The [report](#) was written for utilities and other stakeholders interested in learning about residential heat pump measures and evaluation results from this study's billing analysis. It provides results on realized savings from air source heat pump conversions in heating zones 2 and 3 and variable speed heat pump conversions in all heating zones, based on a billing analysis of FY 20-22 data. Previously, the Region Technical Forum (RTF) categorized these measures as "planning" due to prior lack of sufficient sample sizes and evaluation of the savings in the field. The report also includes a "drivers analysis," which explored reasons for variation in realized savings.
