

Action Items from BPA Voltage Control Technical Conference held on August 23, 2011

Current State	What we heard at the Conference	Action Items
<p>A. Primary Voltage Control</p> <ul style="list-style-type: none"> • BPA already requires wind power plants to operate in voltage control with reactive droop. • BPA requires 0.95 power factor dynamic reactive capability at 34.5-kV collector station plus switched shunts to compensate for reactive losses in the collector system • BPA developed typical designs that would meet the requirements 	<ul style="list-style-type: none"> • Reactive droop is needed for stable reactive power sharing among the multiple plants • Wind power plants are capable of very fast voltage control • Manufacturer’s would like to see consistent “dynamic performance” requirements, UK example was mentioned 	<ul style="list-style-type: none"> • BPA may need to update the voltage control “dynamic performance” requirements based on the manufacturer’s feedback received at the meeting: <ul style="list-style-type: none"> ○ Review international practices, particularly UK ○ Seek collaboration with others, particularly California ISO, ERCOT, Midwest ISO, and PJM Interconnection, UWIG ○ Engage manufacturer’s participation to ensure that the requirements are feasible ○ Provide examples of control settings that would meet the “dynamic performance” requirements ○ Instruct wind power plant operators on capacitor switching coordination • BPA may develop certification tests that new and existing projects must perform to demonstrate its voltage control capabilities – make the tests reasonable, not too onerous • Response validation by observation <ul style="list-style-type: none"> ○ Review of first month operational data from PMUs and SCADA ○ Develop tools for continual validation of voltage control • Develop a handbook on voltage controls for wind power plant operators
<p>B. Retrofit Existing Plants</p> <ul style="list-style-type: none"> • Several existing wind power plants struggle with setting voltage controls to operate correctly in droop mode • BPA need to be able to adjust a power plant voltage schedule either by sending a voltage reference or voltage lower/raise commands. 	<ul style="list-style-type: none"> • It sounds like most plants in BPA control area should have droop capabilities or can be easily upgraded 	<ul style="list-style-type: none"> • BPA work with WTG manufacturers and power plant operators to retrofit and tune up their existing voltage controls. • Addition of the voltage schedule adjustment controls could be included to the retrofit.

Current State	What we heard at the Conference	Action Items
<p>C. Secondary Voltage Controls</p> <ul style="list-style-type: none"> A coordinated secondary voltage controller is required at a wind hub to coordinate the reactive output of wind power plants with BPA shunt capacitors BPA designed the first such controller for Jones Canyon 	<ul style="list-style-type: none"> Wind plants need to be in droop control for stable reactive power sharing BPA Jones Canyon design is in agreement with the coordination work done by GE in other parts of WECC 	<ul style="list-style-type: none"> Initiate a project to design and install secondary voltage controllers at John Day and Rock Creek Planning will complete the development of Time Sequence Simulator Planning will complete secondary voltage control studies for John Day and Rock Creek Design a system-wide coordinated voltage controller (Northwest-wide)
<p>D. Payment for Reactive Power</p> <ul style="list-style-type: none"> BPA attempted to pay for reactive power and voltage support in the past, but had overall bad experience 	<ul style="list-style-type: none"> Reactive power payments received significant interest at the conference 	<ul style="list-style-type: none"> Should BPA look around to see whether there are any large grid operators similar to BPA where the reactive power payments worked well?
<p>E. Frequency Controls</p> <ul style="list-style-type: none"> BPA will require new wind power plants to have a frequency control module 	<ul style="list-style-type: none"> Wind power plants are capable of very impressive frequency response <ul style="list-style-type: none"> Spilling wind is needed for sustained response Inertial-like response can be provided as well Utilities need to specify the frequency response requirements, UK was cited as a good example Need to explore payment for frequency Response 	<ul style="list-style-type: none"> BPA needs to develop the frequency control “dynamic performance” requirements: <ul style="list-style-type: none"> Review international practices, particularly UK Conduct system studies Seek collaboration with others, particularly California ISO, ERCOT, Midwest ISO, and PJM Interconnection, UWIG, NREL Engage manufacturer’s participation to ensure that the requirements are feasible Develop certification tests that a new project must perform during the commissioning to demonstrate its frequency control capabilities Frequency response validation by observation <ul style="list-style-type: none"> Review of operational data from PMUs and SCADA Develop tools for continual validation of plant frequency response Develop a handbook on frequency controls for wind power plant developers

Current State	What we heard at the Conference	Action Items
<p>F. Handbook</p> <ul style="list-style-type: none"> BPA has voltage control requirements in its interconnection standards 	<ul style="list-style-type: none"> There were many comments about having a handbook for all developers and plant operators that provides detail on the interconnection and operational requirements, as well as clarity on the compliance measures with applicable NERC Standards 	<ul style="list-style-type: none"> BPA needs to work with other utilities, plant operators and manufacturers to develop a handbook that provides technical details on the interconnection, modeling and operational requirements for wind power plant developers and operators
<p>G. Operational Data</p> <ul style="list-style-type: none"> BPA needs WPP dynamic reactive reserve calculated for the COI and PDCI operations. The calculation will be done by WPP and the reserves will be telemetered to BPA 	<ul style="list-style-type: none"> Wind power plant management systems appear to have the data for calculating the plant dynamic reactive reserves 	<ul style="list-style-type: none"> BPA to work with the manufacturers on how to calculate reactive reserves at wind power plants BPA to work with the manufacturers to implement the reactive reserve calculations in their plant controller that consider the operational point of each wind turbine Implement reactive reserve calculators at the new and existing wind power plants WPP operators to provide Reactive Reserve data to BPA
<p>H. WPP Model Data</p> <ul style="list-style-type: none"> WECC developed guidelines for wind power plant modeling, including model data forms BPA has made significant progress in collecting “as-build” model data for wind power plants Phase 1 of generic dynamic models is available, more work is planned for Phase 2, sounds like the work in progress. 	<ul style="list-style-type: none"> Many presenters and participants emphasized the importance of having good models and using “as-build” model data Many presenters emphasized the need for WPP model validation Validation of plant models will be required by MOD-026 and 027 NERC Standards, and model validation by observation is an acceptable method. 	<ul style="list-style-type: none"> The effort is on-going Collaborate with WECC Renewable Energy Modeling Task Force, UWIG / EnerNex, NREL, EPRI, IEEE and CIGRE
<p>G. State Estimator Models</p> <ul style="list-style-type: none"> Wind power plant representation in BPA and WECC State Estimators is very deficient 	<p>Was not discussed at the meeting</p>	<ul style="list-style-type: none"> BPA TP to provide the most recent WPP models to TOS to implement in the state estimator Programming needs to be done to extrapolate the model from the metered data Validate state estimator WPP models

Current State	What we heard at the Conference	Action Items
<p>I. PMU program</p> <ul style="list-style-type: none"> BPA requires PMUs to be installed at new power plants connected at 230-kV and above BPA has a project to install PMUs at many existing wind power plants BPA also has a main grid PMU project which will install PMUs at wind hubs and at many large conventional generators BPA developed a Power Plant Model Validation (PPMV) application that uses PMU data for model validation of conventional power plants 	<ul style="list-style-type: none"> Several presenters and participants emphasized the importance of PMU data for performance monitoring and model validation 	<ul style="list-style-type: none"> BPA needs to establish a PMU program: <ul style="list-style-type: none"> Ensure that the new projects have PMUs Retrofit existing projects with PMUs BPA needs to extend the PMU-based power plant model validation application to wind power plants BPA needs to use PMUs to study any possible control interactions related to wind generation
<p>J. Situational Awareness</p> <ul style="list-style-type: none"> BPA has very little real-time situational awareness of wind power plant dynamic performance 	<ul style="list-style-type: none"> PMU-based situational awareness tools were viewed as a high priority 	<ul style="list-style-type: none"> BPA will research applications for using PMU data for real-time situational awareness of dynamic performance of wind power plants
<p>K. Industry Collaboration</p> <ul style="list-style-type: none"> BPA has extensive operating experiences with wind generation 	<ul style="list-style-type: none"> The conference validated that BPA is on the right track with respect to voltage control, frequency control and modeling There were many comments on strengthening the voltage control standards at NERC and WECC level, keeping them technology neutral 	<ul style="list-style-type: none"> BPA needs to be more actively involved in the industry efforts to share their expertise and to influence policy and standard processes at the national level BPA needs to monitor the policy and standard developments world-wide to adopt the best practices at BPA BPA needs to look for opportunities to link with others working on wind integration issues – utilities, grid operators, manufacturers, plant operators, RTOs, NERC, WECC, IEEE, EPRI and DOE National Labs
