

Big Eddy 500 kV Switchyard Cable Replacement

This project involves replacing and upgrading various components within the Big Eddy 500KV Switchyard, including circuit breakers, arrestors, and disconnects, to enhance their capacity and ensure compliance with industry standards. The upgrades aim to address current limitations in the equipment's interrupting capability and continuous current ratings, mitigating risks related to safety, financial stability, and system reliability. The new equipment will be rated for a minimum continuous current of 4000A, ensuring it can handle new system conditions and comply with relevant regulations.
