand Response, published by the OpenADR Alliance, is a communication specification that defines the rules for sharing information between a server and one or more clients on a shared network. The specification includes application-layer messages that exchange information to support energy and other services. The standard also requires that messages be secured in accordance with TLS 1.2 and transported using HTTP or XMPP.

Profile – A set of constraints or rules for applying a standard.

REQ – Requirement

Resource – Smart-Grid Device (SGD)

Requirement – (1) A condition or capability needed to achieve an objective. (2) A condition or capability that must be met or possessed by an actor or system.

Smart-Grid Device (SGD) – Used in the ANSI/CTA-2045-A standard to describe the end-use device.

Standard – A technical specification, usually produced by a Standards Development Organization (SDO). Standards define sets of rules that can be tested across products or services provided by any manufacturer.

Subsystem – one or more actors within a system that work together to perform a specific task. Typically, actors within a subsystem communicate to one another through proprietary interfaces supplied by one manufacturer.

System (Control) – A collection of components (actors) whose collective output (dependent variable) can be predicted by managing the inputs (independent variables).

System (Operational Procedures) – A set of procedures that describes how to operate the system.

Universal Communication Module (UCM) – Name used in the ANSI/CTA-2045-A standard to describe the module that plugs into a ANSI/CTA-2045-A port of an end-use device.

Use-case – A document that includes the rules, requirements, actors, and operational and technical objectives of a system.

INTRODUCTION

This document defines the requirements for exchanging information between the application layers of OpenADR 2.0¹ and ANSI/CTA-2045-A². The requirements included herein (i.e. protocol map) were implemented and field tested in a system comprised of the following actors (1) demand response management system that supports OpenADR 2.0, (2) an ANSI/CTA-2045-A communication module that supports OpenADR 2.0 and (3) end-use devices that support ANSI/CTA-2045-A that conform to publicly available device type specific functional requirements (overview included in [Section 4.0](#) of this report). The research was carried out to demonstrate how loads with built-in demand responsive features, accessible through an open interface could respond directly to dispatch signals, eliminating the need for an intermediary cloud application to consume the dispatch signal and disseminating instructions to loads through a proprietary messaging protocol. The key actor in this system was the ANSI/CTA-2045-A communication module, that was tasked with exchanging information with an OpenADR 2.0 server, converting dispatch instructions into a process by which information is exchanged with the load in a sequential order to provide the instructed service to the grid.

1.1 Approach

OpenADR 2.0 and ANSI/CTA-2045-A were developed to facilitate the open exchange of information between actors participating in a load management system. Even though both protocols were designed to support actors in load management systems, they were designed to exchange information with specific actors. Since both protocols support load management systems, the information supported by the application-layers of both protocols are similar, but they are very different. OpenADR 2.0 for example, was designed to exchange secured information with one or more actors in the system over a shared network (i.e. internet), whereas ANSI/CTA-2045-A was designed to exchange information between two actors, the end-use device (i.e. BTM resource) and a communication module over a private serial communication port. OpenADR 2.0 and ANSI/CTA-2045-A were designed to coexist with one another within the same system. Since load management services are provided by resources at their point of connect to the grid, the systems are dependent on the load management functions supported by resources and the accessibility of their functions. The map between ANSI/CTA-2045-A and load management functions for different types of resources were used to determine the information set to include in this guideline. Specifications for mapping ANSI/CTA-2045-A to functions of different types of resources are included in Table 1-1. The set of ANSI/CTA-2045-A messages common across the specifications listed in Table 1-1 were used to determine the minimum set of OpenADR 2.0 messages to include in the map. Tables that summarize the functional specifications listed in Table 1-1 are included in [Section 4.0](#).

¹ OpenADR Alliance, [OpenADR 2.0 Profile Specification B v1.1](#), 11-17-2015.

² Consumer Technology Association, [ANSI/CTA-2045-A Modular Communications Interface for Energy Management, March 2018](#).

**Table 1-1
Functional Specifications for ANSI/CTA-2045-A Resources**

| Resource Types | EPRI Publication ID for Functional Requirements | Summary Tables (Map between ANSI/CTA-2045-A Messages and Functions) |
|------------------------------------|---|---|
| Domestic Electric Water Heater | 3002002710 | Table 4-1 |
| Heat Pump Water Heater | 3002002719 | Table 4-2 |
| Thermostat | 3002002711 | Table 4-3 |
| Variable Speed Pool Pump | 3002008320 | Table 4-4 |
| Electric Vehicle Supply Equipment | 3002002712 | Table 4-5 |
| Packaged Terminal Air Conditioners | 3002006951 | Table 4-6 |
| Variable Capacity HVAC | AHRI P1380 | Table 4-7 |

To ensure that the requirements defined herein could be applied in contemporary and near-future systems, a general assessment of the technologies available today was performed. Summary findings are included below.

- **OpenADR 2.0 Virtual Top Nodes**, Applications and services are available through different service providers³. Open source OpenADR 2.0 server application (certified by the OpenADR Alliance) is available on GitHub (see [Section 5.2](#)).
- **OpenADR 2.0 Virtual End Nodes**, Applications and libraries that support different operating systems are available through a number of different service providers. Open source applications for a variety of OpenADR 2.0 clients are available on GitHub (see [Section 5.2](#)).
- **ANSI/CTA-2045 Communication Modules**, Hardware with one or more types of physical communication interfaces capable of transporting OpenADR 2.0 payloads are produced by different manufacturers.
- **ANSI/CTA-2045 Resources (Power Consuming Devices)**, Multiple types of resources are available from different manufacturers. [Section 4.0](#) include the recommended (and applied) functional specifications requirements for most of the device types available today.

1.2 Intended Use

This document is intended to enable (1) manufacturers to embed “grid service” functionality into off-the shelf products, (2) consumers to directly access or provide others access (i.e. utility, aggregator or third-party service provider) to the embedded functionality and (3) utilities, aggregators or any third-party to design and deploy systems with interchangeable components that rely on BTM resources to provide predictable services to the grid. The map is intended to be used in the design, development and deployment of systems that manage BTM resources. Before example applications of the requirements are introduced, it’s important to be familiar with system architectures and how these systems are represented in this document. The graphic

³ The OpenADR Alliance publishes a [list of OpenADR 2.0 certified applications and technologies](#).

in Figure 1-1 is used to represent a simplified BTM system. The components of this system include (actors), the flow of information between actors (interface), decisions and actions (logic) that each actor must support to achieve the system’s objective (output or grid service). For further reference, the symbols used in this diagram and subsequent figures are defined in [Section 5.3](#).

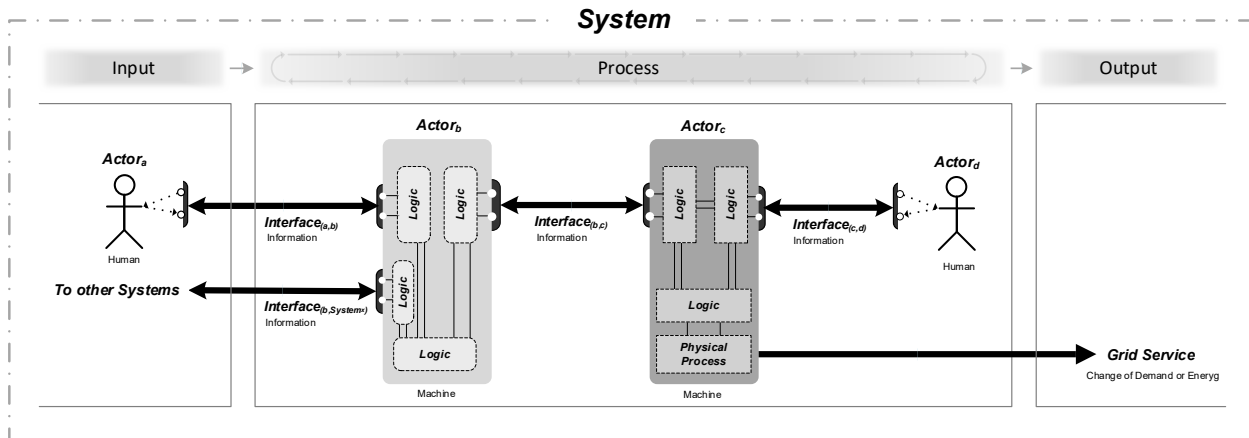

Figure 1-1
Reference BTM System Diagram

The following diagrams are intended to illustrate how the map could be deployed within systems designed to support the same use-case, but architected with different components. To help provide some insight into how the systems are intended to work, some general rules and requirements of the use-case are listed below.

- A Resource is any off-the-shelf energy consuming device that support a variety of different types and levels of grid services that can be accessed at the device through an ANSI/CTA-2045-A interface.
- Dispatch signals conform with the OpenADR 2.0 standard.
- Resources can be dispatched either manually by an operator or automatically by a secondary system.
- Information from the resources, such as Power, Energy Usage, Operational State and other information is available to the operator or to a secondary system.
- Dispatch signals can be sent to a single resource or groups of resources as determined by the operator or secondary system.
- The OpenADR 2.0 client resides within the premise.

In the system illustrated in Figure 1-2, an OpenADR 2.0 client embedded into an ANSI/CTA-2045-A communication module receives dispatch signals. The module uses the information contained in the dispatch signal to determine the sequence of information that must be exchanged with the resource to satisfy the dispatch.

Figure 1-2
Example 1 – Architecture of a Load Management System

In the system illustrated in Figure 1-3, an OpenADR 2.0 client embedded into a Home Energy Management System (HEMS) receives dispatch signals. The HEMS uses the information contained in the dispatch signal to determine which resource to target and sequence of information that must be exchanged with the resource to satisfy the dispatch.

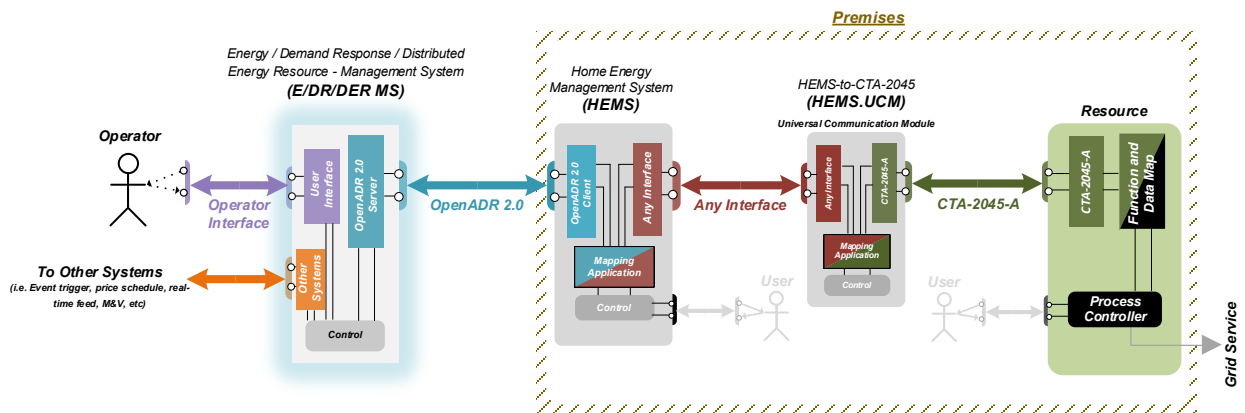

Figure 1-3
Example 2 – Architecture of a Load Management System

Table 1-2 shows how the contents of this document could be used by the components (actors) of both example systems. Included in this table are the names of the actors, their role in the system and how the contents of different sections of this document could be applied to support the system.

**Table 1-2
Example Application of the Requirements (Filtered by Actor)**

| Actor | Description / Role | Dependent Actor(s) | Referenced Section | Example Use of the Requirements in Reference Section |
|---|--|--|---------------------------|---|
| Energy / Demand Response / Distributed Energy Resource - Management System (<i>E/DR/DER MS</i>) | Application designed to manage resources located before or behind the meter to provide aggregation and other control services as determined by the requirements of the system the application is intended to support | <i>OpenADR.UCM</i> <i>HEMS</i> <i>Operator</i> (not specified) <i>Other Systems</i> (not specified) | 2.2 | To specify the minimum set of OpenADR 2.0 event signals required to dispatch ANSI/CTA-2045-A resources. To specify, design and/or develop user interfaces configured to support each event signal identified in the minimum set. |
| | | | 2.3 | To determine the information that could be reported. To specify the information must be made available to support control or measurement and verification requirements of the program |
| | | | 3.0 | To setup groups and subgroups to enable dispatch signals to be sent to a single resource or multiple resources within a group. |
| | | | 4.0 | To determine what functions embedded in different types of resources could be leveraged to provide the most value to consumers and the grid. |
| Home Energy Management System (<i>HEMS</i>) Controller | Application running on a controller within a premises that's designed to manage energy usage or demand of one or more behind the meter resources. Interfaces: OpenADR 2.0 VEN Undefined | <i>E/DR/DER MS</i> <i>HEMS.UCM</i> <i>User or Consumer</i> (not specified) | 2.0 | If programmatic rules require pending and active event notifications at the device, this section could be used to specify how to use issue notifications To specify the Link Layer messages and how to use the payload of the Outside Communication Status command |
| | | | 2.2 | To specify how OpenADR 2.0 dispatch signals must be processed by the controller |
| | | | 2.3 | To specify the information and frequency by which data from the device must be queried and presented to an OpenADR 2.0 VTN through the EiReport service |
| | | | 3.0 | To specify the naming conventions for the resources behind the VEN (ResourceID) To specify the use and format of GroupIDs for filtering and processing events To specify how EiEvents with one or more group IDs match those assigned to the HEMS's VEN |
| | | | 4.0 | To determine and specify the type and level of services that different resources could provide to the grid and how the ANSI/CTA-2045-A interface is used to access the services. |
| <i>HEMS-to-CTA-2045 (HEMS.UCM)</i> Communication Module | A device that meets the minimum requirements for a communication module as defined in ANSI/CTA-2045-A standard that also includes software and hardware required to connect to and communicate with the HEMS | <i>RESOURCE</i> <i>HEMS</i> <i>User or Consumer</i> (not specified) | 2.0 | To specify the minimum set of ANSI/CTA-2045-A commands to communicate with the resource To specify commands required to support the HEMS or the system in which the HEMS is supporting. |
| | | | 2.2 | To specify how OpenADR 2.0 dispatch signals must be converted to ANSI/CTA-2045-A commands and the sequence by which the commands must be sent to the resource. |

| Actor | Description / Role | Dependent Actor(s) | Referenced Section | Example Use of the Requirements in Reference Section |
|---|--|---|--------------------|---|
| | | | 2.3 | To specify the commands that must be sent to the resource to obtain information required to support the HEMS or the system in which the HEMS is supporting. |
| | | | 3.0 | To specify the naming convention for the attached resource (ResourceID). |
| | | | 4.0 | To determine and specify the type and level of services that different resources could provide to the grid and how the ANSI/CTA-2045-A interface is used to access the services |
| OpenADR-to-CTA-2045 (OpenADR.UCM) Communication Module | A device that meets the minimum requirements for a communication module as defined in ANSI/CTA-2045-A standard. The module also includes a certified OpenADR 2.0b VEN and the hardware required to connect to and communicate with an OpenADR 2.0b VTN located outside the premises. | E/DR/DER MS RESOURCE User or Consumer (not specified) | 2.0 | To specify the minimum set of commands required to communicate with a ANSI/CTA-2045-A resource To specify commands required to support the system in which the module is intended to support. |
| | | | 2.2 | To specify how OpenADR 2.0 dispatch signals must be converted to ANSI/CTA-2045-A commands and the sequence by which the commands must be sent to the resource. |
| | | | 2.3 | To specify the commands that must be sent to the resource to obtain information required to support the HEMS or the system in which the HEMS is supporting. |
| | | | 3.0 | To specify the naming conventions for the resources behind the VEN To specify the use and format of GroupIDs for filtering and processing events To specify how EiEvents with one or more group IDs match those assigned to the VEN |
| | | | 4.0 | To determine and specify the type and level of services that different resources could provide to the grid and how the ANSI/CTA-2045-A interface is used to access the services |
| RESOURCE | Energy consuming resource with embedded grid services that can be accessed through a ANSI/CTA-2045-A interface | HEMS.UCM OpenADR.UCM | 4.0 | To specify the type and level of services that must be embedded into the resources and how they must be accessed through an ANSI/CTA-2045-A port. |

2

MAPPING REQUIREMENTS

The requirements in this section define the rules by which information contained in the application-layer of one communication protocol is shared with the application-layer of another. The set of messages (i.e. information) contained in OpenADR 2.0 and ANSI/CTA-2045-A are similar, however the rules that govern how messages are exchanged between specific actors are quite different. OpenADR 2.0 is designed to exchange information over a network, shared by other devices. In the majority of contemporary systems where OpenADR 2.0 is deployed, the shared network is the public internet⁴. ANSI/CTA-2045-A is designed to exchange information between two devices (one being the BTM load and the other, a device physically attached to the load) over a private serial communication bus. Figure 2-1 is included to show where in a system these standards were intended to be deployed. In this system, *Actor_a* conforms to the rules of a OpenADR 2.0 server (i.e. Virtual Top Node) exchanges information with multiple clients over a shared network. *Actor_b* conforms to the rules for both an OpenADR 2.0 client (i.e. Virtual End Node) and ANSI/CTA-2045-A communication module. The module exchanges information with *Actor_c* which conforms to the functional specifications for ANSI/CTA-2045 resources (see [Section 4.0](#)).

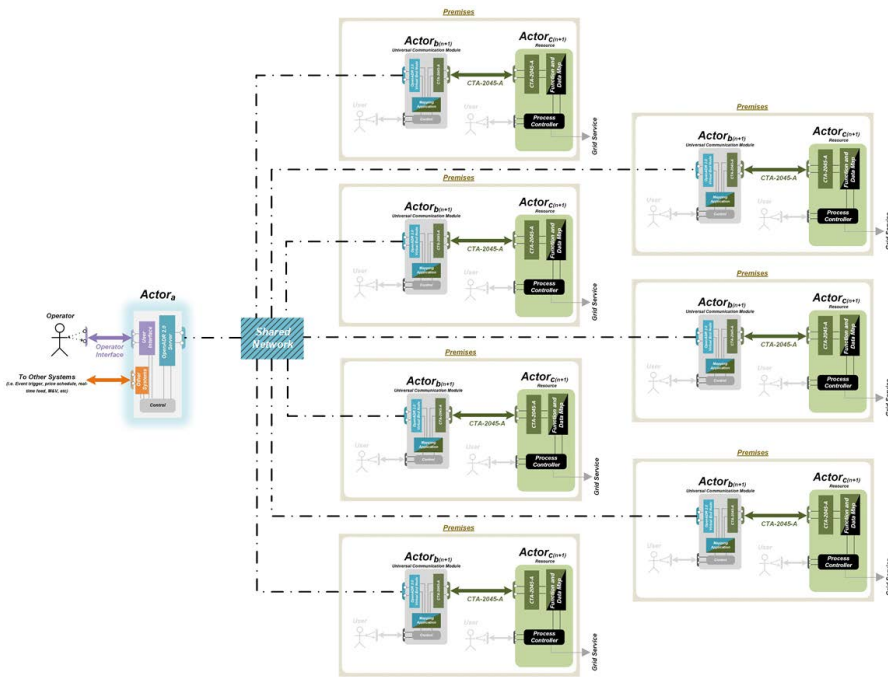

Figure 2-1
Example application of OpenADR 2.0 and ANSI/CTA-2045-A

⁴ To deter security threats inherent to public networks, OpenADR 2.0 requires that the payloads be encrypted using transport-layer security (TLS 1.2).

Each standard defines the roles for each actor along with information each must support and the process for exchanging information between the actors. Each of these two standard define processes that are very different from one another that govern what and when information is exchanged. This process must be considered when applying the mapping requirements and when developing the requirements for the hardware and software to implement the map. For example, the information exchanged between OpenADR 2.0 actors are primarily triggered by events, even though there are some exchanges are scheduled, whereas ANSI/CTA-2045-A actors sequentially exchange information in real-time. The block diagram in Figure 2-2 is included to show the functional blocks of a conceptual mapping application (see *Actor_b*) and that the sequence and time by which information is exchanged between *Actor_b* and *Actor_a* will not align with the sequence and time by which information is exchanged between *Actor_b* and *Actor_c*.

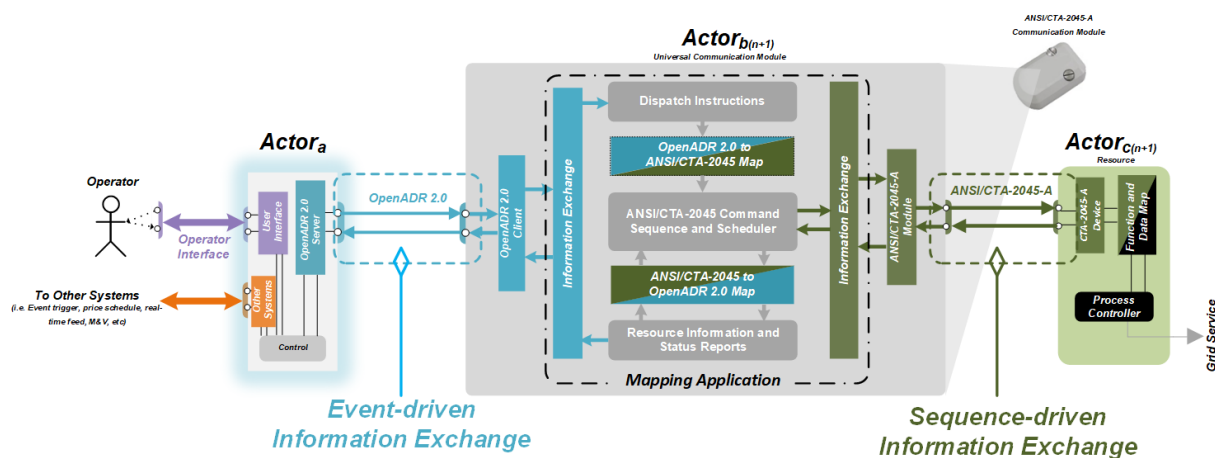

Figure 2-2
Conceptual mapping application and its functional blocks

2.1 Housekeeping Functions (Normative)

This section is titled “Housekeeping” because there are a few ANSI/CTA-2045-A commands that the standard requires all actors to support or are common across the functional specifications for all device types included in [Section 4.0](#). These messages include the link-layer ACK/NAK, query capabilities (Message Types of Supported Query/Response, Max Payload Length, verify that the data contains the appropriate information (Basic Application ACK/NAK) and to inform the resource of its communication status (Outside Communication Status).

This section also includes messages that could be required to support a specific grid services use-case and other information obtained through the information exchange processes themselves. These additional commands include (Operational State Query/Response) used to query the resource for its operational state, (Pending Event Time) and (Pending Event Type) which could be used if the system requires the resource to be informed of the next event type and time (duration) till the next event. Requirements for how these commands must be applied are included in Table 2-1.

**Table 2-1
Housekeeping Requirements**

| REQ. H10 | Basic | Pending Event Time | 0x18 | Time Until Event | <p>Used to inform the resource (and possibly the user) that a Grid Service event will occur in the near future.</p> <p>Time Until Event See Section 8.1.2 for format</p> | For all events that are within 4-hours from their start time, the UCM shall inform the resource of the remaining time at intervals of 15-min. | | | | | | | | | |
| REQ. H11 | Basic | Pending Event Type | 0x19 | Opcode 1 of the Pending Event | <p>Applies to Basic commands</p> <p>Opcode2 set to 0x02 (End Shed/Run Normal) informs the resource that the pending event has been canceled,</p> | For all events that are within 4-hours from their start time, the UCM shall inform the resource of the Basic command that's mapped to the upcoming EiEvent signals. | | | | | | | | | |

2.2 Load Management Functions (Normative)

The purpose of this section is to define the relationship between the application-layer messages of OpenADR 2.0 and ANSI/CTA-2045-A and how to exchange information between the two protocols. The messages included in this section are those targeted at influencing the behavior of different types of ANSI/CTA-2045-A loads (see [Section 4.0](#)).

**Table 2-2
Load Management Mapping Requirements**

| REQ.LM# | OpenADR 2.0 EiEvent Signal | | | | | ANSI/CTA-2045-A Message | | | | Use |
|----------|----------------------------|-----------------|-----------|----------|----------|-------------------------|-------------------------|----------|---|--|
| | Signal Name | Signal Type | Value | Units | Duration | Message Type | Name | Opcode 1 | Opcode 2 | |
| REQ.LM1 | Simple | Level | 0 | None | Any | Basic | End Shed/Run Normal | 0x02 | Event Duration | At start of the event, the same Duration provided in the EiEvent must be sent to the SGD. If the UCM sends subsequent curtailment requests to the resource during the active period of the OpenADR 2.0 event, the Duration sent to the resource must be the actual time remaining in the event and not the original Duration included in the original OpenADR 2.0 signal. |
| REQ.LM2 | Simple | Level | 1 | None | Any | Basic | Shed | 0x01 | Event Duration | |
| REQ.LM3 | Simple | Level | 2 | None | Any | Basic | Critical Peak Event | 0x0A | Event Duration | |
| REQ.LM4 | Simple | Level | 3 | None | Any | Basic | Grid Emergency | 0xB | Event Duration | |
| REQ.LM5 | Custom | x-CTA-2045 | 0 | None | Any | Basic | End Shed/Run Normal | 0x02 | Not Used | The custom signals are similar to that of the SIMPLE LEVEL, except there are (5) five choices (0-4) instead of (4) four. For this custom signal, the "load up" request is assigned to the value of 4.. |
| REQ.LM6 | Custom | x-CTA-2045 | 1 | None | Any | Basic | Shed | 0x01 | Event Duration | |

2.3 Monitoring and Reporting Functions (Normative)

This section includes requirements for transferring operational state type information from the device and making it available to an OpenADR 2.0B server through an OpenADR 2.0b client. OpenADR 2.0B. The information included in this section align with the commands defined in the “monitoring/feedback” sections of each of the functional specification documents, see [Section 4.0](#). Table 2-3 includes the ANSI/CTA-2045-A command and information that could be obtained from the BTM load and how to package the information into a report for the OpenADR 2.0B client to make available to an OpenADR 2.0 server.

3

GROUPING / TARGETING BEHIND-THE-METER RESOURCES

The purpose of this section is to establish a common method for targeting groups or individual BTM resources that reside behind a common client. In OpenADR 2.0, dispatch signal information (i.e. dispatch instructions) are communicated through the EiEvent service. A component of the dispatch signal are messages that are intended to be used to target individual or groups of resources. An excerpt from Section 8.2.1 of the OpenADR 2.0B 2015 OpenADR Alliance specification, included below, provides some insight into how these messages are intended to be used.

Section 8.2.1 Event Targets and Resources (OpenADR 2.0, 2015)

While the A Profile supported event targets (EiTarget), the B Profile includes several more target types, and also allows device class targeting to be applied at the signal level.

A VEN is a communication endpoint that represents one or more logical resources (individual shedable loads, endpoint equipment, meters, etc.).

Event targets select which specific VEN resources the event applies to. If an event target is not specified, the VEN should assume that it applies to all of its resources.

How resources are assigned properties (location, pnode associations, resourceIDs, groupIDs, etc.) is outside the scope of the specification and is up to deployment configurations in the VTN and VEN. However, if a VEN receives an event target that it is not configured for, it should reject the message with the appropriate error code described in section 8.7. [emphasis added]

This excerpt was included to highlight the last two sentences, which state that the application of these targets is beyond the scope of the OpenADR 2.0b specification. To provide some guidance on the use of Targets in different DR programs, the OpenADR Alliance published the [OpenADR 2.0 Demand Response Program Implementation Guide, Revision 1.1, Document Number 20140701](#). The purpose of this document is to provide guidance to those implementing DR programs that utilize OpenADR 2.0 to dispatch resources. With regards to event targeting, the above referenced guide includes informative examples of how different DR programs use event targeting. Included in Table 3-1 is a summary of how targets could be used to support the requirements of different programs. It's important to note that the guide does not specify how resources must be targeted within a specific program. Instead, it only provides guidance on how they could be targeted.

Table 3-1

Uses of Targeting in the [OpenADR 2.0 Demand Response Program Implementation Guide, Revision 1.1, Document Number 20140701](#). (Informative)

| Program Type | Target Loads | Event Targets |
|--|---|---|
| Critical Peak Pricing Program (CPP) | Any | venID or resourceIDs (Typical) |
| Capacity Bidding | Any | venID or resourceID representative of the aggregated load associated with a VEN |
| Thermostat | HVAC | resourceIDs or venID with event signal device class target set to Thermostat |
| Fast DR Dispatch | Those which can respond to real-time dispatches | venID or a resourceID representative of the aggregated load associated with a VEN |
| Residential EV TOU Programs | EV Chargers | No advanced targeting required but targeting can be used to send prices to specific transformers, feeders, or geographic areas. |
| Public Station Electric Vehicle (EV) Real-Time Pricing Program | Public EV Chargers | No advanced targeting required but targeting can be used to send prices to specific transformers, feeders, or geographic areas. |
| Distributed Energy Resources (DER) | Any | venID. No other advanced targeting required |
| The Universal Smart Energy Framework (USEF) Incentive-based | HVAC, Industrial loads | venID or resourceIDs (Typical) |
| The Universal Smart Energy Framework (USEF) Transaction based Program | Any | venID or a resourceID representative of the aggregated load associated with a VEN |
| The Universal Smart Energy Framework (USEF) Override based Program | Those which can respond to real-time dispatches | venID or a resourceID representative of the aggregated load associated with a VEN |

3.1 Targeting Requirements (Normative)

The purpose of this section is to define a standardized set of rules for targeting BTM resources in systems with architectures similar to those shown in Figure 1-2 and Figure 1-3. The reason for defining these rules is to improve the interchangeability between the components of one system and the components of another system. The groups listed in Table 3-2 are some of the mechanisms that the OpenADR 2.0 supports to facilitate the targeted distribution of dispatches.

Table 3-2
Five grouping levels supported by and defined in OpenADR 2.0a and 2.0b

| Group | XML Element | Definition | Intended use |
|---------------|-----------------------|---|---|
| MarketContext | eventDescriptorType | Identifies a particular program or application defined grouping that pertains to an event. | Used to send an event to a group of VENs with the same MarketContext. |
| ei:venID | eiTarget:eiTargetType | A VEN is a communication endpoint that represents one or more logical resources (individual shedable loads, endpoint equipment, meters, etc.). venID must be a unique number. | Used to send an event to a specific VEN |
| ei:partyID | eiTarget:eiTargetType | No definition | Undefined |
| ei:groupID | eiTarget:eiTargetType | No definition | Undefined |
| ei:resourceID | eiTarget:eiTargetType | Unique ID assigned to a single logical resource- (individual shedable loads, endpoint equipment, meters, etc.). | Used to send an event to an individual DER |

OpenADR 2.0 defines rules for how clients accept or reject dispatches based on MarketContext and eiTarget. Besides the venID and resourceID, the protocol does not include rules or provide guidance on what the other eiTargets (such as partyID and groupID) should be used to represent. If eiTargets (besides venID and resourceID) are used in deployments without rules or guidelines that govern their use, each deployment could be unique. This means that a client that interoperates within one deployment is not likely to interoperate in other deployments, even if that client has been certified. To reduce variability between deployments, rules that define the use of partyID and groupID, along with logic for how VENs use targets to determine if events should be accepted (i.e. logic), are included in Table 3-3.

**Table 3-3
Target Level Filtering**

| REQ.T# | Target Level | Group | Use | Target Filtering Logic (VEN Application) ⁵ |
|--------|--------------|---------------|--|--|
| REQ.T1 | 1 | MarketContext | Unique name of a DER program | If eventDescriptorType:MarketContext and the MarketContext of the VEN match, then process event |
| REQ.T2 | 2 | ei:venID | Unique ID assigned to a VEN | If eventDescriptorType:MarketContext and the MarketContext of the VEN match, AND If eiTarget:ei:venID and ei:venID of the VEN match, then process event |
| REQ.T3 | 3 | ei:partyID | Electric network location (Substation / Transformer) | If eventDescriptorType:MarketContext and the MarketContext of the VEN match, AND If eiTarget:ei:venID and ei:venID of the VEN match, AND If eiTarget:ei:PartyID and the eiTarget:ei:PartyID of the VEN match, then process event |
| REQ.T4 | 4 | ei:groupID | Device Type (see Table 3-4 for groupID definitions) | If eventDescriptorType:MarketContext and the MarketContext of the VEN match, AND If eiTarget:ei:venID and ei:venID of the VEN match, AND If eiTarget:ei:PartyID and the eiTarget:ei:PartyID of the VEN match, then process event AND If eiTarget:ei:groupID and the eiTarget:ei:groupID of the VEN match, then process event |
| REQ.T5 | 5 | ei:resourceID | Unique ID assigned to a single logical resource | If eventDescriptorType:MarketContext and the MarketContext of the VEN match, AND If eiTarget:ei:resourceID and ei:resourceID of the VEN match, then process event |

⁵ The filtering logic for level 1,2 and 5 are defined in the OpenADR 2.0 specification.

3.1.1 ResourceID Format (Normative)

The resourceID must be in the following format:

resourceID = partyID:groupID:UniqueIDassignedtoresource

A graphical representation of the targeting filter logic is illustrated in Figure 3-1. For example, to targeted resources at a specific location, the EiEvent must include the MarketContext, vanID, partyID.

Figure 3-1
Use of groups and their assigned level of filtering

The Info Request message of the ANSI/CTA-2045-A standard includes a list of Device Types that must be included in the payload in response to a GetInfo query. This message enables the ANSI/CTA-2045-A communication module application to obtain the device type directly from the end-use device. Once obtained, the OpenADR 2.0 client shall use as the groupID. This mapping between GetInfo Device Type and groupID demonstrates how OpenADR 2.0 and ANSI/CTA-2045-A complement one another. The Device Types that must be used for groupID are listed in Table 3-4.

3.1.2 GroupID Format (Normative)

The groupID must include one of the device types listed in Table 3-4.

GetInfo Response (Device Type) = eiTarget:groupID.

Table 3-4
Resource Device Types for eiTarget:groupID

| eiTarget:groupID | ANSI/CTA-2045-A Get/Set Info Request (Device Types) |

3.2 Example Targeting Application (Informative)

The architectural diagram in Figure 2-1 is provided as an example application of the targeting requirements. In this example, the Operator targets all resources classified as Device Type A and connected to Substation X. Upon the receipt of the dispatch signal, the OpenADR 2.0 client would filter the eiTarget field and determine which resources are being targeted. After the

resources have been identified, the information would be passed to the subroutine that maps the converts the information into ANSI/CTA-2045-A commands and used to manage resources to automatically provide the requested grid service.

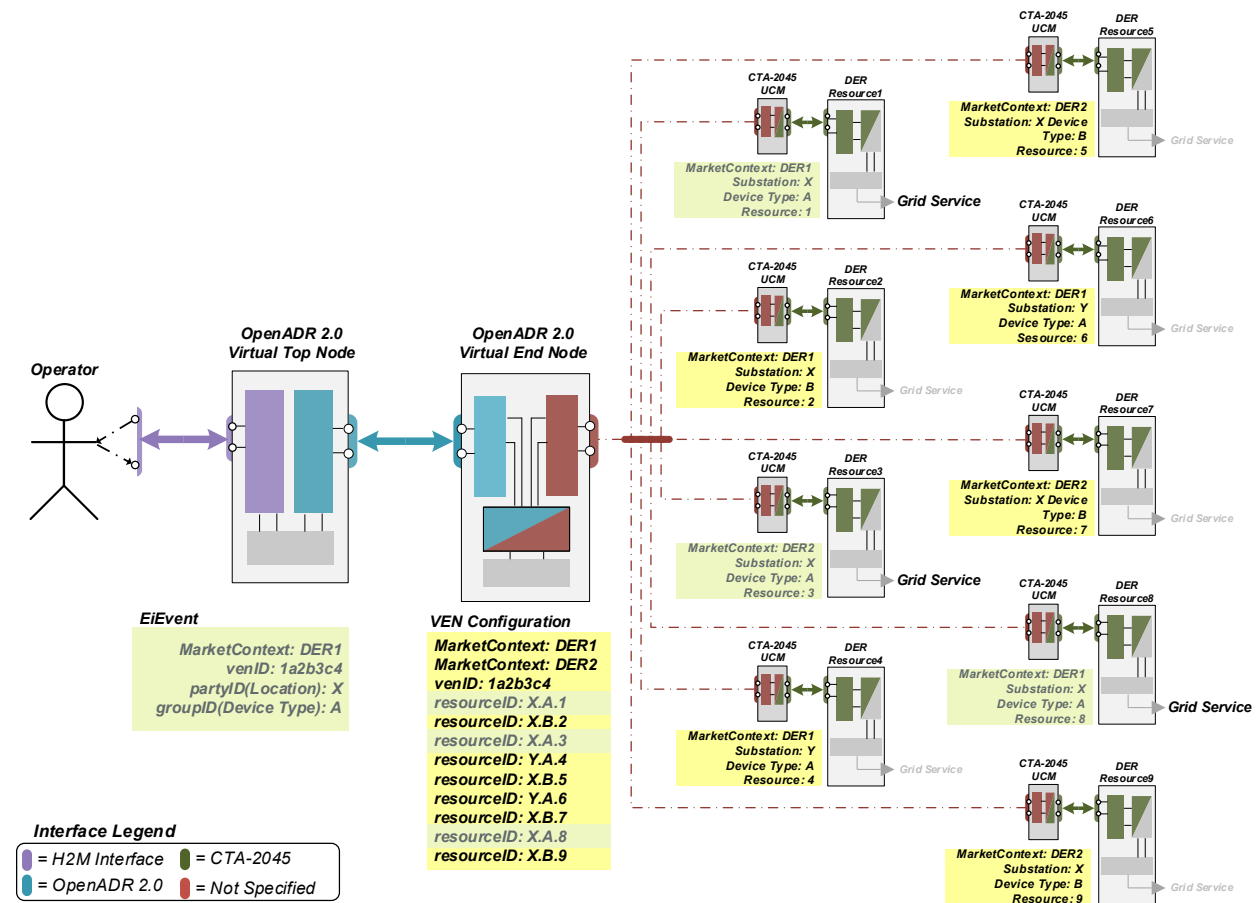

Figure 3-2
Example Use of Targeting Requirements

4

FUNCTIONAL REQUIREMENTS FOR ANSI/CTA-2045 RESOURCES (INFORMATIVE)

The tables in this section are included to show the relationship between load management functions of different types of resources and how ANSI/CTA-2045 is used to access these functions. For the full set of requirements, references are included in the captions of each table.

Domestic Water Heaters

Table 4-1

Demand Response-Ready Domestic Water Heater Specification: Preliminary Requirements for CEA-2045 Field Demonstration. EPRI, Palo Alto, CA: 2014. 3002002710

| ANSI/CTA-2045 Messages | Domestic Water Heater Functional Responses |
|---|---|
| Link Layer | Link ACK, NAK, Max Payload Length Query/Response and Message Type Supported |
| *Shed | Moderately reduce energy usage while maintaining customer comfort at a level determined by the OEM. OEM determines the level of comfort on the estimated average frequency of this request (Estimated AVG Frequency = 1/day) |
| End Shed/Run Normal | Return to normal operation |
| *Critical Peak Event | Aggressively reduce energy usage while maintaining customer comfort at a level determined by the OEM. OEM determines the level of comfort on the estimated average frequency of this request (Estimated AVG Frequency = 20/year) |
| *Grid Emergency | Immediately stop using energy and do not use energy for the duration of this event (If the duration of the event is longer than 1-hr, energy can be added to maintain a minimum customer comfort level, as determined by the OEM) |
| Outside Comm Connection Status | If a curtailment event is active and this message is not communicated, unit will return to normal operating mode |
| Customer Override | Device is required to have a local interface by which the user can override curtailment events. The Customer Override message is used to report the override state of the device. If override occurs when any curtailment event is in effect, ignore all curtailment requests for the next 4-hours. If override occurs when an event is not in effect, ignore all curtailment requests for the next 24-hours. |
| Operational state Query and Response | Operational states: Idle, Running, Idle Grid, Running Grid, Heightened Grid and Fault |
| *Load Up | Unit will go to max set point (as determined by the user) |
| Get/Set Info Request | Vendor ID, Device Type, Model #, SN and Firmware revision |
| Get/Set Temperature Offset | Not supported |
| Get/Set Set Point | Not supported |
| Get/Set Commodity Read | Instantaneous power (W), cumulative energy (W-h), Energy Storage Capacity (W-h), Present Energy Storage Level (W-h). Commodities can be estimated |
| GetPresent Temperature | Not supported |

Note (*): Referred to as “curtailment events” in ANSI/CTA-2045-A

Heat Pump Water Heater

Programmable Thermostat

Table 4-3

DR-Ready Programmable Thermostat Specification: Preliminary Requirements for CEA-2045 Field Demonstration. EPRI, Palo Alto, CA: 2014. 3002002711

| ANSI/CTA-2045 Messages | Thermostat Responses |
|------------------------------|--|
| Link Layer | Link ACK, NAK, Max Payload Length Query/Response and Message Type Supported |
| Shed | Initiate a 4-degree offset for the duration of the event. Display text notification on thermostat's user interface for the duration of the event. |
| End Shed/Run Normal | Used to clear text notification field and to return to user defined set points |
| Critical Peak Event | Initiate a 8 degree offset for the duration of the event. Display text notification on thermostat's user interface for the duration of the event. |
| Grid Emergency | Immediately stop using energy and do not use energy for the duration of this event. |
| Outside Communication Status | <p>If a curtailment event is active and this message is not communicated, thermostat will stop processing event and return to user-defined set points.</p> <p>In conjunction with an indicator, this message is used to convey the connectivity status between the communication module and its supervisory controller.</p> |
| Customer Override | <p>Device is required to have a local interface by which the user can override curtailment events. The Customer Override message is used to report the override state of the device.</p> <p>If override occurs when any curtailment event is in effect, ignore all curtailment requests for the next 4-hours.</p> <p>If override occurs when an event is not in effect, ignore all curtailment requests for the next 24-hours.</p> |
| Query operational state | Idle, Running, Idle Grid, Running Grid and Heightened Grid supported |
| Load Up | If unit is in Cool mode, set point will be decreased by 1 degree. If in Heat mode, set point will be incremented by 1 degree. |
| Info Request | Vendor ID, Device Type, Model #, SN and Firmware revision |
| Get/Set Temperature Offset | Current offset can be read and set. "Conservation Event" displayed in text box until an End Shed is received. |
| Get/Set Setpoint | Cool and Heat mode setpoints can be read and set |
| Get/Set Commodity Read | Thermostat assumes HVAC system draws 2200W. Instantaneous power and cumulative energy are estimated based on this assumption and provided to the communication module. |
| GetPresent Temperature | The current temperature of the controlled zone can be read |

Variable-Speed Pool Pump

Table 4-4
Demand Response-Ready Variable-Speed Pool Pump Specification: Preliminary Requirements for
CEA-2045 Field Demonstration. EPRI, Palo Alto, CA: 2016. 3002008320

| ANSI/CTA-2045 Messages | Pool Pump Responses |
|------------------------------|--|
| Link Layer | Link ACK, NAK, Max Payload Length Query/Response and Message Type Supported |
| Shed | If running, pump will decrease speed to 2X the min setpoint as determined by the operator or limited by the pump. |
| End Shed/Run Normal | Return to normal operation. Normal operation is the mode that the unit would running if the curtailment event were not processed. |
| Critical Peak Event | If running, pump will decrease speed to the min setpoint as determined by the operator or limited by the pump |
| Grid Emergency | Pump will stop pumping and remain off until midnight of the day the event is received |
| Outside Communication Status | The pool pump must monitor for this “heartbeat” signal which is sent from the communication module. If the pool pump is processing a curtailment request and the heartbeat is not received within 15 minutes, the pool pump will return to normal operation. |
| Customer Override | User can override curtailment events through a user interface |
| Query operational state | Idle, Running, Idle Grid, Running Grid, Heightened Grid, Opt Out Idle, Opt Out Running supported |
| Load Up | Unit will run at max speed (default is 3000 RPM). Total daily circulation will not be exceeded in a 24hr period |
| Power Level | Command will variably set speed of pump between min and max RPM (0-100%, where max RPM = 100%) |
| Info Request | Vendor ID, Device Type, Model #, SN and Firmware revision |
| Get/Set Commodity Read | Instantaneous power and cumulative energy are supported |

Electric Vehicle Supply Equipment

Table 4-5

DR-Ready Electric Vehicle Supply Equipment Specification: Preliminary Requirements for CEA-2045 Field Demonstration. EPRI, Palo Alto, CA: 2014 [3002002712](#)

| ANSI/CTA-2045 Messages | EVSE Responses |
|------------------------------|---|
| Link Layer | Link ACK, NAK, Max Payload Length Query/Response and Message Type Supported |
| Shed | Upon receipt of this message, the maximum EV charging current will be set to 50% of max rated current, as determined by the EVSE user |
| End Shed/Run Normal | Return to normal operation. Normal operation is the mode that the unit would running if the curtailment event were not processed. |
| Critical Peak Event | The EVSE will set the maximum allowable EV charging current to the min setting as determined by J1772 standard (6A at 240V) |
| Grid Emergency | EVSE will open contactor and stop charging EV. The pilot is still active and the car will continue to request power from the EVSE. At the end of the event, the EV will return to charging |
| Outside Communication Status | The EVSE must monitor for this “heartbeat” signal which is sent from the communication module in intervals less than 5-minutes. If the EVSE is processing a curtailment request and the heartbeat is not received within 15 minutes, the EVSE will return to normal operation. |
| Customer Override | <p>Device is required to have a local interface by which the user can override curtailment events. The Customer Override message is used to report the override state of the device.</p> <p>If override occurs when either Shed or Critical Peak Event is in effect, ignore all curtailment requests for the next 4-hours.</p> <p>During a Grid Emergency event, the device will ignore the Customer Override and all curtailment requests during the first hour of this event. After the Grid Emergency has been in effect for 1-hour, the customer overrides and curtailment requests will be processed.</p> <p>If override occurs when an event is not in effect, ignore all curtailment requests for the next 24-hours.</p> |
| Query operational state | Idle, Running, Idle Grid, Running Grid, Opt Out Idle, Opt Out Running supported |
| Power Level | Command will variably set max EV charging level between min (6A) and max as set by user. 0-100%, where 100% = Max rated current. Resolution is 1% |
| Info Request | Vendor ID, Device Type, Model #, SN and Firmware revision |
| Get/Set Commodity Read | Instantaneous power and cumulative energy are supported |

Packaged Terminal Air Conditioner

Table 4-6
Demand Response-Ready Programmable Packaged Terminal Air Conditioner Specification:
Preliminary Requirements for CEA-2045 Field Demonstration EPRI, Palo Alto, CA: 2015
[3002006951](#)

| ANSI/CTA-2045 Messages | Packaged Terminal Air Conditioner Responses |
|--------------------------------|--|
| Link Layer | Link ACK, NAK, Max Payload Length Query/Response and Message Type Supported |
| Shed | 4 deg offset is applied for the event duration |
| End Shed/Run Normal | Used to clear text notification field and to return to user defined set points |
| Critical Peak Event | 8 deg offset is applied for the event duration |
| Grid Emergency | Fan and compressor are turned off for the event duration |
| Outside Comm Connection Status | The PTAC must monitor for this “heartbeat” signal which is sent from the communication module in intervals less than 5-minutes. If the PTAC is processing a curtailment request and the heartbeat is not received within 15 minutes, the PTAC will return to normal operation. |
| Customer Override | <p>Device is required to have a local interface by which the user can override curtailment events. The Customer Override message is used to report the override state of the device.</p> <p>If override occurs when any curtailment is in effect, ignore all curtailment requests for the next 4-hours.</p> <p>If override occurs when an event is not in effect, ignore all curtailment requests for the next 24-hours.</p> |
| Query operational state | Idle, Running, Idle Grid, Running Grid and Heightened Grid supported |
| Load Up | If unit is in Cool mode, set point will be decreased by 2 deg. If in Heat mode, set point will be incremented by 2 degree |
| Info Request | Vendor ID, Device Type, Model #, SN and Firmware revision |
| Get/Set Temperature Offset | Current offset can be read and set. |
| Get/Set Set Point | Cool and Heat mode set points can be read and set |
| Get/Set Commodity Read | Instantaneous power and cumulative energy. |
| GetPresent Temperature | The current temperature of the controlled zone can be read |

Variable Capacity Heat Pumps

Table 4-7

Requirements for Variable Capacity Heat Pumps (Air Conditioning, Heating and Refrigeration Institute (AHRI) Standard [P1380](#).

| ANSI/CTA-2045 Messages | Variable Capacity HVAC Responses |
|---|---|
| Shed | Limit input power to a maximum of 70% of the Benchmark Power, do not exceed if set |
| End Shed/Run Normal | Informs HVAC equipment that any curtailment or price events that may be presently in effect are terminated. |
| Critical Peak Event | Limit input power to a maximum of 40% of the Benchmark Power |
| Grid Emergency | Directs HVAC equipment to turn off, reducing input power to near zero |
| Outside Communication Status | Used as a “heartbeat” signal which is sent from the communication module in intervals less than 5-minutes. |
| Info Request | Vendor ID, Device Type, Model #, SN and Firmware revision |
| Get/Set Temperature Offset | Shall be used as the “Maximum Indoor Temperature Offset” for HVAC equipment during a load control or price event unless locally modified by the consumer. |
| Get/Set Commodity Read | N/A |
| Customer Override | User can override curtailment events by manually changing set point or by changing the mode to manual |
| Query operational state | Idle, Running, Idle Grid, Running Grid, Heightened Grid, Idle Heightened, Idle, Opted Out, Running Opted Out |
| Pending Event Warning and Pending Event | Equipment manufacturers may optionally use this information to take proactive action ahead of the event such as precooling or preheating |
| Pending Event Type | Pending event type or notice of cancellation |

5.2 Open Source Code Repositories

The applications and source code listed in Table 5-2 were developed and published to advance research and the adoption of open communication standards.

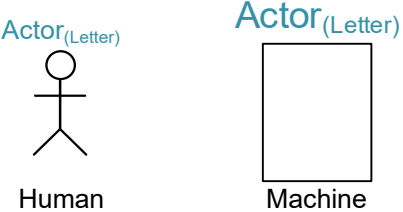

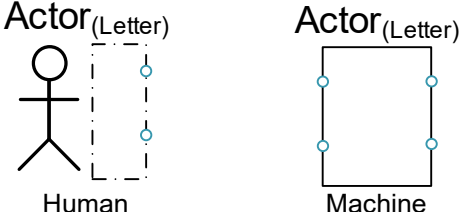

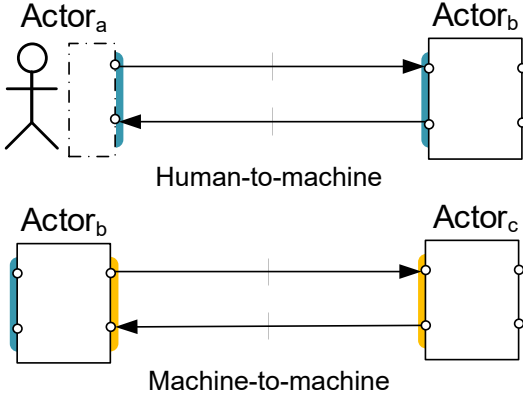

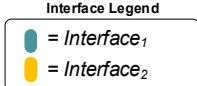

Table 5-2
Open Source Code Repositories for OpenADR 2.0 and ANSI/CTA-2045 Applications

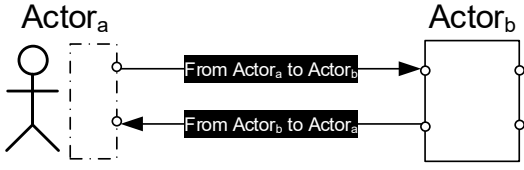

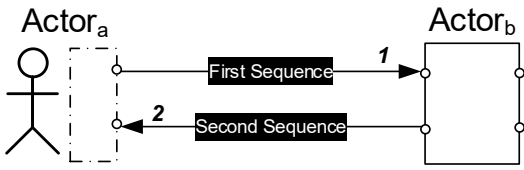

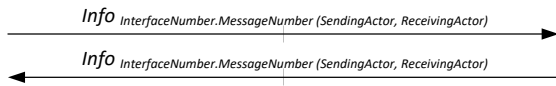

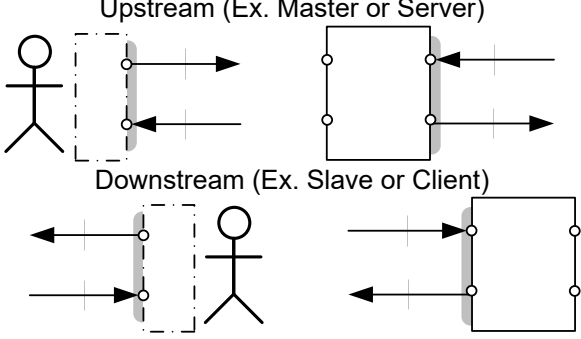

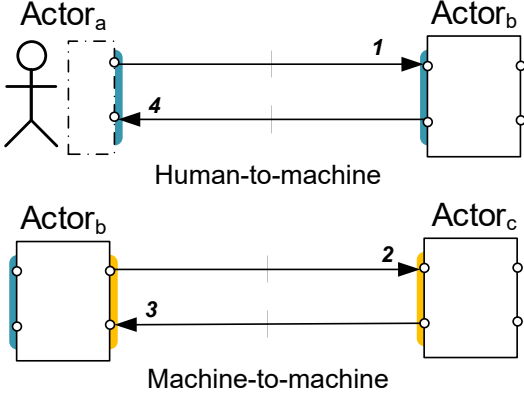

| Name and Link | Description | Programming Language |
|---|--|----------------------|
| OpenADR 2.0 Virtual Top Node (VTN) | This application is an implementation of a virtual top node (VTN) as defined in the OpenADR Alliance's OpenADR 2.0 Profile Specification. | Ruby |
| OpenADR 2.0b Virtual End Node (HTTP Poll) | This application is an implementation of a virtual end node (VEN) as defined in the OpenADR Alliance's OpenADR 2.0 Profile B Specification (HTTP pull) | C# |
| OpenADR 2.0b Virtual End Node (HTTP Poll) C++ Library | This library was developed to support the requirements of an OpenADR 2.0b HTTP Poll VEN client. | C++ |
| CTA-2045 Desktop Simulator | This application is designed to aid in the develop and test of ANSI/CTA-2045 communication ports. This repository also includes hardware designs for the physical test harnesses (AC and DC form factors). | Visual Basic |
| CTA-2045 C++ Library (Communication Module Role) | This software is a C++ library developed and released to support companies in the marketplace who are developing or planning to develop ANSI/CTA-2045 communication modules | C++ |

5.3 System Diagrams (Symbols – Definition, Nomenclature, Use)

Table 5-3 includes definitions for symbols used to compile the system diagrams included in [Section 1.2](#). Another example use of these symbols in a system that leverages OpenADR 2.0 and ANSI/CTA-2045-A to automatically dispatch BTM resources is shown in Figure 5-1.

Table 5-3
System Diagram Symbol Definitions

| Representative Element | Definition, Nomenclature, Use | Symbol |
|----------------------------|--|---|
| Actor | <p>Actors are any human or machine whose interaction with the system contributes to the system's output.</p> <p><i>Actor</i>_(letter)</p> |  |
| Information Exchange Point | <p>A point at which data is exchanged with an actor. This point is represented by a circle located on one or more sides of an actor.</p> |  |
| Interface | <p>A specific format and rules that one or more actors use to exchange information. The colors in the symbol represent a specific format and rules (protocol).</p> <p><i>Suggested Naming Convention</i> <i>Interface</i>_(number)</p> |  |
| Interface Legend | <p>An Interface Legend is used to map the colors used to differentiate one interface to another to the name of the interface.</p> |  |

| Representative Element | Definition, Nomenclature, Use | Symbol |
|--|---|--|
| Information Flow (Direction) | Direction by which information is sent from one actor to another. |  |
| Information Exchange Sequence | The sequence by which information is shared between actors across a system. |  |
| Information | <p>Information (i.e. data, messages, instructions, commands, requests, etc.) shared between actors.</p> <p><i>Example Naming Convention</i></p> <p><i>Info</i> InterfaceNumber.MessageNumber (SendingActorLetter, ReceivingActorLetter)</p> |  |
| Hierarchical Role (Upstream or Downstream) | <p>Term used to describe the role of an actor with reference to another within the system.</p> <p>Note:</p> <p>For example, this concept is analogous to the roles for Masters and Slaves or Servers and Clients.</p> |  |
| Interface | <p>The Colors behind the Actor's Information Exchange point are used to represent a common interface.</p> <p><i>Suggested Naming Convention</i></p> <p>Interface_(number)</p> |  |

| Representative Element | Definition, Nomenclature, Use | Symbol |
|------------------------|--|---|
| | <p>A legend is used to map names to the colors selected to represent the interfaces</p> <p style="text-align: center;">Interface Legend</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: auto;"> <p> = Interface₁</p> <p> = Interface₂</p> </div> | |
| <p>Logic</p> | <p>The Logic block represents decisions or actions that each actor must execute to fulfill the system's objective</p> <p>Arrows between the logic blocks can be used to represent interactions between one or more logic blocks within the same actor.</p> <p><i>Example Naming Convention</i> Logic(ActorLetter).(BlockNumber)</p> <p><i>Application Note:</i> For Actors representing Machines, logic blocks could represent subroutines such as mapping information to other subroutines that process and execute their functional role in the system.</p> <p><i>Application Note:</i> For Actors representing Humans, the logic blocks are used to represent thought processes and actions.</p> | <p>The diagram illustrates three actors: Actor_a, Actor_b, and Actor_c. Actor_a contains two logic blocks, Logic_{a,1} and Logic_{a,2}, connected by a bidirectional arrow. Actor_b contains three logic blocks: Logic_{b,1}, Logic_{b,2}, and Logic_{b,3}. Logic_{b,1} is connected to Logic_{b,2} and Logic_{b,3} with bidirectional arrows. Logic_{b,2} and Logic_{b,3} are also connected to each other with a bidirectional arrow. Actor_c contains two logic blocks, Logic_{c,1} and Logic_{c,2}, connected by a bidirectional arrow. The actors are shown as containers with external ports and internal logic blocks.</p> |

Example use of symbols in a system that relies on OpenADR 2.0 and ANSI/CTA-2045-A to dispatch BTM resources

The Electric Power Research Institute, Inc. The Electric Power Research Institute, Inc. (EPRI, www.epri.com) conducts research and development relating to the generation, delivery and use of electricity for the benefit of the public. An independent, nonprofit organization, EPRI brings together its scientists and engineers as well as experts from academia and industry to help address challenges in electricity, including reliability, efficiency, affordability, health, safety and the environment. EPRI also provides technology, policy and economic analyses to drive long-range research and development planning, and supports research in emerging technologies. EPRI members represent 90% of the electricity generated and delivered in the United States with international participation extending to 40 countries. EPRI's principal offices and laboratories are located in Palo Alto, Calif.; Charlotte, N.C.; Knoxville, Tenn.; and Lenox, Mass.
