Raver Reactor Replacement

On March 25, 2013, a fire destroyed the number 2 reactor bank at Raver Substation. An investigation determined that the fire resulted from a bushing failure, likely due to the bushing insulation wearing out. The unit destroyed consisted of three 60 MVAR units, for a total capacity of 180 MVAR. This project will replace the failed reactor bank with a 300 MVAR bank. The larger reactor bank will be sufficient to meet current and projected future requirements.
