COMMONLY USED ACRONYMS AND SHORT FORMS

AAC	Anticipated Accumulation of Cash
ACNR	Accumulated Calibrated Net Revenue
ACS	Ancillary and Control Area Services
AF	Advance Funding
AFUDC	Allowance for Funds Used During Construction
AGC	automatic generation control
aMW	average megawatt(s)
ANR	Accumulated Net Revenues
ASC	Average System Cost
BAA	Balancing Authority Area
BiOp	Biological Opinion
BPA	Bonneville Power Administration
BPAP	Bonneville Power Administration Power
BPAT	Bonneville Power Administration Transmission
Bps	basis points
Btu	British thermal unit
CAISO	California Independent System Operator
CIP	Capital Improvement Plan
CIR	Capital Investment Review
CDQ	Contract Demand Quantity
CGS	Columbia Generating Station
CHWM	Contract High Water Mark
CNR	Calibrated Net Revenue
COB	California-Oregon border
COE	U.S. Army Corps of Engineers
COI	California-Oregon Intertie
Commission	Federal Energy Regulatory Commission
Corps	U.S. Army Corps of Engineers
COSA	Cost of Service Analysis
COU	consumer-owned utility
Council	Northwest Power and Conservation Council (see also “NPCC”)
COVID-19	coronavirus disease 2019
CP	Coincidental Peak
CRAC	Cost Recovery Adjustment Clause
CRFM	Columbia River Fish Mitigation
CSP	Customer System Peak
CT	combustion turbine
CWIP	Construction Work in Progress
CY	calendar year (January through December)
DD	Dividend Distribution
DDC	Dividend Distribution Clause
dec	decrease, decrement, or decremental
DERBS	Dispatchable Energy Resource Balancing Service

DFS	Diurnal Flattening Service
DNR	Designated Network Resource
DOE	Department of Energy
DOI	Department of Interior
DSI	direct-service industrial customer or direct-service industry
DSO	Dispatcher Standing Order
EE	Energy Efficiency
EESC	EIM Entity Scheduling Coordinator
EIM	Energy imbalance market
EIS	Environmental Impact Statement
ELMP	Extended Locational Marginal Pricing
EN	Energy Northwest, Inc.
ESA	Endangered Species Act
ESS	Energy Shaping Service
e-Tag	electronic interchange transaction information
FBS	Federal base system
FCRPS	Federal Columbia River Power System
FCRTS	Federal Columbia River Transmission System
FELCC	firm energy load carrying capability
FERC	Federal Energy Regulatory Commission
FMM-IIIE	Fifteen Minute Market – Instructed Imbalance Energy
FOIA	Freedom of Information Act
FORS	Forced Outage Reserve Service
FPS	Firm Power and Surplus Products and Services
FRP	Financial Reserves Policy
F&W	Fish & Wildlife
FY	fiscal year (October through September)
G&A	general and administrative (costs)
GARD	Generation and Reserves Dispatch (computer model)
GDP	Gross Domestic Product
GI	generation imbalance or generator interconnection
GMS	Grandfathered Generation Management Service
GSP	Generation System Peak
GSR	Generation Supplied Reactive (service)
GRSPs	General Rate Schedule Provisions
GTA	General Transfer Agreement
GWh	gigawatthour
HLH	Heavy Load Hour(s)
HOSS	Hourly Operating and Scheduling Simulator (computer model)
HYDSIM	Hydrosystem Simulator (computer model)
IE	Eastern Intertie
IIE	Instructed Imbalance Energy
IM	Montana Intertie
inc	increase, increment, or incremental
IOU	investor-owned utility

IP	Industrial Firm Power
IPR	Integrated Program Review
IRD	Irrigation Rate Discount
IRM	Irrigation Rate Mitigation
IRPL	Incremental Rate Pressure Limiter
IS	Southern Intertie
kcfs	thousand cubic feet per second
KSI	key strategic initiative
kW	kilowatt
kWh	kilowatthour
LAP	Load Aggregation Point
LDD	Low Density Discount
LGIA	Large Generator Interconnection Agreement
LLH	Light Load Hour(s)
LMP	Locational Marginal Price
LPP	Large Project Program
LT	long term
LTF	Long-term Firm
Maf	million acre-feet
Mid-C	Mid-Columbia
MMBtu	million British thermal units
MNR	Modified Net Revenue
MRNR	Minimum Required Net Revenue
MW	megawatt
MWh	megawatthour
NCP	Non-Coincidental Peak
NEPA	National Environmental Policy Act
NERC	North American Electric Reliability Corporation
NFB	National Marine Fisheries Service (NMFS) Federal Columbia River Power System (FCRPS) Biological Opinion (BiOp)
NLSL	New Large Single Load
NMFS	National Marine Fisheries Service
NOAA Fisheries	National Oceanographic and Atmospheric Administration Fisheries
NOB	Nevada-Oregon border
NORM	Non-Operating Risk Model (computer model)
NWPA	Northwest Power Act/Pacific Northwest Electric Power Planning and Conservation Act
NP-15	North of Path 15
NPCC	Northwest Power and Conservation Council
NPV	net present value
NR	New Resource Firm Power
NRFS	NR Resource Flattening Service
NRU	Northwest Requirements Utilities
NT	Network Integration

NTSA	Non-Treaty Storage Agreement
NUG	non-utility generation
NWPP	Northwest Power Pool
OATT	Open Access Transmission Tariff
O&M	operations and maintenance
OATI	Open Access Technology International, Inc.
ODE	Over Delivery Event
OS	Oversupply
OY	operating year (August through July)
PDCI	Pacific DC Intertie
PF	Priority Firm Power
PFp	Priority Firm Public
PFx	Priority Firm Exchange
PNCA	Pacific Northwest Coordination Agreement
PNRR	Planned Net Revenues for Risk
PNW	Pacific Northwest
POD	Point of Delivery
POI	Point of Integration or Point of Interconnection
POR	Point of Receipt
PPC	Public Power Council
PRSC	Participating Resource Scheduling Coordinator
PS	Power Services
PSC	power sales contract
PSW	Pacific Southwest
PTP	Point-to-Point
PUD	public or people's utility district
RAM	Rate Analysis Model (computer model)
RAS	Remedial Action Scheme
RCD	Regional Cooperation Debt
RD	Regional Dialogue
RDC	Reserves Distribution Clause
REC	Renewable Energy Certificate
Reclamation	U.S. Bureau of Reclamation
REP	Residential Exchange Program
REPSIA	REP Settlement Implementation Agreement
RevSim	Revenue Simulation Model
RFA	Revenue Forecast Application (database)
RHWM	Rate Period High Water Mark
ROD	Record of Decision
RPSA	Residential Purchase and Sale Agreement
RR	Resource Replacement
RRS	Resource Remarketing Service
RSC	Resource Shaping Charge
RSS	Resource Support Services
RT1SC	RHWM Tier 1 System Capability

RTD-IIIE	Real-Time Dispatch – Instructed Imbalance Energy
RTIEO	Real-Time Imbalance Energy Offset
SCD	Scheduling, System Control, and Dispatch Service
SCADA	Supervisory Control and Data Acquisition
SCS	Secondary Crediting Service
SDD	Short Distance Discount
SILS	Southeast Idaho Load Service
Slice	Slice of the System (product)
SMCR	Settlements, Metering, and Client Relations
SP-15	South of Path 15
T1SFCO	Tier 1 System Firm Critical Output
TC	Tariff Terms and Conditions
TCMS	Transmission Curtailment Management Service
TDG	Total Dissolved Gas
TGT	Townsend-Garrison Transmission
TOCA	Tier 1 Cost Allocator
TPP	Treasury Payment Probability
TRAM	Transmission Risk Analysis Model
Transmission System Act	Federal Columbia River Transmission System Act
Treaty	Columbia River Treaty
TRL	Total Retail Load
TRM	Tiered Rate Methodology
TS	Transmission Services
TSS	Transmission Scheduling Service
UAI	Unauthorized Increase
UDE	Under Delivery Event
UFE	unaccounted for energy
UFT	Use of Facilities Transmission
UIC	Unauthorized Increase Charge
UIE	Uninstructed Imbalance Energy
ULS	Unanticipated Load Service
USACE	U.S. Army Corps of Engineers
USFWS	U.S. Fish & Wildlife Service
VER	Variable Energy Resource
VERBS	Variable Energy Resource Balancing Service
VOR	Value of Reserves
VR1-2014	First Vintage Rate of the BP-14 rate period (PF Tier 2 rate)
VR1-2016	First Vintage Rate of the BP-16 rate period (PF Tier 2 rate)
WECC	Western Electricity Coordinating Council
WSPP	Western Systems Power Pool

1. INTRODUCTION TO THE TRANSMISSION RATES STUDY

1.1 Purpose

The Transmission Rates Study (Study) describes the rate design process and calculations used for developing transmission rates for BPA's wholesale transmission services for fiscal years (FY) 2026 through 2028. The primary purpose of this Study is to demonstrate that the rates have been developed in a manner consistent with statutory directives and will recover the transmission revenue requirement for the rate period. The transmission rates can be found in the 2026 Transmission, Ancillary, and Control Area Service Rate Schedules and General Rate Schedule Provisions (Transmission Rate Schedule and GRSPs), BP-26-A-01-AP02.

This Study also discusses the development and calculation of rates for two ancillary services associated with transmission service: 1) Scheduling, System Control, and Dispatch (SCD) Service, and 2) Reactive Supply and Voltage Control from Generation Sources Service (also known as Generation Supplied Reactive (GSR) Service). The Generation Inputs Study, BP-26-FS-BPA-06, discusses the development and calculation of rates for BPA's other ancillary and control area services, including the implementation of settlement terms for select rates. In addition, EIM charges not directly assigned are shown in the Transmission Revenue Requirement Study Documentation, BP-26-FS-BPA-09A, Table 2.16 and 2.17.

This Study is organized into seven sections. The first is this introduction, which includes a discussion of the statutory and contractual basis for rate development and an overview of the rate design process and methodology. Section 2 describes the sales and revenue forecasts used to calculate the rates for network and intertie services. Section 3 describes revenue credits and other adjustments that are applied to the revenue requirements.

1 Section 4 describes the calculation of the rates for transmission service over the Network
2 segment. Section 5 describes the calculation of the rates for intertie transmission services.
3 Section 6 describes the calculation of the rates for SCD and GSR services. Section 7
4 discusses other transmission services and the GRSPs. The Documentation tables included
5 at the end of this document support the calculations performed in this Study.
6

7 **1.2 Basis for Rate Development**

8 **1.2.1 Statutes**

9 In accordance with Section 4 of the Federal Columbia River Transmission System Act
10 (Transmission System Act), BPA constructs, operates, and maintains the Federal Columbia
11 River Transmission System (FCRTS) to a) integrate and transmit electric power from
12 existing or additional federal or non-federal generating units; b) provide service to BPA
13 customers; c) provide interregional transmission facilities; and d) maintain the electrical
14 stability and reliability of the system. 16 U.S.C. § 838b.
15

16 Section 7(a) of the Northwest Power Act sets forth the overall guidelines to be used in
17 establishing BPA's rates. Under Section 7(a)(2), rates are effective upon a finding by the
18 Federal Energy Regulatory Commission (Commission or FERC) that the rates:

- 19 • are sufficient to ensure repayment of the federal investment in the
20 Federal Columbia River Power System (FCRPS) over a reasonable
21 number of years after first meeting the BPA Administrator's other costs;
- 22 • are based upon the BPA Administrator's total system costs; and
- 23 • insofar as transmission rates are concerned, equitably allocate the costs
24 of the federal transmission system between federal and non-federal
25 power utilizing the FCRTS. *Id.* § 839e(a)(2).
26

1 Section 9 of the Transmission System Act provides that rates shall be established
2 a) to encourage the widest possible diversified use of electric power at the lowest possible
3 rates consistent with sound business principles; b) to recover the cost of producing and
4 transmitting electric power, including amortization of the capital investment allocated to
5 power over a reasonable number of years; and c) at levels that produce such additional
6 revenues as may be required to pay the principal, premiums, discounts, expenses, and
7 interest in connection with bonds issued under the Transmission System Act. *Id.* § 838g.

8
9 Section 10 of the Transmission System Act allows for uniform rates and specifies that the
10 costs of the federal transmission system be equitably allocated between federal and
11 non-federal uses of the system. *Id.* § 838h.

12
13 Section 212(i) of the Federal Power Act sets forth additional ratemaking requirements for
14 transmission rates for transmission service ordered by FERC. *Id.* § 824k(i). Section 211A
15 of the Federal Power Act authorizes FERC to require unregulated transmitting utilities
16 (including BPA) to provide transmission service at rates comparable to those that the
17 unregulated transmitting utilities charge themselves. *Id.* § 824j-1.

18 19 **1.2.2 Existing Contractual Arrangements**

20 The transmission rates developed in this Study will apply to existing agreements and to
21 new agreements established under BPA's Open Access Transmission Tariff (OATT) for the
22 FY 2026 through FY 2028 rate period. For some contracts, such as Direct Service Industry
23 (DSI) delivery contracts, rates change according to a contract schedule independent of the
24 rate proceeding. Under those contracts, new rates will apply only if the rate is due to
25 change under the contract schedule. Other contracts, such as Operations and Maintenance

(O&M) and Use-of-Facilities (UFT) contracts, are fixed-price or formula rate contracts and are not affected by the rate design process discussed in this Study.

1.3 Overview of Transmission Rate Design Process and Methodology

BPA establishes transmission rates by determining the overall costs of the transmission system (revenue requirement) and allocating those costs to its various customer classes through processes of segmentation (discussed below) and cost allocation. The costs allocated to the various segments and customer classes are then divided by the forecast usage of those segments and customer classes to derive transmission rates.

This Study relies on the results of the Transmission Segmentation Study and the Transmission Revenue Requirement Study to calculate the rates. Sections 1.3.1 and 1.3.2 provide an overview of these studies.

1.3.1 Transmission Segmentation Study

BPA assigns transmission facilities to segments based on how those facilities are used. The Transmission Segmentation Study and Documentation, BP-26-FS-BPA-07, explains how BPA established its segments for the FY 2026–2028 rate period and determined the investment and O&M expense ratios for each segment. BPA established six segments for the purposes of developing rates in this period—Generation Integration, Network, Southern Intertie, Eastern Intertie, DSI Delivery, and Ancillary Services.

The gross investment and historical O&M costs for each segment are identified in the Transmission Segmentation Study. These inputs are used in the Transmission Revenue Requirement Study to develop segmented investment ratios (the percentage of total net plant investment represented by each segment’s plant investment) and O&M cost ratios

(the share of total O&M costs represented by each segment's historical O&M costs). In the Transmission Revenue Requirement Study, these ratios are used to determine the portion of the transmission revenue requirement that is allocated to each segment.

1.3.2 Transmission Revenue Requirement Study

The Transmission Revenue Requirement Study, BP-26-FS-BPA-09, establishes the amount of revenue needed to recover the costs associated with providing transmission services for the rate period. The revenue requirement is based on program-level expenses and capital expenditures developed in the FY 2026-2028 Integrated Program Review processes, as described in Sections 2.1-2.2 of the Transmission Revenue Requirement Study, BP-26-FS-BPA-09.

The Transmission Revenue Requirement Study determines the revenue requirements for each segment (the segmented revenue requirement) by applying the investment and O&M ratios developed in the Transmission Segmentation Study to the overall transmission revenue requirement. The segmented transmission revenue requirement for FY 2026-2028 is shown in Table 1 in this Study. Section 2 of the Transmission Revenue Requirement Study, BP-26-FS-BPA-09, describes this allocation.

1.3.3 Transmission Rates Study

Development of the rates for the transmission and ancillary services addressed in this Study relies on two primary inputs: 1) sales forecasts developed as part of this Study; and 2) the segmented transmission revenue requirements developed in the Transmission Revenue Requirement Study. This Study takes the segmented transmission revenue requirements, allocates these revenue requirements to the various transmission services, and divides the allocated revenue requirements by the sales forecasts for each

1 transmission service developed in the rates Study to calculate a rate for each service. This
2 Study demonstrates that the rates have been developed in a manner consistent with
3 statutory directives and that they are sufficient to recover the allocated transmission
4 revenue requirement for the rate period.
5

2. SALES AND REVENUE FORECASTS

2.1 Overview

This Study forecasts sales for each of the transmission services and certain ancillary services for purposes of developing rates. Transmission sales forecasts are generally based on either forecast load or contract transmission demand, depending on the type of transmission service. This Study uses the sales forecast for two purposes: 1) as the basis for the transmission revenue forecasts, which determine the expected levels of revenue for the rate period from transmission and ancillary services rates and other sources; and 2) in the calculation of rates, as described below.

BPA prepared two revenue forecasts for the FY 2026–2028 rate period, both are based on the sales forecast in Tables 4 and 5. One forecast applies the current (BP-24) rates to forecast sales and the other applies the proposed (BP-26) rates to the same sales forecast. These revenue forecasts are used in the Transmission Revenue Requirement Study to test whether current rates are sufficient to recover the transmission revenue requirement and whether proposed rates are sufficient to recover the transmission revenue requirement. See Transmission Revenue Requirement Study, BP-26-FS-BPA-09, §§ 3.2, 3.3.

Sales forecasts are discussed further in Sections 2.2, 2.3, 2.4, and 2.5 below and are shown on Tables 4, 5, 7, 8.1, 11.1, 11.2, 11.3, 12.1, 12.2, and 13 in this Study. Revenue forecasts are discussed further in Section 2.6, and the revenue forecasts at current and proposed rates are shown in Table 10.

In addition, BPA forecasts transmission credits and related interest expense associated with generator interconnection agreements. These transmission credits are applied to

1 customers' invoices for transmission service and result in non-cash revenue (the related
2 interest expense represents non-cash expenses). The non-cash revenues are included in
3 the revenue forecasts because the transmission services to which they apply are included
4 in the sales forecasts. BPA forecasts the transmission credits separately because the non-
5 cash revenues and expenses have other impacts on revenue requirements and cost
6 recovery. These impacts are described further in Section 2.2.5 of the Transmission
7 Revenue Requirement Study. The development of these credits is described later in this
8 document.

9 10 **2.2 Sales Forecasts for Transmission Service on BPA's Network**

11 Sales forecasts for long-term transmission services are generally based on measures of use
12 to which the charges for the service are applied. Sales forecasts of NT transmission service
13 are based on load forecasts because the charges for this service are based on a customer's
14 load. Sales forecasts of long-term Point-to-Point (PTP) transmission service are based on
15 transmission contract demand or reserved capacity because the charges for these services
16 are based on the demand or capacity amounts specified in the customers' transmission
17 contracts. BPA includes both existing sales and expected future sales in the forecasts.

18
19 Because short-term PTP service is not reserved far in advance, there are no existing
20 reserved capacities during the rate period on which to base the sales forecast. Instead, the
21 forecast is developed using the statistical relationship between historical short-term sales
22 data and historical price spread and streamflow data. It is assumed that the historical
23 relationship represents the future relationship between short-term sales and streamflow
24 and forecast price spread. The methodology for forecasting sales for each transmission
25 service is discussed in more detail below.

2.2.1 Sales Forecast for NT Transmission Service

NT service provides transmission service for a customer's designated network load, including network load growth, over the Network segment. The NT service sales forecast used in the rate development process is based on forecasts of the monthly load for all NT customers during the rate period. BPA develops two versions of the monthly load forecasts: a non-coincident peak forecast and a coincident peak forecast. The non-coincident peak forecast, which is developed for use in the Network segment cost allocation methodology, is a forecast of the highest hourly loads of all NT customers each month. A customer's highest hourly load is the sum of the hourly load at each of the customer's Point(s) of Delivery (PODs) on the hour of the month in which this sum is the highest. The coincident peak forecast, which is developed for the calculation of the NT rate and the sales forecast used to forecast revenues, is a forecast of the load at each POD on the hour of the monthly transmission system peak.

The load forecasts for all NT customers are based on the sum of monthly load forecasts (non-coincident peak and coincident peak) developed for individual NT customers and PODs. The customer level load forecasts are developed through the application of the BPA load forecast methodology to each POD of each customer by month and accounts for all retail loads (includes all applicable loads, such as residential, commercial, and industrial loads) in the customer's service territory. Sections 2.2.1.1 and 2.2.1.2 describe the steps in the development of the non-coincident peak and coincident peak load forecasts for each customer and POD. Section 2.2.1.3 describes certain adjustments to the forecasts used for purposes of Network segment cost allocation, calculation of the NT rate, and development of the sales forecasts used to forecast revenues.

2.2.1.1 Determination of the Non-Coincident Peak Load Forecast

BPA uses a multi-step process to determine a customer's non-coincident peak load forecast. Steps 1 and 2 describe how BPA determines the customer's maximum hourly load at the customer's PODs during each month of the rate period. Step 3 explains how BPA adjusts the maximum hourly forecast to determine the sum of the hourly load at the customer's PODs on the hour in which this sum is the highest (the highest hourly load). Step 4 describes the use of the adjusted POD forecasts to determine the highest hourly load for all NT customers by month.

Step 1: Regression Analysis of Historical Meter Readings

BPA uses a regression analysis to identify the historical relationship between POD load levels and temperature. A regression analysis evaluates how one variable (in this case load levels) changes, given changes in independent variables (such as temperature). The regression analysis identifies the statistical relationship between historical load levels at individual PODs and temperature, among other variables. For historical load level data, the analysis typically uses historical monthly meter readings from individual PODs from 2010 to 2022, a period of time that includes a large enough sample to perform meaningful statistical analysis. A shorter period is used for any customer for which these years would not accurately reflect load growth, such as a customer that added a sizeable new load in recent years.

For temperature data, BPA uses actual historical temperatures from National Oceanic and Atmospheric Administration (NOAA) weather stations from the same time period. For each POD, the analysis uses temperature data from a weather station near the POD and identifies the relationship between the load levels and temperature. The model confirms that both increasing and decreasing temperatures can result in increasing load levels.

1 Increasing temperatures lead to greater use of air conditioning during warm weather
2 periods, while decreasing temperatures lead to greater use of heating equipment during
3 cold weather periods.

4
5 The analysis also calculates the relationship between load levels and month of the year.
6 The analysis confirms that in certain months loads are typically higher than in other
7 months, regardless of temperature. For example, January loads are typically higher than
8 March loads because there are fewer daylight hours and, thus, more lighting use in
9 January than in March. As another example, December loads tend to be higher because of
10 increased use of decorative lighting for the holiday season. The analysis determines the
11 amount by which load changes in each month, regardless of temperature. A variable
12 assigned to each month, referred to as the monthly indicator variable, represents the
13 amount by which load varies in each month.

14
15 Finally, individual PODs may have a load shape that is independent of the temperature
16 and monthly variables. Energy efficiency measures, new construction, economic cycles
17 and population changes affect electrical consumption and can increase or decrease load
18 at a POD. Therefore, the analysis calculates how historical load levels at each POD change
19 over time, independent of both temperature and month. A variable assigned to each
20 month, referred to as the time trend variable, represents the amount by which load
21 changes over time independent of other variables.

22
23 BPA uses a forecasting model that incorporates the relationships identified by the
24 regression analysis for each POD and applies indicators of future conditions, discussed
25 below, to develop the forecast. The model assumes that historical relationships between
26 the dependent variable (load) at each POD and the independent variables (temperature,

the monthly indicator, and the time trend variable) represent future relationships. The model applies variables representing possible future conditions to the relationships to produce a forecast.

Step 2: Application of Indicators of Future Conditions to Model Forecast Load at Each POD

BPA forecasts the maximum hourly load at each POD in the customer's contract for each month of the billing period, using the relationships identified in the regression analysis.

BPA inputs into the model independent variables that represent possible future conditions. The variables include a temperature indicator, a monthly indicator, and time trend variables discussed above.

The temperature indicator is the average heating degree days and cooling degree days. Heating and cooling degree days are calculated from daily average temperatures between 2005 and 2019 and area base temperatures for the geographic area. The daily average temperature is the average of the daily minimum and maximum outdoor temperatures on a given day. The area base temperature is the temperature that reflects the use of heating and cooling equipment in that area and other characteristics of the residential, commercial, and industrial load. Heating degree days are days that the daily average temperature is below the area base temperature for the geographic area. Cooling degree days are days that the daily average temperature is above the area base temperature for the geographic area. There is a positive relationship between heating and cooling degree days and load change. More heating degree days mean colder than average temperatures and higher loads from increased use of heating equipment. More cooling degree days mean warmer than average temperatures and higher loads from increased use of air conditioning equipment.

1 The model next applies a monthly indicator variable and the time trend variable to
2 forecast loads for each future month being evaluated. The monthly indicator variable
3 triggers the model to include in the forecast the amount by which historical loads in that
4 month have tended to change over time, regardless of temperature. For example, if the
5 month being forecast is January, the model forecasts loads based on the amount by which
6 loads in January are historically higher than loads in other months, regardless of
7 temperature. Similarly, the time trend variable triggers the model to include in the
8 forecast the amount by which historical loads have changed over time, regardless of
9 temperature and monthly indicator. For example, if the forecast is being developed for
10 June in the first year of the rate period, the model will forecast loads differently, based on
11 historical time trends from Step 1, than it would if the forecast were for June of the
12 second year of the rate period. The time trend variable triggers the model to incorporate
13 into the forecast the amount of load increase that is not attributable to temperature or
14 calendar month.

15
16 After the inputs are included in the model, the model produces a forecast of the maximum
17 hourly load at each POD for each month of the rate period.

18 19 **Step 3: Adjustment of Maximum Hourly Load at the PODs**

20 Because the maximum hourly load at each POD may not occur on the hour of the month
21 in which the sum of the customer's load at all of its PODs is highest, BPA adjusts the
22 forecast of the maximum hourly load at each POD by a coincident factor for each month.
23 The coincident factor is the average of the ratios of the historical POD load on the hour of
24 the customer's monthly peak load to the historical POD load on the hour of that POD's
25 peak load during the same month, for the same years used for the regression analysis
26 (typically 2008 to 2020). For example, to determine the July coincident factor, first BPA

determines the ratio for each July of the historical period. Using the ratio for July 2020 as an example, the calculation starts with dividing the load at POD A during the hour of the customer's highest hourly load (assume it is 3 megawatts (MW) and occurs at 1 p.m. on July 7, 2020) by the maximum load at POD A (assume it is 4 MW at 2 p.m. on July 8, 2020). In this example, the ratio would be 3 divided by 4, which equals 75 percent. Next, BPA averages the July ratios in the historical period to determine a July coincident factor. BPA multiplies the forecast of the maximum hourly load for the month at the POD by its monthly coincident factor to determine the forecast POD load on the hour of the customer's peak load for the month.

Step 4: Determination of the Non-Coincident Peak Load Forecast for all NT

Customers

BPA adds the adjusted POD forecasts to determine the highest hourly load for all NT customers by month to produce the non-coincident peak load forecast. The forecast for all NT customers is the basis for the forecast used for purposes of Network segment cost allocation.

2.2.1.2 Determination of the Coincident Peak Load Forecast

BPA forecasts the coincident peak load of all NT customers on the hour of the monthly BPA transmission system peak to calculate the NT rate and to develop the sales forecast used to forecast revenue at current and proposed rates. BPA develops the coincident peak forecast using the methodology described above in steps 1 and 2 of Section 2.2.1.1. BPA does not use steps 3 and 4. Next, BPA adjusts the maximum hourly load forecast for each POD to reflect the load on the hour of BPA's monthly transmission system peak to create the coincident peak load forecast. These are then summed to a total for all NT customers for use in the NT rate and revenue calculations. (The billing factor for the

NT-26 rate is the customer's load on the hour of BPA's monthly transmission system peak.) These sales forecasts are shown in Table 4, lines 9-12, 25-28, and 41-44. The forecast of revenue at current rates is shown in Table 10.

2.2.1.3 Adjustments for Short Distance Discount and Product Conversions

As noted above, this Study develops a non-coincident peak load forecast for Network cost allocation and a coincident peak load forecast to calculate the NT rate and the NT sales forecast used in the revenue forecast. See Table 4 (the non-coincident peak load forecasts developed in Section 2.2.1.1 for FY 2026–2028 and the average over the rate period are shown in lines 16, 32, 48, and 61; the coincident peak load forecasts developed in Section 2.2.1.2 for FY 2026–2028 and the average over the rate period are shown in lines 12, 28, 44, and 57).

For the Network segment cost allocation (described further in Section 4), BPA reduces the monthly non-coincident peak load forecast to reflect the impact, in megawatts, of the NT Short Distance Discount (SDD). The SDD applies to a customer's Network Resources that are designated for at least 12 months and that use FCRTS facilities for less than 75 circuit miles for delivery to Network Load. BPA forecasts a reduction in sales due to the SDD by multiplying the average generation of the designated network resource during heavy load hours (HLH) by the SDD formula of $40\% \times (75 - \text{distance})/75$. See Table 4 (forecast NT SDD during the rate period is shown in lines 8, 24, and 40).

BPA applies the same formula to reduce the monthly coincident peak load forecasts to reflect the impact of the NT SDD for purposes of the revenue forecast and the billing determinant used to calculate the NT rate (discussed further in Section 4 below). See Table 4 (forecasts developed in Section 2.2.1.2 for FY 2026-2028 and the average over

1 the rate period, including a reduction for the NT SDD, are shown in lines 11, 27, 43,
2 and 56). BPA uses the average of the monthly coincident peak load forecasts, including a
3 reduction for the NT SDD, for each fiscal year.

4
5 There are several steps to forecast the amount of NT load associated with conversion of
6 PTP long-term or legacy service to NT service. First, customer(s) that will elect to
7 convert to NT from PTP are identified. Second, the amount of NT load due to conversion
8 is determined based on the amount of the customer's PTP reservations converting, but no
9 higher than the forecast of the customer's non-coincident peak load. This load is added
10 to the customer's non-coincident peak load forecast described in Section 2.2.1.1. Third,
11 NT loads (coincident peak) for rates and revenue determination are computed by
12 taking the network conversion loads forecast in step 2 multiplied by historical ratio of
13 coincidental NT loads to non-coincident NT loads. The coincidental peak load from
14 conversion is added to the coincident peak load forecast described in Section 2.2.1.2.

15
16 To calculate the NT SCD and GSR Ancillary Services rates (discussed further in Section 6),
17 this Study uses the average of the monthly coincident peak load forecasts, not including a
18 reduction for the NT SDD.

20 **2.2.2 Sales Forecast for PTP Transmission Service on the Network**

21 PTP transmission service provides for the transmission of energy on a firm or non-firm
22 basis from specific point(s) of receipt to specific point(s) of delivery under Part II of
23 BPA's Open Access Transmission Tariff (OATT). PTP service may be long-term (one year
24 or longer) or short-term (hourly, daily, weekly, or monthly service). BPA separately
25 forecasts sales of long-term and short-term PTP transmission service on the Network.

2.2.2.1 Long-Term PTP Transmission Service Sales Forecast

This Study includes forecasts of both existing sales and expected additional sales of long-term PTP service on the Network during the rate period. The forecast of existing long-term PTP sales is based on:

1. Current long-term reserved capacities effective through the FY 2026-2028 rate period. This forecast includes all confirmed reservations for service during the rate period, including confirmed reservations for Conditional Firm Service; and
2. Current long-term reserved capacities with start dates that have been deferred pursuant to OATT Section 17.7 (extensions for commencement of service), which reduce the sales forecast for the period of the deferral.

The forecast of expected additional long-term PTP sales on the Network is based on:

1. Long-term sales that have not yet been requested, but are expected to be requested and begin during the rate period, including renewals of service under OATT Section 2.2 (associated with existing agreements);
2. Transmission Service Request (TSR) Study and Expansion Process (TSEP) reservations that are expected to be confirmed during the rate period (that is, service BPA expects to offer as a result of new or additional infrastructure BPA plans to place into service during the rate period);
3. Expected OATT Section 17.7 customer deferrals (extensions for commencement of service), which reduce the sales forecast for the period of the deferral; and
4. Conversions of long-term PTP to NT service.

In forecasting expected additional long-term PTP sales on the Network, BPA also considers a variety of information sources. BPA examines requests in the queue and consults with customers, account executives, and others with knowledge about long-term PTP requests concerning expected service demand, start date, length of the service, and whether a

1 customer would be expected to accept service if offered. BPA also considers the potential
2 for additional sales as a result of new or changed business practices that are expected to be
3 in effect during the rate period. The forecast reflects the most likely scenario based on this
4 information. If there is uncertainty in the information gathered through this process, BPA
5 looks at historical sales to the customer to determine whether the additional sales should
6 be included in the forecast.

7
8 Table 4 also includes adjusted forecasts that are developed in this Study to reflect the
9 impact of the SDD in the PTP rate schedules. The PTP SDD applies to the contract demand
10 for any long-term reservation using less than 75 circuit miles of BPA transmission. The
11 adjusted forecasts are developed by multiplying the reserved capacity for each reservation
12 or request to which the SDD applies by the distance-based percentage:
13 $40\% \times (75 - \text{distance})/75$. This adjustment is made to both existing and expected sales to
14 which the SDD applies.

15
16 This Study calculates the average of the monthly sales forecasts, including the reduction for
17 the SDD, over the rate period and for each fiscal year. The average of the monthly sales
18 forecasts for each fiscal year, including the reduction for the SDD, is used to establish the
19 revenue forecast from long-term PTP sales. The average of the sales forecasts over the rate
20 period, not including the reduction for the SDD, is used for the Network segment cost
21 allocation, discussed in Section 4.

22
23 This Study uses the average PTP sales forecast for each fiscal year, not including the
24 reduction for the SDD, to calculate an average for the rate period, which is used to establish
25 the sales forecast for SCD and GSR services (described further in Section 2.4). *See* Table 4.

2.2.2.2 Short-Term PTP Network Sales Forecast

Short-term PTP sales are firm or non-firm sales of less than one year, including monthly, weekly, daily, and hourly sales. Because short-term PTP service is not reserved far in advance, there are no existing reserved capacities on which to base the sales forecast. Therefore, the forecast of short-term PTP sales expected to occur during the rate period is developed with a regression model that relies on key market variables—streamflow and price spreads. This method develops a forecast that reflects a) historical relationships between sales and market indicators and b) expected market conditions over the rate period.

BPA performs a regression analysis to determine the statistical relationship between short-term PTP sales and market indicators (streamflow and price spread). The short term sales regression model takes historical regulated streamflow at The Dalles, obtained from the U.S. Geological Survey (USGS), and price spread data of historical day-ahead power prices at North-of-Path 15 (NP-15, a weighted price of Northern California) and at Mid-Columbia (Mid-C, a trading point in the Pacific Northwest) obtained from Intercontinental Exchange (ICE, an operator of over-the-counter electricity markets) and the California Independent System Operator (CAISO).

BPA performs one regression analysis for BPA Power Services' short-term PTP reservations and another for all other customers' short-term PTP reservations. BPA analyzes BPA Power Services' reservations separately from other customers because its reservations correlate with different variables than other customers. For sales of short-term PTP service to BPA's Power Services, the regression analysis is performed on historical short-term PTP sales against streamflow only, because as streamflow increases, short-term sales to Power Services tend to increase, while price spread and seasonality do

1 not tend to influence short-term sales for Power Services. This is because streamflow at
2 The Dalles is a proxy for power generated on the FCRPS. This generation can occur
3 whether or not there are strong price spreads that incentivize generation. For short-term
4 PTP sales to customers other than BPA Power Services, BPA performs the regression
5 analysis on historical short-term PTP sales against streamflow, price spread, and
6 seasonality. For these customers, there is a significant statistical relationship between
7 sales and streamflow, price spread, and seasonality.

8
9 The forecast for future market conditions (streamflow, price spread, and seasonality) are
10 inputs to the development of the rate forecast. The streamflow model uses average
11 streamflow on a monthly basis at The Dalles based on a 30-year hydro year ensemble from
12 1988 through 2018 provided by BPA Power Services Long Term Power Planning. The price
13 spread forecast is derived from Mid-C and NP-15 forward prices obtained from Aurora
14 provided by BPA Power Services Market Policy and Pricing. These forward prices
15 represent expected power prices during the rate period. The Mid-C forecast price is
16 subtracted from the NP-15 forecast price to obtain the price spread input to the forecasting
17 model to predict future sales. To account for monthly seasonality, the model incorporates
18 dummy variables to capture the monthly trends of short-term sales observed in the first
19 step.

20
21 BPA incorporates uncertainty around the streamflow, price spread, and other parameters
22 using a Microsoft Excel add-in, @RISK, a product of Palisade Corporation. @RISK uses a
23 Monte Carlo-based simulation (a method that uses repeated simulations to determine a
24 range of possible outcomes) to run 2,700 short-term sales forecasting iterations to
25 generate the distribution of possible sales under a variety of streamflow and price spread
26 conditions. BPA also models risk around the forecast of other market indicators that are

1 used to develop the sales forecast. BPA models variability in the streamflow dataset for the
2 Columbia River at The Dalles. To determine the variability for price spread used in @RISK,
3 BPA uses Aurora forward prices for Mid-C and NP-15 to represent expected power prices
4 during the rate period. The model creates variability around the forward prices by
5 inputting factors that affect power prices, such as natural gas prices, Columbia River
6 streamflows, and ambient temperatures in the BPA load area. By randomly sampling
7 natural gas, streamflow, and temperature data and applying that data to the historical
8 relationships between these factors and power prices, the model produces power prices at
9 Mid-C and NP-15 for each month, which are adjusted for natural gas price, streamflow, and
10 seasonal variation. The outcome of each iteration is a forecast for short-term sales for each
11 month of each year of the rate period, given the assumed market conditions. The resulting
12 forecast of short-term sales for each month of the rate period is the mean, or average, of the
13 2,700 iterations.

14
15 BPA then allocates the total short-term sales forecast (for sales to Power Services and to all
16 customers other than Power Services) for each month across the different short-term
17 services (monthly, weekly, daily, and hourly service), resulting in a forecast for sales under
18 the Hourly, Block 1 (days 1-5), and Block 2 (days 6+) rates for each month of the rate
19 period. This allocation is made by applying the historical distribution of short-term sales
20 across the three rates, using sales data from October 2016 through June 2024 (the same
21 data used to forecast total short-term sales). This allocation determines the overall short-
22 term PTP sales forecasts for each month under each rate. The forecast of short-term PTP
23 sales is shown in Table 5.

2.3 Sales Forecasts for Transmission Service on BPA's Interties

BPA segments the facilities comprising its external interconnections with California/Nevada (Southern Intertie) and Montana (Eastern Intertie) separately from its Network facilities and separately forecasts the sales on these segments.

2.3.1 Sales Forecast for Southern Intertie Transmission Service

BPA offers PTP transmission service on the Southern Intertie. BPA separately forecasts sales of long-term and short-term transmission service.

2.3.1.1 Sales Forecast for Long-Term Southern Intertie Transmission Service

Forecasts of long-term Southern Intertie sales include existing and expected long-term sales. The forecast of existing long-term sales is based on:

1. Current confirmed long-term reserved capacities effective through the FY 2026-2028 rate period; and
2. Confirmed OATT 17.7 customer deferrals (extensions for commencement of service), which reduce the Intertie sales forecast for the duration of the deferral.

Long-term capacity on the Southern Intertie is fully subscribed in the north-to-south direction, meaning that BPA cannot make additional sales unless existing agreements terminate or are not renewed, or until reliability upgrades on the Pacific DC Intertie (PDCI) and California-Oregon Intertie (COI) increase transfer capability. Long-term capacity on the south-to-north direction, however, is not fully subscribed. As a result, forecasts for incremental sales are included. Additional expected long-term sales are based on:

1. Long-term sales that have been requested, such as OATT Section 2.2 renewals (associated with existing agreements) and sales that BPA expects to make if an existing agreement is not renewed; and

2. Expected OATT Section 17.7 deferrals during FY 2026–2028 (extensions for commencement of service), which reduce the long-term Southern Intertie sales forecast for the duration of the deferral.
3. New confirmed service in the south-to-north direction.

In developing the long-term Southern Intertie sales forecasts, BPA examines existing reservations with service dates ending in the forecast period and requests in the queue that are seeking service. To evaluate the likelihood of existing service renewal and new service from the queue, BPA consults with transmission account executives and other subject matter experts. The forecast reflects the most likely scenario based on this information. If there is uncertainty in the information gathered through this process, BPA reviews historical sales to the customer to determine whether to include the additional sales in the forecast.

Table 4 includes the total forecast of confirmed Southern Intertie sales and expected additional sales for each month of the rate period. Table 4 also shows the fiscal year averages and the averages for the entire rate period. The fiscal year averages are used to forecast revenues, and the average forecast over the rate period is used in the sales forecast for SCD and GSR.

2.3.1.2 Sales Forecast for Short-Term Southern Intertie Transmission Service

Short-term Southern Intertie sales are firm or non-firm sales of less than one year and include monthly, weekly, daily, and hourly sales. Because short-term service is not reserved far in advance, there are no existing reservations for this service on which to base the sales forecast. Therefore, the forecast of short-term sales expected to occur during the rate period is based on historical short-term sales data and price spreads between the Mid-

1 C trading hub and California energy prices. The price spread data used in the regression
2 model is the historical day-ahead power prices at NP-15, SP-15, and at Mid-C obtained from
3 ICE and the CAISO.

4
5 Original hourly reservations are forecast using models developed with regression analysis.
6 The analysis uses historical data from October 2016 through June 2024. BPA performed
7 separate regression analysis for hourly reservations on the COI and hourly reservations on
8 the PDCI. The regression model for the COI estimates the statistical relationship between
9 hourly reservations and the price spread between the Mid-C trading hub and NP-15 trading
10 hub net of BPA IS hourly transmission costs. As the price spread between the two trading
11 hubs increases, so does the mean or expected value of hourly reservations and the variance
12 of the hourly reservations. At a higher price spread, the model would estimate a higher
13 expected volume of hourly reservations and a higher variability of the volume of hourly
14 reservations. By including both the price spread and the rate for hourly transmission in the
15 model, BPA is able to forecast anticipated hourly reservations given a future price spread
16 and transmission rate estimate. The regression model for hourly reservations on the PDCI
17 was developed using the same methodology as the COI model, except it uses price spreads
18 between Mid-C and SP-15 net of BPA Southern Intertie transmission costs.

19
20 As noted earlier, BPA incorporates uncertainty around price spreads and other parameters
21 using a Microsoft Excel add-in, @RISK. @RISK uses a Monte Carlo-based simulation (a
22 method that uses repeated simulations to determine a range of possible outcomes) to run
23 2,700 short-term sales forecasting iterations to generate the distribution of possible sales
24 under a variety of streamflow and price spread conditions. BPA also models the impact of
25 variation in the forecast market indicators that are used to develop the sales forecast. To
26 determine the variability for price spread used in @RISK, BPA uses Aurora forwards prices

1 for Mid-C, NP-15 and SP-15 to represent expected power prices during the rate period. The
2 model creates variability around the Aurora forwards prices by inputting factors that affect
3 power prices, such as natural gas prices, Columbia River streamflows, and ambient
4 temperatures in the BPA load area. By running iterations that randomly sample natural
5 gas, streamflow, and temperature data and applying that data to the historical relationships
6 between these factors and power prices, the model produces power prices at Mid-C, NP-15
7 and SP-15 for each month, which are adjusted for natural gas price, streamflow, and
8 seasonal variation. The outcome of each iteration is a forecast for hourly sales for each
9 month of each year of the rate period, given the assumed market conditions and variability.
10 The resulting forecast of short-term sales for each month of the rate period is the mean, or
11 average, of the 2,700 iterations.

12
13 One further adjustment is made to the sales forecasts for rate development purposes, as
14 described in Section 4. The average sales forecast (including the sales for all three rates)
15 over the rate period, including this adjustment, is used in the sales forecast for SCD and
16 GSR.

17 18 **2.3.2 Sales Forecast for Montana Intertie Transmission Service**

19 BPA offers PTP service over its capacity on the Eastern Intertie. The Montana Intertie
20 Agreement between BPA, Avista Corp., NorthWestern Energy, PacifiCorp, Portland General
21 Electric Company, and Puget Sound Energy, Inc., identifies the facilities that constitute the
22 Eastern Intertie (the Townsend-to-Garrison facilities). It also establishes BPA's share of
23 capacity on the Eastern Intertie as any capacity on the line, in either direction, that is not
24 allocated under the agreement to another party. BPA offers its capacity for sale under the
25 Montana Intertie rate.

1 The forecast of Montana Intertie rate sales is based on contract demand. The Montana
2 Intertie sales forecast during the FY 2026–2028 rate period includes 121 MW of existing
3 confirmed long-term sales in each year of the rate period, a forecast of an additional 79 MW
4 in the transmission queue that begins in December 2026, and the transfer of 1,730 MW of
5 long-term sales from Townsend-to-Garrison (TGT) transmission to Montana Intertie
6 transmission once the Montana Intertie Agreement terminates in September 2027. *See*
7 Table 4, lines 69-71. Historically, BPA has made very few sales of short-term service on the
8 Montana Intertie and does not expect any short-term sales during the rate period. As a
9 result, the sales forecast for short-term service is zero.

10
11 The sales forecast for Montana Intertie service is shown in Table 4. The fiscal year average
12 sales forecasts are used to forecast revenues, and the average forecast over the rate period
13 is used in the sales forecast for SCD and GSR.

14 15 **2.4 Sales Forecasts for Ancillary Services: SCD and GSR**

16 BPA provides the Ancillary Services described in Section 3 of its OATT. The two ancillary
17 services customers are required to purchase from BPA are 1) Scheduling, System Control,
18 and Dispatch Service (SCD), and 2) Reactive Supply and Voltage Control from Generation
19 Sources Service (also known as Generation Supplied Reactive (GSR) Service). The sales
20 forecasts for these Ancillary Services are discussed below.

21
22 SCD service is necessary for the provision of basic transmission service within BPA's
23 balancing authority area (BAA, the area in which the responsible entity, or balancing
24 authority, must maintain a balance between generation and load (consumption)). System
25 control and communications equipment and dispatch of generating resources and
26 transmission facilities maintain generation and load balance and physical and electronic

1 security requirements for North American Electric Reliability Corporation (NERC) critical
2 infrastructure facilities and preserve system reliability for all transactions. SCD service can
3 be provided only by the operator of the BAA in which the transmission facilities used are
4 located, since the service is used to schedule the movement of power through, out of,
5 within, or into the BAA.

6
7 GSR Service also is necessary for the provision of basic transmission service within BPA's
8 BAA. GSR is the provision of reactive power and voltage control by generating facilities
9 under the control of BPA as the operator of the BAA. The GSR rate is set on a quarterly
10 basis according to a formula in the GSR rate schedule.

11
12 Because all transmission customers taking service within BPA's BAA must purchase SCD
13 and GSR, the sales forecast for both services is the sum of the sales forecasts of the
14 transmission services within BPA's BAA (for NT customers, BPA uses the coincident peak
15 load forecast).

16
17 The short-distance discount associated with NT and PTP service does not apply to SCD and
18 GSR sales. Therefore, the sales forecast for SCD and GSR is not adjusted to reflect the SDD.
19 The sales forecast used for developing the SCD rate is shown in Table 8.1. The same sales
20 forecast is included in the formula in the GSR rate schedule. *See* Transmission Rate
21 Schedules and GRSPs, BP-26-A-01-AP02, ACS-26, § II.B.1.

22
23 For purposes of developing revenue forecasts, BPA does not separately forecast sales for
24 SCD and GSR. Instead, the SCD and GSR rates are applied to the sales forecast for applicable
25 long-term and short-term Network and Southern Intertie PTP service, and to the coincident
26 peak load forecast for NT service.

2.5 Revenue Forecasts

The transmission revenue forecasts determine the expected levels of revenue from transmission and ancillary services rates and other sources for the rate period, as indicated in Table 10. As discussed above, this Study includes forecast revenues at current rates and at proposed rates to perform the current revenue test and the revised revenue test. The forecast of revenue at current rates applies the transmission and ancillary services rates placed into effect on October 1, 2024, to the sales forecasts. The forecast of revenue at proposed rates applies the Initial Proposal rates to the sales forecasts. The forecasts are used to test whether the current and proposed rates are sufficient to recover the transmission revenue requirement. Sections 3.2 and 3.3 of the Transmission Revenue Requirement Study, BP-26-FS-BPA-09, further describe the revenue tests.

Both revenue forecasts include revenue credits. Section 3 of this Study discusses revenue credits in detail. In general, revenue credits are revenues from sources other than the transmission rates determined in this rate proceeding. This Study includes revenue credits in the revenue forecasts to ensure that the revenue tests performed in the Transmission Revenue Requirement Study incorporate all sources of transmission-related revenue. Table 10 includes all of the revenue credits applied in the revenue forecast.

2.5.1 Forecast of Non-Cash Revenues: Transmission Credits and Interest Expense Associated with Customer-Financed Projects

A portion of the revenues that BPA forecasts is non-cash revenues due to credits that customers receive against their transmission service charges. (BPA provides these credits in two general circumstances, described below.) The credits (non-cash revenues) are forecast as part of this Study and are included in the revenue forecasts discussed above because the transmission services to which they apply are included in the sales forecasts. However, because BPA does not receive the revenue in the form of cash, the credit (and

1 the related interest expense, described below) has a different impact on BPA's revenue
2 requirements and cost recovery than cash revenue. *See* Transmission Revenue
3 Requirement Study, BP-26-FS-BPA-09, § 2.2.5.

4
5 BPA forecasts transmission credits and related interest expense associated with generator
6 interconnection (GI) agreements, and non-GI line and load interconnection agreements.
7 Under both the GI and non-GI interconnection agreements, interconnection customers
8 advance fund network upgrades (upgrades to the transmission system at or beyond the
9 point at which the interconnection facilities connect to the transmission system) if BPA, as
10 the transmission provider, does not provide the funding. After completion of the network
11 upgrades, the advance funds are then returned to the customers, with interest.

12
13 Advance funds from customers with GI agreements are returned either as credits to the
14 customers' transmission bills or as monthly cash payments. The credits are applied to
15 transmission service used to transmit power from the generating facility. The cash
16 payments are designed to approximate the comparable credits and are based on the
17 generating facility's capacity and its plant capacity factor. The customer chooses whether
18 to receive credits or cash payments. Advance funds from customers with non-GI line and
19 load interconnection agreements are returned as credits to the customers' transmission
20 bills. The credits are applied to transmission service using the advance funded facilities.

3. REVENUE CREDITS AND ADJUSTMENTS TO THE SEGMENTED REVENUE REQUIREMENTS

Revenue credits and adjustments reflect known costs and revenues that are not accounted for in the Transmission Revenue Requirement Study. To develop the revenue requirements for use in calculating rates, this Study allocates the revenue credits among the various segments and then applies these credits and other adjustments to the segmented revenue requirements determined in the Transmission Revenue Requirement Study. It then calculates the net segmented revenue requirements after these credits and adjustments.

3.1 Revenue Credits

Revenue credits are transmission revenues from sources other than the general transmission rates developed in the rate proceeding. Revenue credits include revenue from items such as fixed-price contracts, contracts that specify the rates for services, use-of-facilities contracts, fiber and wireless agreements, and fixed-price fees. This Study forecasts revenue credits based on existing contract charges or rates, expectations of additional sales at such charges or rates, and receipt of fixed-price fees.

The revenue credits for fixed-price contracts and fees relate to items such as fiber and wireless leases (in which BPA leases communications capacity that exceeds BPA's operational needs), land leases, reservation and application fees, direct funding of projects and facilities, and O&M charges.

The segmented revenue requirements are initially set without regard to these additional revenues. This Study allocates revenue credits to particular segments, which reduces the

1 segmented revenue requirements and ensures that this Study accounts for all sources of
2 revenue in determining the net segmented revenue requirements used to calculate rates.
3 The allocation and application of the revenue credits described in this section are separate
4 and distinct from the inclusion of the transmission credits in the revenue forecasts
5 discussed in Section 2.

6
7 This Study allocates revenue credits associated with a particular transmission segment
8 entirely to that segment. For example, revenues related to the O&M charges for customers
9 using facilities on the Southern Intertie are allocated entirely to that segment. If revenue
10 credits are not associated with a particular segment, the revenues are allocated across all
11 segments based on the ratio of net plant investment in each segment to total net plant
12 investment. For example, this Study allocates revenues from fiber and wireless leases to all
13 segments based on portion of the net plant investment in each segment. Table 2 identifies
14 all of the expected revenue credits from various sources and the allocation of the credits by
15 segment.

16 17 **3.2 Adjustments to the Segmented Revenue Requirements**

18 This Study includes certain adjustments to the segmented revenue requirements. These
19 adjustments are not categorized as revenue credits because they do not account for
20 additional revenues. The adjustments are made for the Eastern Intertie and DSI Delivery
21 segments where all costs are recovered through contractually set rates and fees. In
22 general, the adjustments allocate a) individual segment revenues in excess of costs, and
23 b) individual segment costs in excess of revenues. A segment's revenues in excess of costs
24 represent a surplus, which is allocated to the other segments as a credit, reducing the other
25 segments' overall revenue requirements. A segment's costs in excess of revenues

represents a cost, which is allocated to the other segments as an additional revenue requirement, increasing the other segments' revenue requirements.

3.2.1 Eastern Intertie Adjustment

The Eastern Intertie segment includes the Townsend-Garrison transmission (TGT) lines and a portion of the Garrison substation facilities. *See* Transmission Segmentation Study and Documentation, BP-26-FS-BPA-07, § 2.4. BPA constructed these facilities under the Montana Intertie Agreement (Contract No. DE-MS79-81BP90210, as amended), under which BPA provides transmission service from the Colstrip generating facility in Montana to BPA's Network. *Id.* As part of the agreement, the Colstrip Parties (Avista, NorthWestern Energy, PacifiCorp, Portland General Electric, and Puget Sound Energy) acquired transmission rights over a portion of the capacity of the Eastern Intertie, for which BPA receives payment from each Montana Intertie Agreement party, at the TGT rate specified by the contract. BPA has the contractual right to exclusively market any remaining transmission capacity in either direction on the Eastern Intertie. The Montana Intertie Agreement will be expiring September 30, 2027, during the BP-26 rate period. After that time, BPA will exclusively market all transmission capacity in either direction on the Eastern Intertie under the OATT.

To determine the net segmented revenue requirement for the Eastern Intertie, this Study begins with the gross Eastern Intertie revenue requirement shown in Table 1. This Study then applies revenue credits and adjustments to the Eastern Intertie segmented revenue requirement. Table 2 shows the expected revenue credits that apply to the Eastern Intertie segment. The most significant revenue credit relates to revenue from payments to BPA under the Montana Intertie Agreement for rights to transmission service on the TGT transmission lines. The total payment for use of the facilities is set in the Montana Intertie

1 Agreement and totals \$12.536 million annually for the two remaining years of the
2 agreement. During the rate period, \$11.418 million annually is anticipated to come from
3 the TGT rate charged to parties of the Montana Intertie Agreement during the final two
4 years of the agreement, or \$7.612 million average per year of the rate period. Table 3, line
5 37. The Montana Intertie rate, which applies to PTP transmission service on BPA's
6 capacity share of the Eastern Intertie, is forecast to recover approximately \$4.878 million
7 annually during the rate period. Table 3, line 36. Since these revenues arise solely
8 through the use of the Eastern Intertie, this Study applies the entire amount of this
9 revenue credit to the Eastern Intertie segment. *See* Table 3.

10
11 The segmented revenue requirement for the IE is approximately \$13.27 million annually.
12 *See* Table 1, line 36. After applying all of the revenue credits and the Montana Intertie rate
13 revenues to the Eastern Intertie's segmented revenue requirement, the forecast revenues
14 and credits for the Eastern Intertie segment exceed the net segmented revenue
15 requirement on average by approximately \$0.06 million annually. *See* Table 3, line 38.

16
17 This Study allocates the \$0.06 million in excess revenues from the Eastern Intertie segment
18 to all the other segments proportionally based on net plant investment determined in the
19 Transmission Segmentation Study. This allocation reduces the difference between the
20 Eastern Intertie segment's adjusted revenue requirement and its revenue recovery to zero.
21 *See* Table 3, line 40.

22 23 **3.2.2 DSI Delivery Adjustment**

24 The DSI Delivery segment consists of low-voltage transmission facilities that provide
25 transmission service to DSI customers. Charges for service on the DSI Delivery segment
26 are established by contract and change based on a schedule incorporated in those

1 contracts. As a result, this Study does not calculate a rate for delivery service on DSI
2 facilities. *See* Transmission Segmentation Study and Documentation, BP-26-FS-BPA-07,
3 § 2.6.

4
5 However, this Study does account for the revenues and costs associated with this segment
6 to ensure total cost recovery. The average annual segmented revenue requirement
7 attributable to the DSI Delivery segment is \$1.337 million. Table 1, line 36. The revenues
8 generated from sales under the DSI delivery contracts, the Eastern Intertie adjustment,
9 and the other revenue credits allocated to this segment are forecast to average
10 \$945 million annually during the rate period. Table 3, line 33. After applying all of the
11 revenue credits and the DSI Delivery revenues to the DSI Delivery segmented revenue
12 requirement, the forecast revenues for the DSI Delivery segment under-recover the net
13 segmented revenue requirement by an average of \$0.393 million annually. Table 3,
14 line 39.

15
16 This Study allocates the \$0.393 million in remaining costs from the DSI Delivery segment to
17 all the other segments proportionally based on average annual segmented revenue
18 requirement. This allocation reduces the difference between the DSI Delivery segment's
19 adjusted revenue requirement and its revenue recovery to zero. *See* Table 3, line 40. Once
20 the difference between the DSI Delivery segment's adjusted revenue requirement and its
21 revenue recovery has been reduced to zero, no other revenue credits or costs from other
22 segments are allocated to the DSI Delivery segment, since these credits or costs would have
23 to be re-allocated back to other segments.

3.2.3 Adjustment for NT Redispatch Costs

BPA Transmission Services initiates redispatch of federal resources at times as part of its congestion management efforts on the Network. There are three types of redispatch that Transmission Services can request from Power Services to relieve flowgate congestion: Discretionary Redispatch, NT Redispatch, and Emergency Redispatch. Transmission Services requests Discretionary Redispatch to maintain all transmission schedules. Power Services provides this service at its discretion based on real-time operating objectives and constraints. Transmission Services requests NT Redispatch to maintain firm NT schedules and may request NT redispatch only after it has curtailed all non-firm PTP and secondary NT schedules in a sequence consistent with NERC curtailment priority. Power Services must provide NT Redispatch to the extent that it can do so without violating non-power constraints. Transmission Services requests Emergency Redispatch to minimize the risk and/or scope of a transmission system reliability condition. Power Services must provide this service when requested.

Power Services may respond to requests for redispatch through redispatch of federal generation, through purchases or sales of energy, or through purchases of transmission. The forecast of costs for redispatch averages \$244,883 per year. *See* Power Rates Study, BP-26-FS-BPA-01, § 9.3.4. These costs are included in the segmented revenue requirement for the Network. *See* Transmission Revenue Requirement Study Documentation, BP-26-FS-BPA-09A, § 2.1.

Consistent with the settlement agreement adopted in the TC-20 Terms and Conditions Proceeding, costs associated with NT Redispatch are allocated to the Network segment generally. Costs associated with Discretionary Redispatch and Emergency Redispatch also

are allocated to all Network segment users because Discretionary Redispatch and Emergency Redispatch benefit all Network segment users.

The forecast amount for NT Redispatch is \$107,782 per year, a portion of the entire \$244,883 of forecasted annual costs for redispatch. This forecast is based on the historical actual redispatch costs from October FY 2019 through August 2024 (the most recent period for which BPA has actual data). Calculation of the actual costs for providing NT Redispatch is based on one of two sources: 1) for redispatch provided from federal generation, market prices for incrementing and decrementing federal generation at the time the redispatch is provided, or 2) for redispatch provided by purchases or sales of energy or purchases of transmission, the actual cost to Power Services of the purchase or sale. The forecasts of costs for Discretionary Redispatch and Emergency Redispatch are based on this same methodology. For FY 2026 through FY 2028, Transmission Services forecasts Discretionary Redispatch of \$11,419 per year. Because Emergency Redispatch is a rare event, Emergency Redispatch is forecast to be \$0 for FY 2026-2028.

In addition, BPA's OATT provides that after a stakeholder process, NT customers may be required to make their Network Resources available for redispatch to avoid curtailments to NT service when there are transmission constraints. This type of redispatch is referred to as non-federal NT redispatch. BPA has not seen significant costs in its NT redispatch program since its inception and is not currently requiring redispatch of non-federal NT resources. Therefore, no non-federal NT redispatch costs are included in this Study.

3.3 Allocation of Generation Integration Revenues

The Generation Integration segment consists of transmission facilities that integrate federal resources into BPA's Network. The costs allocated to the Generation Integration

1 segment plus all revenue credits and adjustments averages \$24.830 million annually.
2 Table 3, line 40. These costs are assigned to BPA Power Services and recovered through
3 power rates. The payments that Power Services makes to Transmission Services are
4 included as a revenue credit in the transmission revenue forecast and are applied to the
5 Generation Integration segment.

4. NETWORK TRANSMISSION SERVICES

BPA establishes separate rates for the different types of transmission service on its Network: Network Integration Transmission Service (NT) and Point-to-Point Transmission Service (PTP). BPA provides NT and PTP service pursuant to the terms and conditions set forth in its OATT.

In general terms, this Study calculates the rates for Network services by taking the net segmented revenue requirement for the Network segment and allocating a proportionate share of these total Network costs to NT and PTP. The rates for NT and PTP service are calculated by dividing the costs to be recovered by those services by the NT and PTP billing determinants, respectively.

4.1 Network Segment Cost Allocation

To calculate the rates for Network services, this Study allocates the adjusted Network segment revenue requirement among the various services. The adjusted Network segment revenue requirement is calculated by taking the annual average Network segment revenue requirement from the Transmission Revenue Requirement Study, \$1.132 billion (Table 1, line 36), and applying revenue credits and other adjustments. This results in an adjusted Network segment revenue requirement of \$1.113 billion. Table 3, line 40.

This Study allocates costs to PTP service based on contract demand and to NT service based on forecast load. The NT load forecast is based on a 12 non-coincident peak (NCP) measure. *See* Section 2. This Study calculates an allocation percentage for each service based on the ratio of the forecast for each individual service to the total forecast average

annual sales for the services, 45,396 MW. Table 6, line 21. The allocation percentages for NT and PTP services are 25.88 percent and 74.12 percent, respectively. *Id.*, lines 28 and 25. Multiplying the total adjusted average annual Network revenue requirement of \$1.113 billion by the allocation percentage for each service yields an allocated cost of \$288 million for NT service and \$825 million for PTP service. *Id.*, lines 43 and 33. This Study uses these allocated costs to calculate the rates for NT and PTP service.

4.2 Network Integration Rate (NT-26)

Network Integration service provides transmission service for a customer's designated network load, including network load growth. BPA provides this service according to the terms and conditions in Part III of its OATT.

The NT-26 rate schedule identifies a single rate for NT Service under the OATT. *See* Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, NT-26, § II. The monthly billing factor for the NT-26 rate is the customer's Network load on the hour of the Monthly Transmission System Peak Load for the month (the billing period). *Id.* § III.

The NT-26 rate schedule includes a variety of adjustments and references to charges from other rate schedules. The rate schedule includes an SDD available to customers with designated Network Resources that use less than 75 circuit miles of BPA's transmission facilities for delivery to Network Load. *Id.* § IV.D. The SDD is a credit applied to the customer's monthly bill according to the following formula:

$$SDD\ credit = NT\ Rate \times Average\ HLH\ Generation \times (75 - distance) / 75 \times 0.4$$

1 *Id.* For resources that are directly connected to the customer's system or that do not use
2 any FCRTS facilities, the discount is 40 percent of the NT rate multiplied by the average
3 generation of the resource during HLH.

4
5 Other charges and provisions in the NT-26 rate schedule include:

- 6 • A requirement to purchase SCD and GSR ancillary services;
- 7 • The Delivery Charge;
- 8 • The Failure to Comply Penalty Charge;
- 9 • Notice that BPA will collect capital and related costs of a Direct Assignment
10 Facility under the Advance Funding rate or Use-of-Facilities rate;
- 11 • Notice of BPA's intent to charge incremental cost rates under specified
12 conditions;
- 13 • allowance for a rate adjustment pursuant to a FERC order under Section 212 of
14 the Federal Power Act;
- 15 • the Transmission Cost Recovery Adjustment Clause (CRAC), Financial Reserves
16 Policy (FPS) Surcharge, and Reserves Distribution Clause (RDC);
- 17 • Real Power Loss Imbalance Settlement; and
- 18 • Invalid Loss Return Penalty Charge.

19 *Id.* § IV. Section 7 of this Study discusses these charges and provisions.

20
21 To calculate the NT rate, the \$288 million in Network costs allocated to NT service is
22 divided by the NT billing factor of 10,006 MW, which yields a unit cost of approximately
23 \$28,787 per megawatts per year (MW-year). Table 6, lines 43-44. This amount is then
24 divided by 1,000 to derive a kilowatts per year (kW-year) unit cost of \$28.79/kW-year. *Id.*,
25 line 45. The kW-year unit cost is divided by 12 to yield the rate for NT service, which is
26 \$2.399 per kilowatt per month (kW-month). *Id.*, line 46.

4.3 Point-to-Point Rate (PTP-26)

Point-to-Point transmission service provides for the transmission of energy on a firm, non-firm, or conditional firm basis from specific points of receipt to specific points of delivery on BPA's Network. BPA provides this service according to the terms and conditions in Part II of its OATT.

The PTP-26 rate schedule includes rates for long-term service; monthly, weekly, and daily service; and hourly service. Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, § II. A single rate applies to all long-term firm service and to conditional firm service under the rate schedule. The rate schedule includes two rates for monthly, weekly, and daily service: Block 1 for the first five days of a reservation (days 1 through 5), and Block 2 for the remaining days of the reservation up to remaining month (6+ days). One hourly rate applies to all hours of a reservation for hourly service. *Id.*

The PTP-26 rate schedule incorporates a variety of adjustments, charges, notices, and other rate provisions, including:

- SDD for contract paths less than 75 circuit miles;
- A requirement to purchase SCD Service;
- The Delivery Charge;
- An Unauthorized Increase Charge;
- The Reservation Fee;
- The Failure to Comply Penalty Charge;
- A credit for interruption of non-firm service;
- Notice that BPA will collect capital and related costs of a Direct Assignment Facility under the Advance Funding rate or Use-of-Facilities rate;
- Notice of BPA's intent to charge incremental cost rates under specified conditions;

- Allowance for a rate adjustment pursuant to a FERC order under Section 212 of the Federal Power Act;
- The Transmission CRAC, FRP Surcharge, and RDC;
- Real Power Loss Imbalance Settlement; and
- Invalid Loss Return Penalty Charge.

Id. § IV. Section 7 of this Study discusses these charges and provisions.

This Study calculates the rate for long-term firm PTP service by dividing the Network costs allocated to PTP service, \$824.769 million, by the forecast average annual PTP sales of 33,646 MW, yielding a unit cost of \$24,513/MW-year. Table 6, lines 33 and 34. This amount is then divided by 1,000 to derive a kilowatt-year unit cost of \$24.51/kW-year.

Id., line 35. This kilowatt-year unit cost is divided by 12 to yield the monthly rate for long-term PTP service, \$2.043/kW-month. *Id.*, line 36.

The rate for short-term and hourly PTP service is derived from the long-term rate. Short-term sales allow the customer to purchase transmission that more closely matches the energy required in a day-by-day or hour-by-hour time frame. Typically, this means more short-term transmission is purchased during HLH than during light load hours (LLH).

To account for the greater amount of short-term capacity that is expected to be sold during HLH, and to help ensure that the rate for sales during those hours recovers the appropriate amount of costs, this Study sets short-term rates at a level higher than a simple *pro rata* fraction of the long-term rate. It does so by establishing the Block 1 rate for the first five days of short-term daily service based on the costs for a full seven days. This Study calculates the Block 1 rate by multiplying the daily PTP unit cost (*i.e.*, the annual rate divided by 365, the average number of days in each year of the rate period)

1 by a factor of 7/5 (seven total days in the week divided by five weekdays). *See* Table 6,
2 line 37. The resulting Block 1 rate is \$0.094 per kilowatt per day (kW-day). *Id.* The daily
3 PTP short-term Block 2 rate of \$0.067/kW-day is calculated by dividing the unit cost by
4 365 days. *Id.*, line 8.

5
6 This Study applies a similar factor in the calculation of the rates for hourly service. Since
7 there are 16 HLHs each weekday, the hourly rate is set by multiplying the PTP unit cost
8 by an LLH/HLH factor of 24/16 (24 hours per day divided by 16 HLHs) and then by the
9 7/5 daily factor. *Id.*, line 39. The resulting hourly PTP rate of 5.88 mills per kilowatthour
10 (mills/kWh) applies to both firm and non-firm hourly sales. *Id.*

11
12 In the calculation of the PTP unit cost, the forecast of short-term sales in the denominator
13 is adjusted upward by these same LLH/HLH factors for rate development purposes, to
14 recognize that the short-term rates will recover more revenue because the rates are
15 increased by these factors. The final short-term PTP sales forecasts after these
16 adjustments are used in the development of the rates and in the revenue forecasts.

5. INTERTIE TRANSMISSION SERVICES

BPA provides PTP transmission service on the Southern Intertie and the Eastern Intertie. As described below, this Study develops separate rates for service on these interties.

5.1 Southern Intertie Point-to-Point Rate (IS-26)

The IS-26 rate schedule applies to PTP service on the Southern Intertie. The IS-26 rate schedule includes rates for long-term firm service; monthly, weekly, and daily service; and hourly firm and non-firm service. A single rate applies to all long-term firm service. Like the PTP-26 rate schedule, the IS-26 rate schedule provides for daily, weekly, and monthly transmission service at daily Block 1 and daily Block 2 rates. One hourly rate applies to all hours of a reservation for hourly service. See Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, IS-26, § II.

The IS-26 rate schedule also includes these charges and provisions:

- The requirement to purchase certain ancillary services;
- A credit for interruption of non-firm service;
- The Reservation Fee;
- An Unauthorized Increase Charge;
- The Failure to Comply Penalty Charge;
- Notice of BPA's intent to charge incremental cost rates under specified conditions;
- Allowance for a rate adjustment pursuant to a FERC order under Section 212 of the Federal Power Act;
- Notice regarding Direct Assignment Facility costs, which are to be collected under the Advance Funding rate or Use-of-Facilities rate;
- The Transmission CRAC, FRP Surcharge, and RDC;

- Real Power Loss Imbalance Settlement; and
- Invalid Loss Return Penalty Charge.

Id. § IV. Section 7 of this Study discusses these charges and provisions.

To calculate the IS-26 rates, this Study first determines a unit cost for service on the IS. The unit cost equals the net segmented revenue requirement for the IS segment divided by the forecast sales for the segment. To determine the net segmented revenue requirement, this Study begins with the segmented revenue requirement determined in the Transmission Revenue Requirement Study. Revenue credits and other adjustments are then applied to the revenue requirement. *See* Tables 1,2, and 3. Section 3 of this Study describes these revenue credits and adjustments.

The Southern Intertie was originally constructed in 1967 and was expanded in 1993 with the participation of non-federal parties (the capacity owners). The capacity owners obtained a share of the capacity on these facilities and make payments to BPA for use of the capacity. This Study treats revenue from the payments by the capacity owners as a revenue credit allocated to the Southern Intertie segment, which reduces the segmented revenue requirement. *See* Tables 2 and 3.

After all revenue credits and adjustments are applied, the average net segmented revenue requirement is \$121.148 million. Table 3, line 40. The projected sales on BPA's portion of the Southern Intertie equal 8,507 MW. Table 7, line 13. Dividing dollars by megawatts yields an annual rate of \$14.24/kW-year. *Id.*, line 15. This annual rate is divided by 12 to determine the long-term IS-26 rate of \$1.187/kW-month. *Id.*, line 16.

1 The calculation of the daily and hourly IS-26 rates includes the same adjustment for short-
2 term sales that the Study makes for other PTP rates. Section 4.3 explains the adjustment.
3 The daily short-term Block 1 rate is calculated by dividing the annual rate,
4 \$14.24/kW-year, by 365 days/year and multiplying by 7/5 to recognize higher weekday
5 demand, which yields \$0.055/kW-day. *Id.*, line 17. The daily short-term Block 2 rate is
6 calculated by dividing the annual rate by 365 days, yielding \$0.039/kW-day. *Id.*, line 18.
7
8 The hourly IS-26 rate applies to both firm and non-firm hourly sales. It is calculated by
9 dividing the annual rate by 8,760 hours/year, dividing by 1,000 to convert to mills, and
10 multiplying by 24/5 and 7/5 to recognize higher demand during weekday evening peak
11 hours in California. The result is an hourly rate of 10.92 mills/kWh. *Id.*, line 19.
12

13 **5.2 Eastern Intertie (Montana)**

14 The Broadview-to-Garrison intertie facilities, referred to as the Montana Intertie, were
15 built to transmit the output of the Colstrip generating facility, a coal plant in Montana, to
16 the Pacific Northwest. The arrangement for constructing transmission lines and providing
17 transmission service for Colstrip was set forth in the Montana Intertie Agreement. The
18 Colstrip parties to the Montana Intertie Agreement (Avista, NorthWestern Energy,
19 PacifiCorp, Portland General Electric, and Puget Sound Energy, or their predecessors) built
20 the Broadview-to-Townsend transmission facilities. BPA built the facilities between
21 Townsend and Garrison, which are called the Eastern Intertie. Under the Montana Intertie
22 Agreement, BPA provides transmission service on the Eastern Intertie to the Colstrip
23 parties at the TGT rate. BPA has the exclusive right to market any remaining transmission
24 capacity in either direction on the Eastern Intertie. This agreement expires during the

BP-26 rate period, on September 30, 2027. After this expiration, BPA will have the right to market all transmission capacity in either direction on the Eastern Intertie.

The costs associated with the Eastern Intertie segment are recovered primarily through the Montana Intertie Agreement under the TGT rate, which is a formula rate specified in the contract until the contract expires, after which recovery will be through the IM Rate. BPA receives payments under the TGT rate from each Colstrip party for its share of the costs of the Eastern Intertie capacity. These payments are a revenue credit applied to the Eastern Intertie segment costs. *See* Table 3, line 37. Non-firm service for the Colstrip parties is available over the Eastern Intertie under either the IE (until the agreement expires) or IM rates. A proportionate share of any revenue for non-firm service received under the IE and IM rates is credited under the TGT rate to the Colstrip parties. Any firm sales BPA makes on BPA's remaining capacity on the Eastern Intertie are marketed at the IM rate.

5.2.1 Montana Intertie Rate (IM-26)

The IM-26 rate schedule applies to service on BPA's capacity share of the Eastern Intertie facilities. The IM-26 rate schedule includes rates for long-term firm service; monthly, weekly, and daily service; and hourly firm service. Like the PTP-26 rate schedule, the IM-26 rate schedule provides block rates for monthly, weekly, and daily firm and non-firm service. One hourly rate applies to all hours of a reservation for hourly service. *See* Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, IM-26, § II. The IM-26 rate schedule also includes these charges and provisions:

- The requirement to purchase certain ancillary services;
- A credit for interruption of non-firm service;
- The Reservation Fee;
- An Unauthorized Increase Charge;

- The Failure to Comply Penalty Charge;
- Notice of BPA's intent to charge incremental cost rates under specified conditions;
- Allowance for a rate adjustment pursuant to a FERC order under Section 212 of the Federal Power Act;
- Notice regarding Direct Assignment Facility costs, which are to be collected under the Advance Funding rate or Use-of-Facilities rate; and
- The Transmission CRAC, FRP Surcharge, and RDC.

Id. § IV. Section 7 of this Study discusses these charges and provisions.

The IM-26 rates are based on the segmented revenue requirement for the Eastern Intertie. Dividing the Segmented Revenue Requirement, Table 7, line 29, less revenue credits assigned to the Eastern Intertie, Table 7, line 30, by the total sales (1,899 MW), yields an annual rate of \$6.54/kW-year. *Id.*, line 35. The long-term IM-26 rate is calculated by dividing the annual rate by 12 months, yielding \$0.545/kW-month. *Id.*, line 36.

The calculation of the daily and hourly IM-26 rates includes the same adjustment for short-term sales that this Study makes for Network PTP rates. Section 4.3 explains the adjustment. The daily short-term Block 1 rate is set by dividing the IM-26 annual rate by 365 days and multiplying by the LLH/HLH factor of 7/5, which yields \$0.025/kW-day. *Id.*, line 37. The daily short-term Block 2 rate is calculated by dividing the IM-26 annual rate by 365 days, yielding \$0.018/kW-day. *Id.*, line 38.

The hourly IM-26 rate, which applies to both firm and non-firm hourly sales, is calculated by dividing the annual rate by 8,760 hours/year, dividing by 1,000 to convert to mills, and multiplying by the LLH/HLH factors of 24/16 and 7/5. *Id.*, line 39. The result is an IM-26 hourly rate of 1.57 mills/kWh. *Id.*

5.2.2 Townsend-Garrison Transmission Rate (TGT-26)

As described above, BPA recovers the majority of Eastern Intertie costs through the TGT rate, which is a formula rate based on the Montana Intertie Agreement. The TGT rate schedule is Exhibit E to the agreement and has been modified in minor respects in rate proceedings held since execution of the agreement. The calculation of the TGT rate is demonstrated in Table 7, lines 21-27. The TGT revenues are reflected as a revenue credit allocated to the Eastern Intertie segment. Table 3, line 37.

5.2.3 Eastern Intertie Rate (IE-26)

The IE-26 rate is available to the parties to the Montana Intertie Agreement for non-firm transmission service on the Eastern Intertie until the agreement expires. The rate is calculated by dividing the Eastern Intertie Segmented Revenue Requirement (Table 7, line 42) less revenue credits (*id.*, line 43), a total of \$12.429 million, by the total sales on the IE of 1,930 MW (*id.*, line 45). This is then divided by 8,760 hours/year, divided by 1,000 to convert to mills, and multiplied by the LLH/HLH factors of 24/16 and 7/5. *Id.*, line 47. The result is a rate of 1.54 mills/kWh. *Id.*

Under the TGT rate schedule, monthly revenues from any non-firm transactions under the IE-26 and IM-26 rates are deducted from the portion of the total annual costs to be recovered in that month under the TGT rate. The Colstrip parties' portion of the monthly net cost is then allocated to them in accordance with the formula in the TGT rate schedule.

6. ANCILLARY AND CONTROL AREA SERVICES

BPA provides ancillary and control area services that are separate from transmission services. This Study describes the development of the rates for a) Scheduling, System Control, and Dispatch Service (SCD), and b) Generation Supplied Reactive Service (GSR). The Generation Inputs Study, BP-26-FS-BPA-06, discusses the development of the rates for other ancillary and control area services BPA provides.

6.1 Scheduling, System Control, and Dispatch Service

Most customers purchasing transmission service over facilities within BPA's BAA are required to purchase SCD service. Customers taking NT and PTP service (including PTP service over the Southern Intertie) purchase SCD separate from transmission service at the rates in the SCD rate schedule. Customers taking PTP service over the Montana Intertie do not purchase SCD service from BPA, because those facilities are not within BPA's BAA.

The SCD rate schedule includes rates for long-term service; monthly, weekly, and daily service; and hourly service. Like the rate schedules for PTP service, the SCD rate schedule includes Block 1 and Block 2 rates for service on a monthly, weekly, or daily basis. One hourly rate applies to all hourly service.

SCD service applies to all transmission service over facilities in BPA's BAA, and the equipment that comprises the Ancillary Services segment supports all such service. The calculation of the SCD rate starts with the segmented revenue requirement attributable to SCD, which averages \$258.764 million annually over the rate period. Table 8.1, line 9. This Study adjusts the SCD costs by applying revenue credits and other adjustments. *Id.*, lines 10-15; *see also* Table 3; Section 3. The revenue credits and other adjustments reduce

1 the overall SCD costs to an average of \$250.618 million annually over the rate period.

2 Table 8.1, line 15.

3
4 As it does with respect to the calculation of rates for NT and PTP service on the Network,
5 this Study calculates allocation percentages for SCD sales associated with NT (based on the
6 non-coincident peak load forecast) and PTP (including PTP service on the Southern
7 Intertie) service based on the ratio of the sales forecast for each service to the total forecast
8 average annual SCD sales associated with all three services, 53,354 MW. Table 8.1, line 23.
9 The allocation percentages for SCD sales associated with NT and PTP services are 22.2
10 percent and 77.8 percent, respectively. *Id.*, lines 30 and 27. Multiplying the total adjusted
11 average annual SCD revenue requirement by the sales percentage for each service yields an
12 allocated cost of \$55.644 million for NT service, and \$194.974 million for PTP service. *Id.*,
13 lines 45 and 35. This Study uses these allocated costs to calculate the rates for SCD service
14 associated with NT and PTP service.

15
16 To calculate the SCD rate for NT service, this Study divides the \$55.644 million of SCD
17 costs allocated to NT service by the NT billing factor of 10,102 MW (the average monthly
18 PTP forecast for the rate period, not considering the SDD). Table 8.1, lines 45-46. This
19 yields a unit cost of \$5.51/kW-year. *Id.*, line 47. The kW-year unit cost is divided by 12 to
20 yield a monthly SCD for NT service unit cost of \$0.459/kW-month. *Id.*, line 48. This Study
21 sets the SCD rate for NT service equal to this monthly unit cost.

22
23 The same methodology is used to calculate the SCD rates for PTP service on the Network
24 and Southern Intertie. This study divides the \$194.974 million of SCD costs allocated to
25 PTP service by the PTP billing factor of 41,508 MW (long- and short-term PTP combined,
26 with Intertie service, but not considering the SDD). Table 8.1, lines 35-36. This yields a

unit cost of \$4.70/kW-year. *Id.*, line 37. This kW-year unit cost is divided by 12 to yield a monthly SCD for PTP service unit cost of \$0.391/kW-month. *Id.*, line 38.

The rates for Block 1 daily service and hourly SCD service include the adjustment for short-term sales that this Study includes for the rates for every PTP service. Section 4.3 discusses this adjustment. The short-term Block 1 rate of \$0.018/kW-day equals the SCD annual unit cost divided by 365 days and multiplied by the LLH/HLH factor of 7/5 (seven days divided by five HLH days). Table 8.1, line 39. The Block 2 rate of \$0.013/kW-day equals the SCD annual unit cost divided by 365 days. *Id.*, line 40. This Study calculates the hourly rate of 1.13 mills/kWh by dividing the annual unit cost by 8,760 hours/year, dividing by 1,000 to convert to mills, and multiplying by the LLH/HLH factors of 24/16 (24 hours/day divided by 16 HLH/day) and 7/5. *Id.*, line 41.

6.2 Generation Supplied Reactive Service

The GSR rate is set on a quarterly basis pursuant to a formula in the GSR rate schedule. Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, ACS-26, § II.B. As of October 1, 2007, BPA Transmission Services no longer compensates BPA Power Services for generation inputs associated with providing reactive supply and is not required to pay independent power producers for reactive supply inside the deadband. *See Bonneville Power Admin. v. Puget Sound Energy, Inc.*, 120 FERC ¶ 61,211 (2007), *reh'g denied*, 125 FERC ¶ 61,273 (2008). Therefore, no costs exist for GSR inside the deadband. BPA is required to pay generators for reactive supply that it requests outside the deadband, pursuant to the generator's FERC-approved rate. BPA does not expect any costs for GSR outside the deadband during the rate period. Therefore, the GSR rate is expected to be zero for the FY 2026–2028 rate period.

7. OTHER SERVICES AND PROVISIONS

7.1 Regional Compliance Enforcement and Regional Coordinator Rates

The Regional Compliance Enforcement and Regional Coordinator Rates recover costs associated with funding the reliability activities of NERC, the Western Electricity Coordinating Council (WECC), and RC West. The Regional Compliance Enforcement rate recovers costs associated with the Electric Reliability Organization (ERO) responsibilities delegated to WECC by NERC. The Regional Coordinator rate recovers costs associated with the Reliability Coordinator and Interchange Authority functions performed by RC West. The WECC and RC West organizations assign costs to the balancing authorities (BAs) they serve based on load in each BAA. The Regional Compliance and Regional Coordinator rates collect the costs assessed to BPA from customers serving load in BPA's BAA.

Total Regional Compliance Enforcement and Regional Coordinator costs are forecast to average \$5.452 million per year for the FY 2026–2028 rate period. *See* Table 8.2, lines 2 and 9. The forecast is based on best estimated costs based on discussions with RC West. Of the total forecast of \$5.452 million per year, \$3.830 million is for Regional Compliance Enforcement costs from WECC and \$1.621 million is for Regional Coordinator area functions of RC West. *Id.*

In the rate development process, the forecast Regional Compliance Enforcement and Regional Coordinator costs are assigned to the segmented revenue requirement of the Ancillary Services segment but then are removed from the segmented costs for the calculation of the rates. *See* Table 1, Column I; Table 3, lines 34-35. This is done to ensure that the costs that are charged to BPA are directly assigned to those who use the service and not spread across all rates. BPA calculates the rates by dividing the forecast annual

1 average Regional Compliance Enforcement and Regional Coordinator costs resulting from
2 customer's load in BPA's BAA by the forecast average annual load in the BAA of
3 63,476,567 MWh. Table 8.2, lines 6 and 13. This results in a Regional Compliance
4 Enforcement rate of \$0.06 mills/kWh and a Regional Coordinator rate of \$0.03 mills/kWh.
5 *Id.*, lines 7 and 14.
6

7 **7.2 Oversupply Rate (OS-26)**

8 The Oversupply Rate recovers the displacement costs that BPA pays under Attachment P of
9 the Tariff, also known as the Oversupply Management Protocol (OMP), for the FY 2026-
10 2028 rate period. Under the protocol, in order to moderate total dissolved gas levels in the
11 Columbia River, BPA displaces generators located in BPA's BAA under a least-cost
12 displacement cost curve. The Oversupply rate allocates displacement costs to each
13 generator based on the proportion that generator's scheduled generation for the hour
14 bears to the total amount of scheduled generation in the BAA for the hour. For generation
15 scheduled by BPA Power Services, BPA will bill customers that purchase under the PF, IP,
16 or NR rate schedules using Modified Tier 1 Cost Allocators (TOCA). TOCAs are customer-
17 specific power rate billing determinants that are established under the Tiered Rate
18 Methodology for Priority Firm Power (PF) customers. Each power customer's billing
19 determinant is a percentage of the sum of all power customers' billing determinants.
20 *See* 2026 Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, GRSP § II.O.
21

22 **7.3 Use-of-Facilities Transmission Rate (UFT-26)**

23 Use-of-Facilities Transmission (UFT) service is generally offered in a limited set of
24 situations in which PTP transmission service is not appropriate. Such situations include,
25 for example, sales of capacity over a specific set of facilities within a substation

1 (e.g., buswork or a transformer bank) that do not negatively affect power flows on the rest
2 of the transmission system.

3
4 The UFT rate schedule includes a formula monthly rate of one-twelfth of the sum of the
5 annual costs of the transmission facilities used by the UFT customer divided by the sum of
6 the transmission demand reserved by the UFT customer. If more than one customer uses
7 given facilities, the costs of the facilities are allocated among the customers based on usage.

8
9 BPA adjusts the costs of operating and maintaining the transmission facilities (the
10 numerator in the UFT formula rate) annually. Finally, the UFT rate schedule includes
11 provisions for Ancillary Services and Failure to Comply Penalties.

12 13 **7.4 Advance Funding Rate (AF-26)**

14 If a customer and BPA agree that the customer should advance-fund BPA-owned
15 transmission facilities, the customer will pay BPA the cost of those facilities under the
16 AF-26 rate schedule. Such facilities may include, for example, interconnection and resource
17 integration facilities and transmission system upgrades, reinforcements, and replacements.
18 The Advance Funding rate allows BPA to recover costs and prevent stranded costs for
19 facilities that BPA builds under agreements with individual customers. After commercial
20 operation of the facilities, BPA performs a true-up of estimated costs to actual costs and
21 either bills the customer or issues a refund for the difference between the advance
22 payment and the actual costs.

1 **7.5 Rate Adjustment Due to FERC Order Under Section 212 of the Federal**
2 **Power Act**

3 This provision is included in the NT, PTP, IS, IM, and ACS rate schedules. After review by
4 FERC, these rate schedules may be modified to satisfy statutory standards for
5 FERC-ordered transmission service. For customers taking transmission service that has
6 not been ordered by FERC, any modifications would be effective only prospectively from
7 the date of the FERC order that grants final approval of the rate schedule for FERC-ordered
8 transmission.

9
10 **7.6 DSI Delivery Charges**

11 The DSI Delivery Charge applies to direct-service industrial customers that take delivery of
12 power over transmission facilities that are included in the DSI Delivery segment. The DSI
13 Delivery Charge is a Use-of-Facility Charge and is determined under Sections III.A and B of
14 the UFT-26 rate schedule. See Section 7.3 for an explanation of the Use-of-Facility Charge.

15
16 **7.7 Failure to Comply Penalty Charge**

17 The Failure to Comply Penalty Charge applies when a party fails to comply with BPA's
18 dispatch, curtailment, redispatch, or load shedding orders necessary to maintain system
19 reliability. See Transmission Rate Schedules and GRSPs, BP-26-A-01-AP02, GRSP § II.B.
20 The charge is the greater of 500 mills/kWh or 150 percent of an hourly energy index in the
21 Pacific Northwest, measured by the number of kilowatthours a party fails to curtail,
22 redispatch, shed load, or change or limit generation in response to a BPA order.

23
24 **7.8 Unauthorized Increase Charge**

25 For firm transmission service under the PTP, IS, and IM rate schedules, BPA assesses an
26 Unauthorized Increase Charge (UIC) when a customer's transmission usage exceeds its
27 capacity reservations at any Point of Receipt (POR) or POD. *Id.* § II.F. The UIC rate is the

1 lesser of a) 100 mills/kWh plus the price cap established by the FERC for spot market sales
2 of energy in the WECC, or b) 500 mills/kWh. If the FERC eliminates the WECC price cap,
3 the rate will be 500 mills/kWh.
4

5 For each hour, BPA adds the amounts that exceed capacity reservations at all PORs and
6 PODs. The billing factor is the higher of the POR hourly sum or the POD hourly sum. BPA
7 uses hourly measurements based on a 10-minute moving average to calculate actual
8 demands at PODs associated with loads that are one-way dynamically scheduled and at
9 PORs associated with resources that are one-way dynamically scheduled. For two-way
10 dynamic schedules, actual demands are the instantaneous peak demand for the hour. The
11 actual demands associated with all other PORs and PODs are based on 60-minute
12 integrated demands or transmission schedules.
13

14 BPA may waive or reduce a UIC based on the criteria in the GRSPs. Because the UIC is a
15 penalty rate, and BPA expects customers to limit their usage to the amount of reserved
16 capacity, BPA does not expect to assess this charge during the rate period.
17

18 **7.9 Reservation Fee**

19 The Reservation Fee is included in the PTP-26, IS-26, and IM-26 rate schedules. The
20 Reservation Fee applies to customers that, pursuant to OATT Section 17.7, request an
21 extension (deferral) of the Service Commencement Date specified in the Service
22 Agreement. For each extension of the Service Commencement Date, the Reservation Fee is
23 equal to one month's charge for the requested Long-Term Firm PTP Transmission Service.
24

1 **7.10 Transmission Cost Recovery Adjustment Clause**

2 The Transmission CRAC provides for an upward adjustment to transmission rates
3 following a fiscal year in which Transmission Reserves For Risk fall below the
4 Transmission CRAC threshold. The adjustment is applied to rates charged for service
5 beginning in December following the applicable fiscal year. The Transmission CRAC
6 threshold is set in accordance with the FRP.

7
8 **7.11 Transmission Reserves Distribution Clause**

9 The Transmission RDC allows the Administrator to repurpose financial reserves that
10 exceed certain thresholds. Under the BP-26 Transmission Rates Settlement Agreement, the
11 Transmission RDC for the FY 2026-2028 rate period provides for repurposing financial
12 reserves that exceed the applicable thresholds to rate reduction through a Dividend
13 Distribution. A financial reserves distribution may be made if a) financial reserves
14 attributed to transmission exceed the RDC threshold for the business line, and b) BPA
15 financial reserves exceed the BPA RDC threshold. The thresholds are set in accordance
16 with the FRP.

17
18 **7.12 Transmission Financial Reserves Policy Surcharge**

19 The Transmission FRP Surcharge provides for an upward adjustment to applicable
20 transmission rates following a fiscal year in which Transmission Reserves For Risk fall
21 below a specified threshold. The adjustment is applied to rates charged for service
22 beginning in December following the applicable fiscal year. The threshold is set in
23 accordance with the FRP.

7.13 Real Power Loss Imbalance Settlement

The Real Power Loss Imbalance Settlement rate applies to the settlement of imbalance associated with return of Real Power Losses by a Transmission Customer that elects In-Kind Loss Return Service or Slice Output Loss Return Service.

7.14 Invalid Loss Return Penalty Charge

The Invalid Loss Return Penalty Charge applies to a transmission customer that elects In-Kind Loss Return Service when the customer returns a different amount of power than its real power loss obligation or does not timely settle its loss obligation. The charge includes a capacity and energy component. The charge for capacity is \$5.58 mills/kWh for both over and under delivery. The charge for energy differs for under or over delivery of the loss obligation. The charge for under delivery of the loss obligation is the greater of \$0 or 250 percent of the energy price. The charge for over delivery of the loss obligation is 250 percent of the absolute value of the energy price.

7.15 Generator Interconnection Withdrawal Charge

The Generator Interconnection Withdrawal Charge applies to an interconnection customer whose interconnection request is withdrawn or deemed withdrawn from BPA's interconnection process set forth in the Large Generator Interconnection Procedures in BPA's OATT. The proposed rate schedule language specifies the timing of when the charge may be assessed, the calculation of the charge, and when an interconnection customer would be exempt from the charge.
