1.1 Power Rates Study Overview

The Power Rates Study (PRS or Study) explains the processes and calculations used to develop the power rates and billing determinants for Bonneville Power Administration's (BPA) wholesale power products and services. The PRS serves three primary purposes: (1) to demonstrate that rates have been developed in a manner consistent with statutory direction, including the initial allocation of costs and the subsequent reallocations directed by statute; (2) to set rates consistent with BPA policies; and (3) to demonstrate that rates have been set at a level that recovers the allocated power revenue requirement for the upcoming rate period, fiscal years (FY) 2020 and 2021.

12

13

The development of rates in the PRS uses inputs from a variety of sources:

requirement. See Power Revenue Requirement Study, § 2.5.

Net Revenues for Risk (PNRR), if any.

sold and purchased in electric markets and demonstrate that the rates and risk mitigation

Documentation, BP-20-FS-BPA-05A, provide forecast quantities of power expected to be

1	tools together meet BPA's standard for financial risk tolerance—the Treasury Payment
2	Probability (TPP) standard of 95 percent. The Risk Study includes quantitative and
3	qualitative analyses of financial risks and tools for mitigating those risks, including those
4	required by BPA's Financial Reserves Policy. BP-18 Rate Proceeding, Administrator's
5	Final Record of Decision, BP-18-A-04, Appendix A (July 26, 2017).
6	
7	Power Services receives revenue from the generation inputs it provides to Transmission
8	Services. The amount of the anticipated revenues from balancing services and other power
9	services provided to Transmission customers is specified in Power Rates Study Documentation,
10	BP-20-FS-BPA-01A, Table 9.3.
11	
12	The results of the power rate development process, including rates and billing determinants for
13	power products and services and general rate schedule provisions for the rate period, appear in
14	the 2020 Power Rate Schedules and General Rate Schedule Provisions, BP-20-A-03-AP02. The
15	revenues resulting from the rates developed in the PRS are used by the Power Revenue
16	Requirement Study in the Revised Revenue Test to test the adequacy of rates to recover expenses
17	and supply adequate cash to cover non-expense cash outlays. See Power Revenue Requirement
18	Study, BP-20-FS-BPA-02, § 3.3.
19	
20	1.2 Statutory and Legal Overview
21	The Pacific Northwest Electric Power Planning and Conservation Act (Northwest Power Act),
22	16 U.S.C. § 839 et seq., is the primary statute providing ratemaking directives to BPA. The
23	Northwest Power Act's Section 7(a)(1), 16 U.S.C. § 839e(a)(1), states:
24 25 26 27 28	The Administrator shall establish, and periodically review and revise, rates for the sale and disposition of electric energy and capacity and for the transmission of non-Federal power. Such rates shall be established and, as appropriate, revised to recover, in accordance with sound business principles, the costs associated with the acquisition, conservation, and transmission of electric power, including the

1 2 3 4	amortization of the Federal investment in the Federal Columbia River Power System (including irrigation costs required to be repaid out of power revenues) over a reasonable period of years and the other costs and expenses incurred by the Administrator pursuant to this chapter and other provisions of law.
5	
6	The Bonneville Project Act defines "periodically review and revise" as revision of power and
7	transmission rates not less frequently than once in every five years. 16 U.S.C. § 832d(a). Rates
8	also are to be set in accordance with two other statutes: the Federal Columbia River
9	Transmission System Act (Transmission System Act), 16 U.S.C. § 838, and the Flood Control
10	Act of 1944, 16 U.S.C. § 825s.
11	
12	Section 7 of the Northwest Power Act governs the allocation of BPA's costs, which is performed
13	in a cost of service analysis (PRS § 2.1), and establishes a set of rate directives that provide
14	further guidance on how individual rates are to be derived (PRS § 2.2). See 16 U.S.C. § 839e(b).
15	
16	1.3 Regional Dialogue Policy Overview
17	In the Long-Term Regional Dialogue Policy, issued in July 2007, BPA defined its power supply
18	and marketing role for the long term. Key components of the policy include 20-year power sales
19	contracts and a tiered Priority Firm Power (PF) rate construct that provides each preference
20	customer with a Contract High Water Mark (CHWM). Each customer's CHWM defines the
21	amount of power the customer has a right to buy at a Tier 1 rate. Any power a utility chooses to
22	buy from BPA for its load in excess of its CHWM is priced at a Tier 2 rate that is designed to
23	recover the marginal cost of serving this additional load.
24	
25	BPA offered Regional Dialogue contracts to all of its preference and investor-owned utility
26	(IOU) customers. Currently, these power service contracts are in effect for these customers for
27	FY 2012–2028.
28	

1 1.3.1 Regional Dialogue Contract Product Descriptions 2 Below is a brief summary of the products offered under BPA's CHWM Contracts. See BPA's 3 Regional Dialogue Guidebook, available in the Regional Dialogue Policy Implementation 4 section of BPA's website, www.bpa.gov, for full product descriptions and additional details on 5 the interactions of the products, Tier 2 rate service, and Resource Support Services (RSS). 6 7 **Load Following.** The Load Following product supplies firm power to meet a preference 8 customer's Total Retail Load (TRL), less any firm power supplied by the customer from any 9 Dedicated Resources, including "behind the meter" non-Federal resource amounts. The costs 10 associated with the energy and capacity necessary to provide the Load Following service are 11 recovered through Tier 1 rate charges for energy and demand. 12 13 **Block.** The Block product provides a planned amount of firm power to meet a preference 14 customer's planned annual net requirement load. To buy this product, the customer must have 15 dedicated non-Federal resources, and the customer is responsible for using those resources 16 dedicated to its TRL to meet any load in excess of its planned monthly BPA Block purchase. 17 The costs associated with the energy and capacity necessary to provide this service are recovered 18 through Tier 1 rate charges for energy and demand. 19 20 **Slice/Block.** The Slice/Block product provides a combined sale of two distinct power products: 21 (1) firm power for a preference customer's net requirements load and an advance sale of surplus 22 energy based on the generation shape of the Federal system; and (2) firm requirements power 23 under a Block product. The costs associated with the energy and capacity necessary to provide 24 this service are recovered through Tier 1 rate charges for energy and demand. 25 26

1.4 1 **Tiered Rate Methodology** 2 The CHWM Contracts and the Tiered Rate Methodology (TRM) provide long-term certainty to 3 preference customers regarding their access to Tier 1 rate power and to BPA regarding its 4 obligation to serve its preference customers' loads. See 2012 Wholesale Power and 5 Transmission Rate Adjustment Proceeding (BP-12), Tiered Rate Methodology, BP-12-A-03. 6 7 The TRM provides for a two-tiered Priority Firm Public (PFp) rate design applicable to firm 8 requirements power service for preference customers that signed CHWM Contracts. The TRM 9 established a predictable and durable means to calculate BPA's PF tiered rates for power 10 deliveries beginning in FY 2012. The tiered rate design differentiates between the cost of service 11 associated with Tier 1 system resources and the cost associated with additional amounts of power 12 sold by BPA to serve any remaining portion of a customer's net requirement, also referred to as 13 Above-Rate Period High Water Mark (Above-RHWM) load. The tiering of the PFp rate is one 14 of the final steps in the development of rates and does not alter the fundamental manner in which 15 BPA allocates costs to the various rate pools under the Northwest Power Act. PRS Section 3.2 16 describes the steps taken to tier the PFp rate. 17 18 CHWMs, determined according to the TRM, help determine how much of each customer's net 19 requirement purchased from BPA is charged at Tier 1 rates and how much may be charged at 20 Tier 2 rates. The CHWM for each customer was calculated by BPA in FY 2011 based on the 21 expected output of Tier 1 system resources during FY 2012–2013 and customers' actual 22 FY 2010 loads. The individual utility CHWMs set each customer's initial eligibility to purchase 23 power at Tier 1 rates and became part of each utility's CHWM Contract. 24 25 26

1 1.4.1 Rate Period High Water Marks 2 Related to the CHWM and also defined in the TRM is the Rate Period High Water Mark 3 (RHWM), which is an expression of the CHWM scaled to the expected output of resources 4 identified as comprising the Tier 1 system for the relevant rate period. Each customer's RHWM 5 for FY 2020–2021 defines that customer's maximum eligibility to purchase at Tier 1 rates for the 6 rate period, limited for Slice and Block customers by the purchaser's Annual Net Requirement 7 and for Load Following customers by the purchaser's Actual Net Requirement. The TRM 8 specifies how rates will be developed to ensure, to the maximum extent possible, that customers' 9 purchases of power at Tier 1 rates do not pay any of the costs of serving Above-RHWM Load. 10 11 To meet its Above-RHWM Load, a customer may purchase Federal power, non-Federal power, 12 or a combination of the two. To the extent a customer purchases Federal power for its Above-13 RHWM Load, a PF Tier 2 rate(s) will be applied to this portion of its Federal power service. 14 See § 4.1.2 below. 15 16 1.4.2 Rate Period High Water Mark Process 17 The RHWM is determined based on the customer's CHWM and the RHWM Tier 1 System 18 Capability (RT1SC) for each applicable rate period. The determination of a customer's RHWM 19 occurs outside of the rate proceeding in the RHWM Process, as described in TRM Section 4.2.1. 20 21 The RHWM Process for the FY 2020–2021 rate period was completed in August 2018. BPA 22 engaged customers in a public process from May to August 2018, with two public comment 23 periods and two public workshops. After completion of the review and comment periods, BPA 24 examined the information collected. BPA posted its determination of values for the FY 2020-25 2021 rate period for RHWM Tier 1 System Capability, including RHWM Augmentation; each 26 customer's RHWM; and each customer's Above-RHWM Load. See the following link:

1	https://www.bpa.gov/Finance/RateCases/BP-20/Pages/Rate-Period-High-Water-Mark-
2	Process.aspx and PRS Table 1.
3	
4	Once established, RHWMs are, under most circumstances, not changed. Exceptions include
5	certain changes on a customer's system, including annexation that results in a gain or loss of
6	service territory or a later discovery that a load is a New Large Single Load (NLSL).
7	
8	1.5 Overview
9	The next two sections discuss the ratemaking methodology and process, which result in the rate
10	schedules and General Rate Schedule Provisions (GRSPs) discussed in Sections 4 and 5. At a
11	high level, BPA's ratemaking process for power products and services has three main steps:
12	(1) A Cost of Service Analysis (COSA) Step (PRS § 2.1), which allocates the various
13	types of costs (categorized into resource or cost pools) to the various classes of
14	customers (categorized into load or rate pools) using allocation factors calculated
15	based on loads and resources.
16	(2) A Rate Directives Step (PRS § 2.2), which reallocates costs between rate pools to
17	ensure that the relationships between the rates for the different classes of
18	customers comport with the rate directives in the Northwest Power Act.
19	(3) A Rate Design Step (PRS Section 3), which produces tiered PFp rates that collect
20	the PFp revenue requirement determined in the Rate Directives Step. This step
21	also implements the rate design for the non-tiered rates.
22	
23	Section 6 discusses Transfer Service. More than half of BPA's power customers are served by
24	the transmission systems of third parties (entities other than BPA). BPA must acquire
25	transmission services from these third-party transmission providers to deliver Federal power to
26	BPA's power customers. This third-party transmission service is commonly referred to as

1	transfer service. Transfer service customers may be subject to one or more separate charges
2	from BPA.
3	
4	Section 7 discusses the Slice True-Up. Slice customers are subject to an annual Slice True-Up
5	Adjustment for expenses, revenue credits, and adjustments allocated to the Composite cost pool
6	and to the Slice cost pool. BPA calculates the annual Slice True-Up Adjustment for each fiscal
7	year as soon as BPA's audited actual financial data are available.
8	
9	Section 8 discusses Average System Costs. The Residential Exchange Program (REP),
10	established by Section 5(c) of the Northwest Power Act, was designed to provide residential and
11	farm customers of Pacific Northwest utilities a form of access to low-cost Federal power.
12	16 U.S.C. § 839c(c). Under the REP, BPA purchases power from each participating utility at
13	that utility's average system cost (ASC). ASCs (stated in \$/MWh or mills/kWh) are determined
14	by BPA in separate processes occurring outside the BP-20 rate proceeding for each utility
15	participating in the REP.
16	
17	Section 9 discusses BPA's revenue forecast. The revenue forecast calculates the expected
18	revenue from power rates and other sources for the rate period, FY 2020-2021, and the current
19	year, FY 2019. BPA prepares two revenue forecasts, one using rates from the rate schedules
20	currently in effect (BP-18 rates) and the second using BP-20 rates. The revenue forecasts are
21	used to test whether current rates and revised rates will recover the power revenue requirement.
22	
23	
24	
25	
26	

2. RATEMAKING COST OF SERVICE AND RATE DIRECTIVES STEPS

2.1 Cost of Service Analysis

2.1.1 Statutory Background

Northwest Power Act Sections 7(b), 7(d), 7(f), and 7(g) direct how BPA allocates resource and other costs to load (rate) pools. 16 U.S.C. §§ 839e(b), 839e(d), 839e(f), 839e(g). This allocation is performed in the Rate Analysis Model for the BP-20 rate period (RAM2020).

Section 7(b)(1) states:

The Administrator shall establish a rate or rates of general application for electric power sold to meet the general requirements of public body, cooperative, and Federal agency customers within the Pacific Northwest, and loads of electric utilities under Section 5(c) of this title. Such rate or rates shall recover the costs of that portion of the Federal base system resources needed to supply such loads until such sales exceed the Federal base system resources. Thereafter, such rate or rates shall recover the cost of additional electric power as needed to supply such loads, first from the electric power acquired by the Administrator under Section 5(c) of this title and then from other resources.

16 U.S.C. § 839e(b)(1). Section 7(b)(1) thus describes how BPA is to allocate resource costs to meet the general requirements of public body, cooperative, and Federal agency customers within the Pacific Northwest and the loads of electric utilities participating in the Residential Exchange Program (REP) under Section 5(c), collectively called the Priority Firm Power (PF) customer class. *Id.* At this initial stage of the ratemaking process, the PF rate pool consists of the loads of public bodies and cooperatives (collectively identified as preference customers in Northwest Power Act Section 5(b)), Federal agency loads, and the loads of REP-participating utilities.

Section 7(b)(1) requires that Federal base system (FBS) resources be used to serve the PF rate pool until the FBS resources are exhausted. *Id.* Thus, a corresponding amount of FBS costs is allocated to the PF rate pool. After FBS resources are fully used, resources acquired pursuant to

1	the REP (called exchange resources) are used, and then, if needed, new resources are used to
2	serve remaining PF rate load. By allocating resource costs in this order, the appropriate amounts
3	of exchange and new resource costs are allocated to the PF rate pool.
4	
5	Section 7(d)(1) states:
6 7 8 9	In order to avoid adverse impacts on retail rates of the Administrator's customers with low system densities, the Administrator shall, to the extent appropriate, apply discounts to the rate or rates for such customers.
10	Id. at § 839e(d)(1). Section 7(d)(1) thus authorizes BPA to apply a Low Density Discount
11	(LDD) to mitigate the costs of customers with relatively fewer retail consumers spread over
12	relatively larger geographic areas. The LDD is discussed in Sections 2.1.4.3 and 5.4.1 below.
13	
14	Section 7(f) states:
15 16 17 18 19 20	Rates for all other firm power sold by the Administrator for use in the Pacific Northwest shall be based upon the cost of the portions of Federal base system resources, purchases of power under Section 5(c) of this title and additional resources which, in the determination of the Administrator, are applicable to such sales.
21	Id. § 839e(f). Section 7(f) prescribes how costs are allocated to rates for all other firm power
22	after costs are allocated to the PF rate pool and the rates for BPA's direct-service industrial
23	customers (DSIs) are determined. <i>Id.</i> Section 7(f) allocates the remaining exchange and new
24	resource costs to the remaining regional load (power sold at the New Resource Firm Power (NR)
25	rate and the Firm Power and Surplus Products and Services (FPS) rate). Id.
26	
27	Section 7(g) states:
28 29 30 31	Except to the extent that the allocation of costs and benefits is governed by provisions of law in effect on December 5, 1980, or by other provisions of this section, the Administrator shall equitably allocate to power rates, in accordance with generally accepted ratemaking principles and the provisions of this chapter,

1 2 3 4 5 6	all costs and benefits not otherwise allocated under this section, including, but not limited to, conservation, fish and wildlife measures, uncontrollable events, reserves, the excess costs of experimental resources acquired under Section 6 of this title, the cost of credits granted pursuant to Section 6 of this title, operating services, and the sale of or inability to sell excess electric power.
7	Id. at § 839e(g). Section 7(g) thus addresses the allocation of costs that are not covered by the
8	previously cited sections of the Northwest Power Act, such as conservation and fish and wildlife
9	costs.
10	
11	Consistent with these mandates, the Cost of Service Analysis (COSA) assigns (or "allocates")
12	repayment responsibility for BPA's power revenue requirement (which is grouped into resource
13	pools, or "cost pools") to the various classes of service (which are grouped into load pools, or
14	"rate pools"). These allocations are based upon the resources used to serve those loads, in
15	compliance with the statutory directives governing BPA's ratemaking and in accordance with
16	generally accepted ratemaking principles. The COSA and the other ratemaking steps are
17	programmed into RAM2020 for purposes of calculating power rates.
18	
19	2.1.2 COSA Overview
20	The COSA categorizes loads and resources determined in the Loads and Resources Study,
21	BP-20-FS-BPA-03, into "pools." The load pools and resource pools are then used to calculate
22	Energy Allocation Factors (EAFs). The EAFs are calculated based on the priorities of service
23	from resource pools to rate pools specified in Section 7 of the Northwest Power Act, and when
24	Section 7 does not provide guidance, they are based on general principles of cost causation. The
25	COSA then categorizes costs, determined in the Power Revenue Requirement Study,
26	BP-20-FS-BPA-02, and revenue credits, determined in the Power and Transmission Risk Study,
27	BP-20-FS-BPA-05, as well as Section 2.1.6 below, into cost pools. The COSA concludes by
28	using the EAFs to apportion these costs and revenue credits among the rate pools. Sections 2.1.3
29	through 2.1.7 below provide more detail

1 2.1.3 Loads and Resources 2 The COSA uses disaggregated customer load data from the source data used to produce the 3 Power Loads and Resources Study, BP-20-FS-BPA-03. See Power Rates Study Documentation, 4 BP-20-FS-BPA-01A, Table 2.1.1. The disaggregated load data are aggregated into the PF rate 5 pool (consisting of two sub-pools, the PF Public (PFp) rate pool and the PF Exchange (PFx) rate 6 pool); the Industrial Firm Power (IP) rate pool; the NR rate pool; and the FPS rate pool. *Id.*, 7 Table 2.2.2.1. 8 9 The COSA also uses the disaggregated resource data from the source data in the Power Loads 10 and Resources Study. Id., Table 2.1.2. The disaggregated resource data are aggregated into the 11 resource pools specified by Section 7 of the Northwest Power Act. 16 U.S.C. § 839e. These 12 resource pools are the FBS resource pool, the exchange resource pool, and the new resource 13 pool. Id., Table 2.2.2.1. The resources in the FBS and new resource pools are actual or planned 14 resources that are forecast to be able to serve load during the rate period. The ratemaking 15 process requires that the forecasted firm resources available to serve load equal BPA's firm load 16 obligations under critical water conditions. Critical water conditions assume very low 17 streamflow conditions based on the historical record, along with today's generating facilities and 18 constraints, to yield an amount of energy output. 19 20 **2.1.3.1** Load Pools 21 Load pools are groupings of forecast sales into customer classes for cost allocation purposes. 22 These load pools are used to create rate pools. The Northwest Power Act establishes three rate 23 pools based on the loads served at particular rates. The 7(b) rate pool includes sales to public 24 body and cooperative customers (consumer-owned utilities or COUs), Federal agencies, and 25 utilities participating in the REP. 16 U.S.C. § 839e(b). The 7(c) rate pool includes sales to

BPA's DSI customers under contracts authorized by Section 5(d) of the Northwest Power Act.

Id. at §§ 839e(c), 839c(d). The 7(f) rate pool includes three types of sales: (1) power sold to

26

27

1	consumer-owned utilities to serve NLSLs; (2) Section 5(b) requirements power sold to the
2	region's investor-owned utilities (IOU); and (3) power sold by BPA pursuant to Section 5(f) of
3	the Northwest Power Act. Id. at § 839e(f).
4	
5	The Northwest Power Act states that after July 1, 1985, BPA is not required to allocate any
6	resource costs to the IP rate pool; rather, the IP rate is set using a formula pursuant to
7	Section 7(c). <i>Id.</i> at § 839e(c). The formula ties the IP rate to the PF rate. However, if DSI loads
8	were excluded from cost allocations, loads and resources would be out of balance, leaving an
9	amount of resource costs not allocated to any loads. Therefore, for ratemaking purposes BPA
10	allocates resource costs to IP loads as it does to all other remaining firm power sold. The result
11	is that BPA has, for all practical purposes, only two rate pools, the 7(b) rate pool and all other
12	loads. The resource cost allocations to the IP rate pool are adjusted later in the Rate Directives
13	Step to conform the IP rate to the statute-based formula.
14	
15	2.1.3.2 Resource Pools
16	The three resource pools are Federal base system resources, exchange resources, and new
17	resources.
18	
19	The FBS resource pool and associated costs are defined in Section 3(10) of the Northwest Power
20	Act. Id. at § 839a(10). The FBS consists of the costs of the following resources: (1) the Federal
21	Columbia River Power System (FCRPS) hydroelectric projects; (2) resources acquired by the
22	Administrator under long-term contracts in force on the effective date of the Northwest Power
23	Act; and (3) replacements for reductions in the capability of the resources listed in (1) and (2).
24	Market purchases of system augmentation, balancing purchases, and purchases designated for
25	Tier 2 rates are included in the FBS as replacements for reductions in the capability of FBS

1	resources. Forecast costs for FBS replacement resources during the rate period are included in
2	the FBS resource cost pool.
3	
4	To implement the direction in Northwest Power Act Section 5(c)(1) that BPA is to purchase
5	resources from each eligible REP participant and sell an equivalent amount of electric power to
6	each participant, the exchange resources are sized to be equal to the forecast of the eligible REP
7	exchange load during the rate period. <i>Id.</i> at § 839c(c)(1). To calculate the eligible REP
8	exchange load, the COSA determines whether the potential exchanging utilities have ASCs that
9	are greater than the applicable Base PF Exchange rate for the rate period. Utilities with ASCs
10	higher than the Base PFx rate are assumed to participate in the REP during the rate period. In
11	this way, BPA estimates the PFx load, the size of the exchange resource pool, and the costs of
12	the exchange resources (the ASCs multiplied by the eligible exchange loads). See Power Rates
13	Study Documentation, BP-20-FS-BPA-01A, Table 2.1.3. This process is iterative and dependent
14	upon the outcomes of the Rate Directives Step. See Section 2.2.2 below.
15	
16	Exchange resources are set equal to the amount of resulting qualifying exchange load, which
17	implements the direction in Section 5(c)(1) that BPA is to purchase power from each eligible
18	REP participant and sell an equivalent amount of electric power to each participant.
19	16 U.S.C. § 839c(c)(1).
20	
21	The new resources pool includes all other resources acquired by BPA unless a resource has been
22	determined to be a replacement for reduced FBS capability.
23	
24	2.1.3.3 Order of Resource Service to Load Pools
25	Section 7(b)(1) of the Northwest Power Act specifies how resource costs must be allocated to the
26	Priority Firm Power customer class. <i>Id.</i> at § 839e(b)(1). FBS resources are used to serve the PF

1 rate pool until FBS resources are exhausted, whereupon exchange resources and then, if required, 2 new resources are used to serve remaining PF rate load. Section 7(f) of the Northwest Power Act 3 specifies what and how costs are allocated to "all other firm power" after costs are allocated to 4 the PF rate pool: the remaining exchange and new resources costs are allocated to remaining 5 load. Id. at § 839e(f). That remaining load is served under Industrial Firm Power, New 6 Resource Firm Power, and Firm Power and Surplus Products and Services contracts. 7 8 For the BP-20 rates, the PF load (which includes both PFp and PFx loads) exceeds the capability 9 of the FBS resources. Therefore, all FBS costs and benefits are allocated to the PF rate pool. A 10 pro rata share of exchange resource costs is allocated to the PF rate pool in an amount necessary 11 for the exchange resources to serve the PF load not served by FBS resources. The costs of any 12 remaining exchange resources and all new resources are allocated to all other firm load, with a 13 small fraction of new resources serving PF load if necessary. See Power Rates Study 14 Documentation, BP-20-FS-BPA-01A, Table 2.5.4. 15 16 2.1.3.4 Load and Resource Adjustments 17 The Loads and Resources Study includes a forecast of the generating capability of all resources 18 available to BPA to serve its load obligations. Ratemaking uses only the amount of resources 19 available to serve the rate pool loads; thus, some adjustments must be made. BPA has certain 20 system obligations, including the Canadian Entitlement and U.S. Bureau of Reclamation (USBR) 21 pumping loads (together called FBS obligations), that have existed since before the passage of 22 the Northwest Power Act. See Treaty between Canada and the United States of America relating 23 to the Cooperative Development of the Water Resources of the Columbia River Basin

("Columbia River Treaty"), Art. VI 4(b), Jan. 17, 1961, 15 U.S.T. 1555, 542 U.N.T.S. 244.

FBS resources used to serve these system obligations are taken "off the top," removing both the

obligation and a corresponding amount of FBS resources before the ratemaking load-resource

24

25

26

1	balance is calculated. The ratemaking load-resource balance, after adjustments, is shown in
2	Power Rates Study Documentation, BP-20-FS-BPA-01A, Tables 2.2.2.1-2.
3	
4	2.1.3.5 Energy Allocation Factors
5	The aggregated load and resource data are used to calculate energy allocation factors that the
6	COSA uses to apportion costs among rate pools. EAFs are calculated for each resource and rate
7	pool combination by dividing the amount of annual energy load in each rate pool by the amount
8	served from each resource pool. The annual EAFs for each resource cost pool and for the rate
9	directive steps are shown in Tables 2.2.3.1–2. <i>Id.</i> The General and Conservation allocation
10	factors assume a pro rata allocation of costs to all firm loads. For example, the General and
11	Conservation ("Total Usage") EAFs are used to allocate some Section 7(g) costs and rate
12	directive allocation adjustments to all firm energy loads.
13	
14	2.1.4 Ratemaking Costs
15	The COSA aggregates costs from the Power Revenue Requirement Study (id., Tables 2.3.1.1–5)
16	into BPA's ratemaking cost pools specified by Section 7 of the Northwest Power Act. <i>Id.</i> ,
17	Table 2.3.2; 16 U.S.C. § 839e.
18	
19	Functionalization of costs between the generation and transmission functions (BPA does not
20	have a distribution function normal to most utilities) is reflected in the Power Revenue
21	Requirement Study, BP-20-FS-BPA-02, and the Transmission Revenue Requirement Study,
22	BP-20-FS-BPA-09. The costs functionalized to the generation function are included in the
23	power revenue requirement found in the COSA. An exception is exchange resource costs (see
24	Section 2.1.4.2 below). The exchange resource costs are calculated internal to RAM2020. The
25	exchange resource costs include transmission function costs. The exchange resource costs are
26	functionalized in the COSA modeling so that only the generation portion of the exchange

1	resource costs is subject to the power cost rate steps, and the transmission cost portion is then
2	added back in after the Rate Directives Step is completed. See Power Rates Study
3	Documentation, BP-20-FS-BPA-01A, Table 2.3.4.2. In this way, the statutorily mandated power
4	cost relationships between the various rate pools are maintained without being affected by the
5	transmission function costs of the exchange.
6	
7	The COSA modeling uses other costs that are internally generated by RAM2020. These include
8	exchange resource costs, some power purchase costs, revenue shortfall costs associated with
9	some rate credits, and revenues from secondary power sales. These are covered in greater detail
10	below.
11	
12	2.1.4.1 Revenue Requirement
13	The revenue requirement from the Power Revenue Requirement Study is supplemented in the
14	COSA for costs that are determined in other steps of the ratemaking process (such as projected
15	balancing purchase power costs; system augmentation costs; Planned Net Revenues for Risk
16	(PNRR), if any; and the functionalized exchange resource costs). Disaggregated costs are listed
17	in a form consistent with the income statement from the Power Revenue Requirement Study and
18	are shown in Table 2.3.1.1-5. <i>Id.</i> RAM2020 uses unique identifier key codes to categorize these
19	costs to the COSA cost pools. <i>Id.</i> , Table 2.3.2.
20	
21	In addition to costs associated with operation of the FCRPS, there are three categories of
22	purchased power that are included in the COSA: (1) purchased power under contract;
23	(2) forecast system augmentation; and (3) forecast balancing power purchases.
24	
25	Purchased Power. The purchased power subset of purchased power costs includes the costs of
26	acquisition of power through renewable energy, wind, geothermal, and competitive acquisition
	$\ddot{\mathbf{n}}$

1	programs. Costs of purchased power from the Power Revenue Requirement Study are included
2	in the new resources pool.
3	
4	System Augmentation. For ratemaking purposes, it may be assumed that BPA acquires
5	resources beyond the inventory represented by the system generating resources and balancing
6	power purchases if loads exceed resources under critical water year assumptions. See Power
7	Loads and Resources Study, BP-20-FS-BPA-03, § 4.2. System augmentation amounts are
8	determined in the Power Loads and Resources Study and are used to meet annual customer firm
9	power loads in excess of annual firm system resources. The mean price from the Critical Water
10	Run is used to value the cost of system augmentation. See Power and Transmission Risk Study,
11	BP-20-FS-BPA-05, § 3.1.2.1.1. System augmentation purchases are treated as FBS
12	replacements and, as such, the costs are included in and allocated as FBS costs. See Power Rates
13	Study Documentation, BP-20-FS-BPA-01A, Tables 2.3.1.5 & 2.3.2.
14	
15	Balancing Power Purchases. The costs of power purchases and storage required to meet firm
16	deficits on a monthly/diurnal basis are included in the category of balancing power purchases.
17	Projected balancing power purchases are generally needed to serve firm loads in months other
18	than the spring fish migration period under some water conditions. Balancing purchase expenses
19	are calculated for each monthly/diurnal period where BPA is energy deficit across all 3,200
20	iterations in the Revenue Simulation Model (RevSim). The median purchasing price and
21	quantity associated with these purchases for each year of the rate period are passed to RAM2020
22	to compute balancing purchase costs. See Power and Transmission Risk Study,
23	BP-20-FS-BPA-05, § 3.1.2.1. Balancing power purchases are treated as FBS replacements and,
24	as such, the costs are included in and allocated as FBS costs. See Power Rates Study
25	Documentation, BP-20-FS-BPA-01A, Tables 2.3.1.5 & 2.3.2.
26	

2.1.4.2 Functionalization of Exchange Resource Costs In the COSA, exchange resource costs are based on participating utilities' ASCs and their exchange power sales to BPA. Each utility's ASC includes the cost of power and transmission services associated with serving the utility's total retail load. By definition, exchange resource sales to BPA equal the exchange sales by BPA. The rate directive adjustments that occur subsequent to the COSA use the results of the COSA allocations of the generation revenue requirement. Therefore, because the exchange resource costs in the COSA include transmission costs, the PF Exchange rate includes a transmission cost adder, and the exchange resource costs are functionalized between power and transmission. The exchange resource costs functionalized to power continue through the ratemaking process. The exchange resource costs functionalized to transmission are removed from the generation revenue requirement for the Rate Directives Step and are added back to determine the PF Exchange rate after the Rate Directives Step is completed. In this way, the exchange resource costs functionalized to power are treated the same as other power function costs through the rate development process. The transmission function costs are collected directly from PFx loads through a transmission adder included in the PFx rate. Because the amount of exchange resource costs functionalized to transmission is equal to the increased revenue due to the PFx rate adder, there is no net cost to other rates due to these transmission costs. The functionalization of exchange resource costs is shown in Table 2.3.4.2. *Id.* 2.1.4.3 Low Density Discount

25

26

Section 7(d)(1) of the Northwest Power Act instructs BPA to apply a Low Density Discount (LDD) to mitigate the costs of customers with relatively fewer consumers spread over relatively larger geographic areas. 16 U.S.C. § 839e(d)(1). See Power Rate Schedules and General Rate Schedule Provisions (GRSPs), BP-20-A-03-AP02, GRSP II.B.

1	The cost of providing the discount is computed in RAM2020 using offset quantities and the
2	internally computed Tiered Rate Methodology (TRM) rates. Offset quantities are the sum of the
3	applicable LDD percentages applied to the customer-specific billing determinants. See TRM,
4	BP-12-A-03, § 10.2. These offsets are computed in the TRM Billing Determinants Model,
5	which is a module of RAM2020.
6	
7	The estimated cost of the LDD is shown in Power Rates Study Documentation,
8	BP-20-FS-BPA-01A, Table 2.3.3.1. The entire cost of the discount is allocated to the PF load
9	pool prior to linking the IP rate to the PF rate. <i>Id.</i> , Table 2.3.4.1.
10	
11	2.1.4.4 Irrigation Rate Discount
12	A rate discount is available to qualifying irrigation loads pursuant to CHWM Contracts and the
13	TRM. The discount is a rate, expressed in mills per kilowatthour, that when applied to qualified
14	irrigation load produces a dollar credit on eligible customers' power bills. See Power Rate
15	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.C. The Irrigation Rate Discount (IRD) rate
16	is calculated in RAM2020, as described in Section 5.4.2 below. The cost of the discount is
17	computed in RAM2020 using contract irrigation loads and the internally calculated rate. The
18	entire cost of the IRD is allocated to the PF load pool prior to linking the IP rate to the PF rate.
19	
20	2.1.5 Cost Pools
21	The COSA has six cost pools for the initial allocation of BPA's power costs: FBS resource
22	costs, exchange resource costs, new resource costs, conservation costs, BPA program costs, and
23	power transmission costs. These costs are allocated to the rate pools using direction from
24	Sections 7(b)(1), 7(f), and 7(g) of the Northwest Power Act. 16 U.S.C. §§ 839e(b)(1), 839e(f),
25	839e(g).
26	

2.1.5.1 Section 7(b)(1) and 7(d) Costs 1 2 Section 7(b)(1) costs are associated with the resource cost pools necessary to serve PF load, 3 including the PFp load and the PFx load. 16 U.S.C. § 839e(b)(1). For the BP-20 rates, these 4 resources include all of the FBS resources and all of the exchange resources. Therefore, all FBS 5 resource costs and all exchange resource costs are Section 7(b)(1) costs allocated to serve 6 Section 7(b)(1) loads. Costs associated with the Low Density Discount under Section 7(d) and 7 the Irrigation Rate Discount are allocated along with Section 7(b)(1) costs. 8 9 **2.1.5.2** Section 7(f) Costs 10 Section 7(f) costs are associated with the resource cost pools necessary to serve non-PF load, 11 including IP, NR, and FPS loads. *Id.* at § 839e(f). For the BP-20 rates, these resources include 12 most of the new resources. Therefore, most new resource costs are Section 7(f) costs allocated to 13 serve all remaining loads, that is, IP, NR, and FPS loads. 14 15 **2.1.5.3** Section **7(g)** Costs 16 **Conservation Costs.** The Northwest Power Act requires BPA to treat cost-effective 17 conservation savings as a resource in planning to meet the Administrator's obligations to serve 18 loads. The "conservation" line item, as seen in Power Rates Study Documentation, 19 BP-20-FS-BPA-01A, Tables 2.3.1.1–5, includes (1) amortization of BPA's previous 20 conservation resource acquisition activities; (2) BPA's continuing contributions to the region's 21 market transformation efforts; (3) costs associated with BPA's energy efficiency business; and 22 (4) a share of Net Revenues (Minimum Required Net Revenues (MRNR) plus PNRR, if any). 23 Conservation costs are allocated to all rate pools using the Conservation EAFs. *Id.*, Table 2.3.4.3. 24 25 26

1	BPA Program Costs. Some of BPA's program costs are not identified directly with any
2	specific resource pool. An example is the cost of tracking and implementing national energy
3	policies and initiatives. Development of these power program costs occurs in the Integrated
4	Program Review, as described in Power Revenue Requirement Study, BP-20-FS-BPA-02,
5	Section 2.1. The power portion appears in the COSA as BPA program costs. BPA program
6	costs are allocated to all rate pools based on the Total Usage EAFs. See Power Rates Study
7	Documentation, BP-20-FS-BPA-01A, Table 2.3.4.3.
8	
9	BPA Power Transmission Costs. Power transmission expenses include the costs of serving
10	customers under Transfer Service. See § 6 below. They also include the costs Power Services
11	incurs to procure transmission and ancillary services to transmit surplus Federal power to
12	purchasers that do not hold transmission contracts, primarily outside the Pacific Northwest. BPA
13	also has Federal generation that exists in third-party service territories; both wheeling costs and
14	financial payments to cover losses are included in this category of costs. Finally, it includes an
15	FCRPS generation-integration cost. Transmission costs are allocated to all rate pools based on
16	the Total Usage EAFs. <i>Id.</i> , Table 2.3.4.3.
17	
18	2.1.5.4 Planned Net Revenues for Risk
19	PNRR is an amount of net revenues required to be recovered from power rates to ensure that
20	cash flows from such rates are sufficient to meet BPA's TPP Standard. See Power and
21	Transmission Risk Study, BP-20-FS-BPA-05, § 2.3. PNRR may also include an amount of
22	additional revenue to build financial reserves under the Financial Reserves Policy. Power and
23	Transmission Risk Study, BP-20-FS-BPA-05, Appendix A (FRP), § 4.2.
24	
25	Under the ratemaking methodology, the amount of PNRR (if any) needed to meet the TPP
26	Standard is the result of an iterative process among several models: RAM2020, RevSim, the

Power Non-Operating Risk Model (P-NORM), and ToolKit. See Power and Transmission Risk
Study, BP-20-FS-BPA-05, § 4. The iteration is initiated with a seed value of \$0 for PNRR in the
Power Rates Study Documentation, BP-20-FS-BPA-01A, Tables 2.3.1.4 and 2.3.2. The
resulting rates are used in RevSim to produce net revenue probability distributions. These net
revenue distributions are then used in the ToolKit to test whether TPP is at least 95 percent. If
not, the ToolKit produces a new PNRR value that just meets the TPP standard, rates are
recalculated, a new distribution of net revenues is created, and TPP is calculated for the new
distribution. The iterations are stopped when the smallest value of PNRR that meets the TPP
standard has been determined. <i>Id.</i> , Table 2.3.1.4. Because no PNRR was required to meet the
TPP Standard in the BP-20 rates, no iterative process was necessary. No PNRR was included in
the BP-20 rates for liquidity purposes because any accrual of additional cash reserves required by
the Financial Reserves Policy is to be collected through a separate surcharge. See § 5.2.3 below.

2.1.6 Revenue Credits

In addition to allocating cost data, the COSA allocates various revenue credits that offset costs in each pool. Allocation of revenue credits follows the same principles as the allocation of costs, based upon statutory guidance. For example, some revenue credits are associated with the operation of FBS resources and reduce FBS resource costs to be recovered by PF rates. Some revenue credits reduce the new resource and conservation costs. Other revenue credits that are not associated with any particular cost pool are allocated to rate pools pro rata to load.

2.1.6.1 Downstream Benefits and Pumping Power Revenues

- 23 Downstream benefits and pumping power revenues are described in Section 9.2 below.
- 24 Downstream benefits and pumping power revenues are associated with FBS resources, and these
- 25 | credits are allocated to the same loads to which FBS costs are allocated. See Power Rates Study
- 26 Documentation, BP-20-FS-BPA-01A, Table 2.3.6.

1	2.1.6.2 Section 4(h)(10)(C) Credits
2	Section 4(h)(10)(C) credits are described in Section 9.4.1. The forecast credit is calculated as
3	described in the Power and Transmission Risk Study, Section 4.1, and supplied to RAM2020.
4	Section 4(h)(10)(C) credits are associated with FBS resources, and the credits are allocated to the
5	same loads to which FBS costs are allocated. <i>Id.</i> , Table 2.3.6.
6	
7	2.1.6.3 FBS Contract Obligations Revenue
8	BPA has certain FBS system obligations that provide revenues. For the BP-20 period, this
9	includes only Upper Baker revenues for energy and capacity purchased by Puget Sound Energy
10	to enable flood control elevation levels at that project. These FBS system obligation revenues
11	are allocated to the same loads to which FBS costs are allocated. <i>Id.</i> , Table 2.3.6.
12	
13	2.1.6.4 Colville Credit
14	The Colville credit is described in Section 9.4.2 below. The Colville credit is associated with
15	FBS resources, and this credit is allocated to the same loads to which FBS costs are allocated.
16	<i>Id.</i> , Table 2.3.6.
17	
18	2.1.6.5 Energy Efficiency Revenues
19	The Energy Efficiency revenue credit reflects revenues associated with the activities of BPA's
20	Energy Efficiency program. These revenues are generally payments for reimbursable
21	expenditures that are included in the generation revenue requirement. The Energy Efficiency
22	revenue credit is allocated in the same way as BPA's conservation expenses and effectively
23	reduces the amount of those expenses allocated to power rates. <i>Id.</i> , Table 2.3.6.
24	
25	
26	

1	2.1.6.6 Miscellaneous Revenues
2	Miscellaneous revenues are described in Section 9.2 below. These revenues are allocated to all
3	firm load through the Total Usage EAFs. <i>Id.</i> , Table 2.3.6.
4	
5	2.1.6.7 Renewable Energy Certificates
6	Revenues result from BPA's sales of Renewable Energy Certificates (RECs). For FY 2020–
7	2021, no revenues are expected, and the forecast is zero. <i>Id.</i> , Table 2.3.6.
8	
9	2.1.6.8 General Revenue Credits
10	In the course of marketing power, Power Services generates transmission-related revenues and
11	credits. The revenues and credits are predominantly revenues associated with providing reserves
12	and energy for ancillary services, control area services, and other reliability needs. See Section
13	9.3 below. In addition to revenues associated with generation inputs, revenues from PF Load
14	Forecast Deviation Liquidated Damages, Energy Shaping Service products for NLSL service,
15	New Resource Flattening Service, and Resource Support Services for non-Federal resources are
16	allocated to all loads through the Total Usage EAFs. See Power Rates Study Documentation,
17	BP-20-FS-BPA-01A, Tables 2.3.7.5 and 2.3.7.6.
18	
19	2.1.6.9 Secondary Energy Revenue Credits
20	The Secondary Energy Revenue Credit adjustment recognizes that BPA collects revenues from
21	certain power sales to which costs are not allocated. BPA credits these revenues to classes of
22	service served with firm Federal power.
23	
24	The ratemaking process ensures that the forecast of firm resources available to serve load is
25	equal to BPA's firm load obligations under critical water conditions. However, if firm load
26	obligations exceed firm resources, a system augmentation purchase is assumed to achieve load-

resource balance. If firm resources exceed firm load obligations, a firm surplus secondary sale is
assumed to achieve load-resource balance. All firm surplus is valued in RAM2020 at the
Remarketing Value. See Power and Transmission Risk Study, BP-20-FS-BPA-05, § 4.1.1.2.1;
see also section 3.2.2.6 of this study. System Augmentation expenses are included as FBS
replacements in the COSA. See § 2.1.4.1. Firm Surplus Secondary Sales are included in the
secondary revenue credit calculation but allocated in the Surplus Power Sales Revenue
Deficiency/Surplus Reallocation. See § 2.1.7 below.
Secondary sales recognize that better than critical water conditions will most likely occur.
Generation from water in excess of critical water conditions is called secondary energy. The
projected secondary energy revenue credits are included so that power rates are set at a level
such that revenues from all sources do not recover more than the total Power Services revenue
requirement.
The sales of energy in excess of firm obligations on a monthly/diurnal basis under 3,200 games
The sales of energy in excess of firm obligations on a monthly/diurnal basis under 3,200 games of different risk conditions are calculated by RevSim. Power and Transmission Risk Study,

Mean prices and quantities of these secondary sales are passed to RAM2020 for the purposes of the secondary revenue credit and the computation of the load shaping rates. The secondary revenues projected in RevSim are for market sales BPA expects to make on behalf of Non-Slice customers. However, RevSim also calculates the value of secondary energy
of different risk conditions are calculated by RevSim. Power and Transmission Risk Study, BP-20-FS-BPA-05, § 4.1.1; <i>see also</i> Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 2.3.8. Mean prices and quantities of these secondary sales are passed to RAM2020 for the purposes of the secondary revenue credit and the computation of the load shaping rates. The secondary revenues projected in RevSim are for market sales BPA expects to make on behalf of Non-Slice customers. However, RevSim also calculates the value of secondary energy that is expected to be sold by Slice customers. The ratemaking process does not consider

1	based on the FBS and new resources energy allocation factors to credit the revenues against the
2	costs of the resources producing the secondary energy.
3	
4	2.1.7 Surplus Power Sales Revenue Deficiency/Surplus Reallocation
5	BPA sells surplus firm power under the FPS rate schedule. If BPA anticipates firm generation to
6	exceed firm load obligations on an annual average basis, Firm Surplus Secondary Sales are
7	included as a revenue credit. The COSA includes the quantity of these sales in the FPS rate pool
8	and allocates costs to these sales. Sales of such firm power are not necessarily made at rates that
9	recover the exact costs allocated in the COSA to these sales. Therefore, either a revenue surplus
10	or a revenue deficiency will result when the costs allocated to the sales of this firm power are
11	compared with the revenues received under the applicable contract. The expected revenue
12	forecast from the sale of firm power and settlements, the allocated costs, and the resulting FPS
13	revenue deficiency are shown in Table 2.3.9. <i>Id.</i> This revenue deficiency is allocated to all other
14	firm power (PF, IP, and NR) rates.
15	
16	This is the final step of the COSA. At this point, all of BPA's costs have been allocated to the
17	PF, IP, NR, and FPS rate pools, as have all revenues derived from sources other than these rate
18	pools. After completion of the COSA, certain statutory reallocations of these COSA-allocated
19	costs are performed in the Rate Directives Step.
20	
21	2.2 Rate Directives Step
22	2.2.1 Statutory Background
23	Northwest Power Act Sections 7(c), 7(b)(2), and 7(b)(3) provide guidance for the Rate
24	Directives Step. 16 U.S.C. §§ 839e(c), 839e(b)(2), 839e(b)(3). After the COSA allocation of
25	costs and credits to rate pools, the Rate Directives Step reallocates costs among rate pools to

1 ensure that the relationships between the rates for the different classes of customers comport with 2 the rate directives in the Northwest Power Act. 3 4 Section 7(c), in pertinent part, states: 5 The rate or rates applicable to direct service industrial customers shall be established for the period beginning July 1, 1985, at a level which the 6 7 Administrator determines to be equitable in relation to the retail rates charged by 8 the public body and cooperative customers to their industrial consumers in the 9 region. 10 11 16 U.S.C. § 839e(c). Section 7(c) describes how BPA is to set the rate it charges DSI customers. 12 *Id.* It provides that the DSI rate will be set to be equitable in relation to retail industrial rates of consumer-owned utility (COU) customers. Section 7(c) provides guidance on how to establish 13 14 and modify this equitable relationship: 15 The [DSI rate] shall be based upon the Administrator's applicable wholesale rates to such public body and cooperative customers and the typical margins included 16 17 by such public body and cooperative customers in their retail industrial rates but shall take into account the comparative size and character of the loads served, the 18 relative costs of electric capacity, energy, transmission, and related delivery 19 20 facilities provided and other service provisions, and direct and indirect overhead 21 costs, all as related to the delivery of power to industrial customers, except that 22 the Administrator's rates during such period shall in no event be less than the 23 rates in effect for the contract year ending on June 30, 1985. 24 25 Id. Section 7(c) speaks of the "applicable wholesale rates" to COUs plus the "typical margins" 26 included by those customers in their retail industrial rates. *Id.* The computation of these 27 elements of the DSI rate is discussed below in Sections 2.2.2.5.1–2, Section 4.3.1.1.2, and 28 Appendix A. Section 7(c) also requires a comparison of the DSI rate to the DSI rate in effect in 29 1985, as discussed in Section 2.2.2.5.4 below. *Id*.

Finally, Section 7(c)(3) provides: 1 2 The Administrator shall adjust such rates to take into account the value of power 3 system reserves made available to the Administrator through his rights to interrupt or curtail service to such direct service industrial customers. 4 5 6 Id. § 839e(c)(3). Section 7(c)(3) thus directs that the DSI rate is to be adjusted to account for the 7 value of power system reserves provided through contractual rights that allow BPA to restrict 8 portions of the DSI load. This adjustment is typically made through a Value of Reserves (VOR) 9 credit. The VOR analysis is discussed in Sections 2.2.2.5.2 and 4.3.1.1.1 below. 10 11 In summary, the result of Section 7(c) requirements is that the DSI rate is set equal to the 12 applicable wholesale rate, plus the typical margin, minus the VOR credit, subject to the DSI floor 13 rate test. Because the DSI rate interacts with the PF rate and the NR rate, the three rates are 14 determined simultaneously through a solution called the 7(c)(2) delta. The determination and 15 application of the 7(c)(2) delta are discussed below in Sections 2.2.2.1–4 and 2.2.2.5.1–4 and 16 applied to the IP rate in Section 4.3.1.1. 17 18 Section 7(b)(2) states: 19 After July 1, 1985, the projected amounts to be charged for firm power for the 20 combined general requirements of public body, cooperative and Federal agency 21 customers, exclusive of amounts charged such customers under subsection (g) of this section for the costs of conservation, resource and conservation credits, 22 23 experimental resources and uncontrollable events, may not exceed in total, as 24 determined by the Administrator, during any year after July 1, 1985, plus the 25 ensuing four years, an amount equal to the power costs for general requirements 26 of such customers if the Administrator assumes [five specified assumptions]. 27 28 Id. at § 839e(b)(2). Section 7(b)(2) describes a rate test designed to ensure that preference 29 customers' firm power rates are no higher than rates calculated using five assumptions that 30 remove specified effects of the Northwest Power Act. Id. The rate test is now implemented 31 through provisions of the 2012 Residential Exchange Program Settlement Agreement, which

1	resolved challenges to BPA's previous implementation of Sections 7(b)(2) and 7(b)(3). See 2012
2	Residential Exchange Program Settlement Agreement, Contract No. 11PB-12322,
3	REP-12-A-02A (2012 REP Settlement). The 2012 REP Settlement provides the manner by
4	which BPA computes the amount of rate protection for preference customers, and the amount of
5	REP benefits to the IOUs, in lieu of performing the rate test every rate period.
6	
7	Section 7(b)(3), in pertinent part, states:
8 9 10 11	Any amounts not charged to public body, cooperative, and Federal agency customers by reason of [section 7(b)(2)] shall be recovered through supplemental rate charges for all other power sold by the Administrator to all customers.
12	16 U.S.C. § 839e(b)(3). Section 7(b)(3) directs that the cost of any rate protection afforded to
13	preference customers arising from implementation of Section 7(b)(2) be borne by all other BPA
14	power sales. Id. The rate protection does not extend to all PF customers: the public body,
15	cooperative, and Federal agency customers receive the rate protection, but REP participants do
16	not. Thus, to allow the cost reallocations due to the rate protection, the PF rate is bifurcated.
17	The two resulting rates are the PF Public (PFp) rate, which receives the rate protection, and the
18	PF Exchange (PFx) rate, which does not receive rate protection and bears its allocated share of
19	the rate protection reallocation. The rate protection amount is collected through additional
20	charges included in rates for all non-PF Public sales. The reallocation of rate protection costs is
21	discussed in Section 2.2.2.3 below. The 2012 REP Settlement retains the allocation of rate
22	protection costs to all other rates through mechanisms specified therein. See 2012 REP
23	Settlement Agreement, Contract, 11PB-12322, REP-12-A-02A.
24	
25	2.2.2 Rate Directives Step Modeling
26	The Rate Directives Step modeling takes as input the costs allocated to the four rate pools
27	(PF, IP, NR, and FPS) from the COSA modeling. The Rate Directives Step adjusts these initial

1 allocations among the PF, IP, and NR rate pools with reallocations of costs that conform to 2 Section 7 of the Northwest Power Act. 16 U.S.C. § 839e. At this point in the modeling, the 3 allocation of costs to the FPS rate pool is equal to the expected revenues from FPS sales and will 4 not be altered throughout the remaining ratemaking steps. 5 6 2.2.2.1 First IP-PF Rate Link 7 The IP rate for sales of power to BPA's DSI customers is a formula rate tied to the unbifurcated 8 PF rate (i.e., the PF rate at this point in the modeling includes costs to be allocated between the 9 PFp and PFx rate sub-pools later in the process). Also at this point in the modeling, the costs 10 allocated to the IP and NR rate pools are equal on a per-megawatthour basis. An adjustment is 11 needed to set the IP rate to its proper relationship with the PF rate. That adjustment, the IP-PF 12 Link 7(c)(2) rate adjustment, will result in the 7(c)(2) delta, thereby reducing the allocated costs 13 to the IP rate pool and increasing the costs allocated to the PF and NR rate pools. 14 15 The IP-PF Link adjustment sets the IP rate equal to the monthly/diurnal PFp energy rates applied 16 to DSI billing determinants, plus the net industrial margin. To determine the IP rate, the model 17 first calculates the net industrial margin by subtracting the Value of Reserves provided by sales 18 to the DSIs from the typical industrial margin calculated in the 7(c)(2) Margin Study, which is in 19 the Power Rates Study, BP-20-FS-BPA-01, Appendix A. See Power Rates Study 20 Documentation, BP-20-FS-BPA-01A, Table 2.4.1. Monthly and diurnally PF melded rates are 21 calculated as described in Section 4.1.3 below. *Id.*, Tables 2.4.2–3. Because the IP-PF Link 22 calculation maintains a set relationship between the levels of the IP and PF rates for each year 23 and simultaneously allocates costs between the two rates, and to avoid multiple iterations, 24 RAM2020 has an algebraic formula to approximate a solution and then uses an intrinsic Excel 25 function, "Goal Seek," to converge on a solution for each year of the rate test period. Id., 26 Table 2.4.4.

1	After allocation of the 7(c)(2) delta in the IP-PF Link reallocation, the IP floor rate test
2	determines if the currently calculated IP rate is below the IP rate that was in effect for the
3	contract year ending on June 30, 1985, as required by Section 7(c)(2) of the Northwest Power
4	Act. 16 U.S.C. § 839e(c)(2). The BP-20 IP rate at this point in the modeling is not below the IP
5	floor rate, and no floor rate adjustment is needed.
6	
7	2.2.2.2 Determination of Active Exchanging Utilities
8	With the proper relationship between the IP rate and the unbifurcated PF rate established, the
9	Base PF Exchange rates for the IOUs and the COUs can be calculated. The Base PF Exchange
10	rate for the IOUs is the average unbifurcated PF rate plus a transmission adder. The Base
11	PF Exchange rate for the COUs begins with the IOU rate and removes Tier 2 costs and loads.
12	A test is again conducted to determine if the ASCs of the potential IOU and COU exchanging
13	utilities are greater than the IOU and COU Base PF Exchange rates. If a utility's ASC is greater
14	than its Base PF Exchange rate, the utility is included as an active exchanging utility.
15	
16	2.2.2.3 7(b)(2) Rate Protection and 7(b)(3) Reallocations
17	The next step is to calculate the level of rate protection due to preference customers as a result of
18	the ASC and PFx calculation and pursuant to Section 7(b)(2) of the Northwest Power Act.
19	16 U.S.C. § 839e(b)(2). The rate test specified in Section 7(b)(2) of the Northwest Power Act
20	ensures that BPA's rates for public body, cooperative, and Federal agency customers
21	(collectively referred to as preference customers or 7(b)(2) customers) are no higher than rates
22	calculated using specific assumptions that remove certain effects of the Northwest Power Act.
23	<i>Id.</i> The BP-20 rates are calculated pursuant to a settlement of litigation associated with the REP
24	and the Section 7(b)(2) rate test. See 2012 REP Settlement, Contract 11PB-12322,
25	REP-12-A-02A, at 1. The 2012 REP Settlement was evaluated for compliance with, among
26	other statutory provisions, Sections 7(b)(2) and 7(b)(3). 16 U.S.C. §§ 839e(b)(2), 839e(b)(3).

1 Rate modeling for the REP under the 2012 REP Settlement begins with total IOU REP benefits, 2 as specified in the 2012 REP Settlement, known as Scheduled Amounts. See Power Rates Study 3 Documentation, BP-20-FS-BPA-01A, Table 2.4.9. 4 5 The 2012 REP Settlement rate modeling first calculates the Unconstrained Benefits, which are 6 the REP benefits that would be in place if there were no PFp rate protection. In such 7 circumstance, the REP benefits for each exchanging utility would be its ASC minus its 8 appropriate Base PFx rate multiplied by its qualified exchange load. The Unconstrained Benefits 9 are shown in Table 2.4.10. *Id.* These Unconstrained Benefits are then used to calculate COU 10 REP benefits, as specified in individual settlements with each eligible COU. COU REP benefits 11 are calculated using a ratio of (1) the IOU Scheduled Amounts to (2) the total IOU 12 Unconstrained Benefits for IOUs. This ratio is then multiplied by COU Unconstrained Benefits 13 to derive COU REP benefits. 14 15 The total rate protection provided to preference customers is composed of two parts. With the 16 Unconstrained Benefits and the total IOU and COU REP benefits determined, the first part of 17 rate protection due to preference customers is calculated as the Unconstrained Benefits minus the 18 sum of REP benefits. The REP Settlement modeling then allocates this amount to individual 19 REP participants. This allocation to each REP participant is divided by the exchange load for 20 each participant, calculating a utility-specific 7(b)(3) Surcharge that is added to the appropriate 21 Base PFx rates to produce a utility-specific PFx rate. See Power Rates Study Documentation, 22 BP-20-FS-BPA-01A, Table 2.4.11. After the utility-specific PFx rates are calculated, the utility-23 specific REP benefits are calculated and summed after any reallocations necessary under 24 Section 6.2 of the 2012 REP Settlement Agreement. *Id.*, Tables 2.4.11–12. These tables show 25 reallocations between participating IOUs pursuant to Section 6.2 of the 2012 REP Settlement 26 Agreement.

1	A second part of rate protection, the REP Surcharge, is calculated and allocated to the IP and NR
2	rate pools. The REP Surcharge is determined by multiplying the REP benefit costs determined
3	above (REP Recovery Amounts plus COU REP benefits) by a scalar specified in the 2012 REP
4	Settlement. The scalar is based on the WP-10 7(b)(3) rate surcharge to the IP and NR rates and
5	increases this historical 7(b)(3) rate surcharge in direct proportion to increases in REP Recovery
6	Amounts relative to WP-10 REP benefit levels. The REP Surcharge, when multiplied by the
7	forecast sales under the IP and NR rate schedules, produces an amount of rate protection dollars.
8	Id., Table 2.4.14. This amount is allocated to the IP and NR rate pools.
9	
10	The REP Settlement rate protection allocations increase the IP, NR, and PFx rates while
11	decreasing the PFp rate. <i>Id.</i> , Tables 2.4.13-15.
12	
13	2.2.2.4 Second IP-PF Rate Link
14	After the IP and NR adjustment, the now-lower PFp rate and the now-higher IP rate must be
15	adjusted to maintain the proper 7(c)(2) rate directive cost relationship. For this second IP-PF
16	Link calculation, monthly/diurnal PFp energy rates are determined, and the IP rate is set equal to
17	the flat PFp rate plus the net Industrial Margin plus the REP Surcharge. At this point in the
18	ratemaking process, a reallocation of costs (consistent with Section 2.2.2.5 below) establishes the
19	NR rate. <i>Id.</i> , Tables 2.4.16–19.
20	
21	2.2.2.5 IP Rate
22	The IP rate is calculated using directives in Sections $7(c)(1)$, $7(c)(2)$, and $7(c)(3)$ of the
23	Northwest Power Act. 16 U.S.C. §§ 839e(c)(1)-(3). As discussed in Section 2.2.1 above,
24	Section 7(c)(1)(B) provides that, after July 1, 1985, the rates to DSI customers will be set "at a
25	level which the Administrator determines to be equitable in relation to the retail rates charged by
26	the public body and cooperative customers to their industrial consumers in the region."

ı	
1	Id. at § 839e(c)(1). "Equitable in relation" pursuant to Section 7(c)(2) is defined as basing the
2	DSI rate on BPA's "applicable wholesale rates" to its COU customers plus the "typical margins"
3	included by those customers in their retail industrial rates. <i>Id.</i> at § 839e(c)(2). Section 7(c)(3)
4	provides that the DSI rate is to be adjusted to account for the value of power system reserves
5	provided through contractual rights that allow BPA to restrict portions of the DSI load. <i>Id.</i> at
6	§ 839e(c)(3). This adjustment is made through a Value of Reserves credit. Thus, the rate for the
7	DSIs, the IP rate, is set equal to the applicable wholesale rate, plus the typical margin, plus the
8	VOR credit, subject to the DSI floor rate test and the outcome of the determination of PFp rate
9	protection.
10	
11	2.2.2.5.1 Applicable Wholesale Rate
12	The applicable wholesale rate is calculated as the rate(s) at which BPA is selling power to COUs,
13	that is, the PFp rate (for general requirements, as defined in Section 7(b)(4) of the Northwest
14	Power Act) and the NR rate (for power used to serve New Large Single Loads). 16 U.S.C.
15	§ 839e(c)(4). The IP rate begins by being set to the average of the PF and NR rates, weighted by
16	sales to COUs at each rate and reflecting the DSI class load factor. No sales to COUs at the NR
17	rate are projected for this rate period.
18	
19	2.2.2.5.2 Typical Margin, Value of Reserves, and Net Industrial Margin
20	As noted above, the DSI rate is set by adding the VOR credit and typical margin to the
21	applicable wholesale rate. The VOR credit is calculated as described in Section 4.3.1.1.1 below.
22	The typical margin is calculated in Appendix A. The typical margin plus the VOR credit yields
23	the net industrial margin. See Power Rates Study Documentation, BP-20-FS-BPA-01A,
24	Table 2.4.1. The net industrial margin is added to the applicable wholesale rate, and the result is
25	multiplied by the forecast DSI load to determine the costs for the IP rate pool.

1 2.2.2.5.3 IP-PF Link 7(c)(2) Adjustment 2 The IP-PF Link 7(c)(2) adjustment accounts for the difference between the revenues expected to be recovered from the DSIs at the final IP rate and the costs allocated to the rate. This 3 4 difference, known as the 7(c)(2) delta, is allocated to non-DSI rates, primarily the PF rate. 5 Because the allocation of the 7(c)(2) delta changes the PF and the NR rates, together forming the 6 applicable wholesale rate upon which the IP rate is based, the 7(c)(2) delta must be recalculated. 7 The interaction between the applicable wholesale rate and the IP rate has been reduced to an 8 algebraic formula to approximate a solution, and then the RAM uses an intrinsic Excel function, 9 "Goal Seek," to converge on a solution for each year of the rate test period. *Id.*, Table 2.4.4. 10 11 2.2.2.5.4 IP Floor Rate Verification 12 Section 7(c)(2) of the Northwest Power Act requires that the rates to DSI customers shall not be 13 less than the rates in effect for the contract year ending June 30, 1985 (the floor rate). 16 U.S.C. 14 § 839e(c)(2). Accordingly, a test is performed to determine if the IP rate is at a level below the 15 1985 IP rate. If so, an adjustment is made that raises the IP rate to the floor rate and credits other 16 customers with the increased revenue from the DSIs. If the IP rate is set at a level above the 17 floor rate, no floor rate adjustment is necessary. 18 19 The first step in calculating the floor rate is to apply the IP-83 Standard rate components to rate 20 period (FY 2020–2021) DSI billing determinants. The resulting revenue figure is divided by 21 total IP rate period energy loads to arrive at an average rate in mills per kilowatthour. This rate 22 is reduced by an Exchange Cost Adjustment and a Deferral Adjustment, which were included in 23 the IP-83 rate but are no longer applicable. Both adjustments are made on a mills-per-24 kilowatthour basis. 25 26 In addition, the transmission component of the IP-83 rate is removed to allow a power-only floor 27 rate comparison. The floor rate is adjusted for transmission costs by subtracting total

1	transmission costs in mills per kilowatthour from the IP-83 rate in the same manner as the
2	Exchange Cost Adjustment and Deferral Adjustment are removed. The unit transmission
3	component is determined by dividing total transmission costs in the IP-83 rate by the total energy
4	billing determinants for that rate period. See Power Rates Study Documentation,
5	BP-20-FS-BPA-01A, Table 2.4.6.
6	
7	These calculations result in an "undelivered" IP floor rate. The floor rate is applied to the current
8	rate period DSI billing determinants to determine floor rate revenue. Revenue at the IP rates is
9	compared to the revenue at the floor rate. Because revenue from the IP rate is greater than the
10	floor rate revenue, no floor rate adjustment is necessary. <i>Id.</i> , Tables 2.4.6-7.
11	
12	2.3 Rate Modeling Iterations
13	Several iterations—both within RAM2020 and between other models and RAM2020—are
14	required before the ratemaking process is complete. These iterations ensure that the appropriate
15	costs are computed and allocated consistent with the principles of the Northwest Power Act and
16	TRM rate design.
17	
18	2.3.1 Iterations Internal to the Model
19	2.3.1.1 Participation in the Residential Exchange Program
20	For a utility participating in the REP to be eligible to receive REP benefits, the modeling requires
21	that the applicable Base PFx rate be less than a participating utility's ASC. The applicable Base
22	PFx rate is either (1) the Base Tier 1 PFx rate for COUs, or (2) the Base PFx rate for IOUs
23	(the difference being the inclusion of Tier 2 costs in the Base PFx rate for IOUs). If a utility has
24	an ASC less than its applicable Base PFx rate, that utility is ineligible to receive financial
25	benefits through the REP as an "active" exchanger for the upcoming rate period (see
26	Section 2.2.2.2 above). RAM2020 uses a macro loop feature to test whether, for each year of the

exchange period, each utility with an ASC qualifies for REP benefits. If a utility does not qualify, a binary index is used to exclude it, and if it does qualify, the index is set to include it.

This test is performed such that the exchange resource costs are calculated including the resources purchased from only REP-active participants. It is performed before the Rate

Directives Step of the 7(c)(2) linking of the IP and PF rates, the determination of rate protection, and subsequent reallocation of rate protection.

2.3.1.2 Costs of Rate Discounts

The costs of the LDD and IRD are included in the Composite customer charge, but these costs are jointly determined with other aspects of ratemaking, such as REP benefits and IP and NR revenues. Because these revenues change depending on the costs of the LDD and IRD programs, the amounts of these costs are determined through iteration in the model. As explained in Sections 2.1.4.3–4 above, RAM2020 computes the cost of the LDD program by applying the applicable discount percent to the forecast billing determinants, which are then applied to the rates. The IRD program cost is based on a historical percentage and a resulting \$/MWh rate discount, which is then applied to internally computed customer charges. For each iteration, the appropriate charges are applied and new discount costs are computed. These new discount costs are allocated in the COSA Step, whereupon the Rate Directives Step and rate design under the TRM are performed again. New charges and rates are computed, which are again applied to the discount calculations. The iterative process continues until convergence.

2.3.1.3 Contract Formula Rates

If a power sales contract rate was agreed to be tied contractually to a result of rate modeling, an iterative approach might be required to solve for the amount of revenue to be credited in the COSA Step. No internal iterations are currently required to model contracts at formula rates.

1 2.3.2 Iterations External to the Model 2 Some aspects of the ratemaking process are dependent upon the rates computed in RAM2020. 3 Many of these dependencies have been integrated within RAM2020, as described above. Other 4 dependencies are simply too large to incorporate into one model. Thus, external iterations must 5 be performed before rates can be finalized. 6 7 2.3.2.1 Consumer-Owned Utility Average System Costs 8 The ASCs of COUs participating in the REP are based in part on the cost of power purchased 9 from BPA at rates determined in RAM2020. Moreover, the COU customer's FRP Surcharge 10 Amount is dependent upon the COU's Non-Slice Tier 1 Cost Allocator (TOCA). These two 11 factors require a recomputation of ASCs for COUs based on the PFp rate level and the FRP 12 Surcharge Amount. This iteration is manually performed between RAM2020 and the ASC 13 forecast model. Revised ASCs are included in RAM2020, and rate levels are recomputed until 14 the results converge. 15 16 2.3.2.2 Risk Analysis and Mitigation: PNRR 17 As discussed in Section 2.1.5.4 above, the amount of PNRR added to rates in order to meet the 18 TPP Standard is the result of an iterative process among four models: RAM2020, RevSim, 19 P-NORM, and ToolKit. See Power and Transmission Risk Study, BP-20-FS-BPA-05, § 4. The 20 iterative process is initiated with a seed value for PNRR in the revenue requirement used in 21 RAM2020. The resultant rates are used in RevSim and P-NORM to produce distributions of net 22 revenues. These distributions are then used in the ToolKit to produce a new PNRR value for the 23 RAM2020 revenue requirement that just satisfies the TPP standard. Because this portion of 24 PNRR for the BP-20 rates is determined to be zero, no iteration is required. 25 26

1	2.3.2.3 Revised Revenue Test
2	The revised revenue test is described in the Power Revenue Requirement Study,
3	BP-20-FS-BPA-02, Section 3.3. The revised revenue test demonstrates that the BP-20 rates are
4	sufficient to recover the revenue requirement, and no further rate adjustment is needed.

3. RATE DESIGN AND COST ALLOCATION

3.1 Introduction

BPA's rates must follow the ratesetting directives of Section 7 of the Northwest Power Act, but, as noted in the legislative history of that Act, the rate directives govern the amount of revenue the Administrator collects from each class of customers, not the rate form. *See*, *e.g.*, H.R. Rep. No. 96-976, 2d Sess., pt. I, at 69 (1980). Northwest Power Act Section 7(e) reserves rate design (how the revenue is collected) to the Administrator.

Section 7(e) states:

Nothing in this chapter prohibits the administrator from establishing, in rate schedules of general application, a uniform rate or rates for sale of peaking capacity or from establishing time-of-day, seasonal rates, or other rate forms.

16 U.S.C. § 839e(e). Rate design uses the results of the cost and credit allocations of the COSA, as modified by the rate directives, to develop the rate components that will recover the costs allocated to each rate pool. Thus, rate design is applied after BPA has allocated its total power revenue requirement to five rate pools: Priority Firm Public Power (PFp), Priority Firm Exchange Power (PFx), New Resource Firm Power (NR), Industrial Firm Power (IP), and Firm Power and Surplus Products and Services (FPS). Rate design does not change the amount of the revenue requirement allocated to each of the five rate pools. Rather, rate design determines how the revenue requirement is collected through rates for each of the five rate pools. Rate design resolves the revenue collection within a particular rate pool and distinguishes between different types of service and power consumption of individual wholesale power customers. Rate design is also used to convey price signals to customers to encourage more efficient power usage, differentiating between the relative market values of the products and services BPA offers to its customers.

1 Based on the results of the Rate Directives Step, the Rate Analysis Model for the BP-20 rate 2 period (RAM2020) designs rates for each rate pool. For the PFx rate, the IP rate, and the NR 3 rate, rate design can be applied without further processing. 4 3.2 5 **PFp Rates** 6 The rate design for the PFp rate is established in the TRM. See TRM, BP-12-A-03. As 7 described in the TRM, the PFp rate design includes two tiers and different products within each 8 tier. The costs and credits are allocated to the Tier 1 and Tier 2 cost pools based upon the 9 principle of cost causation. While the TRM cost allocations do not change the costs allocated to 10 the PFp rate pool, they do assign cost responsibility to the rates paid by customers purchasing the 11 PFp products offered in the CHWM Contracts: Slice/Block, Load Following, Block, and Tier 2. 12 Id. 13 14 The TRM specifies that all costs and credits constituting BPA's PFp revenue requirement be 15 allocated to one of four customer cost pools: Composite, Non-Slice, Slice, or Tier 2. The Tier 2 16 cost pool is further divided into Short-Term, Load Growth, and Vintage cost pools, if any sales 17 are being forecast in those cost pools. *Id.* After reflecting the cost allocations to other rate pools, 18 the end result of the TRM cost allocations is that the total costs allocated to the four customer 19 charge cost pools will equal the total costs allocated to the PFp rate pool after the COSA Step 20 and the Rate Directives Step. Thus, the TRM cost allocations neither increase nor decrease the 21 cost allocations to the PFp rate pool after the Rate Directives Step. A mathematical proof is 22 included in RAM2020 which shows that the revenue requirement allocated to the PFp rate pools 23 in the COSA equals the revenue collected from the seven cost pools under the PFp tiered rate 24 design. See Power Rates Study Documentation, BP-20-FS-BPA-01A, Tables 3.1.7.1 & 3.1.7.2. 25 26

1	While the TRM cost allocations do not change the costs allocated to the PFp rate pool, they do
2	assign cost responsibility to the rates paid by customers purchasing the three primary products
3	offered in the CHWM Contracts: Slice/Block, Load Following, and Block. In addition, the
4	TRM cost allocations recognize that, even though the ratesetting methodology described in this
5	section is performed as if the REP were an actual purchase and sale of power, at this point in the
6	ratesetting process the PFp rate can be determined based on its allocated share of the total REP
7	benefit costs, rather than exchange resource costs and PFx revenues.
8	
9	The sections below detail the calculation of PF Public rates consistent with the TRM.
10	
11	3.2.1 PFp Tier 1 Costs
12	3.2.1.1 Composite Costs
13	The Composite cost pool includes all Tier 1 costs and credits that are not otherwise allocated to
14	the Non-Slice and Slice cost pools. The Composite cost pool forms the cost basis for the
15	Composite Customer Charge, which is paid by all preference customers with CHWM Contracts.
16	Generally speaking, all costs associated with FBS resource costs, exchange resource costs (net of
17	exchange program revenues), new resource costs, conservation costs, BPA program costs, and
18	power transmission costs not otherwise allocated to the Non-Slice or Slice cost pools are
19	allocated to the Composite cost pool. In addition to the costs from expense and capital programs
20	(as outlined in the Revenue Requirement Study, BP-20-FS-BPA-02), significant ratemaking
21	costs allocated to the Composite cost pool are as follows:
22	Costs of the Irrigation Rate Discount and Low Density Discount programs.
23	Net costs associated with the REP:
24	Costs are calculated using the ASC and exchange load for each qualifying REP
25	participant, net of

o Revenues that are calculated at the PFx Rates, incorporating REP surcharges.

1	System augmentation costs required to achieve annual load-resource balance.
2	See Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.1.1.1.
3	
4	3.2.1.2 Non-Slice Costs
5	The Non-Slice cost pool includes only those costs and credits that are specifically and uniquely
6	attributed to the Load Following and Block products (including the Block portion of the
7	Slice/Block product). Tier 1 costs and credits, primarily secondary revenues that are not
8	associated with the Slice product, are allocated to the Non-Slice cost pool. The Non-Slice cost
9	pool forms the cost basis for the Non-Slice customer rate, which is paid by preference customers
10	that have selected the Load Following product or the Block product and customers selecting the
11	Slice/Block product for their Block purchases. Significant Non-Slice costs include:
12	Balancing power purchase costs required to serve the monthly/diurnal loads of Load
13	Following customers.
14	Hedging costs associated with winter shaping or locational swapping that result in
15	changes to anticipated secondary revenues.
16	Transmission costs incurred to deliver secondary sales.
17	Costs (or credits) associated with the Composite interest obligation when financial
18	reserves available for Power are less than the \$586.6 million starting balance of the
19	reserves at the inception of the Slice product offering.
20	See id., Table 3.1.1.2.
21	
22	3.2.1.3 Slice Costs
23	The Slice cost pool includes only those costs and credits that are specifically and uniquely
24	attributed to the Slice product. Tier 1 costs and credits that are associated with the Slice product
25	are allocated to the Slice cost pool. The Slice cost pool forms the cost basis for the Slice

1	customer rate, which is paid by preference customers that have selected the Slice/Block product
2	for their Slice purchases. In the BP-20 rates there are no costs allocated to this cost pool.
3	See id., Table 3.1.1.2.
4	
5	3.2.2 PFp Tier 2 Costs
6	Costs and credits that are associated with the sale of power to serve a customer's Above-RHWM
7	Load are allocated to Tier 2 cost pools. The primary costs allocated to a Tier 2 cost pool are the
8	power purchase costs (forecast and actual), including the cost of real power losses, designated by
9	BPA as being for this purpose. In addition to power purchase costs, Tier 2 rates recover
10	Resource Support Services, overhead, and other BPA costs that are not necessarily incurred
11	solely for the purpose of serving Above-RHWM Load, but support making such sales. The
12	initial allocation of these other costs is to either the Composite cost pool or the Non-Slice cost
13	pool. Therefore, a portion of these other costs is allocated to Tier 2 cost pools.
14	
15	The CHWM Contracts include the following Tier 2 rate alternatives: Load Growth, Vintage, and
16	Short-Term. In FY 2020 and FY 2021, BPA has sales of power only at the Tier 2 Short-Term
17	rate; therefore, in the BP-20 Final Studies there is one Tier 2 cost pool: the Short-Term cost
18	pool. See id., Table 3.5.
19	
20	3.2.2.1 Tier 2 Power Purchase Costs
21	As of June 1, 2019, BPA does not have any power purchases for Tier 2 rate service for the
22	FY 2020–FY 2021 rate period and expects power sold at Tier 2 rates to be served with power
23	from the FCRPS. BPA uses the Remarketing Value as a forecast forward market price to
24	calculate the cost of unpurchased amounts of Tier 2 energy. See Section 3.2.2.6.
25	

1 3.2.2.1.1 Tier 2 Real Power Losses 2 Power purchased at Tier 2 rates is delivered power and thus must include the cost of real power 3 losses. The cost of real power losses is calculated using the Federal transmission loss factor as 4 described in the Loads and Resources Study, BP-20-FS-BPA-03, Section 3.1.5. The Federal 5 transmission loss factor represents the generation loss factor and must be adjusted to calculate 6 the equivalent loss factor at the load. The load equivalent is calculated as 1/(1-[Federal 7 transmission loss factor]), which equates to a 3.06 percent real power loss factor for the load in 8 BP-20. The power purchase costs include the cost of energy associated with this real power loss 9 factor. 10 11 3.2.2.2 Tier 2 Resource Support Services 12 A cost for Transmission Scheduling Service (TSS) is added to each Tier 2 cost pool. A TSS 13 Adder is calculated by dividing the operations scheduling costs for the rate period by the total 14 megawatthours actually scheduled in FY 2017 and FY 2018 to produce a yearly \$/MWh value. 15 Inputs to this calculation are shown in the Power Rates Study Documentation, 16 BP-20-FS-BPA-01A, Table 3.4. This value is multiplied by the amount of planned Tier 2 sales 17 in each year for each Tier 2 alternative to produce the annual cost for the TSS Cost Adder 18 included in each cost pool for each year. The Tier 2 TSS Cost Adder is one of the credits to the 19 Composite cost pool summed in the Resource Support Services Revenue Credit. See 20 Section 3.2.3.1.3. The calculated costs assigned to the Tier 2 Short-Term rate cost pool in each 21 year are shown in the Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.5. 22 23 Service at Tier 2 rates includes Transmission Curtailment Management Service (TCMS), which 24 is a service that addresses transmission curtailment events. See Section 5.6.1.5. To recover costs 25 associated with TCMS, Tier 2 rates are subject to the Tier 2 Rate TCMS Adjustment, described 26 in Section 5.4.5 below. The Tier 2 cost pools do not include any costs associated with

1	financially flattening a resource because there are no variable, non-dispatchable resources
2	assigned to the Tier 2 cost pools for the BP-20 rate period.
3	
4	3.2.2.3 Tier 2 Overhead Cost Adder
5	Section 6.3.3 of the TRM, BP-12-A-03, describes an Overhead Cost Adder to be included as part
6	of the Tier 2 rates. The overhead cost components used to calculate the Tier 2 Rate Overhead
7	Cost Adder are listed in the Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.6.
8	For each year of the rate period, the total of these overhead costs is divided by BPA's total
9	forecast of revenue-producing energy sales (PFp, IP, NR, FPS, Downstream Benefits and
10	Pumping Power, Pre-Subscription, Generation Inputs for Ancillary and Other Services Revenue,
11	and Secondary sales). The result is a \$1.07/MWh adder for FY 2020 and a \$1.11/MWh adder for
12	FY 2021. The \$/MWh value in each year is multiplied by the amount of planned sales in each
13	year for each Tier 2 alternative to produce the Overhead Cost Adder included in each Tier 2 cost
14	pool for each year. The Tier 2 Overhead Cost Adder provides the revenue credit to the
15	Composite cost pool (called Tier 2 Overhead Adjustment). See Section 3.2.5 below. The
16	specific cost and sales values used in these calculations are shown in the Power Rates Study
17	Documentation, BP-20-FS-BPA-01A, Table 3.6.
18	
19	3.2.2.4 Tier 2 Risk Adder
20	Section 6.3.1 of the TRM, BP-12-A-03, describes a possible cost adder for risk when BPA has
21	not made all the market purchases needed to serve the Tier 2 obligation. In accordance with the
22	Tier 2 Risk Analysis described in the Power and Transmission Risk Study, BP-20-FS-BPA-05,
23	Section 4.3.1, BPA does not have a discrete risk adder included in the Tier 2 cost pools to cover
24	Tier 2 risks in the FY 2020–2021 rate period. Instead of including a discrete risk adder for the
25	remaining power purchase needs for the Tier 2 cost pools, BPA uses the Remarketing Value as a
26	forecast forward market price for physically delivered power. See Section 3.2.2.6. The

1	Remarketing Value is based on either prices from a transaction (or multiple transactions) for
2	power to be physically delivered in the upcoming rate period or Intercontinental Exchange (ICE)
3	forward market settlement prices with an adder to convert the settlement prices to a physically
4	delivered price. Forward market prices inherently include a risk premium for locking in a power
5	purchase well in advance of delivery. Using these prices for valuing Tier 2 power that has not
6	been transacted for in advance helps ensure that Tier 2 rates are not subsidized by Tier 1 rates.
7	See Power and Transmission Risk Study, BP-20-FS-BPA-05, §4.3.1.
8	
9	3.2.2.5 Reallocated Power from Remarketing
10	When power purchased for a Tier 2 rate pool exceeds Above-RHWM Loads, BPA remarkets the
11	excess amounts and reallocates the value of that power to other Tier 2 pools if there is a need.
12	Similarly, BPA remarkets excess non-Federal amounts and reallocates and values that power in
13	the same manner. The remarketing values are determined in accordance with Section 3.2.2.6
14	below.
15	
16	The treatment of remarketing varies by the type of Above-RHWM service, including individual
17	Tier 2 Cost Pools remarketing the energy. When non-Federal resource and Tier 2 Vintage
18	amounts are remarketed, the value from such reallocations is credited to the individual
19	customers, as required under the CHWM Contract and the TRM and as described in Section 5.7
20	below. When remarketing for the Tier 2 Load Growth pool, the value of remarketed energy is
21	credited to the Tier 2 Load Growth pool and not directly to individual customers.
22	
23	The remarketed Tier 2 energy amounts are first reallocated to another Tier 2 pool with Above-
24	RHWM Loads that exceed the power purchased for that pool, then purchased by BPA for
25	augmentation if there is a need, or deemed surplus power available for resale into the market.
26	See TRM, BP-12-A-03, § 3.4. Table 3.8 of the Power Rates Study Documentation,

1	BP-20-FS-BPA-01A, summarizes the sources of remarketed power meeting the various Tier 2
2	loads. It includes remarketed power from other Tier 2 cost pools, if any, and remarketed power
3	from non-Federal resources with Diurnal Flattening Service (DFS), if any.
4	
5	3.2.2.6 Remarketing Value
6	The Remarketing Value is used to price any remaining power needed to serve the Tier 2 cost
7	pools (Section 3.2.2.1) and to value all forms of remarketing (Tier 2, non-Federal, and Resource
8	Remarketing Service, Section 5.7). It is also used to value any firm surplus inventory. See
9	Section 2.1.6.9 above. The Remarketing Value may differ by fiscal year. See Power Rates
10	Study Documentation, BP-20-FS-BPA-01A, Tables 3.9 and 3.10.
11	
12	The definition for Remarketing Value from the 2020 Power Rate Schedules and General Rate
13	Schedule Provisions (GRSPs), BP-20-A-03-AP02, GRSP III.B.24, states:
14 15 16 17 18 19 20 21 22 23 24 25	The Remarketing Value is the value BPA returns to customers for remarketed Tier 2 and non-Federal energy. This value is also used to calculate the cost of unpurchased amounts of Tier 2 energy. If BPA makes a transaction for a flat annual block of power (between November 1, 2018 and June 1, 2019) to be delivered in a fiscal year in the upcoming Rate Period, then the Remarketing Value for that fiscal year is based on the price of that transaction. If multiple transactions are made, then the Remarketing Value for that fiscal year is based on the weighted-average price of all transactions for the applicable delivery fiscal year. Otherwise, the Remarketing Value for a fiscal year is based on average ICE MID-C settlement prices from two separate five consecutive-business-day periods (the last full week in September 2018 and the last full week March 2019) for a flat block of annual power in the same fiscal year, plus \$0.50 per megawatthour.
27	The \$0.50 per megawatthour adder described above in the definition of Remarketing Value is
28	used to convert the financial settlement prices on ICE to physically delivered prices and is based
29	on the average difference between (1) the forward market settlement ICE prices from the dates
30	BPA made market purchases for Tier 2, and (2) the purchase prices from BPA's market
31	purchases for Tier 2. If multiple transactions are made, then the Remarketing Value for that

fiscal year is based on the weighted-average price of all transactions for the applicable delivery
fiscal year. See Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.10.
3.2.3 PFp Tier 1 Revenue Credits
The Composite and Non-Slice cost pools contain credits for revenues collected from other
components of the PFp rates. All of these rate design credits are necessary to ensure that the PFp
rates do not over-collect the allocated revenue requirement and that the costs and credits have
been allocated as specified in the TRM.
3.2.3.1 Composite Cost Pool Revenue Credits
As stated in Section 3.2.1.1, the Composite cost pool includes all Tier 1 costs and credits that are
not otherwise allocated to the Slice and Non-Slice cost pools. As described in Section 2.1.6,
revenue credits are directly assigned to the TRM cost pool according to cost causation principles
at the same time the COSA steps are completed. Significant ratemaking credits allocated to the
Composite cost pool after the ratemaking steps in Section 2 are completed include revenues BPA
receives from the following:
DSI customers
Power sales under the NR rate schedule
Resource Support Services
PF Load Forecast Deviation Liquidated Damages
3.2.3.1.1 Revenues from DSI Customers
These are forecast IP rate revenues consistent with sales forecasts from the Power Loads and
Resources Study applied to the IP rate as determined in Section 4.3 below.

1 3.2.3.1.2 Revenues from Power sales under the NR rate schedule 2 These are forecast NR rate revenues excluding revenues associated with NR Resource Flattening 3 Service (NRFS) and Energy Shaping Service (ESS), as described in Section 4.2 below. 4 5 **3.2.3.1.3** Revenues from Resource Support Services 6 BPA provides RSS and related services, which generate revenue from preference customers. 7 See Section 5.6 below. Revenues received from the capacity components of RSS are credited to 8 the Composite cost pool. For transparency purposes, BPA committed in the TRM to apply the 9 applicable RSS to resources serving system augmentation needs (currently Klondike III) and to 10 resources supporting the Tier 2 rates, if appropriate. In these situations, the source of the RSS 11 revenue credit to the Composite cost pool is provided through either an RSS adder to the system 12 augmentation cost or an RSS cost allocated to a Tier 2 cost pool. Revenues provided by the 13 energy components of RSS are credited to the Non-Slice cost pool. Unlike the capacity used to 14 provide RSS, which operationally impacts the Slice/Block, Block, and Load Following products, 15 the provision of RSS energy operationally impacts the Non-Slice products only (including the 16 Block portion of the Slice/Block product). 17 18 BPA committed in the TRM to apply RSS to resources serving RHWM Augmentation needs 19 (e.g., Klondike III). The cost of Klondike III, a wind plant, is assigned to Tier 1 Augmentation 20 in the Composite cost pool. The TRM states that RSS pricing will be used to make certain 21 Federal resource acquisitions financially equivalent to a flat block. See TRM, BP-12-A-03, § 8. 22 Tier 1 Augmentation is assumed to be in the shape of an annual flat block purchase for 23 ratemaking purposes. See id., § 3.5. Because Klondike III's generation is variable and non-24 dispatchable, the RSS module of RAM2020 calculates a DFS capacity charge, a DFS energy

charge, a Resource Shaping charge, and a Transmission Scheduling Service (TSS) charge for

Klondike III, and the resulting costs are allocated to the Composite cost pool. See Power Rates

25

Study Documentation, BP-20-FS-BPA-01A, Table 3.11. The total annual RSS revenue credit for FY 2020–2021 is shown in Power Rates Study Documentation Table 3.2.
FY 2020–2021 is shown in Power Rates Study Documentation Table 3.2.
3.2.3.1.4 Revenues from Liquidated Damages for PF Load Forecast Deviation
The PF Load Forecast Deviation Liquidated Damages revenue credit reflects load served by non-
Federal power at large industrial facilities where the customer would otherwise have an
obligation to serve this load with Federal power. Liquidated damages are valued at the Load
Shaping True-Up Rate (LSTUR), which is the difference between PF Tier 1 Equivalent Rates
and the Load Shaping Rates (market price forecast) at the time rates are set. See Section 5.4.4
below. PF Load Forecast Deviation Liquidated Damage revenues are allocated to the Composite
cost pool, and the revenue credit for FY 2020 and FY 2021 is shown in the Power Rates Study
Documentation, BP-20-FS-BPA-01A, Table 3.12.
3.2.3.2 Non-Slice Cost Pool Revenue Credits
As stated in Section 3.2.1.2, the Non-Slice cost pool includes all Tier 1 costs and credits that are
not otherwise allocated to the Composite and Slice cost pools. As described in Section 2.1.6,
revenue credits are directly assigned to the TRM cost pool according to cost causation principles
as the COSA steps are completed. Significant ratemaking credits allocated to the Non-Slice cost
pool after the ratemaking steps in Section 2 are completed include revenues BPA receives from
the following:
Secondary Energy (including Firm Surplus Secondary Sales)
Load Shaping
• Demand
Resource Shaping Charge (RSC)
NR Flattening Service and Energy Shaping Service

1	3.2.3.2.1 Revenues from Secondary Energy
2	These are revenues associated with secondary sales and Firm Surplus Secondary Sales.
3	Secondary sales are valued in RevSim, as calculated in the Power and Transmission Risk Study
4	Documentation, BP-20-FS-BPA-05A, Table 15-20. Firm surplus sales are valued in RAM2020
5	by applying the quantity of Firm Surplus Secondary Sales to the Remarketing Value. The
6	revenue credit includes only non-Slice secondary sales and excludes secondary energy sold
7	under the Slice product as described in Section 2.1.6.9 above.
8	
9	3.2.3.2.2 Revenues from Load Shaping
10	The Load Shaping charge is designed to recover costs associated with shaping the firm output of
11	the Tier 1 System Resources to the monthly/diurnal shape of a customer's Tier 1 load. The Load
12	Shaping charge applies to Non-Slice products, Block (including the Block portion of the
13	Slice/Block product), and Load Following, but not the Slice portion of the Slice/Block product.
14	As stated in Section 5.2 of the TRM, BP-12-A-03, forecast revenue from the Load Shaping
15	charge is credited to the Non-Slice cost pool by means of the Load Shaping Revenue Credit.
16	See Section 4.1.1.3 below.
17	
18	3.2.3.2.3 Revenues from Demand
19	The Priority Firm Demand charge is designed to send a price signal to a limited portion of a
20	customer's overall demand on BPA and applies to customers purchasing Load Following and
21	Block with Shaping Capacity products. As stated in Section 5.3 of the TRM, BP-12-A-03,
22	forecast revenue from the Demand charge is credited to the Non-Slice cost pool by means of the
23	Demand Revenue Credit. See Section 4.1.1.2 below.
24	
25	
26	

1 3.2.3.2.4 Revenues from the Resource Shaping Charge 2 All balancing purchase costs, either resource or load, are allocated to the Non-Slice cost pool. 3 The RSC collects additional revenues for balancing purchase costs associated with balancing 4 resources against a flat annual block. See Sections 5.6.1.2 & 5.6.1.3. To pair cost allocation 5 with revenue collection of balancing purchase costs, the forecast RSC revenue credit is applied 6 to the Non-Slice cost pool. 7 8 BPA committed in the TRM to apply RSC to resources serving system RHWM Augmentation 9 needs (e.g., Klondike III) and to resources supporting the Tier 2 rates in order to make these 10 acquisitions financially equivalent to a flat block. See TRM, BP-12-A-03, § 8. In these 11 situations, the source of the RSC revenue credit is provided through either an RSC adder to the 12 system augmentation cost or an RSC adder within a Tier 2 cost pool. The forecast annual RSC 13 revenue credit for FY 2020–2021 is shown in the Power Rates Study Documentation, 14 BP-20-FS-BPA-01A, Table 3.2. 15 16 3.2.3.2.5 Revenues from NR Resource Flattening Service and Energy Shaping Service 17 The New Resource Firm Power rate schedule includes a Resource Flattening Service (NRFS), 18 which is available to Load Following customers applying the actual generation output of a 19 Specified Resource to a New Large Single Load. See Section 5.6.2.2. The New Resource rate 20 schedule also includes the Energy Shaping Service (ESS), which includes a capacity (demand) 21 component. Forecast revenue from the NRFS and the capacity component of the ESS is credited 22 to the Non-Slice cost pool by means of the NR Revenue Credit. No revenues are expected under 23 these services in FY 2020–2021. See Power Rates Study Documentation, BP-20-FS-BPA-01A, 24 Table 2.3.6. 25 26

1 3.2.4 Rate Design Adjustments Made Between Tier 1 Cost Pools 2 Once costs and rate design revenue credits have been balanced with the revenue requirement, 3 additional adjustments to the PFp cost pools are made to the extent necessary to avoid cost shifts 4 among products (Load Following, Block, and Slice/Block) and tiers (Tier 1 and Tier 2). These 5 rate design adjustments move dollars from one cost pool to another through equal credits and 6 debits and do not change the total revenue requirement for PFp. These rate design adjustments 7 include three adjustments made within Tier 1 and one adjustment made between Tier 1 and 8 Tier 2 (see Section 3.2.5). The three types of adjustments made within Tier 1 are the (1) 9 Transmission Loss Adjustments, (2) Firm Surplus and Secondary Adjustments from Unused 10 RHWM, and (3) Balancing Augmentation Load Adjustments. The adjustment made between 11 Tier 1 and Tier 2 is the Tier 2 Overhead Adjustment. See Section 3.2.5 below. The TRM 12 allocation of these rate design adjustments is shown in the Power Rates Study Documentation, 13 BP-20-FS-BP-01A, Tables 3.1.6.1 & 3.1.6.2. 14 15 3.2.4.1 Transmission Loss Adjustments 16 Transmission Loss Adjustments provide a credit to the Composite cost pool and an equal debit to 17 the Non-Slice cost pool based on Non-Slice transmission losses. Transmission Loss 18 Adjustments address the different accounting of transmission losses for the Slice/Block and 19 Non-Slice products. The Non-Slice products and the Block portion of the Slice/Block product 20 are delivered to the purchaser's load service area, while the Slice product is delivered to the 21 purchaser at BPA's generation bus bar. The cost of generating the real power losses for the 22 transmission of Non-Slice sales is included in the Composite cost pool. Conversely, the cost of 23 generating the real power losses for the transmission of Slice sales is borne by the purchaser. 24 25 Transmission Loss Adjustments transfer the cost of generating the real power losses for the 26 transmission of Non-Slice PF sales from the Composite cost pool to the Non-Slice cost pool. 27 Transmission Loss Adjustments are calculated by multiplying the network losses associated with

1	the Non-Slice PF products, including the Block portion of the Slice/Block product, by the
2	average Slice and Non-Slice Tier 1 rate. See id., Tables 3.1.6.1 & 3.1.6.2. The calculation and
3	result of the Transmission Loss Adjustments are shown in the Power Rates Study
4	Documentation, BP-20-FS-BPA-01A, Table 3.1.3.
5	
6	3.2.4.2 Firm Surplus and Secondary Adjustments from Unused RHWM
7	Unused RHWM occurs when a customer's Forecast Net Requirement is less than its RHWM.
8	Firm Surplus and Secondary Adjustments from Unused RHWM reallocate costs between the
9	Composite cost pool and the Non-Slice cost pool.
10	
11	Unused RHWM reduces the need for system augmentation and/or increases firm power available
12	for sale in the market. The reduced augmentation expenses and/or increased firm power market
13	revenues are reflected in three lines on the TRM cost table: (1) Augmentation, (2) Secondary
14	Energy Credit, and (3) Balancing Purchases from RevSim. See id., Tables 3.1.1.1-2. The
15	Augmentation line is part of the Composite cost pool, and the Secondary Energy Credit and
16	Balancing Purchases are part of the Non-Slice cost pool. To share the entire benefit of Unused
17	RHWM with all customers, the Composite and Non-Slice cost pools contain a Firm Surplus and
18	Secondary Adjustment (from Unused RHWM), which appears as a credit to the Composite cost
19	pool and an equal and offsetting charge to the Non-Slice cost pool.
20	
21	Firm Surplus and Secondary Adjustments have two purposes. The first is to reflect the
22	difference between the value of a flat annual block of system augmentation and the value of the
23	Unused RHWM when the Unused RHWM displaces augmentation. The difference between a
24	flat annual block of system augmentation and the shape of the Unused RHWM is reflected in
25	changes in the assumed balancing purchases and associated costs. These changes in balancing
26	purchase costs are captured in the Non-Slice cost pool. A Firm Surplus and Secondary

1	Adjustment reallocates the change in balancing purchase costs associated with the difference in
2	value from the Non-Slice cost pool to the Composite cost pool.
3	
4	The second purpose of Firm Surplus and Secondary Adjustments is to reflect the full value of the
5	Unused RHWM when the Unused RHWM creates firm surplus power. The revenue associated
6	with this change in firm surplus power related to the Unused RHWM is reflected in the
7	secondary revenue credit in the Non-Slice cost pool. A Firm Surplus and Secondary Adjustment
8	reallocates this change in secondary revenues associated with the Unused RHWM from the
9	Non-Slice cost pool to the Composite cost pool.
10	
11	The value of Unused RHWM consists of portions of RHWM Augmentation, Tier 1 System Firm
12	Critical Output, and an associated portion of secondary energy. Each of these three components
13	is valued at its respective price: the Augmentation price for the RHWM Augmentation
14	component; the market price (as expressed by the Load Shaping rates) for the Tier 1 System
15	Firm Critical Output component; and the market price (as expressed by the average price
16	received for secondary sales) for the secondary component. The value of Unused RHWM
17	(expressed in dollars per megawatthour) also will be calculated for use in the Slice True-Up of
18	the Firm Surplus and Secondary Adjustments line item in the Composite cost pool. See Power
19	Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.1.2, for results and calculation of
20	Firm Surplus and Secondary Adjustments from Unused RHWM and the dollar-per-
21	megawatthour Slice True-Up value of Unused RHWM.
22	
23	3.2.4.3 Balancing Augmentation Load Adjustments
24	As explained further in the subsections below, balancing augmentation load is (1) Above-
25	RHWM Load that is forecast to be served at Load Shaping rates; (2) Above-RHWM Load that is
26	no longer forecast to occur (net negative Load Shaping billing determinants); or (3) changes to

the Tier 1 System during the applicable Section 7(i) ratemaking process from that used to establish each customer's allocation of the cost of the Tier 1 System during the applicable RHWM Process. The sum total of these conditions is either a charge or credit to the Composite cost pool and an offsetting credit or charge, respectively, to the Non-Slice cost pool. See id., Tables 3.1.6.1 & 3.1.6.2. **Above-RHWM Load Forecast to be Served at Load Shaping Rates**

This first condition occurs when Above-RHWM Load is forecast to be served at Load Shaping rates either (1) when a Load Following customer's annual Above-RHWM Load is less than 8,760 MWh and the Load Following customer made no alternative election to serve its Above-RHWM Load, or (2) when Above-RHWM Load is determined in the RHWM Process and the load forecast is updated during the rate proceeding to reflect the forecast of a larger load. When either (1) or (2) is true and the amount of system augmentation purchases is equal to or greater than the amount of balancing augmentation load, the acquisition costs attributable to supplying balancing augmentation load are included as a system augmentation expense in the Composite cost pool. The revenue from supplying balancing augmentation load is credited to the Non-Slice cost pool through the Load Shaping charge revenue credit. Without a Balancing Augmentation Load Adjustment, only Non-Slice customers would receive credits through an increased Load Shaping Charge revenue credit, but both Slice and Non-Slice customers would bear the cost of increased system augmentation expense. The Balancing Augmentation Load Adjustment corrects this situation with a credit to the Composite cost pool and an equal debit to the Non-Slice cost pool.

1	This condition causes the sum of Load Shaping billing determinants to be positive. Balancing
2	Augmentation Load Adjustments to the Composite and Non-Slice cost pools are calculated as
3	the lesser of (1) the sum of the Load Shaping billing determinants for each fiscal year, or (2) the
4	incurred system augmentation amount for each fiscal year. The result is multiplied by the
5	augmentation price for the respective fiscal year.
6	
7	3.2.4.3.2 Above-RHWM Load No Longer Forecast to Occur
8	The second condition that creates a change to balancing augmentation occurs when the load
9	forecast decreases from the forecast used in the RHWM Process. When this condition occurs,
10	there is a reduction in system augmentation expenses from what otherwise would have occurred.
11	The Composite cost pool would have received an implicit reduction in costs due solely to load
12	variation attributable to Non-Slice customer loads. In this case, the Balancing Augmentation
13	Adjustment is a debit to the Composite cost pool and an equal credit to the Non-Slice cost pool.
14	
15	All other things being equal, this condition causes the sum of the Load Shaping billing
16	determinants to be negative. Balancing Augmentation Load Adjustments to the Composite and
17	Non-Slice cost pools are calculated as the greater of (1) the sum of the Load Shaping billing
18	determinants for each fiscal year, or (2) the avoided augmentation amount (expressed as a
19	negative number) for each fiscal year. The result is multiplied by the augmentation price for the
20	respective fiscal year.
21	
22	3.2.4.3.3 Changes to the Tier 1 System During the Applicable 7(i) Ratesetting Process
23	The third condition occurs when the forecast of Tier 1 System output is updated from the Tier 1
24	System forecast in the RHWM Process. Any change in the Tier 1 System that changes the
25	amount of System Augmentation will cause either a cost or a credit to be included in the
26	Balancing Augmentation Load Adjustment. System Augmentation is allocated to the Composite

1	cost pool, and therefore any change to the Tier 1 System which changes the cost allocated to this
2	pool requires an adjustment. The cost or credit is included as an addition to the Balancing
3	Augmentation Adjustment rather than in the Balancing Power Purchase costs computed in
4	RevSim. Tier 1 System Firm Critical Output changes will increase or decrease, on an annual
5	average basis, the amount of augmentation required, and such augmentation is considered
6	Balancing Power Purchases under the TRM.
7	
8	RevSim computes Balancing Power Purchase costs after load-resource balance has been
9	achieved under critical water. See TRM, BP-12-A-03, § 3.3. If the Tier 1 System increases
10	relative to the RHWM Process Tier 1 System output, the Non-Slice cost pool will receive a
11	credit for this additional anticipated energy equal to the avoided System Augmentation expense
12	due to the change. Alternatively, if the Tier 1 System decreases, the Non-Slice cost pool will be
13	charged for the reduction in anticipated energy to the extent that the reduction contributed to a
14	higher System Augmentation expense. Equal and offsetting costs/credits are applied to the
15	Composite cost pool. See Power Rates Study Documentation, BP-20-FS-BPA-01A,
16	Tables 3.1.6.1 & 3.1.6.2.
17	
18	Balancing Augmentation Load Adjustments to the Composite and Non-Slice cost pools are
19	calculated as the avoided augmentation amount for each fiscal year multiplied by the
20	augmentation price for the respective fiscal year.
21	
22	3.2.5 Rate Design Adjustment Made Between Tier 1 and Tier 2 Cost Pools
23	The Tier 2 Overhead Adjustment credits the Composite cost pool for the overhead costs charged
24	to the Tier 2 cost pools. Each of the Tier 2 cost pools includes an Overhead Cost Adder, which
25	reflects a proportionate share of BPA's total overhead costs. See Section 3.2.2.3 above. The
26	Tier 2 Overhead Adjustment credited to the Composite cost pool is equal to the sum of the

1	Overhead Cost Adders charged to all of the Tier 2 cost pools. The calculation of the Tier 2
2	Overhead Adjustment for FY 2020–2021 is shown in the Power Rates Study Documentation,
3	BP-20-FS-BPA-01A, Table 3.6.
4	
5	3.2.6 Allocation of New Costs and Credits
6	BPA will allocate New Expenses or New Credits, as defined in the TRM, to the cost pools based
7	on the cost allocation principles stated in Section 2 of the TRM. TRM Section 2.3 states that
8	BPA will propose an allocation of the New Expenses and New Credits, if any, to the appropriate
9	cost pools in the next applicable Section 7(i) process. <i>Id</i> .
10	
11	For BP-20, BPA identified a need to create several New Expense lines due to accounting
12	changes related to non-Federal debt andthe CGS decommissioning trust fund. These additional
13	line items affect the Net Interest, Amortization, and Minimum Required Net Revenue (MRNR)
14	sections of the Revenue Requirement. These changes are detailed in Section 7.2.16 below.
15	
16	Another New Expense (actually a credit but included in the expense portion of the Revenue
17	Requirement) is due to excess dollars expected in the Energy Northwest Decommissioning Fund
18	associated with the WNP-1 and WNP-3 terminated nuclear plants. Because decommissioning
19	funding is a Composite cost pool expense, this expense offset is allocated to the Composite cost
20	pool. These changes are detailed in Section 7.2.16 below.
21	
22	A New Credit for BP-20 was allocated to the Composite cost pool to account for expected
23	liquidated damages associated with PF load Tier 1 that is served with non-Federal power due to a
24	change in contract provisions for certain Slice/Block or Block-only customers with large and
25	uncertain loads. If a customer elects to invoke its new contractual rights to assume a lower load
26	forecast at particular and identified facilities in establishing its Block Obligation, these

1	inventories are included in the Secondary Revenue Credit and, as applicable, in the Unused
2	RHWM Credit Reallocation. However, overall PF load expectations result in a lower Tier 1
3	Cost Allocator (TOCA) billing determinant applied to the Composite Customer Charge, and a
4	higher Composite rate. Therefore, any liquidated damages are appropriately allocated to the
5	Composite cost pool. See Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.12.

1	4. RATE SCHEDULES
2	
3	BPA's power rate schedules state the applicability of each rate schedule to the products that BPA
4	offers, the rates for the products, the billing determinants to which the rates are applied, and the
5	sections of the General Rate Schedule Provisions (GRSPs) that apply to each rate schedule. The
6	power rate schedules described in this section are presented in their entirety in the 2020 Power
7	Rate Schedules and GRSPs found in Appendix B of the Final Record of Decision,
8	BP-20-A-03-AP02.
9	
10	4.1 Priority Firm Power (PF-20) Rate
11	The PF-20 rate applies to sales of firm (continuously available) power to be used within the
12	Pacific Northwest by public bodies, cooperatives, Federal agencies, and investor-owned utilities
13	participating in the Residential Exchange Program. The PF-20 rate schedule is available for the
14	contract purchase of Firm Requirements Power pursuant to Section 5(b) of the Northwest Power
15	Act. 16 U.S.C. § 839c(b). Utilities participating in the REP under Section 5(c) of the Northwest
16	Power Act may purchase PF power pursuant to a Residential Purchase and Sale Agreement
17	(RPSA) or Residential Exchange Program Settlement Implementation Agreement (REPSIA).
18	Northwest Power Act § 839c(c). See Section 8 below.
19	
20	The PF Public rate applies to firm requirements purchases under CHWM Contracts and includes
21	Tier 1 and Tier 2 charges. See Sections 4.1.1 and 4.1.2. Rates for firm requirements purchases
22	under arrangements other than CHWM Contracts include the PF Melded rate and the
23	Unanticipated Load Service rate. See Sections 4.1.3 and 4.1.4.
24	
25	
26	

1 4.1.1 PFp Tier 1 Charges 2 The majority of PF Public revenue is collected from firm requirements power purchased at Tier 1 3 rates. Tier 1 charges (rates and billing determinants) apply to PF power purchased to meet a 4 customer's RHWM Load. Tier 1 charges include: 5 • Customer Charges (Composite, Non-Slice, Slice) 6 • Demand Charge 7 Load Shaping Charge 8 9 PF Public Tier 1 Non-Slice rates are subject to risk adjustments during the Rate Period pursuant 10 to the Power Cost Recovery Adjustment Clause (Power CRAC); the Power Reserves 11 Distribution Clause (Power RDC); and the Power Financial Reserves Policy Surcharge (Power 12 FRP Surcharge). See Section 5.2 below. Any adjustments to rates and GRSPs during the Rate 13 Period due to such risk adjustments will be summarized in GRSP Appendix A. See 2020 Power 14 Rate Schedules and GRSPs, BP-20-A-03-AP02, PF-20, § 2.1.4. 15 16 4.1.1.1 Customer Charges 17 4.1.1.1.1 Customer Charge Rates 18 Rates for the Composite, Non-Slice, and Slice customer charges are expressed as dollars per 19 1 percentage point of billing determinant (TOCA, Non-Slice TOCA, or Slice percentage, 20 respectively). Each of the three rates is calculated by dividing the total costs allocated to each 21 cost pool (see Section 3.2.1) by the sum of the respective forecast billing determinants, as 22 described in Section 4.1.1.1.2 below. The quotient of that calculation is then divided by 12 to 23 yield a monthly rate per one percent of the applicable billing determinant. 24 25 The resulting monthly rates are shown in Power Rates Study Documentation, 26 BP-20-FS-BPA-01A, Table 3.1.6.3.

1	4.1.1.1.2 Customer Charge Billing Determinants
2	The Tier 1 Cost Allocator (TOCA) is the customer-specific billing determinant applied to the
3	Composite Customer rate. The majority of BPA's costs to be collected through PF rates are
4	allocated among customers through the TOCA. Each customer's annual TOCA percentage is
5	calculated by dividing the lesser of an individual customer's RHWM or its Forecast Net
6	Requirement by the total of the RHWMs for all PFp customers.
7	
8	The Forecast Net Requirement and RHWM for the individual customer and the sum of RHWMs
9	for all customers are expressed in average annual megawatts. The total of the RHWMs for all
10	customers is shown in Power Rates Study Table 1, and the sum of TOCAs used for FY 2020-
11	2021 is shown in Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.1.6.3.
12	
13	The Non-Slice TOCA is the customer-specific billing determinant applied to the Non-Slice
14	Customer rate. The Non-Slice TOCA is equal to a customer's TOCA if the customer is
15	purchasing the Load Following or Block product. The Non-Slice TOCA for customers
16	purchasing the Slice/Block product is computed as the difference between the customer's TOCA
17	and its Slice percentage. The forecast sum of Non-Slice TOCAs used for FY 2020–2021 is
18	shown in Table 3.1.6.3. <i>Id</i> .
19	
20	The Slice percentage is the customer-specific billing determinant applied to the Slice Customer
21	rate. Initial Slice percentages appear in Exhibit J of each Slice customer's CHWM Contract.
22	These percentages can be adjusted each year pursuant to TRM Section 3.6, and the final Slice
23	percentage is established in Exhibit K of the customer's CHWM Contract. See TRM,
24	BP-12-A-03, § 3.6.
25	
26	

4.1.1.2 Tier 1 Demand Charge 1 2 **4.1.1.2.1** Demand Charge Rates 3 Demand rates are based on the annual fixed costs (capital and O&M) of a marginal capacity 4 resource, an LMS100 combustion turbine, as determined by the Northwest Power and 5 Conservation Council's (Council) Microfin model. The Microfin model estimates the nominal 6 all-in capital costs of an LMS100 with a 2020 in-service date. The all-in capital cost under these 7 specifications is \$1,139/kW as shown in Power Rates Study Documentation, 8 BP-20-FS-BPA-01A, Table 4.1. 9 10 The projected debt payment on the \$1,139/kW fixed capital costs is estimated at \$65.39/kW/yr., based on a cost of debt of 3.94 percent financed over 30 years. The plant is assumed to be 11 12 owned by a publicly owned utility with BPA-backed bonds. The cost of debt is from BPA's 13 FY 2019 Third-Party Tax-Exempt 30-Year Borrowing Rate Forecast. See Power Revenue 14 Requirement Study Documentation, BP-20-FS-BPA-02A, § 6, FY 2019 Interest Rate and 15 Inflation Forecast Memorandum. 16 17 The cost of fixed O&M included in the Demand rate calculation is obtained from the Microfin 18 model. The calculation of the Demand rate uses the Microfin model's 2012 estimate of 19 \$11/kW/yr. escalated to 2020 and 2021 dollars using the 2013 to 2018 average (five-year) rate of 20 1.64 percent calculated from Implicit Price Deflators from the U.S. Bureau of Economic 21 Analysis. The two-year average annual cost for fixed O&M is \$12.64/kW/yr. 22 23 Insurance and fixed fuel costs are also included in the calculation of the Demand rate. The 24 average annual insurance cost of \$2.76/kW/yr. is calculated based on 0.25 percent of the 25 mid-year assessed value obtained from the Council's Microfin model. The average annual fixed 26 fuel cost assumed in the Demand rate calculation is \$42.64/kW/yr. The fixed fuel cost is

1	estimated using Microfin's vintaged heat rate of 8,541 Btu/kWh applied to the average of the
2	existing eastside and westside Pacific Northwest fixed fuel costs for the applicable fiscal year.
3	
4	The average annual expense is \$123.42/kW. This annual value is shaped into the 12 months of
5	the year using the shape of the Heavy Load Hours (HLH) Load Shaping rates, resulting in
6	Demand rates specific to each month. See Power Rates Study Documentation,
7	BP-20-FS-BPA-01A, Table 4.1, and the 2020 Power Rate Schedules and GRSPs,
8	BP-20-A-03-AP02, e.g., PF-20, § 2.1.2.1.
9	
10	4.1.1.2.2 Demand Charge Billing Determinant
11	The Demand billing determinant applies to customers purchasing the Load Following and Block
12	with Shaping Capacity products. TRM Sections 5.3.1–5 contain a detailed explanation of how to
13	calculate the customer-specific Demand billing determinant, which is only a limited portion of a
14	customer's overall demand on BPA. TRM, BP-12-A-03. The following discussion summarizes
15	the TRM explanation.
16	
17	Four quantities are used in calculating a PFp customer's Demand charge billing determinant:
18	(1) the Tier 1 Customer's System Peak (CSP); (2) the average amount of a customer's electric
19	load (measured in average kilowatts) that was served at Tier 1 rates during the HLH of a month;
20	(3) the customer's Contract Demand Quantity (CDQ, expressed in kilowatts); and (4) any
21	applicable Super Peak Credit as specified in a customer's CHWM Contract.
22	
23	The Demand billing determinant is determined by measuring a customer's CSP and then
24	subtracting the other three quantities. The Demand billing determinant calculation can never
25	result in a negative billing determinant; if the calculation results in a value less than zero, the
26	billing determinant is deemed to be zero.

1	The Tier 1 CSP is equal to a customer's maximum Actual Hourly Tier 1 Load (measured in
2	kilowatts) during the Heavy Load Hours of a month.
3	
4	Twelve CDQs are specified for each PFp customer in the customer's CHWM Contract.
5	
6	The Super Peak Credit is determined pursuant to a customer's CHWM Contract. If a customer
7	does not supply the Super Peak amount listed in Section 9 of Exhibit A of its CHWM Contract
8	for at least two hours of the Super Peak Period, then the customer does not receive a Super Peak
9	Credit for that month. The Super Peak Period for FY 2020–2021 is defined in the 2020 Power
10	Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP III.B.30.
11	
12	There are two possible adjustments that may be made to a customer's Demand billing
13	determinant. The first is an adjustment to offset anomalous recovery load peaks that occur after
14	a customer has had power restored to its service territory following a weather-related system
15	outage or other extreme peak event. The second is an adjustment to offset extreme load changes
16	that have severely and adversely affected a customer's load factor. The 2020 Power Rate
17	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.D, include the calculations for applying
18	these adjustments, applicable qualifying criteria, and notice requirements. See Section 5.4.3
19	below for more information regarding this adjustment.
20	
21	4.1.1.3 Tier 1 Load Shaping Charge
22	4.1.1.3.1 Load Shaping Charge Rates
23	The PFp rate design includes 24 Load Shaping rates (two diurnal periods—HLH and LLH—for
24	each of 12 months). The Load Shaping rates are set equal to the rate period average marginal
25	cost of power for each monthly/diurnal period as determined in the Power Market Price Study

1	and Documentation, BP-20-FS-BPA-04, Section 2.4. See also Power Rates Study
2	Documentation, BP-20-FS-BPA-01A, Table 4.2.
3	
4	See Section 5.4.4 below for information on the Load Shaping Charge True-Up Adjustment.
5	
6	4.1.1.3.2 Load Shaping Charge Billing Determinant
7	The billing determinant for the Load Shaping charge is the difference between (1) a customer's
8	actual load served at Tier 1 rates and (2) the System Shaped Load, which is the customer's
9	annual load reshaped into the monthly/diurnal shape of RHWM Tier 1 System Capability. The
10	Load Shaping billing determinant can have either a positive or a negative value. Pursuant to the
11	TRM, a Load Following customer's Above-RHWM Load that is forecast to be less than
12	8,760 MWh and is not served with non-Federal resources will be served by BPA at the Load
13	Shaping rate and is reflected in this billing determinant. See TRM, BP-12-A-03, at 54, and
14	§ 4.1.2.1.
15	
16	A customer's System Shaped Load is calculated as the RHWM Tier 1 System Capability
17	(see § 1.4.2) for each of the 24 monthly/diurnal periods of the fiscal year multiplied by the
18	customer's Non-Slice TOCA. The Load Shaping billing determinants are calculated as the
19	amount of a customer's actual monthly/diurnal load (measured in kilowatthours) to be served at
20	Tier 1 rates minus the customer's System Shaped Load for the same monthly/diurnal period.
21	
22	4.1.1.3.3 Monthly/Diurnal RHWM Tier 1 System Capability
23	The TRM prescribes that the monthly/diurnal shape of the RHWM Tier 1 System Capability will
24	be used to compute the System Shaped Load for purposes of computing Load Shaping billing
25	determinants. The System Shaped Load is not updated if the RHWM Tier 1 System Capability
26	that was determined in the RHWM Process is updated in the rate proceeding. The system shape

1	
1	is computed to be constant across both years of the rate period and is the average of each year's
2	respective monthly/diurnal megawatthour amount. In a rate period that does not include a leap
3	year, there will be 24 monthly/diurnal amounts for the RHWM Tier 1 System Capability
4	specified in the GRSPs. In a rate period that includes a leap year, there will be 26 amounts, with
5	a unique value for each February to account for the additional day. See 2020 Power Rate
6	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.A.
7	
8	4.1.2 PFp Tier 2 Charges
9	Tier 2 charges (rates and billing determinants) apply to Priority Firm power purchased to meet a
10	customer's Above-RHWM Load. Tier 2 charges include:
11	Load Shaping Charge
12	Short-Term Charge
13	
14	See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, PF-20, § 2.2.
15	
16	4.1.2.1 Tier 2 Load Shaping Charge
17	Pursuant to the TRM, a Load Following customer's Above-RHWM Load that is forecast to be
18	less than 8,760 MWh and that is not served with non-Federal resources will be served at Tier 2
19	rates set equal to the Load Shaping rate. For ease of ratesetting and billing, and since it would
20	create no material difference because the rate for the two is the same, BPA does not separate the
21	Tier 2 Load Shaping billing determinant from the Tier 1 Load Shaping billing determinant.
22	Rather, the Tier 1 Load Shaping billing determinant can include power purchased at Tier 1 and
23	Tier 2 rates. See Section 4.1.1.3 above.
24	
25	
26	

1	4.1.2.2 Tier 2 Short-Term Charge
2	With the exception of the Tier 2 Load Shaping Charge, Tier 2 rates are calculated in a module of
3	RAM2020 and are summarized in Power Rates Study Documentation, BP-20-FS-BPA-01A,
4	Table 3.5. Each rate is calculated by dividing the annual costs allocated to the specific Tier 2
5	cost pool (see Section 3.2.2 above) by the billing determinants (based on the annual average
6	megawatt load obligations, excluding real power losses, for each Tier 2 rate alternative) in that
7	same fiscal year. Each Tier 2 rate is established to recover all of the allocated costs associated
8	with the product. The Tier 2 rates may be adjusted under certain circumstances, as shown in PF-
9	20, Section 7 of the 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02.
10	
11	The Tier 2 billing determinant is equal to each customer's commitment to purchase from BPA all
12	or a portion of the customer's Above-RHWM Load. Each customer's Tier 2 rate service amount
13	will be contractually established by March 31, 2019, for FY 2020–2021. The estimated totals for
14	all customers are summarized in Power Rates Study Documentation, BP-20-FS-BPA-01A,
15	Table 4.3. In BP-20 the estimated totals include only sales at the Tier 2 Short-Term rate.
16	
17	4.1.3 PFp Melded Rates (Non-Tiered Rate)
18	The PF Melded rate is a non-tiered rate applicable to the sale of Firm Requirements Power under
19	contracts other than CHWM Contracts. No sales under the PF Melded rate are forecast during
20	the rate period, FY 2020–2021.
21	
22	Melded PF Public rates are included in Section 3 of the PF rate schedule and consist of 12 HLH
23	Energy rates, 12 LLH Energy rates, and 12 Demand rates. The PFp Melded Energy rates are
24	equal to the PFp Load Shaping rates less a scalar. The scalar is a single mills/kWh value that
25	adjusts the Load Shaping rates so that the PFp Melded Energy rates, in conjunction with the
26	demand revenue, do not collect more or less revenue than the Tier 1 and Tier 2 revenue

1	requirement allocated to the PFp loads. Calculation of the PFp Melded rate components,
2	including the scalar, is shown in Power Rates Study Documentation, BP-20-FS-BPA-01A,
3	Table 3.1.8.2. The applicable Demand rates are equal to the PFp Tier 1 Demand rates.
4	
5	The PFp Melded Energy rates are subject to risk adjustments during the Rate Period pursuant to
6	the Power CRAC; the Power RDC; and the Power FRP Surcharge. See Section 5.2 below. Any
7	adjustments to rates and GRSPs during the Rate Period due to such risk adjustments will be
8	summarized in GRSP Appendix A. See 2020 Power Rate Schedules and GRSPs,
9	BP-20-A-03-AP02, PF-20, § 3.
10	
11	4.1.4 Unanticipated Load Service Charge
12	BPA provides Unanticipated Load Service (ULS) for Load Following customers under the
13	PF rate schedule and provides a similar service under the NR and FPS rates. ULS is described
14	in Section 5.10 below and in the 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,
15	GRSP II.M.
16	
17	4.1.5 PFp Resource Support Services (RSS) Rates
18	BPA offers RSS and related services for customers' variable, non-dispatchable non-Federal
19	resources in accordance with the CHWM Contract. In general, RSS are designed to financially
20	convert these resources into a flat annual block of power or the specified monthly/diurnal
21	resource shape found in Exhibit A of the customer's CHWM Contract. RSS available under the
22	PFp rate schedule include the following:
23	• Diurnal Flattening Service, as discussed in Section 5.6.1.1 below and the 2020 Power
24	Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.I.1.
25	• Grandfathered Generation Management Service, as discussed in Section 5.6.1.7 below
26	and the 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.I.6.

1	The PFx rate has two components: (1) two common Base PFx rates (one for COUs with CHWM
2	Contracts and another for all other REP participants); and (2) utility-specific REP surcharges.
3	The COUs have a different Base PFx rate because the PFp rate is tiered. Neither component of
4	the PFx rate is diurnally differentiated or contains an additional charge for demand. Each
5	participant's ASC is a single mills/kWh rate applied to all kilowatthours. Likewise, the rate
6	design for each participant's PFx rate is a single mills/kWh rate applied to all kilowatthours.
7	
8	Base PFx rates are based on the average PF rate immediately prior to the determination of
9	Section 7(b)(2) rate protection. The PFx rate applicable to IOUs (and any eligible COU without
10	a CHWM Contract) is computed by dividing all costs allocated to the PF rate pool by all PF rate
11	pool loads and then adding a transmission charge for delivering the exchange power to the
12	customer. The PFx rate applicable to COUs with CHWM Contracts is calculated in the same
13	manner, except that the costs allocated to Tier 2 cost pools are excluded from the numerator and
14	loads served at Tier 2 rates are excluded from the denominator.
15	
16	Under the 2012 REP Settlement, the utility-specific 7(b)(3) surcharge to recover the cost of
17	providing 7(b)(2) rate protection continues to be assessed. See 2012 REP Settlement, REP-12-
18	A-02A; see Section 2.2.2.3 above. The amount of 7(b)(2) rate protection costs allocated to the
19	PFx rates is allocated to each IOU REP participant on a pro rata basis using REP Unconstrained
20	Benefits calculated from the difference between utility-specific ASCs and the Base PFx rate for
21	IOUs as the allocator. The cost of 7(b)(2) protection recovered from the 7(b)(3) Surcharge
22	applied to the PFx rate for exchanging COUs is imputed from the aggregate protection allocated
23	to IOUs relative to the aggregate Unconstrained Benefits among the IOUs, so that exchanging
24	COUs bear an equitable responsibility for 7(b)(2) rate protection owed to the PFp rate pool. The
25	total amount allocated to each REP participant is divided by the participant's exchange load to
26	derive its utility-specific 7(b)(3) surcharge.

1	For each REP participant, the applicable Base PFx rate is added to its utility-specific 7(b)(3)
2	surcharge to determine its utility-specific PFx rate. For each month of the rate period, the
3	participant will submit its exchange load to BPA for the prior month. Under either an RPSA or
4	an REPSIA, a utility-specific PFx rate is applied to BPA's sales of exchange energy and the
5	participating utility's ASC is applied to BPA's purchase of exchange energy, where the exchange
6	energy is equal to the utility's eligible residential and farm load. The difference between the
7	amount BPA pays for exchange "purchases" and the amount BPA receives for exchange "sales"
8	determines the amount of monetary REP benefits BPA pays the utility. BPA will multiply this
9	invoiced exchange load by the difference between the participant's ASC and its PFx rate to
10	calculate the amount of REP benefits payable to the participant. See Power Rates Study
11	Documentation, BP-20-FS-BPA-01A, Table 2.4.11.
12	
13	4.2 New Resource Firm Power (NR-20) Rate
14	The NR-20 rate applies to sales to investor-owned utilities under Northwest Power Act
15	Section 5(b) requirements contracts. 16 U.S.C. § 839c(b). The NR-20 rate is also applicable to
16	sales to any public body, cooperative, or Federal agency to the extent such power is used to serve
17	any New Large Single Load, as defined by the Northwest Power Act, including planned NLSLs,
18	as defined in Exhibit D of a customer's CHWM Contract. The NR-20 rate includes energy and
19	demand rates.
20	
21	4.2.1 NR Energy Charge
22	Monthly and diurnal differentiation of NR energy rates is calculated based on the HLH and LLH
23	differentiation of the PFp Load Shaping rates. See Power Rates Study Documentation,
24	BP-20-FS-BPA-01A, Table 3.1.8.4. The NR energy rates are determined by adjusting each PFp

Load Shaping rate by an equal scalar until the NR energy rates recover the allocated NR revenue

requirement minus the forecast NR Demand charge revenue. Id.

25

26

1	After the scaling process is complete, an REP Surcharge is added to each of the monthly/diurnal
2	energy rates. Section 7(b)(3) of the Northwest Power Act provides that the cost of 7(b)(2) rate
3	protection afforded to preference customers is allocated to all other power sold, which includes
4	power sold at the NR rate. 16 U.S.C. §§ 839e(b)(2)-(3); see Section 2.2.2.4 above. The cost of
5	rate protection allocated to the NR rate is determined pursuant to the 2012 REP Settlement.
6	Refer to Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 2.4.14, for the
7	calculation of the REP Surcharge.
8	
9	A customer's billing determinant for the NR Energy charge is the total of the customer's NR
10	hourly loads for each diurnal period.
11	
12	The NR Energy rates are subject to risk adjustments during the Rate Period pursuant to the
13	Power CRAC, the Power RDC, and the Power FRP Surcharge. See Section 5.2 below. Any
14	adjustments to rates and GRSPs during the Rate Period due to such risk adjustments will be
15	summarized in GRSP Appendix A. See 2020 Power Rate Schedules and GRSPs,
16	BP-20-A-03-AP02, NR-20, § 2.1.1.2.
17	
18	4.2.2 NR Demand Charge
19	The Demand rates for the NR rate schedule are equal to the PFp Demand rates described in
20	Section 4.1.1.2 above. As with the PFp Demand charge, the NR Demand billing determinant is
21	only a portion of the peak demand placed on BPA. The NR Demand billing determinant is equa
22	to the highest NR Hourly Load during HLH minus the average hourly HLH energy purchased in
23	that particular month at the NR energy rates.
24	
25	
26	

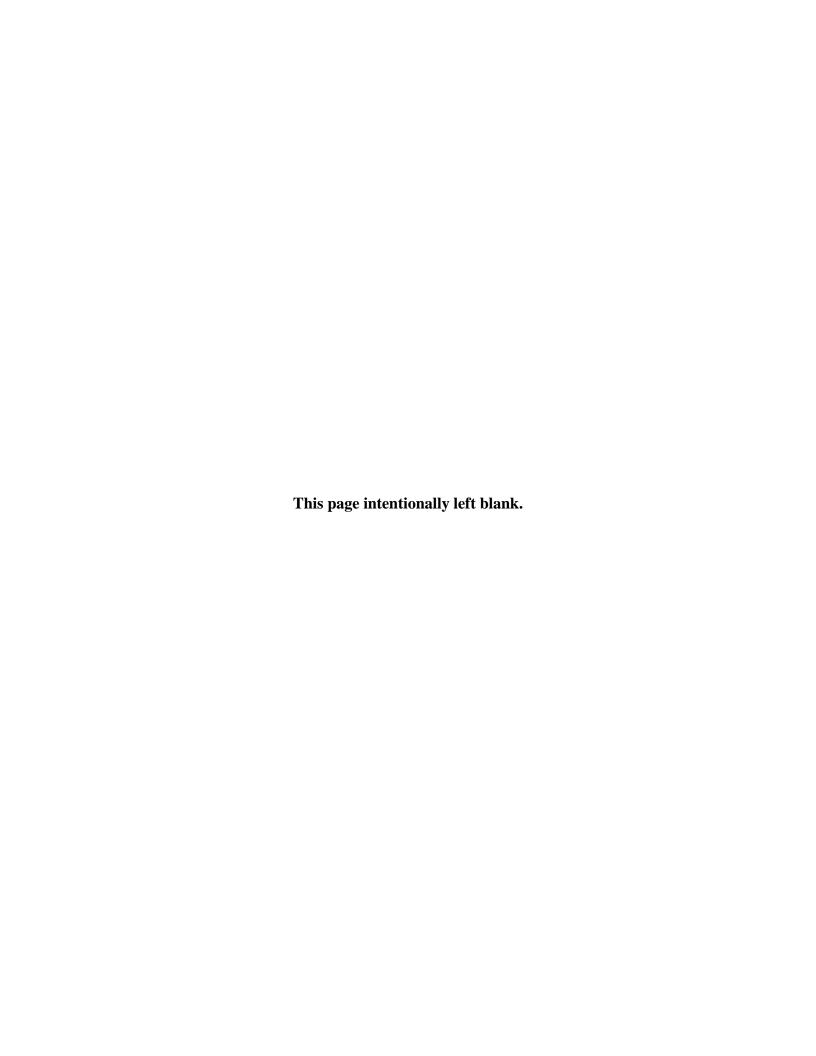

1	4.2.3 Unanticipated Load Service Charge
2	ULS is available under the NR-20 rate schedule for New Large Single Loads and requirements
3	service requested by investor-owned utilities. See Section 5.10 below and the 2020 Power Rate
4	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.M, for details.
5	
6	4.2.4 NR Services for Non-Federal Resources
7	BP-20-A-03-AP02, GRSP II.J.1, and NR Resource Flattening Service is discussed in Section
8	5.6.2.2 below and specified in the 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,
9	GRSP II.J.2.
10	
11	4.3 Industrial Firm Power (IP-20) Rate
12	The IP-20 rate schedule is available for firm power sales to DSIs pursuant to Section 5(d) of the
13	Northwest Power Act. 16 U.S.C. § 839c(d). The IP-20 rate includes energy and demand rates.
14	DSIs purchasing power pursuant to the IP-20 rate schedule are required to provide the Minimum
15	DSI Operating Reserve–Supplemental.
16	
17	4.3.1 IP Energy Charge
18	4.3.1.1 IP Energy Rates
19	The IP rate design includes 24 monthly/diurnal energy rates, two for each month, and one each
20	for HLH and LLH. The IP energy rates are shaped using the PFp Melded rates. See
21	Section 4.1.3 above.
22	
23	As described below, IP energy rates are calculated by adjusting the PFp Melded rates by the
24	Value of Reserves (VOR) credit for operating reserves provided by the DSI load, the typical
25	industrial margin, and an REP surcharge. See Power Rates Study Documentation Table 3.1.8.3.

1	The IP energy rates are subject to risk adjustments during the Rate Period pursuant to the Power
2	CRAC; the Power RDC; and the Power FRP Surcharge. See Section 5.2 below. Any
3	adjustments to rates and GRSPs during the rate period due to such risk adjustments will be
4	summarized in GRSP Appendix A. See 2020 Power Rate Schedules and GRSPs,
5	BP-20-A-03-AP02, IP-20, § 2.1.1.3.
6	
7	4.3.1.1.1 IP Adjustment for Value of Reserves Provided
8	A VOR credit is included in the IP rate, as provided in Section 7(c)(3) of the Northwest Power
9	Act. 16 U.S.C. § 839e(c)(3); see Section 2.2.2.5.2 above. The forecast DSI load amount is
10	shown in the Power Loads and Resources Study, BP-20-FS-BPA-03, § 2.4. Based on provisions
11	of DSI contracts currently in place, these power sales are assumed to provide interruption reserve
12	rights (operating reserves) to BPA, and therefore the IP rate includes a VOR credit.
13	
14	The first step for valuing operating reserves provided by DSIs is to determine a marginal price
15	for these reserves. Because the DSI-supplied reserves are used to meet BPA's reserve
16	obligations, the cost of Operating Reserves-Supplemental service is used to establish the
17	marginal value.
18	
19	The second step in valuing the DSI reserves is to determine the quantity of reserves provided.
20	To calculate this quantity, the total DSI load is reduced to account for wheel-turning load that
21	cannot be curtailed. The wheel-turning load is forecast to be 0 aMW. The interruption reserves
22	provided are 10 percent of the remaining DSI load (12 MW), or 1.2 aMW.
23	
24	The VOR credit included in the IP-20 rate is 0.967 mills/kWh. See Power Rates Study
25	Documentation, BP-20-FS-BPA-01A, Table 2.4.1 for calculation of the value of DSI reserves.
26	

1	4.3.1.1.2 IP Rate Typical Margin
2	Another component of the IP rate is the typical margin, as provided in Section 7(c)(2) of the
3	Northwest Power Act. 16 U.S.C. § 839e(c)(2); see Section 2.2.2.5.2 above. The typical margin
4	is based generally on the overhead costs that COUs add to the cost of power in setting their retail
5	industrial rates. The typical margin included in the IP-20 rate is 0.788 mills/kWh. The typical
6	margin is calculated in Appendix A.
7	
8	4.3.1.1.3 REP Surcharge
9	The final component of the IP rate is the REP Surcharge. Section 7(b)(3) of the Northwest
10	Power Act provides that the cost of 7(b)(2) rate protection afforded to preference customers must
11	be allocated to all other power sold, which includes power sold at the IP rate. 16 U.S.C.
12	§§ 839e(b)(2)-(3); see Section 2.2.2.3 above. The cost of rate protection allocated to the IP rate
13	is determined pursuant to the 2012 REP Settlement and is included in the IP-20 rate. See Power
14	Rates Study Documentation, BP-20-FS-BPA-01A, Table 2.4.14, for calculation of the REP
15	surcharge.
16	
17	4.3.1.2 IP Energy Charge Billing Determinant
18	The customer-specific energy billing determinant is the Energy Entitlement specified in the
19	customer's contract.
20	
21	4.3.2 IP Demand Charge
22	The demand rates for the IP rate schedule are equal to the PFp Demand rates described in
23	Section 4.1.1.2 above. As with the PFp Demand charge, the IP demand billing determinant is
24	applied to only a portion of the DSI peak demand placed on BPA. The IP demand billing
25	determinant in each billing month is equal to a DSI's highest HLH schedule, or metered amount,
26	minus the average HLH schedule amount, or metered amount, less any applicable Industrial
27	Demand Adjuster. The Industrial Demand Adjuster is a monthly demand (expressed in

1	kilowa	atts) that is subtracted from the hourly peak schedule amount when calculating the IP
2	deman	nd billing determinant. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,
3	IP-20,	§ 2.2.2.
4		
5	4.4	Firm Power and Surplus Products and Services (FPS-20) Rate
6	Produc	cts and services available under the FPS rate schedule are listed in the next paragraph and
7	descril	bed in the FPS-20 rate schedule. Sales under this rate schedule are discretionary; BPA is
8	not ob	ligated to sell any of these products, even if such sales will not displace PF, NR, or IP
9	sales.	Products priced under the FPS-20 rate schedule may be sold at market-based or negotiated
10	rates,	which may have a demand component, an energy component, or both. Rates and billing
11	determ	ninants for the products and services sold under the FPS rate schedule are either specified
12	by BP	A or mutually agreed upon by BPA and the customer. See 2020 Power Rate Schedules
13	and G	RSPs, BP-20-A-03-AP02, FPS-20.
14		
15	When	available for use within and outside the Pacific Northwest, the FPS-20 rate schedule has
16	eight c	categories of products and services:
17	1.	Firm Power (capacity and/or energy), including secondary energy or firm capacity.
18	2.	Capacity Without Energy: stand-alone capacity products.
19	3.	Energy shaping services.
20	4.	Reservations and rights to change services: reservations of power and services, when
21		available, and the rights to change sales and services.
22	5.	Reassignment or remarketing of surplus transmission capacity: Power Services may
23		reassign or remarket its surplus transmission capacity that has been purchased from a
24		transmission provider, including BPA's Transmission Services, consistent with the terms
25		of the transmission provider's Open Access Transmission Tariff.
26	6.	Other capacity, energy, and power scheduling products and services, as available.

1	7. Services for non-Federal resources:
2	a. Transmission Scheduling Service and Transmission Curtailment Management
3	Service, Section 5.6.1.5 below and 2020 Power Rate Schedules and GRSPs,
4	BP-20-A-03-AP02, GRSP II.I.5.
5	b. Forced Outage Reserve Service, Section 5.6.1.4 below and 2020 Power Rate
6	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.I.4.
7	c. Resource Remarketing Service, Section 5.6.1.8 below and 2020 Power Rate
8	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.I.7.
9	d. Unanticipated Load Service, Section 5.10 below and 2020 Power Rate Schedules
10	and GRSPs, BP-20-A-03-AP02, GRSP II.M.4.
11	See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, FPS-20.

23	
24	
25	
26	

1	5. GENERAL RATE SCHEDULE PROVISIONS
2	
3	The General Rate Schedule Provisions (GRSPs) describe the adjustments, charges, and special
4	rate provisions applicable to BPA's rate schedules. The GRSPs also define the power products
5	and services BPA offers and other applicable terms. The GRSPs described in this section are
6	presented in their entirety in the 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,
7	GRSPs.
8	
9	5.1 RHWM Tier 1 System Capability
10	The Rate Period High Water Mark Tier 1 System Capability (RT1SC) is determined in the
11	RHWM Process outside the rate proceeding, as described in Section 1.4 above and the TRM,
12	BP-12-A-03, Section 4.2.1.
13	
14	As described in Section 4.1.1.3.2 above, BPA uses the monthly/diurnal shape of RT1SC and the
15	resulting System Shaped Load in developing the billing determinant for the Load Shaping
16	charge. The billing determinant for the Load Shaping charge is the difference between a
17	customer's actual load served at Tier 1 rates and the customer's annual load used to calculate its
18	TOCA reshaped into the monthly/diurnal shape of RT1SC. The monthly/diurnal RT1SC values
19	for the FY 2020–2021 rate period are shown in the 2020 Power Rate Schedules and GRSPs,
20	BP-20-A-03-AP02, GRSP II.A, Table A.
21	
22	5.2 Risk Adjustments
23	5.2.1 Power Cost Recovery Adjustment Clause (Power CRAC)
24	For each year of the rate period, the Power CRAC may result in an upward rate adjustment to
25	respond to the financial circumstances BPA experiences before it can conduct a Section 7(i) rate
26	proceeding to adjust its rates. If stated conditions are met, the CRAC will trigger, and a rate
27	increase will go into effect for the period of December 1 through September 30 of the applicable

1	year. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.O, and Power
2	and Transmission Risk Study, BP-20-FS-BPA-05, § 4.2.
3	
4	5.2.2 Power Reserves Distribution Clause (Power RDC)
5	For each year of the rate period, the Power RDC may result in a reduction in Power's reserves as
6	financial reserves are used to further Power's objectives such as debt reduction, incremental
7	capital investment, rate reduction through a Power Dividend Distribution (Power DD), a
8	distribution to customers, or any other Power-specific purposes determined by the Administrator
9	The RDC will trigger if (1) financial reserves attributed to Power exceed a defined threshold, and
10	(2) BPA's financial reserves exceed a defined threshold. If the RDC triggers, the Administrator
11	will determine what part of the RDC Amount will be devoted to the Power objectives noted
12	above. If reserves are allocated to a Power DD, the resulting rate decrease will go into effect for
13	the period of December 1 through September 30 of the applicable year. See 2020 Power Rate
14	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.P, and Power and Transmission Risk Study,
15	BP-20-FS-BPA-05, § 4.2.
16	
17	5.2.3 Power Financial Reserves Policy (Power FRP) Surcharge
18	For each year of the rate period, the Power FRP Surcharge may result in an upward adjustment to
19	certain rates to increase financial reserves when reserves are below the lower threshold for
20	Power. See Power and Transmission Risk Study, BP-20-FS-BPA-05, § 4.2. If stated conditions
21	are met, the Power FRP Surcharge will trigger, and a rate increase will go into effect for the
22	period of December 1 through September 30 of the applicable year. See id., Appendix A (FRP)
23	and § 4.2.2; and 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.Q.
24	
25	

1	5.3 Slice True-Up Adjustment
2	Slice customers pay their share of BPA's actual costs. Therefore, Slice customers are subject to
3	an annual Slice True-Up Adjustment for expenses, revenue credits, and adjustments allocated to
4	the Composite cost pool and the Slice cost pool. See Section 7 and the 2020 Power Rate
5	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.R.
6	
7	5.4 Discounts and Other Adjustments
8	5.4.1 Low Density Discount (LDD)
9	Pursuant to Section 7(d)(1) of the Northwest Power Act, the LDD is a rate discount for
10	customers with low system densities that meet the criteria specified in the 2020 Power Rate
11	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.B. 16 U.S.C. § 839e(d)(1). As set forth in
12	the TRM, LDD percentages are calculated to provide a discount on power purchased at Tier 1
13	rates that approximates the discount the customer would have received under non-tiered rates.
14	LDD credits for FY 2020 and FY 2021 are listed below in Table 4, Line 9.
15	
16	5.4.2 Irrigation Rate Discount (IRD)
17	The IRD is a discount to the PFp Tier 1 rates for eligible irrigation load served by customers. An
18	irrigation credit is available to customers with eligible irrigation load as set forth in Exhibit D of
19	the customers' CHWM Contracts. The amount of irrigation credit a customer will receive on its
20	monthly bills during the irrigation season is based on the lesser of the customer's actual Tier 1
21	energy purchase and the eligible irrigation load amounts in the customer's CHWM Contract.
22	The discount will appear as a credit on customers' bills to offset Tier 1 charges for eligible
23	irrigation loads. This discount is available to eligible loads during May, June, July, August, and
24	September during the BP-20 rate period. See 2020 Power Rate Schedules and GRSPs,
25	BP-20-A-03-AP02, GRSP II.C. IRD credits for FY 2020 and FY 2021 are listed below in
26	Table 4, Line 8.

1	5.4.2.1 Irrigation Rate Discount True-Up and Reimbursement
2	At the end of each irrigation season, each customer with eligible irrigation load will provide to
3	BPA its measured May-through-September irrigation load amounts, which will be used to
4	determine if a true-up and reimbursement to BPA is applicable. If BPA determines that the
5	measured irrigation load amounts are less than the billed irrigation load amounts, then the
6	purchaser must reimburse BPA for the excess IRD credits. Excess IRD credits are calculated as
7	the IRD rate multiplied by the difference between the billed irrigation load and the measured
8	irrigation load. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.C.3.
9	
10	5.4.2.2 Calculation of the Irrigation Rate Discount
11	The TRM establishes the method for calculating the IRD. The process begins with a fixed
12	Irrigation Rate Mitigation Program (IRMP) percentage of 37.06 percent. See TRM, BP-12-A-03,
13	§ 10.3, and BP-12 Power Rates Study Documentation, BP-12-FS-BPA-01A, Table 3.12.
14	
15	The IRMP percentage is multiplied by the sum of the forecast revenue that irrigation loads will
16	pay through the Composite customer charge, Non-Slice customer charge, and Load Shaping
17	charge, adjusted for any applicable Low Density Discount, divided by the sum of the irrigation
18	loads (expressed in megawatthours) to derive a dollars-per-megawatthour discount. The
19	applicable LDD is calculated as the weighted average LDD of eligible irrigation customers,
20	weighted with eligible irrigation loads. See Power Rates Study Documentation,
21	BP-20-FS-BPA-01A, Table 5.1 for the calculation of the applicable LDD.
22	
23	Forecast revenue for irrigation loads is calculated using an IRD TOCA derived by dividing the
24	sum of the irrigation loads (expressed in average megawatts) by the sum of all RHWMs. The
25	IRD TOCA is applied consistent with TRM Section 5 for calculation of forecast irrigation
26	revenues from the Composite customer charge, Non-Slice customer charge, and Load Shaping

1	charge. The calculation is shown in the Power Rates Study Documentation,
2	BP-20-FS-BPA-01A, Table 2.3.3.1.
3	
4	5.4.3 Demand Rate Billing Determinant Adjustment
5	As described in GRSP II.D, in two limited circumstances BPA may reduce an unusually high
6	demand charge billing determinant and provide some demand billing relief to a customer. See
7	2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
8	
9	First, when a customer's loads differ significantly from one part of the month to another, the
10	customer may experience overall low average HLH energy use, relatively high customer system
11	peak, and a resulting high demand billing determinant. In this situation, BPA may adjust the
12	billing determinant by calculating partial-month billing determinants and use the higher of the
13	two (or more) partial-month billing determinants for the entire billing month. Example loads
14	include large industrial or irrigation loads that occur during only a part of a month.
15	
16	Second, when an Uncontrollable Force outage occurs on a customer's system, the restoration of
17	service may result in a spike in usage, called a recovery peak. BPA may reduce the customer's
18	system peak established by a recovery peak to the next highest peak of the month and thereby
19	reduce that month's billing determinant.
20	
21	5.4.4 Load Shaping Charge True-Up Adjustment
22	As noted in TRM Section 5.2.4, at the end of each fiscal year BPA will calculate the Load
23	Shaping Charge True-Up for each Load Following customer. The purpose of the true-up is to
24	avoid charging or crediting the market-based Load Shaping rate for energy within the customer's
25	RHWM rather than charging or crediting the cost-based Tier 1 rate for that energy. BPA applies
26	the true-up when a Load Following customer's TOCA Load or Actual Annual Tier 1 Load is less

1	than its RHWM. The Load Shaping True-Up rate is the difference between (1) the Non-Slice
2	load-weighted average of the Load Shaping rates, and (2) the Composite Customer rate plus the
3	Non-Slice Customer rate, converted to mills per kilowatthour. The process for calculating the
4	Load Shaping True-Up Adjustment is shown in TRM, BP-12-A-03, Section 5.2.4; Power Rates
5	Study Documentation, BP-20-FS-BPA-01A, Table 3.1.8.5; and the 2020 Power Rate Schedules
6	and GRSPs, BP-20-A-03-AP02, GRSP II.E.
7	
8	5.4.4.1 Special Implementation Provision for Load Shaping True-Up
9	The Load Shaping True-Up Adjustment includes a special implementation provision that applies
10	if two conditions are met: (1) a customer has Above-RHWM Load, and (2) the customer has
11	unused RHWM. If these conditions are met, the customer may be eligible for a Load Shaping
12	True-Up credit in addition to the one described above. The amount of the additional Load
13	Shaping True-Up credit depends on a second calculation. See 2020 Power Rate Schedules and
14	GRSPs, BP-20-A-03-AP02, GRSP II.E.3.
15	
16	The special implementation provision was originally designed to solve a transitional
17	implementation issue caused by setting Above-RHWM Load based on a forecast different from
18	the one used to determine a customer's TOCA. This provision also has a longer-term
19	application, because Above-RHWM Load is determined in the RHWM Process (prior to the
20	Initial Proposal of each rate proceeding), and the calculation of a customer's TOCA occurs in the
21	Final Proposal. A consequence of using forecasts prepared at different times is the possibility
22	that a customer could have both Above-RHWM Load and unused RHWM.
23	
24	5.4.5 Tier 2 Rate Transmission Curtailment Management Service Adjustment
25	The Tier 2 rate schedule includes an adjustment for TCMS-related costs. This adjustment will
26	recover the cost BPA incurs as a result of a transmission event—either a planned transmission

1	outage or a transmission curtailment. The event would occur along the transmission path used to
2	deliver energy associated with power purchases for the Tier 2 cost pools; that is, it would occur
3	between the Point of Receipt and the Point of Delivery. The adjustment is described in the 2020
4	Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.F.
5	
6	5.4.6 TOCA Adjustment
7	For each customer purchasing Firm Requirements Power under a CHWM Contract, a TOCA for
8	each year of the rate period is calculated in the BP-20 7(i) process. A Load Following
9	customer's TOCA for a fiscal year may be adjusted (1) to account for a significant change in the
10	customer's total load, and (2) within a fiscal year due to a change to the customer's Existing
11	Resource amounts within the same fiscal year, as detailed in the 2020 Power Rate Schedules and
12	GRSPs, BP-20-A-03-AP02, GRSP II.G.1. A Slice/Block or Block customer's TOCA may be
13	adjusted (1) for a fiscal year as part of the CHWM Contract annual Net Requirement process,
14	and (2) within a fiscal year due to a change to the customer's Specified Resource amounts within
15	the same fiscal year, as detailed in the 2020 Power Rate Schedules and GRSPs,
16	BP-20-A-03-AP02, GRSP II.G.2. Additionally, a customer's TOCA may be modified for a
17	fiscal year or within a fiscal year if the customer's CHWM and associated RHWM have changed
18	due to load annexations between customers with CHWM Contracts.
19	
20	5.4.7 DSI Reserves Adjustment
21	In the event BPA agrees to acquire an additional reserve product from a DSI, this provision
22	(1) establishes the mechanism through which BPA compensates the DSI, and (2) places a cap on
23	the unit price of any supplemental operating reserve product to be purchased to ensure that the
24	reserve acquisition is cost-effective. See 2020 Power Rate Schedules and GRSPs,
25	BP-20-A-03-AP02, GRSP II.H.
26	

1	5.5 Conservation Surcharge
2	Section 7(h) of the Northwest Power Act states that BPA may apply to rates a surcharge
3	recommended by the Northwest Power and Conservation Council pursuant to Section 4(f)(2)
4	of the Act. 16 U.S.C. §§ 839e(h), 839b(f)(2). BPA does not currently anticipate applying such a
5	surcharge in the FY 2020–2021 rate period. See 2020 Power Rate Schedules and GRSPs,
6	BP-20-A-03-AP02, GRSP II.U.
7	
8	5.6 Resource Support Services and Related Services
9	BPA offers services to support resources under the PF, NR, and FPS rate schedules. These
10	services are designed to support non-Federal resources; however, there are situations for
11	ratemaking purposes where these services are used to financially flatten Federal resources.
12	See Section 3.2.3.1.3 above. The RSS rates relevant to the PFp rate schedule include:
13	Diurnal Flattening Service Charges
14	Resource Shaping Charge and Resource Shaping Charge Adjustment
15	Secondary Crediting Service Charges
16	Grandfathered Generation Management Service Reservation Fee
17	
18	The RSS and related service rates relevant to the NR rate schedule for NLSLs include:
19	NR Energy Shaping Service Charges
20	NR Resource Flattening Service Charge
21	The RSS and related rates relevant to the FPS rate schedule include:
22	Forced Outage Reserve Service Charges
23	Transmission Scheduling Service Charges
24	Transmission Curtailment Management Service Charges
25	Resource Remarketing Service Credits
26	

1	Forecast revenue from RSS and related services is used to credit Tier 1 cost pools. See Power
2	Rates Study Documentation, BP-20-FS-BPA-01A, Tables 3.2 and 3.7.
3	
4	5.6.1 Resource Support Services and Transmission Scheduling Service
5	5.6.1.1 Diurnal Flattening Service (DFS)
6	DFS is an optional service that financially converts the output of a variable, non-dispatchable
7	non-Federal resource to an equivalent flat amount of power within each diurnal period of a
8	month. When DFS charges are coupled with Resource Shaping Charges, the variable output of a
9	generating resource is financially converted to a flat annual block of power. DFS applies to any
10	non-Federal resource the customer applies to its load and any portion of the resource remarketed
11	by BPA.
12	
13	The RSS module of RAM2020 calculates a unique set of rates and charges for each resource to
14	which DFS is applied. Included in Power Rates Study Documentation, BP-20-FS-BPA-01A,
15	Table 3.11 are the final rates and charges calculated for customers that have requested DFS for
16	their resources. PF-20 rate schedule Sections 5.1 and 5.2 describe the general rate application of
17	the DFS-related charges. GRSP II.I includes DFS rates and Resource Shaping Charges. See
18	2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
19	
20	DFS charges include the following elements:
21	A DFS capacity charge based on the PFp Tier 1 Demand rate applied to the difference
22	between the calculated firm capacity of the resource and the planned average HLH
23	generation of the resource. This charge reflects the costs of reserving an amount of
24	capacity to smooth the variable generation of a resource into a flat block of power.
25	A DFS energy charge based on the potential cost of storing and releasing power using a

resource capable of storing energy (pumped storage) to balance the hourly shape of the

26

i	
1	resource to which DFS is applied. This charge reflects the costs of energy storage to
2	smooth the hourly generation variation into a flat monthly/diurnal block of power.
3	
4	When DFS is applied to a resource, the Resource Shaping Charges and Adjustment must be
5	added to the DFS charges to complete the financial conversion to a flat annual block of power.
6	See Sections 5.6.1.2–3 below.
7	
8	Typically, the RSS module of RAM2020, which computes resource-specific RSS rates, will use
9	scheduled amounts for resources that require e-Tags and meter amounts for "behind-the-meter"
10	resources. However, for small resources or small shares of a resource, BPA may apply a meter
11	amount instead of a schedule amount for purposes of pricing RSS if the meter amount produces
12	lower RSS rates and charges.
13	
14	5.6.1.1.1 DFS Energy Charge
15	A unique DFS energy rate is developed for each resource to which DFS is applied. The purpose
16	of this rate is to reflect the potential cost of storing and releasing energy to offset the hourly
17	variability of the resource's Exhibit D amounts. The DFS energy billing determinant is the total
18	actual generation. The DFS energy charge, GRSP II.I.1(a), is the product of multiplying the DFS
19	energy rate by the DFS energy billing determinant for each month. See 2020 Power Rate
20	Schedules and GRSPs, BP-20-A-03-AP02, GRSPs. Power Rates Study Documentation,
21	BP-20-FS-BPA-01A, Table 3.11 shows the DFS energy rates for the individual resources.
22	
23	5.6.1.1.2 DFS Capacity Charge
24	The DFS capacity charge is a fixed monthly amount calculated as noted in GRSP II.I.1(b)(3) and
25	is based on the monthly PF Tier 1 demand rates, monthly planned amounts in Exhibit D, and the

1 calculated monthly firm capacity of the resource. See 2020 Power Rate Schedules and GRSPs, 2 BP-20-A-03-AP02, GRSPs. 3 4 The RSS module of RAM2020 calculates the monthly firm capacity amounts for each resource. 5 This calculation represents the lowest level of historical generation in an HLH period for each 6 month after accounting for planned and forced outages. The firm capacity of a resource is 7 the percentile of the forced outage rating calculated from the historical monthly HLH generation 8 levels. For example, a resource with a 5 percent forced outage rating would have a firm capacity 9 amount equal to the 5th percentile of the hourly historical generation amounts for the HLH 10 period of a month. 11 12 Each type of generating resource has a standard forced outage rating. This rating represents the 13 average percentage of time that a generating resource is unavailable for load service due to 14 unanticipated breakdown. BPA uses a minimum 5 percent forced outage rating for hydroelectric 15 resources, 7 percent for thermal resources, and 10 percent for all other resources. Customers 16 taking services that have charges including the use of a forced outage rating may request that 17 BPA increase the forced outage rating for their resource, and those with a resource other than a 18 hydroelectric resource may request that BPA decrease the forced outage rating to as low as 19 7 percent. 20 21 The monthly calculated HLH firm capacity of the resource also includes a planned outage 22 adjustment. If the historical hourly data reflects an outage that was planned, the model does a 23 second calculation of the monthly firm capacity amount. This test runs the same calculation as 24 above but calculates the value approximately equal to the forced outage percentile of an hourly 25 sample that does not include the hours that were identified as a planned outage. If the number of 26 planned outage hours is less than 25 percent of the HLH in the month, no further adjustments are

ı	
	made to the value calculated by the planned outage calculation of firm capacity. If the number of
	planned outage hours is equal to 25 percent or more of the HLH in the month but less than
	75 percent of the hours in the month, the planned outage adjusted firm capacity value is reduced
	by multiplying it by one minus the percentage of planned outage hours in the month. If the
	number of planned outage hours in the month is equal to or greater than 75 percent of the HLH
	in the month, the firm capacity of the resource in that particular month is set to zero.
	Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 3.11 shows the individual DFS
	capacity charges that are calculated for the individual resources to which DFS is applied.
	5.6.1.2 Resource Shaping Charge (RSC)
	The purpose of the RSC, GRSP II.I.2.(a), is to reflect the value of buying and selling flat
	monthly/diurnal blocks of power in the market to convert a diurnally flat resource within the
	month into one that, on a planned basis, is flat across the year. See 2020 Power Rate Schedules
	and GRSPs, BP-20-A-03-AP02, GRSPs. The Resource Shaping rates are set equal to the PFp
	Tier 1 Load Shaping rates, which represent a proxy market price. On a monthly basis the RSC
	can be a charge or a credit. The flat monthly RSCs are shown in Power Rates Study
	Documentation, BP-20-FS-BPA-01A, Table 3.11, for individual resources.
	For Small, Non-Dispatchable Resources (as defined in the CHWM Contract), the RSC will not
	apply. The actual generation amounts of these resources will be used in the calculation of the
	Actual Monthly/Diurnal Tier 1 Load when calculating the PFp Tier 1 Load Shaping charge and
	Demand charge.

1	5.6.1.3 Resource Shaping Charge Adjustment
2	The purpose of the RSC Adjustment, GRSP II.I.2(b), is to capture the cost or value of the energy
3	differences between the Exhibit D amounts and the actual generation of the resource. See 2020
4	Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs. This adjustment is a true-up of
5	the RSC and completes the financial conversion to a flat annual block of power by making up for
6	any energy cost differences between planned and actual generation amounts. The RSC
7	Adjustment can result in either a charge or a credit.
8	
9	5.6.1.4 Forced Outage Reserve Service (FORS)
10	FORS in GRSP II.I.4 is an optional service for BPA to provide an agreed-upon amount of
11	capacity and energy to a customer with a qualifying resource that experiences a forced outage.
12	See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs. FORS is offered under
13	the FPS rate schedule to customers with resources that meet requirements specified in the
14	CHWM Contract.
15	
16	The charges for FORS are intended to reflect the cost of BPA (1) reserving capacity to back up a
17	resource as insurance to cover a potential forced outage, and (2) providing replacement energy
18	should a forced outage occur.
19	
20	The FORS charges include the following elements:
21	A FORS Capacity charge based on the PFp Tier 1 Demand rate, the calculated firm
22	capacity of the resource for customers whose resource is also taking DFS, and the forced
23	outage rating for the applicable resource. Power Rates Study Documentation,
24	BP-20-FS-BPA-01A, Table 3.11 shows the FORS Capacity charges calculated for each
25	resource. The calculations regarding firm capacity and forced outage ratings are
26	described above in Section 5.6.1.1.2. Additionally, the firm capacity amounts used to

- calculate the FORS Capacity charges may be adjusted to account for planned outages if such planned outages are included in the DFS Capacity charge.
- A FORS Energy charge designed to pass through the cost of replacement energy that
 BPA provides during a customer's forced outage. The energy rate is based on a Mid-C index price under two conditions and the amount of energy supplied during a forced outage event.

Additionally, customers with FORS are limited to a maximum amount of energy provided during a Fiscal Year and a Purchase Period, as defined in the CHWM Contracts. Such Fiscal Year and Purchase Period limits are calculated in the RSS module of RAM2020 and listed in Exhibit D of the customer's CHWM Contract. The Fiscal Year limits are set equal to two times the product of the following: (1) the forced outage rating of the applicable resource, and (2) the sum of the monthly planned amounts in Exhibit D in megawatthours. The Purchase Period limits are set equal to the product of the following: (1) the forced outage rating of the applicable resource; (2) the annual average planned amounts in Exhibit D in megawatthours; and (3) the number of years in the Purchase Period.

5.6.1.5 Transmission Scheduling Service (TSS) and Transmission Curtailment Management Service (TCMS)

TSS is offered under the FPS rate schedule. It is a required service for customers with resources that meet eligibility requirements specified in the CHWM Contract. TSS is a service provided by Power Services to undertake certain scheduling obligations on behalf of the customer. There are two available service levels of TSS: (1) full service (TSS-Full), in which BPA creates e-Tags for a customer's resources or Tier 2 purchases; and (2) partial service (TSS-Partial), in which a customer (or its scheduling agent) creates e-Tags for its non-Federal resources and carbon copies Power Services on each tag. TCMS is an optional service related to TSS that is also offered

under the FPS rate schedule for customers with resources that meet eligibility requirements
specified in the CHWM Contract. TCMS is a feature of TSS (both TSS-Full and TSS-Partial)
under which BPA provides either replacement transmission or replacement energy to customers
with qualifying resources that experience transmission events pursuant to the conditions
specified in Exhibit F of the CHWM Contract.
If a Load Following customer is served by transfer service or is purchasing DFS or SCS services
from BPA, it is required to have the TSS provisions added to its CHWM Contract. However,
only customers that have non-Federal resources requiring e-Tags will be charged for TSS
services. Customers that have one or multiple non-Federal resource(s) requiring e-Tags may
choose either TSS-Full or TSS-Partial for all of their non-Federal resources that require e-Tags.
Load Following customers that are not contractually required to take TSS can elect this optional
service if they wish to have BPA produce the e-Tags for their resources. Without this service,
the customer must supply replacement transmission or power when the resource's transmission
path experiences an outage or curtailment. If it is unable to do so, it may face an Unauthorized
Increase charge. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.N.
Application of TSS to Tier 2 rates is described in Section 3.2.2.2 above. Application of the
TCMS Adjustment to Tier 2 rates is described in Section 5.4.5 above.
5.6.1.5.1 TSS-Full Pricing Summary
The charge for TSS-Full reflects the cost of scheduling a resource to its Point of Delivery. A
unique set of charges will be calculated for each resource to which TSS-Full is applied. The
TSS-Full charges, GRSP II.I.5(a), include the following elements:

1	Power Services produced in FY 2017 and FY 2018. See 2020 Power Rate Schedules and
2	GRSPs, BP-20-A-03-AP02, GRSP II.I.5(a)(3).
3	
4	For Unspecified Resource Amounts serving an NLSL or a 9(c) export decrement obligation, if
5	the annual cost calculated using the TSS rate exceeds \$2,688 when divided by 12, then the
6	monthly charge is capped at \$2,688/month. This cap follows the same methodology applied to
7	Specified Resources and Unspecified Resource Amounts serving Above-RHWM Load but
8	assumes three daily transactions. It is the result of multiplying 90 schedules per month
9	(i.e., three schedules per day on average) by the forecast operations scheduling cost for the rate
10	period, divided by the total number of schedules Power Services produced in FY 2017 and
11	FY 2018. <i>Id</i> .
12	
13	5.6.1.5.3 TSS-Partial Pricing Summary
14	A customer with TSS-Partial takes on all scheduling and tagging functions for its non-Federal
15	resources and is required to carbon copy Power Services on each tag. TSS-Partial charges are
16	based on the staffing time costs that are incurred by BPA when a customer fails to carbon copy
17	BPA on an e-Tag or when BPA provides replacement power or transmission for a resource
18	supported with TCMS. The TSS-Partial charges, GRSP II.I.5(b), include the following
19	elements:
20	
21	A TSS-Partial rate of \$185 per TSS-Partial event, which is based on three hours of BPA
22	Full Time Employee (FTE) staffing time. An average BPA employee costs \$128,000
23	(including benefits) per year, or \$61.50 per hour.
24	A TSS-Partial billing determinant, which is a count of TSS-Partial events that occur
25	within a month. Each of the following is considered a single TSS-Partial event:

5.6.1.5.5 TCMS Charge if Replacement Power is Provided If RPA purchases replacement power during a transmission even

2 | If BPA purchases replacement power during a transmission event for a resource supported by

TCMS, then the TCMS rate will be based on the costs of such purchased power. If BPA does

not make a discrete purchase of replacement power, then the TCMS rate will be based on

Powerdex Mid-C hourly index prices. The hourly index prices are scaled up by 110 percent or

125 percent if the amount of replacement power that BPA supplies meets defined size thresholds.

See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.I.5(c). The thresholds

are based on the bands used in BPA Transmission's Generation Imbalance (GI) and Energy

Imbalance (EI) charges. However, unlike GI and EI, which allow for netting hourly energy

amounts across the month, the bands are used to determine the TCMS charge for each hourly

transmission event and do not include a crediting component.

5.6.1.6 Secondary Crediting Service (SCS)

14 The PF-20 rate schedule includes SCS Charges, GRSP II.I.3, which provide a credit or charge to

a Load Following customer that dedicates its entire share of the output of a hydroelectric

Existing Resource to its load. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,

GRSPs. The customer will receive a credit for the energy produced by that resource in excess of

the monthly/diurnal amounts specified in CHWM Contract Exhibit A. The additional generation

would increase BPA's revenues because of the increased secondary energy BPA can market, or

would lower BPA's costs because of reduced balancing purchases. The customer will receive a

charge for any energy shortfall by the resource from the monthly/diurnal Exhibit A amounts,

because BPA's secondary revenues would be lower or BPA's balancing costs would be higher.

If a customer does not take this service, it must apply the exact Exhibit A amounts to its load

unless the resource is a small, non-dispatchable resource or qualifies for Grandfathered

Generation Management Service.

1	The charges and credits for SCS are intended to reflect the cost or value of reshaping the
2	customer's resource into its Exhibit A amounts. The SCS charges include the following
3	elements:
4	• SCS energy charge or credit, priced at the Resource Shaping rate. See Power Rates Study
5	Documentation, BP-20-FS-BPA-01A, Table 3.11.
6	An Administrative Charge based on the forced outage rating of the hydro resource, the
7	PFp Tier 1 Demand rate, and the monthly HLH Exhibit A amounts.
8	
9	GRSP II.I.3(a) includes the calculation for the SCS Shortfall Energy Charges and Secondary
10	Energy Credits for the individual resources to which SCS is applied. See 2020 Power Rate
11	Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
12	
13	5.6.1.7 Grandfathered Generation Management Service (GMS) Reservation Fee
14	The PF Tier 1 rate includes GMS, which allows a Load Following customer dedicating the entire
15	output of an Existing Resource that received GMS during Subscription to run that resource
16	against its load and offset its Tier 1 load and charges. The only charge specific to GMS is the
17	GMS Reservation Fee, GRSP II.I.6, which is based on the forced outage rating of the applicable
18	resource, the PFp Tier 1 Demand rate, and the resource's firm capacity. See 2020 Power Rate
19	Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
20	
21	5.6.1.8 Resource Remarketing Service (RRS)
22	RRS is available under the FPS rate schedule. It is a service that BPA may make available, at its
23	discretion, to Load Following customers. Under RRS, BPA remarkets non-Federal resources on
24	behalf of customers and provides them with a remarketing credit net of possible remarketing fees
25	for doing so. Further details on RRS are provided in Section 5.7.2.4 below.

1	5.6.2 NR Services for New Large Single Loads (NLSL)
2	5.6.2.1 NR Energy Shaping Service (ESS) for New Large Single Loads
3	The NR-20 rate schedule includes NR ESS. ESS is offered to Load Following customers serving
4	NLSLs with non-Federal resources. ESS is a service provided by BPA to shape the energy
5	provided by customers to the energy needs of NLSLs. This service allows customers some
6	flexibility in the accuracy of meeting the real-time energy needs of NLSLs. This service
7	includes a capacity component and an energy component. The capacity component applies to
8	the amount of capacity that a customer requests BPA to stand ready to provide to the customer's
9	NLSL(s).
10	
11	The ESS charges in GRSP II.J.1 include the following elements:
12	The energy component credits or debits the customer for energy differences between the
13	energy amounts provided by the customer's non-Federal resource serving its NLSL(s)
14	and the customer's measured NLSL(s).
15	• Energy charges can be positive or negative and are determined in a two-step process.
16	The NR ESS Capacity charge is based on the NR demand rate and the amount of capacity
17	the customer requests from BPA for standing ready to serve its NLSL(s).
18	
19	See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs. NR energy rates will
20	apply to any net monthly energy amounts purchased from BPA. The Unauthorized Increase
21	Charge for demand will apply to actual capacity amounts used in excess of the monthly amounts
22	of capacity included in the customer's request to BPA.
23	
24	5.6.2.2 NR Resource Flattening Service (NRFS)
25	The NRFS is applicable to Load Following customers that apply the generation output of a non-
26	dispatchable Specified Resource to a New Large Single Load. This service financially converts,
27	excluding the cost of capacity, the output of a non-dispatchable Specified Resource to the

1	equivalent flat amount of power within each diurnal period of the month. See 2020 Power Rate
2	Schedules and GRSPs, BP-20-A-03-AP02, NR-18 and GRSP II.J.2. The capacity costs of
3	diurnally flattening the resources are excluded from NRFS because this service is offered in
4	conjunction with the ESS service, and the capacity costs are included in that service.
5	The NRFS charges, GRSP II.J.2, include an NRFS energy charge based on the potential cost of
6	storing and releasing power using a resource capable of storing energy (e.g., pumped storage) to
7	balance the hourly shape of the resource. See 2020 Power Rate Schedules and GRSPs,
8	BP-20-A-03-AP02, GRSPs. This charge reflects the costs of energy storage to smooth the
9	hourly generation variation into a flat monthly/diurnal block of power.
10	
11	No customers are forecast to take NRFS during the BP-20 rate period. GRSP II.J.2 includes the
12	calculation for NRFS Energy charges for the individual resources if the NRFS is required. See
13	2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
14	
15	5.7 Resource Remarketing for Individual Customers
16	The Remarketing credit conveys the value BPA receives when it remarkets (1) committed Tier 2
17	purchases in excess of need, and (2) non-Federal resources to which Diurnal Flattening Service
18	applies that are temporarily in excess of need. The excess power is created when commitments
19	to purchase are made prior to establishing need in the RHWM Process. See 2020 Power Rate
20	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.K.
21	
22	5.7.1 Tier 2 Remarketing
23	5.7.1.1 Tier 2 Remarketing for Load Following Customers
24	Section 10 of the CHWM Contract states that a Load Following customer may elect to have BPA
25	remarket its Tier 2 rate purchase amount in the event its Above-RHWM Load as forecast for an
26	upcoming rate period year is less than the sum of its Tier 2 rate purchase amounts and new

1	resource amounts. The Load Following customer must provide BPA notice of such election by
2	October 31 of the year preceding the rate period for which the customer elects to have BPA
3	remarket its Tier 2 purchase amount.
4	
5	5.7.1.2 Tier 2 Remarketing for Slice/Block or Block Customers
6	Section 10 of the CHWM Contract states that a Slice/Block or Block customer may elect to have
7	BPA remarket its Tier 2 rate purchase amount in the event its forecast Net Requirement for the
8	upcoming fiscal year is less than the sum of its RHWM and Tier 2 rate purchase amounts.
9	Notice of such election must be provided by August 31 of each fiscal year for the upcoming
10	fiscal year.
11	
12	5.7.1.3 Calculating the Remarketed Tier 2 Proceeds for Load Following and Slice/Block
13	or Block Customers
14	Section 6.4 of the TRM states that if BPA remarkets a customer's Tier 2 purchase obligation
15	pursuant to the CHWM Contract, BPA will credit the proceeds from the remarketing (net of any
16	remarketing costs) to such customer. The customer must continue to pay for the entire purchase
17	at the appropriate Tier 2 rate.
18	
19	The remarketed Tier 2 proceeds are computed for Load Following customers using
20	(1) the remarketed amount of Tier 2 service (in megawatthours) plus real power losses, and
21	(2) the Remarketing Value determined in accordance with Section 3.2.2.6 above.
22	
23	After notice is provided by a Slice/Block or Block customer, the remarketed Tier 2 proceeds will
24	be computed for that customer using (1) the remarketed amount of Tier 2 service (in
25	megawatthours) plus real power losses, and (2) the flat annual equivalent market price forecast

1	after the time the notice is provided to BPA, for the applicable fiscal year, plus any additional
2	costs incurred by BPA in purchasing power from other entities.
3	
4	The annual remarketing proceeds for each customer are divided by 12 to compute a flat monthly
5	credit that is applied to the customer's bill. No Load Following customers are forecast to have
6	monthly remarketing Tier 2 proceeds for FY 2020 and FY 2021. Slice/Block and Block
7	customers' monthly remarketed Tier 2 proceeds are calculated in the annual Net Requirements
8	process, which occurs after the Section 7(i) process concludes.
9	
10	5.7.2 Non-Federal Resource Remarketing
11	5.7.2.1 Non-Federal Resource with DFS for Load Following Customers
12	Section 10 of the CHWM Contract states that a customer may elect to remove a new non-Federal
13	resource in the event its Above-RHWM Load, as forecast for an upcoming rate period year, is
14	less than the sum of its Tier 2 rate purchase amounts and New Resource amounts. A Load
15	Following customer must provide BPA notice of such election by October 31 of the year
16	preceding the rate period for which the customer elects to remove its new non-Federal resource.
17	Section 10.5 of the CHWM Contract states that BPA shall remarket the amounts of removed
18	resources for which the customer purchases DFS in the same manner BPA remarkets Tier 2 rate
19	purchase amounts. The customer will continue to pay for DFS on the entire resource amount
20	that is applied to load and any portion of the resource remarketed by BPA.
21	
22	5.7.2.2 Non-Federal Resource with DFS for Slice/Block or Block Customers
23	Section 10 of the CHWM Contract states that a customer may elect to remove a new non-Federal
24	resource in the event its forecast Net Requirement for the upcoming fiscal year is less than the
25	sum of its RHWM, Tier 2 rate purchase amounts, and new resource amounts. Notice of such
26	election must be provided by August 31 of each fiscal year for the upcoming fiscal year.

1	Additionally, Slice/Block and Block customers are responsible for remarketing removed new
2	resource amounts unless such resource is supported with DFS. Section 10.9 of the CHWM
3	Contract states that BPA shall remarket the amounts of removed resources for which the
4	customer purchases DFS in the same manner BPA remarkets Tier 2 rate purchase amounts.
5	
6	The customer will continue to pay for DFS on the entire resource amount that is applied to load
7	and any portion of the resource remarketed by BPA.
8	
9	5.7.2.3 Calculating the DFS Remarketing Proceeds for Load Following and Slice/Block or
10	Block Customers
11	The DFS remarketing proceeds are computed for Load Following customers using the
12	Remarketing Value determined in accordance with Section 3.2.2.6 above for the applicable fiscal
13	year. The DFS remarketing proceeds are computed for Slice/Block and Block customers using
14	the flat annual equivalent market price forecast, as determined by BPA after the time the notice
15	to remarket has been received, for the applicable fiscal year, plus any additional costs incurred
16	by BPA in purchasing power from other entities.
17	
18	For each applicable non-Federal resource to which DFS applies, the billing determinant is
19	(1) the customer's total non-Federal resource, less (2) the amount of the customer's non-Federal
20	resource needed to meet Above-RHWM Load, as reflected in the customer's CHWM Contract
21	Exhibit A, when updated.
22	
23	For each resource, the DFS remarketing credit will be the product of multiplying the DFS
24	remarketing rate by the DFS remarketing billing determinant for each applicable year of the rate
25	period. The annual value is divided by 12 to calculate a flat monthly credit. Power Rates Study
26	Documentation, BP-20-FS-BPA-01A, Table 5.2 shows the forecast monthly DFS Remarketing

1	Credits that are calculated for the individual resources to which the DFS remarketing is applied
2	for Load Following customers. Slice/Block and Block customers' DFS remarketing credits are
3	calculated in the annual Net Requirements process, which occurs after the Section 7(i) process
4	concludes.
5	
6	5.7.2.4 Resource Remarketing Service
7	Exhibit D of the CHWM Contract for Load Following customers offers an optional service for
8	customers that have purchased non-Federal resources in anticipation of future need. At the
9	customer's request and with BPA's agreement, BPA will remarket the excess non-Federal
10	resource amounts on the customer's behalf until the customer's need meets or exceeds the
11	non-Federal resource amount. In order to qualify for this service the customer must also request
12	DFS for the non-Federal resource. The DFS charges will be applicable to both the non-Federal
13	resource amounts the customer dedicates to its load and any portion that BPA remarkets on the
14	customer's behalf.
15	
16	5.7.2.4.1 RRS Credits
17	RRS is administered in accordance with GRSP II.I.7 and includes the following components:
18	RRS Rate. For each non-Federal resource, the rate will be based on the Remarketing
19	Value determined in accordance with Section 3.2.2.6.
20	RRS Billing Determinant. The RRS billing determinant will be the annual average
21	megawatt Resource Remarketed Amounts in the customer's CHWM Contract Exhibit D
22	(when updated).
23	• RRS Credit. For each resource, the RRS Credit will be the product of multiplying the
24	RRS rate by the RRS billing determinant for each applicable year of the rate period. The
25	annual value is divided by 12 to calculate a flat monthly credit.

RRS Fee. The fee for providing RRS to customers is determined on a case-by-case basis.

1	See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
2	
3	5.8 Transfer Service
4	About half of BPA's power customers are served by the transmission systems of third parties
5	(entities other than BPA). Under the CHWM Contract, BPA must acquire transmission services
6	from these third-party transmission providers to deliver Federal power to BPA's power
7	customers. This third-party transmission service is commonly referred to as transfer service. For
8	information about transfer service, see Section 6 below and the 2020 Power Rate Schedules and
9	GRSPs, BP-20-A-03-AP02, GRSP II.L.
10	
11	5.9 Rate Payment Options
12	5.9.1 Flexible PF Rate Option
13	The Flexible PF rate option, offered at BPA's discretion, allows PF-20 rates and billing
14	determinants to be modified to accommodate a customer's request to change the way power is
15	charged under the PF-20 rate schedule. See 2020 Power Rate Schedules and GRSPs,
16	BP-20-A-03-AP02, GRSP II.W.
17	
18	5.9.2 Priority Firm Power Shaping Option
19	If requested, BPA will, to the maximum extent practicable while ensuring timely BPA cost
20	recovery, accommodate individual customer requests to reshape charges within each year of the
21	rate period to mitigate adverse cash flow effects on the customer. Such reshaping of charges
22	must recover the same number of dollars on a net present value basis within the fiscal year as
23	would have been recovered without the reshaping. The reshaping of the payments will be agreed
24	upon between BPA and the customer prior to the start of the rate period. See 2020 Power Rate
25	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.X.
26	

1 **5.9.3** Flexible NR Rate Option 2 The Flexible NR rate option, offered at BPA's discretion, allows NR-20 rates and billing 3 determinants to be modified to accommodate a customer's request to change the way power is 4 charged under the NR-20 rate schedule. See 2020 Power Rate Schedules and GRSPs, 5 BP-20-A-03-AP02, GRSP II.Y. 6 7 5.10 **Unanticipated Load Service (ULS)** 8 ULS applies to any request for Firm Requirements Power received after February 1, 2019, that 9 results in an unanticipated increase in a customer's load placed on BPA during the FY 2020-10 2021 rate period. Contractual obligations that result from a request for service under Section 9(i) 11 of the Northwest Power Act also will be considered ULS. 16 U.S.C. § 839f(i). ULS also may 12 apply to a customer that adds load through retail access, including load that was once served by 13 the customer and returns under retail access. See 2020 Power Rate Schedules and GRSPs, 14 BP-20-A-03-AP02, GRSP II.M. 15 16 **5.10.1 PF Unanticipated Load Service** 17 The energy rate is equal to the greater of the following: (1) the rate for the applicable diurnal 18 period in GRSP II.M.2; or (2) the projected market price for the applicable diurnal period 19 calculated after a request for ULS is made. The energy rates in GRSP II.M.2 are equal to the PF 20 Tier 1 Equivalent rates and were determined by taking the greater of (1) the Load Shaping rates, 21 or (2) the PF Tier 1 Equivalent rates. See Section 4.1.1.3.1 above for a description of the Load 22 Shaping rates and Section 5.14 below for a description of the PF Tier 1 Equivalent rates. The PF 23 ULS also includes a demand charge, which uses the PF-20 demand rate. The ULS under the 24 PF-20 rate schedule is specified in GRSP II.M.2. See 2020 Power Rate Schedules and GRSPs,

25

26

BP-20-A-03-AP02, GRSPs.

1 **5.10.2** NR Unanticipated Load Service 2 The energy rate is equal to the greater of (1) the rate for the applicable diurnal period in 3 GRSP II.M.3; or (2) the projected market price for the applicable diurnal period calculated after 4 a request for ULS is made. The energy rates in GRSP II.M.3 are equal to the NR energy rates 5 and were determined by taking the greater of (1) the Load Shaping rates, or (2) the NR energy 6 rates. See Section 4.1.1.3.1 above for a description of the Load Shaping rates and Section 4.2.1 7 above for a description of the NR energy rates. The NR ULS also includes a demand charge, 8 which uses the NR-20 demand rate. The ULS under the NR-20 rate schedule is specified in 9 GRSP II.M.3. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs. 10 11 **5.10.3 FPS Unanticipated Load Service** 12 Under the FPS-20 rate schedule, the Resource Replacement (RR) rate or a projected market price 13 will be applied to Unanticipated Load Service for circumstances that cause an increase in a 14 customer's load placed on BPA not anticipated in the rate case. Such circumstances could 15 include, but are not limited to, delays in the online date of a customer's specified resource for 16 Above-RHWM service; New Specified Resources that are 10 aMW or less and either experience 17 permanent failure during the rate period or fail to come online; and transfer service customers 18 that both (1) cannot secure Firm Network Transmission (NT) from source to sink for their 19 dedicated non-Federal resource to their Above-RHWM Load by the time power deliveries begin 20 under the Regional Dialogue contract, and (2) are expected to face high TCMS charges due to 21 their reliance on Secondary Network Transmission while they pursue Firm Network 22 Transmission. The provision of ULS will be at BPA's sole discretion. 23 24 The energy rate is the greater of (1) the RR rate, and (2) the projected market price calculated 25 after the time when the request for ULS is made. The RR rates are equal to the PF Tier 1 26 Equivalent rates and were determined by taking the greater of (1) the Load Shaping rates, or (2) the PF Tier 1 Equivalent rates. See Section 4.1.1.3.1 above for a description of the Load 27

1	Shaping rates and Section 5.14 below for a description of the PF Tier 1 Equivalent rates. The
2	FPS ULS also includes a demand charge, which uses the demand rate in the PF, NR, and IP rate
3	schedules. The ULS under the FPS-20 rate schedule is specified in GRSP II.M.4. See 2020
4	Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
5	
6	5.11 Unauthorized Increase (UAI) Charges
7	The UAI charge is a penalty charge to customers taking more power from BPA than they are
8	contractually entitled to take. The UAI demand rate is 1.25 times the applicable monthly
9	demand rate. The UAI energy rate is the greater of (1) 150 mills/kWh, or (2) two times the
10	highest hourly Powerdex Mid-C Index price for firm power for the month. See 2020 Power Rate
11	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.N.
12	
13	5.12 Residential Exchange Program Settlement Implementation
14	The 2012 REP Settlement established a fixed stream of financial benefits payable to the IOUs
15	beginning in FY 2012 and ending in FY 2028. These benefits are allocated among the IOUs
16	based on their specific ASCs, PF Exchange rates, and eligible residential and farm loads
17	(Residential Loads). GRSPs II.S and II.T address two issues specific to the implementation of
18	the 2012 REP Settlement. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,
19	GRSPs.
20	
21	Pursuant to the terms of the 2012 REP Settlement, REP Residential Loads are calculated using a
22	two-year monthly average of the IOUs' eligible residential and farm actual loads. The FY 2020
23	and 2021 Residential Load monthly averages for each IOU are provided in Power Rate
24	Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.S, Table H.
25	
26	

1	GRSP II.T addresses the recalculation of the PF Exchange rate in the event of a change to an
2	IOU's ASC. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
3	Calculation of the PF Exchange rate is described in detail in Section 4.1.6 above. The PF
4	Exchange rate calculation is dependent upon, among other factors, the IOUs' Final ASCs. ASCs
5	are determined outside the rate proceeding in an ASC Review Process that BPA conducts
6	pursuant to the 2008 ASC Methodology (ASCM). See ASCM, 18 C.F.R. § 301 et seq. (2008).
7	Forecast ASCs for participating IOUs and participating COUs are used for establishing rates in
8	the Initial Proposal. See Section 8. Final ASCs are determined coincident with the Final
9	Proposal and are incorporated therein. An IOU's Final ASC can change after final rates are set,
10	although such changes are rare. In the event of such a change, the PF Exchange rate must be
11	recalculated for each REP participating utility. GRSP II.T describes the process for such
12	recalculation. See 2020 Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSPs.
13	
14	5.13 Cost Contributions
15	In accordance with Section 7(j) of the Northwest Power Act, BPA provides the approximate cost
16	contributions of different resource categories to BPA's rates for the sale of energy and capacity.
17	16 U.S.C. § 839e(j). The rate schedules also indicate the cost of resources BPA acquires to meet
18	load growth and the relationship of such cost to BPA's average resource cost. See 2020 Power
19	Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.Z.
20	
21	5.14 PF Tier 1 Equivalent Rates
22	For use in contracts that have rates tied to a traditional PF HLH/LLH rate design without tiering,
23	the PFp Tier 1 Equivalent rates consist of 12 HLH Energy rates, 12 LLH Energy rates, and
24	12 Demand rates. The PFp Tier 1 Equivalent Energy rates are equal to the Load Shaping rates
25	less a scalar. The scalar is a single mills/kWh value that adjusts the Load Shaping rates to a level
26	at which the PFp Tier 1 Equivalent Energy rates, in conjunction with the demand revenue, would

1	collect the Tier 1 revenue requirement allocated to the PFp Non-Slice loads (the Composite cost
2	pool plus the Non-Slice cost pool). This mills/kWh value is equivalent to the Load Shaping
3	True-Up rate. This calculation is shown in Power Rates Study Documentation, BP-
4	20-FS-BPA-01A, Table 3.1.8.5. The Demand rates are equal to the Tier 1 Demand rates. The
5	PF Tier 1 Equivalent rates are subject to adjustment during the rate period to reflect the Power
6	CRAC, the Power RDC, and the Power FRP Surcharge. See 2020 Power Rate Schedules and
7	GRSPs, BP-20-A-03-AP02, GRSP II.AA.

26	

1	6. TRANSFER SERVICE
2	
3	6.1 Introduction
4	More than half of BPA's power customers are served by the transmission systems of third
5	parties, that is, entities other than BPA. Under the Regional Dialogue contracts, BPA must
6	acquire transmission services from these third-party transmission providers to deliver Federal
7	power to BPA's power customers. This third-party transmission service is commonly referred to
8	as transfer service.
9	
10	Transfer Service customers may be subject to one or more separate charges from BPA:
11	(1) the Transfer Service Delivery Charge, (2) the Transfer Service Operating Reserve Charge,
12	(3) the Transfer Service Regulation and Frequency Response Charge, and (4) the Transfer
13	Service Regional Compliance Enforcement Charge. See 2020 Power Rate Schedules and
14	General Rate Schedule Provisions (GRSPs), BP-20-A-03-AP02, GRSP II.L. In addition to these
15	charges, transfer service customers are responsible for the cost of any distribution upgrades
16	associated with their respective points of delivery, as provided in the Supplemental Direct
17	Assignment Guidelines. <i>Id.</i> at GRSP I.E. BPA will continue to follow the cost allocation
18	methodology developed in BP-16 for Southeast Idaho Load Service.
19	
20	6.2 Supplemental Guidelines
21	The Supplemental Guidelines for Direct Assignment of Facilities Costs Incurred Under Transfer
22	Agreements address how BPA will recover the costs for facility expansions and upgrades on
23	third-party transmission systems for transfer service customers. The Supplemental Guidelines,
24	in conjunction with the Transmission Services Facility Ownership and Cost Assignment
25	Guidelines, are used to determine whether and in what way specific facility or expansion costs
26	should be assigned to particular transfer service customers. <i>Id.</i> at GRSP I.E.

6.3 Transfer Service Delivery Charge
The Transfer Service Delivery Charge (TSDC) is a charge for low-voltage delivery service of
Federal power provided under non-Federal transmission service agreements over a third-party
transmission system. Id. at GRSP II.L.1. The Transfer Service Delivery Charge applies to
power customers that take delivery at voltages below 34.5 kV unless such costs have been
directly assigned to the specific customer. The Transfer Service Delivery Charge is a dollars-
per-kilowatt rate levied monthly on customer load at the customer's low-voltage points of
delivery (POD) at the time of that customer's system peak. See Power Rates Study
Documentation, BP 20-FS-BPA 01A, Table 6.1. Calculation of the rate is described below.
6.3.1 Transfer Service Delivery Rate Revenue Requirement
The revenue requirement for the Transfer Service Delivery rate is computed by compiling the
total low-voltage distribution, use of facility, and delivery charges paid by Power Services to
third-party transmission providers in each of FY 2017 and FY 2018. Any known changes for the
FY 2020–2021 rate period are added and the average calculated for FY 2017 and FY 2018.
NorthWestern Energy (NorthWestern) is BPA's only third-party transmission provider that does
not charge separately for low-voltage delivery. Instead, NorthWestern rolls all the costs of
low-voltage service into its transmission rate that BPA pays for transfer service. To estimate a
cost for low-voltage delivery services provided by NorthWestern, BPA uses a static value
established for NorthWestern in BP-14 when the TSDC was first implemented.
BPA's total average cost for low-voltage delivery for FY 2017–2018 was \$2,976,214.

1	6.3.2	Trans	sfer Service Delivery Forecast Load	
2	The av	erage (of FY 2017 and FY 2018 customer system peaks is	determined by reviewing
3	customer bills and extracting customer load data for the low-voltage PODs at the time of each			
4	custon	ner's sy	ystem peak. The average of the FY 2017 and FY 20	018 customer system peaks is
5	2,340,	095 kW	V.	
6				
7	6.3.3	Trans	sfer Service Delivery Rate Calculation	
8	To cal	culate t	the Transfer Service Delivery rate for FY 2020–202	21, as shown below, the adjusted
9	FY 2017–2018 average revenue requirement is divided by the average FY 2017–2018 customer			verage FY 2017–2018 customer
10	system	n peak:		
11		Distri	bution, Use-of-Facility, and Low-Voltage Costs:	\$2,976,214
12		BPA	Customer System Peak:	2,340,095kW
13		Trans	fer Service Delivery Rate FY 2020–2021:	\$1.27 per kW/mo.
14				
15	6.4	Trans	sfer Service Operating Reserve Charge	
16	The Ti	ransfer	Service Operating Reserve Charge is designed to c	ompensate BPA for the cost of
17	acquir	ing ope	erating reserves assessed by third-party transmission	n providers and non-BPA
18	balanc	ing aut	horities for service to transfer service customers' lo	pads.
19				
20	Assess	sment c	of the Transfer Service Operating Reserve Charge is	s conditioned on the satisfaction
21	of two	criteria	a:	
22		(1)	BPA serves the power customer by transfer service	ce; and
23		(2)	the transfer service customer is not already paying	g BPA for operating reserves for
24			the customer's load under the ACS-20 rate scheduler	ule.
25				
26	The T	ransfer	Service Operating Reserve rates are the same as the	e ACS-20 rates for operating
27	reserve	es that	BPA charges customers that have load in the BPA	balancing authority area; that is,

1	the Transfer Service Spinning Operating Reserve rate is equal to the ACS-20 Operating
2	Reserve – Spinning Reserve Service rate, and the Transfer Service Supplemental Operating
3	Reserve Charge is equal to the ACS-20 Operating Reserve – Supplemental Reserve Service rate
4	The monthly billing determinant for both Transfer Service Operating Reserves charges is the
5	amount of the customer's metered load served by transfer (non-BPA balancing authority area
6	load).
7	
8	To compute a revenue forecast for these charges, the forecast Total Retail Load of BPA
9	customers served under Transfer Service is aggregated for each Transfer Service provider.
10	These loads are responsible for operating reserves charges (spinning and supplemental) and are
11	applied to transfer service customers in the same manner as operating reserves are applied to
12	directly connected customers under ACS-20. See Power Rates Study Documentation,
13	BP-20-FS-BPA-01A, Table 6.1.
14	
15	6.5 Transfer Service Regulation and Frequency Response Charge
16	The Transfer Service Regulation and Frequency Response Charge is designed to compensate
17	BPA for the cost of acquiring regulation and frequency response service assessed by third-party
18	transmission providers and non-BPA balancing authorities for service to transfer service
19	customers' loads. Although this cost has been billed to transfer customers under the FPS rate
20	schedule, customers will now be billed under the PF rate schedule. 2020 Power Rate Schedules
21	and GRSPs, BP-20-A-03-AP02, GRSP II.L.3.
22	
23	Assessment of the Transfer Service Regulation and Frequency Response Charge is conditioned
24	on the satisfaction of two criteria:
25	(1) BPA serves the power customer by transfer service; and

1	(2) the transfer service customer is not already paying BPA for regulation and
2	frequency response for the customer's load under the ACS-20 rate schedule.
3	The Transfer Service Regulation and Frequency Response rate is the same as the ACS-20 rate
4	for regulation and frequency response that BPA charges customers with load in the BPA
5	balancing authority area; that is, the Transfer Service Regulation and Frequency Response rate is
6	equal to the ACS-20 Regulation and Frequency Response rate. The monthly billing determinant
7	for the Transfer Service Regulation and Frequency Response charge is the amount of the
8	customer's metered load served by transfer (non-BPA balancing authority area load).
9	
10	To compute a revenue forecast for these charges, the forecast Total Retail Load of BPA
11	customers served under Transfer Service is aggregated for each Transfer Service provider.
12	These loads, 11,911,672 MWh, are multiplied by the ACS-20 Regulation and Frequency
13	Response rate of 0.49 mills per kilowatthour. The resulting revenue forecast for the Transfer
14	Service RFR rate is \$5,836,719 per year. See Power Rates Study Documentation,
15	BP-20-FS-BPA-01A, Table 6.1.
16	
17	6.6 Transfer Service Regional Compliance Enforcement Charge
18	The Transfer Service Regional Compliance Enforcement Charge applies to all transfer service
19	customer loads located outside of the BPA balancing authority area. The Transfer Service
20	Regional Compliance Enforcement Charge is a separate stand-alone charge.
21	
22	6.6.1 Background on Regional Compliance Enforcement Charge
23	The Regional Compliance Enforcement Charge recovers costs associated with funding the
24	Electric Reliability Organization, which is the North American Electric Reliability Corporation
25	(NERC), and the Regional Entity, which is the Western Electricity Coordinating Council
26	(WECC). WECC develops and assesses a charge to loads located in balancing authority areas

1	within the Western Interconnection to support its regional operations. The charge is based on a
2	Net Energy for Load (NEL) value, which includes all loads within a balancing authority area,
3	including system losses. Each balancing authority submits its NEL to WECC yearly. WECC
4	adds the NEL amounts for all balancing authority areas to identify a total NEL for all loads in the
5	Western Interconnection. The annual revenue requirement for WECC is then divided by the
6	total NEL to establish a \$/MWh assessment.
7	
8	6.6.2 Regional Compliance Enforcement Assessment
9	The Regional Compliance Enforcement Charge is assessed to the individual loads identified in
10	the NEL data submitted by the balancing authority areas. The format of each balancing authority
11	area's NEL submission to WECC varies across the region; for example, some balancing
12	authority areas identify each individual customer load in their NEL submissions, including both
13	native and non-native load. In the past, for these balancing authority areas WECC would issue
14	an invoice to each customer for WECC charges. Other balancing authority areas identify and
15	submit single load quantities for their balancing authority areas, with no differentiation between
16	native and non-native loads. In these instances, the balancing authority area receives a single
17	invoice from WECC for all loads in the balancing authority area. BPA's transfer service
18	customer loads are located in balancing authority areas that report in both manners.
19	
20	6.6.3 BPA's Transfer Services Regional Compliance Enforcement Charge
21	For FY 2020–2021, WECC will bill Power Services for all NEL quantities reported by the
22	balancing authority areas that are associated with transfer service customer loads outside the
23	BPA balancing authority area. BPA will recover this billed amount from all transfer service
24	customer loads located outside of the BPA balancing authority area through the Transfer Service

Regional Compliance Enforcement Charge, regardless of how each balancing authority area

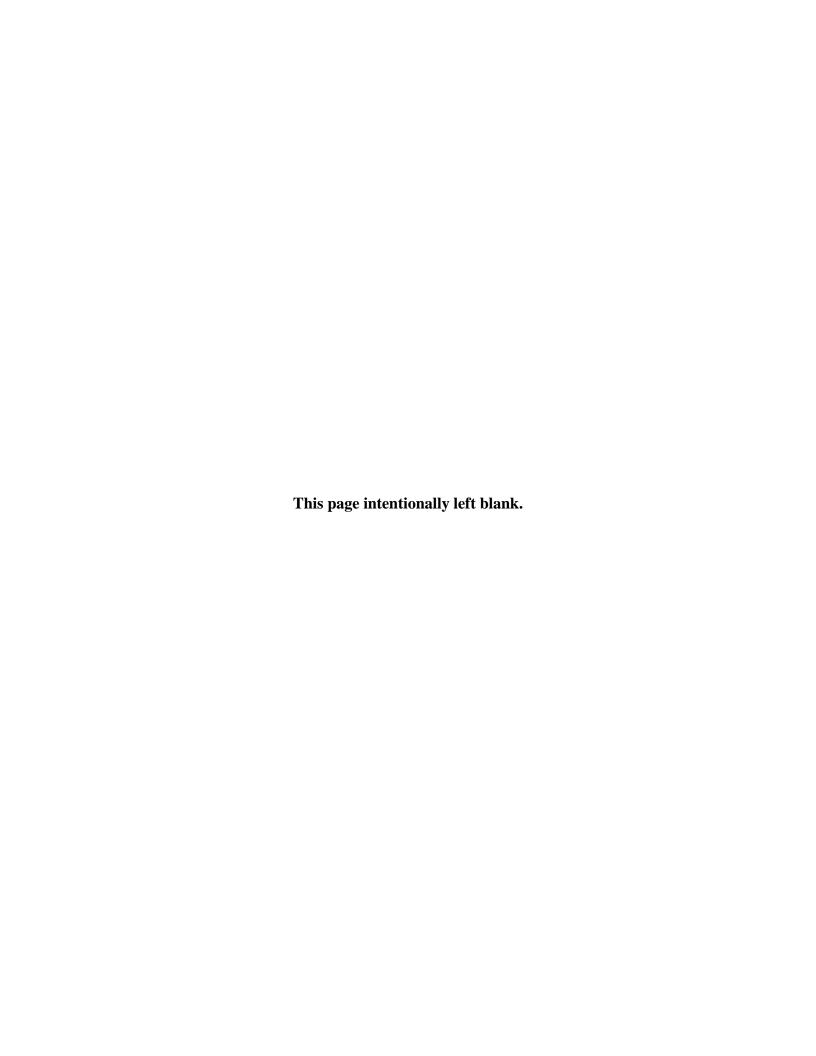

reports the transfer service customer's load in its NEL submission.

25

1	6.6.4 Regional Compliance Enforcement Charge
2	6.6.4.1 Regional Compliance Enforcement Revenue Requirement
3	To forecast the BPA revenue requirement for the Transfer Service Regional Compliance
4	Enforcement rate, total NEL reported to WECC is computed for BPA transfer service customer
5	loads outside BPA's balancing authority area. The 2018 WECC NEL assessment list is used to
6	identify specific transfer service customers by name, their corresponding NEL amounts, and
7	NEL amounts associated with only BPA by the reporting balancing authority areas. All of these
8	NEL amounts are then summed to establish a total transfer service NEL value. The NEL
9	quantities include losses, as do the NEL quantities WECC uses to assess its charges. The 2018
10	WECC NEL assessment is based on 2017 load information, which is the most current
11	information available for forecasting BPA's WECC assessment for transfer service customers for
12	FY 2020–2021.
13	
14	The revenue requirement for the Transfer Service Regional Compliance Enforcement rate is
15	\$299,241 and is computed by summing all individual assessment amounts as calculated by
16	WECC and given to BPA.
17	
18	6.6.4.2 Regional Compliance Enforcement Rate Calculation
19	The Transfer Service Regional Compliance Enforcement rate is computed by dividing the above
20	revenue requirement by the total of all BPA transfer service customers' load from outside the
21	BPA balancing authority area. All non-BPA balancing authority area transfer service customer
22	loads are included, regardless of NEL reporting standards. For FY 2020–2021 this quantity of
23	6,502,619 MWh is used to calculate the Transfer Service Regional Compliance Enforcement rate
24	of 0.03 mills/kWh.
25	
26	

6.7 1 **Revenue Received from Transfer Service Charges** 2 Revenue received from Transfer Service Charges includes the Transfer Service Delivery Charge, 3 the Regional Compliance Enforcement Charge, along with forecast revenues associated with the 4 Transfer Service Operating Reserve Charge and Regulation and Frequency Response Charge. 5 Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 2.3.1.5, Line 215. These 6 revenues offset the ancillary service costs Power Services will pay to third-party transmission 7 systems for providing similar services, which are included as a cost in the Power Revenue 8 Requirement. *Id.*, Table 2.3.1.2, Lines 54-56. 9 10 6.8 **Southeast Idaho Load Service Cost Allocation** 11 From 1989 to 2016, BPA used an exchange agreement with PacifiCorp and a transmission 12 wheeling agreement to deliver power to BPA's preference customers in Southeast Idaho. The 13 exchange agreement with PacifiCorp expired in June 2016. Because of limited transmission 14 capability between BPA's system and BPA's Southeast Idaho customers, BPA entered into two 15 five-year fixed-price market purchases starting in July 2016 as part of an interim plan of service 16 for a portion of BPA's transfer customer load located in Southeast Idaho. 17 18 The cost of these purchases, \$74.4 million for FY 2020–2021, is allocated in two parts. The 19 fixed price of the market purchases, less a market delta (difference), is allocated to balancing 20 purchases, which are assigned to the Non-Slice cost pool. This cost is \$64.7 million for the 21 two-year rate period. See Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 6.2, 22 Line 14, Column E. The remaining cost of the purchases, the market delta, is allocated to the 23 transfer service budget, which is a component of the Composite cost pool. This cost is 24 \$9.7 million for the two-year rate period. See id., Table 6.2, Line 14, Column C. 25

T.
The market delta reflects the difference in price due to BPA's two market purchases being
sourced from resources outside the Mid-Columbia market footprint. The market delta is
determined by calculating the difference between the market purchase contract prices and the
Intercontinental Exchange (ICE) forward Mid-Columbia power price on the date each of the two
transactions was made (May 9, 2014 and September 30, 2014). To calculate the delta, the ICE
forward market price for the entire contract term is assumed to be the one in effect at the time
each contract was finalized. Due to limitations in the monthly light load ICE market data, values
for calculating the deltas from January 2021 through June 2021 were generated using the January
2020 through June 2020 monthly light-to-heavy ratio percentage multiplied by the 2021 monthly
heavy load prices.
For the term of the market purchases, the cost to the transfer service budget (the delta) is fixed at
\$6.01/MWh for both of the two forward market purchases. Table 6.3 shows the calculation of
the total contract cost of \$219,386,064 for the two five-year market purchase and the total five-
year delta cost of \$27,131,407. See PowerRates Study Documentation, BP-20-FS-BPA-01A,
Table 6.3. The calculation of the monthly and annual delta for the duration of the two market
purchases is shown in Table 6.2. <i>Id</i> .

1	7. SLICE TRUE-UP
2	
3	7.1 Slice True-Up Adjustment
4	Slice customers are subject to an annual Slice True-Up Adjustment for expenses, revenue credits
5	and adjustments allocated to the Composite cost pool and the Slice cost pool. The annual Slice
6	True-Up Adjustment will be calculated for each fiscal year as soon as BPA's audited actual
7	financial data are available (usually in November). See TRM, BP-12-A-03, § 2.7.
8	
9	7.2 Composite Cost Pool True-Up
10	The Composite Cost Pool True-Up is the calculation of the annual Slice True-Up Adjustment for
11	the Composite cost pool for each fiscal year. For each Slice customer, the annual Slice True-Up
12	Adjustment Charge for the Composite cost pool will be calculated as shown in the 2020 Power
13	Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.R.1. The dollar amount calculated
14	may be positive or negative. The Composite Cost Pool True-Up Table shows the forecast
15	expenses, revenue credits, and adjustments that form the basis for the Slice True-Up Adjustment
16	calculation for the Composite cost pool for the applicable fiscal year. <i>Id.</i> at GRSP II.R, Table F.
17	
18	The following sections discuss the treatment of certain expenses, revenue credits, and
19	adjustments included in the Composite Cost Pool True-Up.
20	
21	7.2.1 System Augmentation Expenses
22	System augmentation expenses are included in the FY 2020–2021 Composite cost pool. Some
23	of these augmentation expenses are a cost for service to Non-Slice customers' Above-RHWM
24	Load that is served at Load Shaping rates. For a description of these system augmentation
25	expenses, see Section 3.2.4.3.2 above.
26	

1	System augmentation expenses are not subject to the Composite Cost Pool True-Up. However,
2	implicit in the Composite Cost Pool True-Up of the Firm Surplus and Secondary Adjustment
3	(for Unused RHWM) and the DSI Revenue Credit are adjustments that reflect the effects of
4	additional power purchases (or lack thereof) or additional power sales to the market.
5	Sections 3.2.4.2 and 7.2.3 describe the treatment of the Firm Surplus and Secondary Adjustment
6	(for unused RHWM) for Composite Cost Pool True-Up purposes. Section 7.2.4 below describes
7	the DSI revenue credit.
8	
9	BPA's purchase of output from the Klondike III resource is a Tier 1 augmentation expense, and
10	the Composite cost pool includes the cost of Resource Support Services (RSS) and Resource
11	Shaping Charges (RSC) applicable to Klondike III. Because the RSS and RSC charges
12	financially convert the variable output of Klondike III to a firm annual block of power and are
13	committed to in advance, the augmentation expense and RSS and RSC costs associated with
14	generation output from the Klondike III resource are not subject to the Composite Cost Pool
15	True-Up.
16	
17	7.2.2 Balancing Augmentation Load Adjustment
18	The Balancing Augmentation Load Adjustment can result in a positive or negative credit to the
19	Composite cost pool. Section 3.2.4.3 describes the Balancing Augmentation Load Adjustment,
20	the circumstances that would result in a credit, and the circumstances that would result in a
21	negative credit. The Balancing Augmentation Load Adjustment is not subject to the Composite
22	Cost Pool True-Up.
23	
24	7.2.3 Firm Surplus and Secondary Adjustment (from Unused RHWM)
25	The Firm Surplus and Secondary Adjustment (from Unused RHWM) is subject to the Composite
26	Cost Pool True-Up. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02,

1	GRSP II.R.1(b). This adjustment reflects the fact that when the sum of actual TOCAs is greater
2	than the sum of forecast TOCAs, additional power is sold to customers at the Composite
3	Customer rate, and it is assumed that BPA incurs additional costs in the form of forgone market
4	sales or increased power purchases. Likewise, when the sum of actual TOCAs is less than the
5	sum of forecast TOCAs, less power is sold to customers at the Composite Customer rate, and it
6	is assumed that BPA sells more power in the market or faces lower power purchase costs.
7	
8	7.2.4 DSI Revenue Credit
9	The forecast costs associated with service to the DSIs are included in the Composite cost pool.
10	See TRM, BP-12-A-03, § 3.2.1.3. DSI revenues received by BPA are included in the Composite
11	cost pool as credits. The DSI Revenue Credit thus is subject to the Composite Cost Pool
12	True-Up. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP II.R.1(c).
13	
14	The calculation of the DSI Revenue Credit starts with the forecast DSI revenue credit, which is
15	adjusted to calculate the actual DSI revenue credit. When actual DSI sales are greater than the
16	rate case forecast DSI sales, it is assumed that additional power is sold to the DSIs at the IP rate,
17	and BPA incurs additional costs in the form of forgone market sales or increased power
18	purchases. The adjustment to the forecast DSI revenue credit reflects both the revenues from the
19	additional power sold to the DSIs and the additional costs that are incurred. Likewise, when
20	actual DSI sales are less than the rate case forecast DSI sales, it is assumed that BPA sells less
21	power to DSIs at the IP rate and sells more power in the market, or it is assumed that such power
22	may be used to meet BPA obligations so that fewer power purchase costs are incurred. The
23	adjustment to the forecast DSI revenue credit reflects these effects. The adjustment also includes
24	any DSI take-or-pay revenues recorded by BPA, if applicable.
25	
26	

1	7.2.5 Interest Earned on the Bonneville Fund
2	On the first day of the Slice contract, October 1, 2001, BPA had \$495.6 million in financial
3	reserves attributed to the Power function. TRM Section 2.5 provides for an interest credit that
4	BPA will allocate to the Composite cost pool based on the pre-FY 2002 (FY 2002 began on
5	October 1, 2001) level of reserves. TRM Section 2.5 further provides that future circumstances
6	may occur that make it reasonable and fair to make adjustments to the size of the base amount of
7	financial reserves attributed to the Power function as of October 1, 2001, for purposes of
8	calculating the interest credit allocated to the Composite cost pool.
9	
10	BPA made several adjustments to the base reserve amount in setting the BP-14 rates, as shown in
11	Table 5. In addition, there were adjustments made in FY 2018. The adjustments reflected in
12	Table 5 are not amounts that have been shared with or collected from Slice customers through a
13	prior Slice True-Up. As a result, these amounts are reflected as adjustments to the size of the
14	base amount of financial reserves. As shown in Table 5, Line 32, the revised reserve amount for
15	purposes of calculating the interest credit is \$586.6 million. See Power Rates Study
16	Documentation, BP-20-FS-BPA-01A, Table 2.3.1.3.
17	
18	The interest credit on the financial reserves amount is subject to the Composite Cost Pool
19	True-Up. The actual interest credit calculated on the revised base amount of financial reserves
20	can change from the forecast interest credit if there are changes in the factors used to calculate
21	the forecast interest credit. <i>Id</i> .
22	
23	7.2.6 Bad Debt Expenses
24	Bad debt expenses, if any, are allocated between the Composite cost pool and the Non-Slice cost
25	pool, as specified in the TRM, BP-12-A-03, Table 2A. There is no forecast bad debt expense for
26	the FY 2020–2021 period for ratemaking purposes. If a bad debt expense is identified and
27	accounted for in BPA's actual audited financial reports for a given fiscal year, BPA will

1	determine whether the expense should be included in the actual expenses and revenue credits that
2	are allocable to the Composite cost pool in the applicable fiscal year of the rate period. If so,
3	then the expense may be included for purposes of the Composite Cost Pool True-Up, and the bad
4	debt expense would be allocated according to the principle of cost causation, as described
5	generally in the TRM, BP-12-A-03, Section 2.1.
6	
7	Any bad debt expense associated with a sale to any customer that purchased Federal power
8	exclusively at the FPS-18 and FPS-20 rates would be excluded for Composite Cost Pool True-Up
9	purposes. Bad debt expenses associated with sales of power at only these FPS rates are related
10	solely to BPA's sales of surplus power after the inception of the Slice product and not to sales of
11	requirements power. The expenses and revenues from such sales are included in the Non-Slice
12	cost pool. See TRM, BP-12-A-03, § 2.2.3.
13	
14	Any bad debt expense associated with a sale to a customer that purchases power at only the PF or
15	IP rate will be included for purposes of the Composite Cost Pool True-Up. The allocation to the
16	Composite cost pool of any bad debt expense associated with a sale to a customer that purchases
17	power at both the PF rate and the FPS rate, or a sale to a customer that purchases power at both
18	the IP rate and the FPS rate, will be contingent on the circumstances of the particular instance of
19	a full or partial non-payment of a power bill.
20	
21	Revenue recoveries of bad debt expenses will be included for Composite Cost Pool True-Up
22	purposes if Slice customers paid for the bad debt expense through their Slice True-Up
23	Adjustment Charge.
24	
25	
26	

1 7.2.7 Settlement and Judgment Amounts 2 BPA payments or receipts of money related to settlements and judgments will be allocated on a 3 case-by-case basis to either the Composite cost pool or the Non-Slice cost pool. If an amount 4 (payment or receipt) is accounted for in BPA's actual audited financial reports for any given 5 fiscal year (reports are produced after rates are set), BPA will determine whether such amount 6 will be included or excluded for Composite Cost Pool True-Up purposes. Such a determination 7 will be made based on the principle of cost causation. See id. § 2.1. 8 9 **Transmission Costs for Designated BPA System Obligations** 10 Transmission and Ancillary Services expenses are allocated between the Composite cost pool 11 and the Non-Slice cost pool, as specified in the TRM, BP-12-A-03, Table 2A. The Transmission 12 and Ancillary Services expenses associated with Designated BPA System Obligations are 13 allocated to the Composite cost pool. Such Transmission and Ancillary Services expenses are 14 not subject to the Composite Cost Pool True-Up. 15 16 Transmission reservations are set aside for non-discretionary obligations (e.g., Designated BPA 17 System Obligations). Because Power Services does not know the actual amounts of transmission 18 usage until the preschedule period for such obligations, the transmission reservations for those 19 obligations are purchased based on the maximum need for the year. Therefore, the forecast cost 20 of the reservations for Designated BPA System Obligations is included in the Composite cost 21 pool, and such costs are not subject to the Composite Cost Pool True-Up. 22 23 Any revenues from the resale of transmission that appear to be the result of BPA sales of unused 24 transmission inventory associated with set-aside transmission will be excluded for Composite 25 Cost Pool True-Up purposes. Because the cost of additional transmission purchased (or of using 26 Non-Slice transmission inventory) to serve Designated BPA System Obligations in excess of 27 what was forecast in the ratesetting process is not included in the Composite Cost Pool True-Up,

1	revenues from sales of surplus transmission inventory also are excluded from the Composite
2	Cost Pool True-Up.
3	•
4	7.2.9 Power Services Third-Party Transmission and Ancillary Services
5	These costs are associated with transmission or losses for Federal generation telemetered into
6	BPA's balancing authority area and delivered under BPA's Open Access Transmission Tariff.
7	The costs are tied to any Federal resources or generation included in the RHWM Tier 1 System
8	Capability and delivered in the Slice product. Therefore, these costs are allocated to the
9	Composite cost pool and are subject to the Composite Cost Pool True-Up.
10	
11	7.2.10 Transmission Loss Adjustment
12	A transmission loss adjustment is included in the Composite cost pool. Without such an
13	adjustment, Slice customers would pay not only for real power losses (through loss return
14	schedules to BPA) on the transmission of their Slice purchases, but also a proportionate share of
15	losses on the transmission of non-Slice products. See Section 3.2.4.1 above for an explanation of
16	the calculation of this credit.
17	
18	The transmission loss adjustment is not subject to the Composite Cost Pool True-Up.
19	
20	7.2.11 Resource Support Services Revenue Credit
21	A credit for RSS revenue is included in the Composite cost pool. The credit is for revenues
22	earned by uses of capacity to support resources that receive RSS. See Section 3.2.3.1.3 above.
23	This revenue credit is not subject to the Composite Cost Pool True-Up.
24	
25	
26	

1	7.2.12 Generation Inputs for Ancillary and Other Services Revenue Credit
2	The uses of the generating capacity available to BPA to support the transmission system and
3	maintain reliability are generally referred to as generation inputs. Generation inputs include
4	capacity-related and energy-related services that BPA uses to provide Ancillary and Control
5	Area Services, support transmission, and maintain the reliability of the transmission system.
6	These services include balancing reserve services, operating reserve services, synchronous
7	condensing, generation dropping, redispatch service, station service, and COE/BOR
8	segmentation. A credit for Generation Inputs revenue is included in the Composite cost pool.
9	See TRM, BP-12-A-03, Table 2, Line 120, and Table 3.4, Line 44. This revenue credit is subject
10	to the Composite Cost Pool True-up.
11	
12	7.2.13 Tier 2 Rate Adjustments
13	Tier 2 rate adjustments are ratemaking adjustments to the Composite cost pool to reflect a share
14	of expenses incurred by Power Services that are allocable to all power sold. See Section 3.2.2
15	above. There are two types of rate adjustments: the Tier 2 overhead cost adder and the Tier 2
16	transmission scheduling service cost adder.
17	
18	The Tier 2 overhead cost adder is an adjustment for administrative costs incurred by Power
19	Services. See Section 3.2.2.3. The Tier 2 overhead cost adder is included in the Composite cost
20	pool. This adjustment is estimated for ratemaking purposes and is not subject to the Composite
21	Cost Pool True-Up.
22	
23	The Tier 2 Transmission Scheduling Service cost adder is an adjustment for administrative costs
24	incurred by Power Services. For a description of this adjustment, see Section 3.2.2.2 above. The
25	forecast of this adjustment is included in the RSS revenue credit. This adjustment is not subject
26	to the Composite Cost Pool True-Up.

1 7.2.14 Residential Exchange Program Expense 2 Forecast REP benefits are included in the Composite cost pool for ratemaking purposes. The 3 forecast of REP expense on the Composite Cost Pool True-Up Table is equal to the forecast of 4 REP benefits expected to be paid to REP participants. The forecast REP expense is subject to 5 the Composite Cost Pool True-Up. 6 7 7.2.15 Canadian Designated System Obligation Annual Financial Settlements 8 The Non-Treaty Storage Agreement (NTSA) is an agreement between BPA and BC Hydro that 9 allows water transactions to be financially settled between them. The NTSA provides two 10 mechanisms to settle the transaction benefits, which BPA designates as a system obligation: 11 (1) energy deliveries during the year, and (2) a financial settlement based on the August 31 12 balance at the end of the fiscal year. The Short-Term Libby Agreement (STLA) and subsequent 13 updates are agreements between the United States and Canada that allow water transactions to be 14 financially settled between BPA, acting on behalf of the U.S., and BC Hydro, acting on behalf of 15 Canada. The STLA does not have a provision to settle transactions by energy delivery. BPA 16 designates the STLA as a system obligation, and the financial settlement is based on the 17 August 31 balance at the end of the fiscal year. Financial settlements in a fiscal year and the 18 financial accrual amount recorded for the month of September of the same fiscal year are 19 charged or credited to other power purchases, and Slice customers pay their share of the charge 20 or receive their share of the credit through the Composite Cost Pool True-Up Table. 21 22 7.2.16 Other Adjustments 23 Several changes have been made to the Slice True-Up Composite Cost Pool table in the BP-20 24 rate proceeding. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, GRSP.II.R. 25 26 The first is the accounting of non-Federal debt. The treatment of non-Federal principal and 27 interest will instead appear like Federal debt: interest will appear on the income statement and

principal will appear on the statement of cash flows. The accounting will be amortized over the
life of the operating license or the remaining maturity of the debt. This will show as
amortization expense on the income statement and will be shown as single entries and no longer
aggregated.
The second change concerns Regional Cooperation Debt (RCD). RCD refinancing will be
directly forecast and displayed in the revenue requirement. Previously, the RCD transactions
and their effect were estimations and were included as an adjustment called the RCD Effect. The
RCD Effect calculation included cash transferred from Transmission to Power to repay Debt
Service Reassignment (DSR)-related bonds, which would be refinanced and extended as part of
the RCD program. It has been determined that it is now necessary to show the cash freed up by
the transaction, labeled Cash Free-up (DSR), in the Minimum Required Net Revenues (MRNR)
calculation. Otherwise the MRNR would be higher than needed, which would increase the
revenue requirement.
Third, after the completion of the Initial Proposal, BPA determined that the accounting treatment
related to the CGS decommissioning trust fund would need to change beginning in FY 2020.
With the consent of parties, BPA has included these changes in the final studies. These changes
include adding two new components of amortization expense. One is the amortization of the
CGS decommissioning trust asset retirement cost (ARC), which is treated as an asset on BPA's
balance sheet. The other is the accretion of the CGS decommissioning asset retirement
obligation (ARO). The net interest section of the income statement has been renamed "Other
Expense and (Income)" and now includes several new items. One is the interest income earned
on the decommissioning trust fund. The other is the realized gains and losses on the trust fund
investments. In addition to these changes, the annual contribution to the trust fund will no longer

1	be embedded	in CGS O&M on the income statement and will instead be a cash-only event on the
2	statement of c	eash flows. All of these changes are included in the calculation of MRNR.
3		
4	Fourth, the fo	llowing lines are obsolete and no longer in use or needed:
5	1.	All non-Federal debt service lines, due to the accounting change noted above;
6	2.	The RCD Effect line in the "Other Income and Expense" section, due to the
7		change noted above;
8	3.	The RCD Offset line in the "Other Income and Expense" section, which was a
9		one-time adjustment; and
10	4.	The Energy Efficiency (EE) Offset line in the "Other Income and Expense"
11		section, which is no longer needed because debt is no longer being refinanced and
12		extended to mitigate the transition from capital to expense of the EE capital
13		program.
14		
15	Fifth, names of	of several lines were revised to better reflect their nature:
16	1.	Premiums/Discounts, formerly identified as Capitalized Bond Premiums. Power
17		Services does not currently have capitalized bond premiums but repayment
18		modeling may occasionally produce small premiums or discounts that would not
19		be capitalized.
20	2.	Other Income & Expense (Composite) formerly identified as Other Income &
21		Expense (Composite) – IPR undistributed reduction.
22		
23	Sixth, the Lar	ge Project Program revenue credit for conservation line was removed; this program
24	was terminate	ed in the BP-18 rate period.
25		
26		

1	Finally, the PF Load Forecast Deviation Liquidated Damages revenue credit has been added to
2	reflect load served by non-Federal power at large industrial facilities where the customer would
3	otherwise have an obligation to serve this load with Federal power.
4	
5	7.3 Slice Cost Pool True-Up
6	The Slice Cost Pool True-Up is the calculation of the annual Slice True-Up Adjustment for the
7	Slice cost pool, as described in TRM, BP-12-A-03, Section 2.7.2. Calculation of the Annual
8	Slice Cost Pool True-Up is described in GRSP II.R.2 and is shown in GRSP Table G. See 2020
9	Power Rate Schedules and GRSPs,BP-20-A-03-AP02. Slice expenses and credits are forecast to
10	be zero in FY 2020 and FY 2021. If there are any actual Slice expenses and credits incurred
11	during the rate period, such expenses and credits will be subject to the Slice Cost Pool True-Up.

1	8. AVERAGE SYSTEM COSTS
2	0. AVERAGE STOTEM COSTS
3	8.1 Overview of the Residential Exchange Program (REP)
4	The REP, established by Section 5(c) of the Northwest Power Act, was designed to provide
5	residential and farm customers of Pacific Northwest utilities a form of access to low-cost Federal
6	power. 16 U.S.C. § 839c(c). Under the REP, BPA purchases power from each participating
7	utility at that utility's average system cost (ASC). The ASC (\$/MWh or mills/kWh) is a rate
8	determination that is calculated for each utility participating in the REP. (For ratemaking
9	purposes, the power purchased by BPA is called "exchange resources.") BPA sells to the utility,
10	in exchange for the power it purchases, an equivalent amount of electric power at BPA's Priority
11	Firm Power Exchange (PFx) rate. (For ratemaking purposes, the power purchased by the utilities
12	is called "exchange loads.")
13	
14	The "exchange" transfers no actual power to or from BPA; it is an accounting transaction in
15	which dollars are exchanged rather than electric power. However, to ensure proper cost
16	allocations and rate determinations, RAM2020 models the REP as purchases of power by BPA
17	(priced at the participants' respective ASCs) and simultaneous sales of power to the REP
18	participants (priced at the participants' respective PFx rates).
19	
20	BPA is implementing the 2012 REP Settlement, BPA Contract No. 11PB-12322, with IOU
21	exchange participants through Residential Exchange Program Settlement Implementation
22	Agreements (REPSIA) and with COU participants through Residential Purchase and Sale
23	Agreements (RPSA). Total REP costs are included in rates for FY 2020–2021.
24	
25	The 2012 REP Settlement established a fixed stream of REP benefits payable to the IOU REP
26	participants beginning in FY 2012 and ending in FY 2028. <i>Id.</i> Individual IOU REP benefit

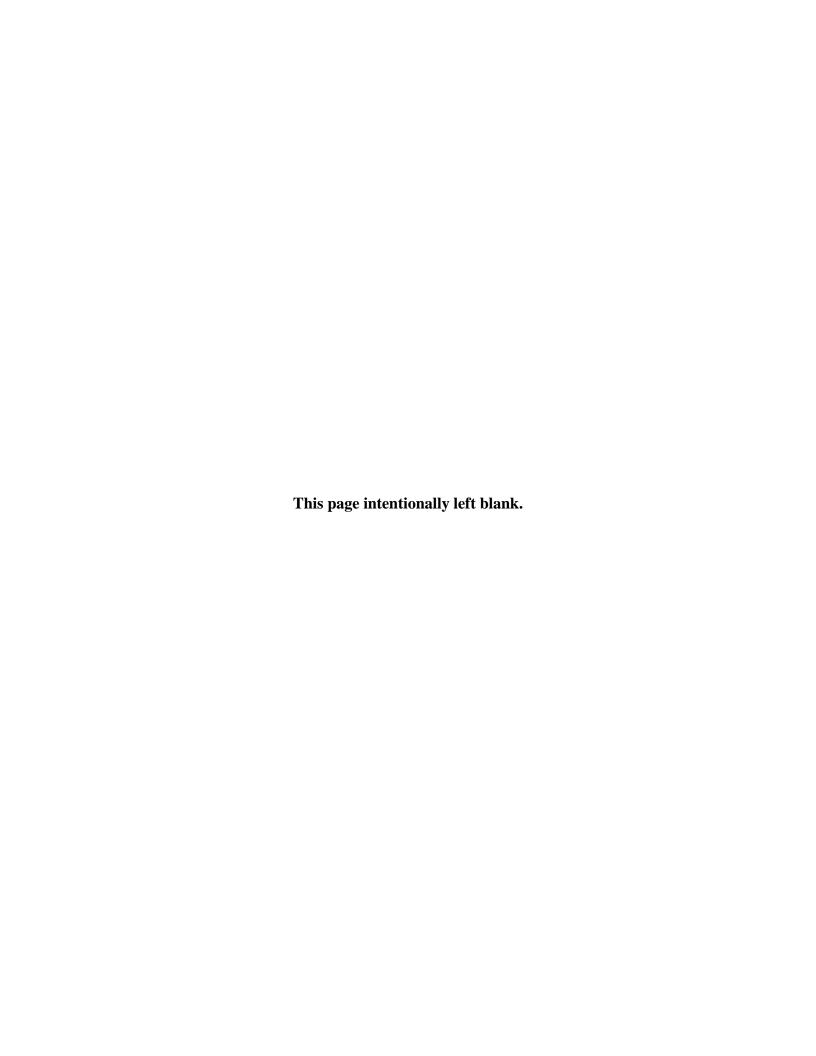

determinations under the 2012 REP Settlement will continue to be calculated as under the

1	traditional REP; that is, BPA will compare each IOU's ASC for FY 2020-2021 with its
2	respective BP-20 PFx rate and, if the difference is positive, multiply the difference by the IOU's
3	exchange load to calculate its REP benefit (in dollars). <i>Id.</i> Similarly, pursuant to the RPSAs
4	with the two COUs participating in the REP, BPA will compare each COU's ASC for FY 2020-
5	2021 with its respective BP-20 PFx rate and, if the difference is positive, multiply the difference
6	by its exchange load to calculate its REP benefit. The COUs' REP benefits are in addition to
7	(i.e., are not included in) the fixed stream of IOU REP benefits under the 2012 REP Settlement.
8	Id. For a forecast of individual utility annual REP benefit payments for FY 2020–2021, see
9	Table 6 of this Study.
10	
11	8.2 ASC Determinations
12	BPA determines participating utilities' ASCs outside the rate proceeding in an ASC Review
13	Process conducted pursuant to the substantive and procedural requirements of the 2008 ASC
14	Methodology (ASCM), 18 C.F.R. § 301, et seq. The Federal Energy Regulatory Commission
15	granted final approval to the 2008 ASCM on September 4, 2009.
16	
17	A utility's ASC for the rate period is calculated by dividing the utility's allowable resource costs
18	and revenues (Contract System Cost) by its allowable load (Contract System Load). The
19	quotient is the utility's rate period ASC. Contract System Cost is the sum of the utility's
20	allowable generation-related and transmission-related costs and overheads; distribution-related
21	costs are not included. Contract System Load is calculated as the total retail sales of a utility as
22	measured at the meter, plus distribution losses, less any New Large Single Loads (NLSLs), if
23	applicable.
24	
25	Under the 2008 ASCM, the ASC for each utility may change if the utility adds a new resource,
26	retires an existing resource, or adds an NLSL. However, under the 2012 REP Settlement,

1	participating IOUs agreed not to submit ASC revisions based on new resources coming on line
2	or being removed during the Exchange Period (the Exchange Period is the same as the rate
3	period, currently FY 2020–2021). See 2012 REP Settlement Agreement, BPA Contract
4	No. 11PB-12322, § 6.4. Therefore, for COUs only, the ASC may change if the utility adds a
5	new resource or retires an existing resource during the Exchange Period. The revised ASC takes
6	effect in the month after a new resource comes on line, an existing resource is retired, or a new
7	NLSL begins taking service. The ASCs for the BP-20 rate period are shown in Table 8.1 of the
8	Power Rates Study Documentation, BP-20-FS-BPA-01A.
9	
10	Under the 2012 REP Settlement, the IOU ASCs that are effective on the first day of the rate
11	period will continue to be in effect throughout the Exchange Period, with the exception of the
12	addition of an NLSL. 2012 REP Settlement Agreement, BPA Contract No. 11PB-12322. These
13	"day-one" IOU ASCs are developed for use in establishing rates for the BP-20 rate period.
14	Section II.T of the 2020 Power Rate Schedules and General Rate Schedule Provisions (GRSPs),
15	BP-20-A-03-AP02, specifies how the PFx rate applicable to each REP participant will change if
16	a revised ASC takes effect.
17	
18	The ASCs used in the BP-20 Final Proposal were determined in the separate ASC Review
19	Processes and published in the Final ASC Reports on July, 25, 2019. The ASCs reflected in the
20	Final ASC Reports were based on REP Staff's assessment of the utilities' ASCs filings. BPA
21	issued Final ASC Reports for eight utilities: Avista Utilities, Idaho Power Company,
22	NorthWestern Energy, PacifiCorp, Portland General Electric, Puget Sound Energy, Clark County
23	PUD, and Snohomish County PUD. ASC Final Reports are available at
24	https://www.bpa.gov/Finance/ResidentialExchangeProgram/Pages/FY-20-21-ASC-Utility-
25	<u>Filings.aspx</u> .
26	

8.3 1 Residential Exchange Program Load 2 Exchange loads are defined as a utility's qualifying residential and farm consumer loads as 3 determined in accordance with the utility's RPSA or REPSIA. 4 5 Under the 2012 REP Settlement, participating IOUs agreed to use a two-year historical average 6 for determining monthly exchange load, referred to as Residential Load, to calculate IOU REP 7 benefits. 2012 REP Settlement Agreement, BPA Contract No. 11PB-12322, § 2 ("Residential 8 Load"). For the BP-20 rate period, the historical years are calendar year (CY) 2017 and 9 CY 2018. The monthly loads applicable to both years of the BP-20 rate period are shown in 10 GRSP II.S, Table H. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, 11 GRSP II.S, Table H. 12 13 The COUs' RPSAs do not specify the use of historical exchange loads in computing COU REP 14 benefits; therefore, forecasts are used to estimate COU REP benefits for ratemaking purposes. 15 For the COUs, the FY 2020–2021 exchange load forecasts are based on the exchange load 16 information provided by the COUs in the ASC Review Process. Each COU's exchange load 17 forecast is adjusted for the COU's Tier 1 percentage (if applicable), as required by the TRM. 18 The Tier 1 percentage is defined as BPA's forecast percentage of the COU's load that is 19 expected to be served by purchases of power at Tier 1 rates from BPA and from the COU's 20 Existing Resources for CHWM. COU REP benefits will be paid on actual residential and farm 21 sales as adjusted by the Tier 1 percentage for each COU, as submitted after each month during 22 the rate period. The monthly IOU Residential Loads and monthly forecast COU exchange loads 23 are shown in Table 8.2 of the Power Rates Study Documentation, BP-20-FS-BPA-01A. 24 25 26

8.4 1 REP 7(b)(3) Surcharge Adjustment 2 The REP Section 7(b)(3) surcharge is a utility-specific addition to the Base PF Exchange rates 3 that recovers each REP participant's allocated share of rate protection provided pursuant to 4 Section 7(b)(2) of the Northwest Power Act. 16 U.S.C. §§ 839e(b)(2)-(3). Each REP 5 participant's initial 7(b)(3) surcharge is determined in the Section 7(i) rate proceeding based on 6 the Base PFx rates, the ASCs, and the forecast exchange loads of all utilities assumed for 7 ratemaking to participate in the REP. *Id.* at § 839e(i). Each REP participant's initial 7(b)(3) 8 surcharge is displayed in Section 6.1 of the PF-20 rate schedule. See 2020 Power Rate Schedules 9 and GRSPs, BP-20-A-03-AP02, PF-20 Rate Schedule, § 6.1. Each participating utility's 7(b)(3) 10 surcharge is subject to change during the rate period if any participant's ASC changes during the 11 rate period due to the addition of an NLSL in the utility's service territory. For COUs only, the 12 addition or removal of a resource from the participant's resource portfolio will also change its 13 7(b)(3) surcharge. The procedures for modifying the 7(b)(3) surcharges of all REP participants 14 are codified in GRSP II.T. See 2020 Power Rate Schedules and GRSPs, BP-20-A-03-AP02, 15 GRSP II.T. 16 17 18 19 20 21 22 23 24 25 26

9. REVENUE FORECAST

The revenue forecast calculates the expected revenue from power rates and other sources for the rate period, FY 2020–2021, and the current fiscal year, FY 2019. Two revenue forecasts are prepared. The first uses rates from the rate schedules currently in effect (BP-18 rates), and the second uses proposed rates (BP-20 rates). The revenue forecasts are used to test whether current rates and proposed rates will recover the power revenue requirement. If the revenue test shows that revenues at current rates will not generate sufficient revenue to recover the power revenue requirement, new rates are calculated, and revenues at proposed rates are generated. *See* Power Revenue Requirement Study, BP-20-FS-BPA-02, §§ 3.2–3.3. Both forecasts are based on the Power Loads and Resources Study, BP-20-FS-BPA-03, forecast of firm loads for the current fiscal year and the rate period.

In addition to forecasts of revenues, this section of the Study presents power purchase expenses that are directly related to balancing purchases needed to meet load under different water conditions. Power purchases are included in the forecast for FY 2019–2021 and discussed in Section 9.5 below.

The revenue forecast includes revenue calculations for the current fiscal year, FY 2019, to help estimate the amount of financial reserves available to BPA at the beginning of the rate period. *See* Power and Transmission Risk Study, BP-20-FS-BPA-05, § 4.2.2.1.1.

The revenue forecast is divided into four main categories: (1) revenues from gross sales, described in Section 9.1 below; (2) miscellaneous revenues, described in Section 9.2; (3) revenues from generation inputs for ancillary, control area, and other services, described in Section 9.3; and (4) Treasury credits, described in Section 9.4.

1	9.1	Revenue Forecast for Gross Sales
2	Gross	Sales is Power Services' largest category of revenue. There are seven sources of revenue
3	in this	category:
4	1.	Priority Firm power sales under the CHWM Contracts, described in Section 9.1.1;
5	2.	Industrial Firm Power sales to DSIs, described in Section 9.1.2;
6	3.	Scheduling products under the FPS rate, described in Section 9.1.3;
7	4.	Short-term market sales, described in Section 9.1.4;
8	5.	Long-term contractual obligations, described in Section 9.1.5;
9	6.	Canadian entitlement returns, described in Section 9.1.6; and
10	7.	Other sales, described in Section 9.1.7.
11		
12	9.1.1	Priority Firm Power Sales under CHWM Contracts
13	For FY	Y 2019, the revenues from Priority Firm Power sales pursuant to CHWM Contracts are
14	calcula	ated using the product of (1) forecast loads documented in the Power Loads and Resources
15	Study,	BP-20-E-BPA-03, Section 2.2, and accompanying Power Loads and Resources
16	Docum	nentation Table 1.2.1 for energy, Table 1.2.2 for HLH, and Table 1.2.3 for LLH; and
17	(2) PF	-18 rates. Revenues from PF sales pursuant to CHWM Contracts for FY 2019 are listed
18	in Tab	le 4 of this Study, lines 3–12, and in Power Rates Study Documentation,
19	BP-20	-FS-BPA-01A, Table 9.2, Lines 3-12.
20		
21	For FY	Y 2020 and FY 2021, revenues from PF sales pursuant to CHWM Contracts are computed
22	using t	the product of (1) forecast loads assuming normal weather, documented in the Power
23	Loads	and Resources Study, BP-20-FS-BPA-03, and accompanying Power Loads and Resources
24	Docum	nentation, BP-20-FS-BPA-03A; and (2) the appropriate PF rates derived by RAM2020.
25	Inputs	and results for the revenue forecast are managed and calculated pursuant to the CHWM
26	Contra	acts using the Revenue Forecasting Application (RFA). Revenues are reported for Tier 1

1	Customer charges (Composite, Slice, and Non-Slice), Load Shaping, and Demand, including the
2	Low Density Discount and Irrigation Rate Discount credits, and any additional Tier 2 and/or
3	RSS charges.
4	
5	9.1.1.1 Composite and Non-Slice Customer Charges
6	Revenues from each customer for the Composite and Non-Slice Customer charges are based on
7	the customer's TOCA and the customer's contractually specified products. There are no Slice
8	charges for FY 2019–2021. Revenues obtained from the Composite and Non-Slice Customer
9	charges represent the majority of revenues from firm power sales under CHWM Contracts for
10	FY 2019–2021. The calculation of forecast Composite and Non-Slice revenues is shown in
11	Power Rates Study Documentation, BP-20-FS-BPA-01A, Tables 3.1.6.1-3.1.6.3. Composite and
12	Non-Slice revenues for FY 2019–2021 are listed in Table 4 of this Study, Lines 1-2, and Power
13	Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Lines 3-4.
14	
15	9.1.1.2 Load Shaping Charge
16	The Load Shaping charge reflects the costs and benefits of shaping the Tier 1 System Capability
17	to the monthly/diurnal shape of a customer's below-RHWM load. A charge to the customer
18	results when the customer's shaped load is greater than its share of the Tier 1 System Output in
19	any month for both HLH and LLH; the customer receives a credit from BPA when the opposite
20	occurs. The Load Shaping charge is described in Section 4.1.1.3 above. The forecast of Load
21	Shaping revenues for FY 2019–2021 is listed in Table 4 of this Study, Line 6, and Power Rates
22	Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 6.
23	
24	9.1.1.3 Demand Charge
25	The Demand charge is applicable to customers purchasing Load Following or Block with
26	shaping capacity products; for FY 2019–2021, there are no customers purchasing Block with

1	shaping capacity. The Demand charge is calculated using customer-specific information
2	including actual Customer Tier 1 System Peak, average actual monthly below-RHWM load
3	occurring in HLH, Contract Demand Quantities (CDQs), and Super Peak Credit (if applicable).
4	Calculation of a customer's Demand charge is described in Section 4.1.1.2.2 above. The demand
5	revenue forecast for FY 2019–2020 is also shown in Table 4 of this Study, Line 7, and Power
6	Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 7.
7	
8	9.1.1.4 Irrigation Rate Discount (IRD)
9	The IRD is a rate credit available to eligible customers and provides a fixed rate discount on
10	Tier 1 rates (the discount does not apply to loads served at Tier 2 rates). May through September
11	eligible irrigation loads are identified in each customer's CHWM Contract. The methodology
12	for calculating the IRD end-of-year true-up appears in GRSP II.C.3. See Power Rate Schedules
13	and GRSPs,BP-20-A-03-AP02. Forecast credits for irrigation loads are calculated using an IRD
14	that is derived by multiplying the irrigation loads identified in the CHWM Contracts by the IRD
15	rate. The IRD is described in Section 5.4.2. Forecast IRD credits for FY 2019–2021 are listed in
16	Table 4 of this Study, Line 8, and Power Rates Study Documentation, BP-20-FS-BPA-01A,
17	Table 9.2, Line 8.
18	
19	9.1.1.5 Low Density Discount (LDD)
20	The LDD is prescribed in Section 7(d)(1) of the Northwest Power Act and offers a discount of up
21	to 7 percent for customers that meet the criteria specified in the Power Rate Schedules and
22	GRSPs, BP-20-A-03-AP02, GRSP II.B. 16 U.S.C. § 839e(d)(1). As set forth in the TRM, LDD
23	percentages are calculated to provide a discount on power purchased at Tier 1 rates that
24	approximates the discount the customer would have received under non-tiered rates. Forecast
25	LDD credits for FY 2019–2021 are listed in Table 4 of this Study, Line 9, and Power Rates
26	Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 9.

1	9.1.1.6 Tier 2 and Resource Support Services (RSS)
2	Tier 2 rates are based on a cost allocation that recovers the cost of BPA service to Above-
3	RHWM Load. Tier 2 revenues are based on sales to customers that have elected to have BPA
4	serve their Above-RHWM Loads. Forecast Tier 2 revenues for FY 2019–2021 are listed in
5	Table 4 of this Study, Line 10, and Power Rates Study Documentation, BP-20-FS-BPA-01A,
6	Table 9.2, Line 10.
7	
8	RSS revenues are based on known services chosen by customers. Forecast RSS revenues for
9	FY 2019–2021 are listed in Table 4 of this Study, Line 11, and Power Rates Study
10	Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 11.
11	
12	9.1.2 Industrial Firm Power Sales (IP) to Direct Service Industrial Customers (DSI)
13	BPA sells power to DSIs at the IP rate. Revenues from the IP rate are computed using the
14	product of (1) forecast loads documented in Power Loads and Resources Study,
15	BP-20-FS-BPA-03, Section 2.4, and accompanying Power Loads and Resources Documentation,
16	BP-20-FS-BPA-03A, Tables 1.2.1 for energy, 1.2.2 for HLH, and 1.2.3 for LLH; and (2) the
17	appropriate IP rate from RAM2020. For FY 2019, the revenues for DSI customers are calculated
18	using the IP-18 rate. Forecast IP revenues for FY 2019–2021 are listed in Table 4 of this Study,
19	Line 14, and Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 14.
20	
21	9.1.3 Scheduling Products under the FPS Rate
22	During FY 2019–2021, BPA is providing power scheduling products and services under the FPS
23	rate described in Section 4.4 of this Study. Revenues from the scheduling products are derived
24	by multiplying individual customer billing determinants by the appropriate FPS rate. Forecast
25	FPS revenues for FY 2019–2021 are listed in Table 4 of this Study, Line 15, and Power Rates
26	Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 15.

1 9.1.4 Short-Term Market Sales 2 The revenue forecast includes revenues from the sale of surplus energy, which can be a 3 combination of secondary energy and firm energy in excess of that required to serve firm loads. 4 The wholesale market price effects of a number of factors are considered in determining the 5 forecast of surplus sales revenue. For FY 2019, the surplus energy revenue included in the 6 revenue forecast consists of the average of the surplus energy revenues in forecast months 7 computed during RevSim simulations of 40 games for each of 80 historical water years, for a 8 total of 3,200 games. For FY 2019–2021, the surplus energy revenue is the median of the 9 surplus energy revenues across those 3,200 games. In addition, BPA includes a credit to account 10 for the incremental value of marketing power to extra-regional points of delivery. See Power and 11 Transmission Risk Study, BP-20-FS-BPA-05, § 4.1.1.2.3. 12 13 The revenue forecast for short-term market sales is computed using RevSim to calculate monthly 14 HLH and LLH energy surpluses for each of the 3,200 games, applying corresponding market 15 prices developed for each game. Additionally, the short-term market sales forecast contains 16 revenue from contract sales for FY 2019–2021. The contract sales portion consists of DSI sales 17 and sales outside the Pacific Northwest. See Power and Transmission Risk Study, 18 BP-20-FS-BPA-05, § 4.1.1.2.4. Revenues for FY 2019–2021 are shown in Table 4 of this Study, 19 Line 16, and Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 16. 20 21 9.1.5 Long-Term Contractual Obligations 22 Long-term obligation contracts include a wind energy exchange and capacity and energy 23 exchanges. For FY 2019–2021, revenue from these contractual obligations is calculated 24 pursuant to the individual contracts and then summed and added to the forecast as a group. Note 25 that the energy exchanges will not generate revenue in FY 2020–2021. Beginning in 2021, BPA enters into two five-year agreements to sell up to 200 megawatts of surplus hydropower. Each 26

1	
1	contract is an advanced noticed right to power. See the Power and Transmission Risk Study,
2	BP-20-FS-BPA-05, for more information. Forecast revenue for FY 2019–2021 is listed in
3	Table 4 of this Study, Line 17, and Power Rates Study Documentation, BP-20-FS-BPA-01A,
4	Table 9.2, Line 17.
5	
6	9.1.6 Canadian Entitlement Return
7	The Canadian Entitlement Return is an obligation for BPA to deliver power to Canada at the
8	border pursuant to Columbia River Treaty between Canada and the United States of America.
9	No revenues are generated from the delivery of this power, but energy amounts are listed in the
10	revenue forecast to represent this system obligation. The average megawatt deliveries for
11	FY 2019–2021 are listed in Table 4 of this Study, Line 18, and Power Rates Study
12	Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 18.
13	
14	9.1.7 Other Sales
15	Other Sales include forecast revenues from primarily the Slice True-Up, Load Shaping True-Up,
16	and any liquidated damages,. The forecast of Other Sales revenue for FY 2019–2021 is listed in
17	Table 4 of this Study, Line 19, and Power Rates Study Documentation, BP-20-FS-BPA-01A,
18	Table 9.2, Line 19.
19	
20	9.2 Revenue Forecast for Miscellaneous Revenues
21	Miscellaneous Revenues include revenues from the Transfer Service charges, Energy Efficiency
22	Downstream Benefits, U.S. Bureau of Reclamation (Reclamation) power for irrigation, and the
23	Upper Baker project.
24	The Transfer Service revenue forecast accounts for costs of the delivery of Federal power over
25	non-Federal transmission systems and is described in Section 6 of this Study. Included in the
26	Transfer Service revenue forecast are revenues from the Transfer Service Delivery charge,

Operating Reserve charge, Regulation and Frequency Response charge, and Regional 1 2 Compliance Enforcement charge as described in Sections 6.3–6.6. 3 4 Energy Efficiency revenues are received by BPA as reimbursements for costs relating to 5 implementation of various energy efficiency projects. For FY 2019–2021, revenues from Energy 6 Efficiency are calculated by estimating project expenses. While these revenues are wholly offset 7 by the associated expenses, which are recorded on the expense ledger, the expenses are included 8 in the revenue requirement; therefore, the revenues are included in this forecast. 9 10 Downstream Benefits are revenues BPA receives from utilities that benefit from the coordinated 11 planning and operation of Corps of Engineers and Reclamation upstream storage reservoirs as 12 part of the Pacific Northwest Coordination Agreement. 62 Fed. Reg. 40512 (July 7, 1997). For 13 FY 2019–2021, revenues from downstream benefits are estimated by applying a three-year 14 average from the three most recent studies of downstream benefits conducted by the Northwest 15 Power Pool (NWPP). 16 17 Reclamation power for irrigation includes power that has been reserved from the FCRPS for use 18 at Reclamation projects. For revenue forecasting purposes, power that has been reserved for 19 Reclamation irrigation projects is classified as either reserved power or irrigation pumping 20 power. Revenue from reserved power for FY 2019–2021 is forecast in equal monthly amounts 21 based on an annual amount that is aggregated for Reclamation projects. The annual aggregated 22 amounts are forecast based on an average of actual results from the prior three years provided by 23 Reclamation. Revenue from Irrigation Pumping Power for FY 2019–2021 is calculated using the 24 same methodology as reserved power. 25 26

1	Finally, revenues from the Upper Baker project are forecast. Puget Sound Energy keeps
2	58,000 acre-feet of flood control at this reservoir, which must be held at a lower level during the
3	winter than it would be without flood control, creating head losses. On behalf of the Corps, BPA
4	compensates Puget by delivering non-firm energy and capacity during the flood control season
5	of November through March. In turn, BPA offsets the value of energy and capacity delivered to
6	Puget from the yearly Treasury payment, and the deduction is listed as a revenue receipt from the
7	Corps.
8	
9	Miscellaneous revenues for FY 2019–2021 are listed in Table 4 of this Study, Line 21, and
10	Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Lines 21-28.
11	
12	9.3 Revenue Forecast for Generation Inputs for Ancillary, Control Area, and Other
13	Services and Other Inter-Business Line Allocations
14	Power Services receives revenue from Transmission Services for providing generation inputs for
15	ancillary and control area services. Certain generation inputs, cost allocations, and the unit cost
16	of balancing and operating capacity were agreed upon in the BP-20 Partial Rates Settlement
17	Agreement. The Settlement sets out the revenue forecast (inter-business line allocations) for
18	Synchronous Condensing, Generation Dropping, Redispatch, Segmentation of Corps and
19	Reclamation network and delivery facilities costs, and station service. The Settlement also
20	includes the unit cost of the capacity that Power Services would charge for the capacity provided
21	to support Regulating Reserves, Balancing Reserve Capacity for Variable Energy Resource
22	Balancing Service (VERBS) Reserves, Dispatchable Energy Resource Balancing Service
23	(DERBS) Reserves, and Operating Reserves. The settled unit cost was applied to a forecast of
24	the amount of capacity that Power Services would provide for these services. The revenues
25	(inter-business line allocations) are shown in Table 4 of this Study. Line 22, and Power Rates

Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Lines 29-47.

26

9.4 **Revenue from Treasury Credits** Revenues are also forecast from two kinds of Treasury credits, or deductions, made from BPA's annual Treasury payment. These credits represent a partial reimbursement by the Treasury for expenses incurred by BPA throughout the year. **9.4.1** Section 4(h)(10)(C) Credits BPA pays all the costs relating to the obligations of Northwest Power Act Section 4(h)(10)(C) regarding protecting, enhancing, and mitigating fish and wildlife in the region. 16 U.S.C. § 839b(h)(10)(C). BPA is reimbursed by the U.S. Treasury for 22.3 percent of the replacement power purchases BPA is expected to make due to fish mitigation, as well as an equal percentage of program and capital expenses related to the fish and wildlife programs. The 22.3 percent represents the non-power portion of the total FCRPS costs, which is the responsibility of taxpayers rather than BPA ratepayers. This Treasury credit is treated as Power Services revenue. Expenses relating to fish and wildlife programs are discussed in the Power Revenue Requirement Study, BP-20-E-BPA-02, and Section 1.2.1.4. The methodology for estimating the replacement power purchases resulting from changes in hydro system operations to benefit fish and wildlife is described in the Power Loads and Resources Study, BP-20-FS-BPA-03, Section 3.3.1. The cost of the increased purchases is estimated using RevSim and the market price forecast and is included in the Power and Transmission Risk Study, BP-20-FS-BPA-05, Section 4.1.1.1.5.6, and the Power and Transmission Risk Study Documentation, BP-20-FS-BPA-05A, Table 13. Forecast 4(h)(10)(C) credits are listed in Table 4 of this Study, Line 23, and Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 48.

26

1 9.4.2 Colville Settlement Credits 2 The Colville Settlement Agreement obligates BPA to make annual payments to the Colville 3 Tribes. BPA receives annual credits from the U.S. Treasury against payments due the Treasury 4 to defray a portion of the costs of making payments to the Colville Tribes. The Treasury credit 5 for the Colville Settlement in FY 2020 and FY 2021 is set by legislation at \$4.6 million per year. 6 See Confederated Tribes of the Colville Reservation Grand Coulee Settlement Act, Pub. L. 7 No. 103-436, 108 Stat. 4577 (Nov. 2, 1994). The credit is shown on Table 4 of this Study, 8 Line 24, and Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 49. 9 10 9.5 **Power Purchase Expense Forecast** 11 Power Services forecasts three types of power purchase expenses: Augmentation Purchases, 12 Balancing Purchases, and Other Power Purchases. Although most expenses, including some 13 power purchase expenses, such as long-term generating resources, are forecast in the Power 14 Revenue Requirement Study, the power purchase expenses described here are directly related to load, resource, and price assumptions used to develop power rates. Therefore, they are included 15 16 in the Power Services revenue forecast. 17 18 9.5.1 Augmentation Purchase Expense 19 For planning purposes, the forecast of firm FCRPS output is based upon critical (1937) water 20 conditions. See Power Loads and Resources Study, BP-20-FS-BPA-03, § 3.1.2.1.3. The 21 forecast annual firm FCRPS output under critical water plus the output of other Federal resources 22 may not be adequate to meet annual average firm loads. Therefore, system augmentation is 23 added to Federal resources to balance firm annual resources with firm annual loads. However, 24 the Power Loads and Resources Study projects that BPA is firm surplus in both years of the rate 25 period and there is no need to acquire system augmentation to meet firm loads in FY 2020 and 26 FY 2021. *Id.* at § 4.3.

1	The forecast expense for the augmentation is based on projected prices using the AURORA®
2	model assuming critical water conditions. See Power and Transmission Risk Study,
3	BP-20-FS-BPA-05, § 4.1.1.2.1. Augmentation purchase amounts for FY 2019–2021 are listed in
4	Table 4 of this Study, line 26, and Power Rates Study Documentation, BP-20-FS-BPA-01A,
5	Table 9.2, Line 51.
6	
7	9.5.2 Balancing Power Purchases
8	Balancing power purchases are calculated by RevSim, which finds any monthly HLH and LLH
9	energy deficits by simulations of 40 games in each of the 80 water years, for a total of
10	3,200 games, and application of the corresponding market prices developed for each game.
11	Similar to the treatment of short-term market sales, the median value for balancing purchases
12	over the 3,200 games is reported for FY 2019 for forecast months and added to actual purchases
13	in past months, and the median value is reported for FY 2019–2021. Total balancing purchase
14	expense for FY 2019–2021 is listed in Table 4 of this Study, Line 27, and Power Rates Study
15	Documentation, BP-20-FS-BPA-01A, Table 9.2, Line 52. A full description is found in the
16	Power and Transmission Risk Study, BP-20-FS-BPA-05, Section 4.1.1.2.2 and Table 19.
17	
18	9.5.3 Other Power Purchases
19	Other power purchases are primarily committed purchases BPA has made to serve preference
20	customer loads in Southeastern Idaho. In those months and water years in which firm loads
21	exceed resources, Southeast Idaho Load Service (SILS) purchases reduce balancing purchases.
22	Conversely, in those months and water years in which resources are sufficient to serve firm
23	loads, SILS purchases increase the amount of surplus sales. RevSim accounts for the energy
24	related to SILS purchases in the balancing purchases category. However, the amount of expense
25	is included separately as a balancing purchase cost and composite cost. A full description is

1	found in the Power and Transmission Risk Study, BP-20-FS-BPA-05, Section 4.1.1.2.2, and in
2	Section 6.6 of this Study.
3	
4	The cost of Tier 2 power is also included in other power purchases, as are other miscellaneous
5	contracts. Total other power purchase expense for FY 2019–2021 is listed in Table 4 of this
6	Study, Line 28, and Power Rates Study Documentation, BP-20-FS-BPA-01A, Table 9.2,
7	Line 53.
8	
9	9.6 Summary of Power Revenues
10	A detailed summary of power revenues at current and proposed rates is found in Tables 3 and 4
11	of this Study, and in Power Rates Study Documentation, BP-20-FS-BPA-01A, Tables 9.1 and
12	9.2.

23 Reasons for adjustments

22

27

28

29

31

33

- 24 1) BPA's receipt of payments for settlements or judgments pertaining to power marketing transactions that occurred before FY 2002.
- 25 2) BPA's receipt of funds as collections of outstanding receivables relating to revenues that occurred before FY 2002.
- 26 3) BPA's payment for settlements or judgments pertaining to power marketing transactions that occurred before FY 2002.

Base amount of financial reserves =

\$495,600,000

30 Adjustment to the base amount of financial reserves = \$495,600,000 + \$90,996,319

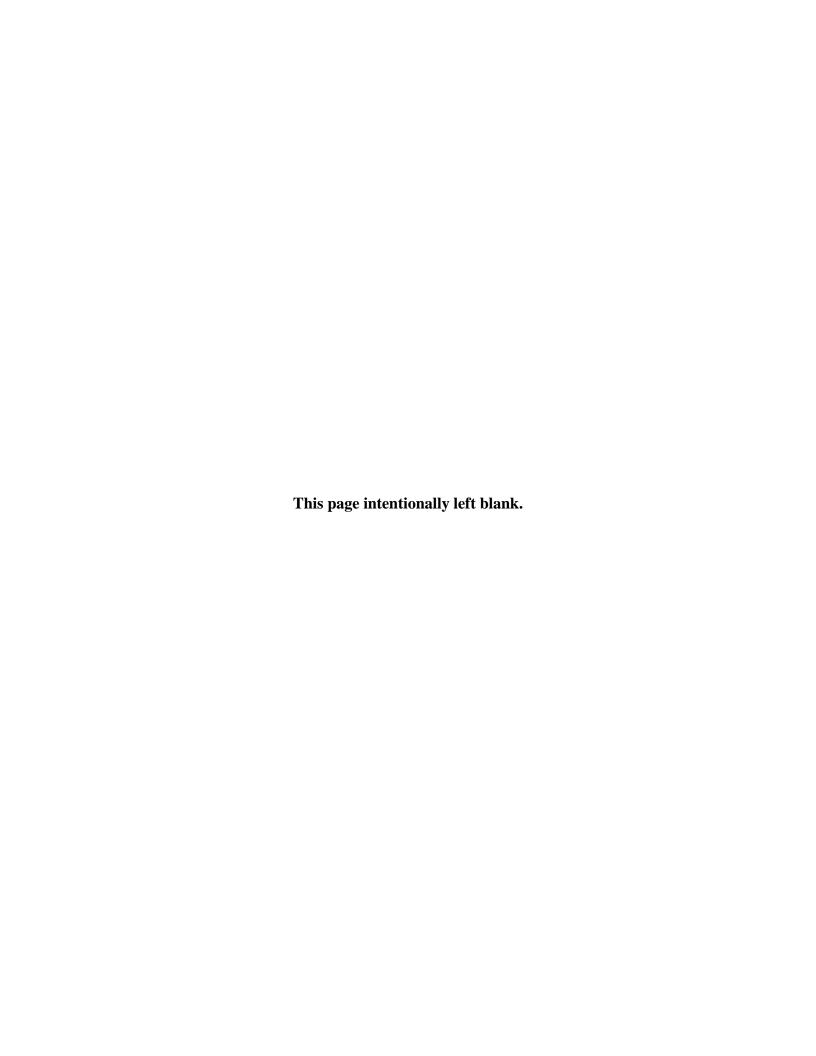

Resulting amount of financial reserves = \$ 586,596,319

34 Adjustment amounts, if negative, are added to the base amount of financial reserves, thereby increasing the size of the base amount.

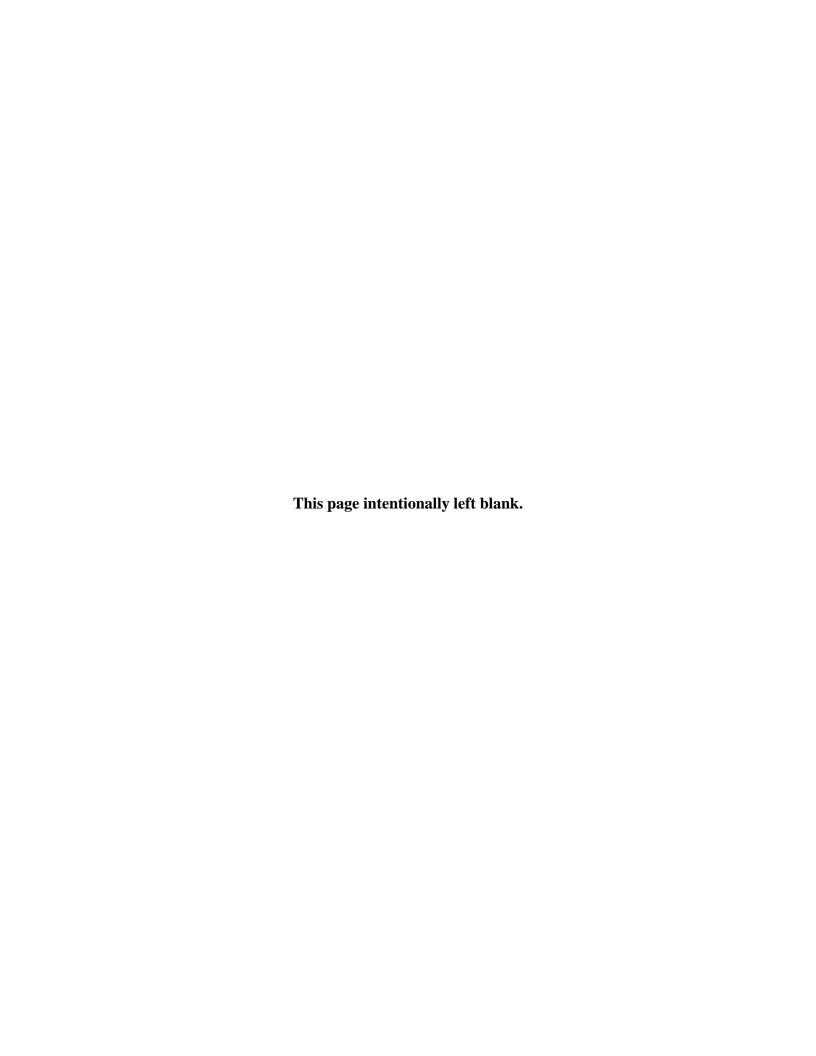

35 Adjustment amounts, if positive, are subtracted from the base amount of financial reserves, thereby decreasing the size of the base amount.

Appendix A

Appendix A

7(c)(2) Industrial Margin Study

1. INTRODUCTION

The purpose of this appendix is to describe BPA's calculation of the "typical margin" included by the Administrator's public body and cooperative customers in their retail industrial rates. The resulting margin is added to the PF-20 energy rates, which become the energy rates used in the IP-20 rate for BPA's direct-service industrial customers (DSIs).

Section 7(c)(1)(B) of the Northwest Power Act provides that rates applicable to BPA's DSI customers shall be set "at a level which the Administrator determines to be equitable in relation to the retail rates charged by the public body and cooperative customers to their industrial consumers in the region." Section 7(c)(2) provides that this determination shall be based on "the Administrator's applicable wholesale rates to such public body and cooperative customers and the typical margins included by such public body and cooperative customers in their retail industrial rates." This section further provides that the Administrator shall take into account:

- (1) the comparative size and character of the loads served;
- (2) the relative costs of electric capacity, energy, transmission, and related delivery facilities provided and other service provisions; and
- (3) direct and indirect overhead costs, all as related to the delivery of power to industrial customers.

2. METHODOLOGY

2.1 Administrator's Applicable Wholesale Rates to Public Body and Cooperative Customers

The Administrator's applicable wholesale rates to public body and cooperative customers are the PF-20 demand and energy rates before any 7(b)(2) or floor rate adjustments are applied.

2.2 Typical Margin

The typical margin is based generally on the overhead costs that consumer-owned utilities add to the cost of power in setting their retail industrial rates; *see* § 2.3 below.

2.3 Margin Determination Factors

Comparative Size and Character of the Loads Served. The data base used for the study includes utilities that serve at least one industrial consumer with a peak demand of at least 3.5 MW.

Relative Costs of Electric Capacity, Energy, Transmission, and Related Delivery Facilities

Provided and Other Service Provisions. The utility margins in this study are based to the

extent possible on utility cost of service analyses and incorporate costs allocated to the industrial

consumer class. The utilities segregate these costs into various cost categories, and only those

categories considered to be appropriate margin costs are included in the industrial margin

calculation.

In the past, BPA has accounted for "other service provisions" through a character of service adjustment for service to the first quartile of DSI load, which was interruptible as defined in the DSIs' power sales contract. Because the DSI contracts no longer include these provisions, this adjustment is not included in this study.

Direct and Indirect Overhead Costs. Cost of service studies and other spreadsheets prepared by the public body and cooperative customers provide information to calculate the per-unit overhead costs associated with service to large industrial consumers.

3. APPLICATION OF THE METHODOLOGY

3.1 Data Base

The data base consists of cost of service information from 33 utilities that have at least one industrial consumer with a peak load of at least 3.5 MW. The data was collected in 2011 from qualifying utilities by the Public Power Council (PPC) under the terms of a confidentiality agreement. Under the terms of that agreement, the names of the individual utilities and their industrial consumers were deleted from the data base, and the names were not publicly disclosed. Furthermore, all parties wishing to evaluate the utility margin data at the PPC offices were required to sign confidentiality agreements. All utility data reported has been identified by a randomly assigned number. Attachment A to this appendix displays each participating utility's individual data.

3.2 Utility Margins

The individual utility margins are based on costs allocated by the utilities to their industrial consumers. The categories of costs include production, transmission, distribution, taxes, and other overhead costs. Derivation of the margin involves three steps. First, an individual margin is determined for each utility in the study. Second, each margin is weighted according to energy sales to derive an overall weighted average margin. Third, the BPA DSI delivery facilities charge is added to replace the distribution costs that otherwise may be included in the margin.

3.3 Summary of Results

The final results of each step in the industrial margin calculation for each utility are shown on the summary table in Attachment A to this appendix. These results were used in the BP-12 rate case. As shown on the summary table, the weighted industrial margin for the BP-12 rate case was 0.685 mills/kWh.

4. THE INDUSTRIAL MARGIN FOR THE BP-20 RATE CASE

BPA did not conduct a new industrial margin survey for the BP-20 rate case. Instead, the industrial margin is escalated for inflation between the start of the BP-12 rate period and the start of the BP-20 rate period. The escalation factor uses the GDP Implicit Price Deflator using actuals from the Bureau of Economic Analysis and forecast from IHS Markit. Accordingly, the BP-12 industrial margin, 0.685 mills/kWh, is multiplied by 1.15. The BP-20 industrial margin is 0.788 mills/kWh.

Two industrial customers; rates set through contract.

Customer 1: BPA rate plus \$1.09/MWh; 2009 sales (kWh) = **31,485,920**

Margin = \$ 34,320

Customer 2: BPA rate plus \$21,430/mo; 2009 sales = **19,924,508**

Margin = \$ 257,160

Total margin from Customers 1 & 2 = \$ 291,480

Sales to Customers 1 & 2 (kWh) = **51,410,428**

Large Industrial includes sales under Schedules 14, 15, & 16
