TIP 326: Combined Space and Water CO₂ Heat Pump System Performance Research

**Context**

Combined space and water heating systems using CO₂ refrigerant are an emerging technology that is farther back on the development curve than CO₂ HPWHs. Based on the lab and field performance research done on CO₂ refrigerant HPWHs, combined systems using the split system technology appear to be a good fit for highly energy efficient homes that are the policy goal in Washington State and a popular voluntary standard throughout the Pacific Northwest.

**Description**

This research project will conduct lab and field tests on a prototype combined space and water heat pump system using carbon dioxide (CO₂) refrigerant. Six of the units will be installed in energy efficient homes built under NEEA’s Next Step Homes specifications. The homes and the equipment will be fully monitored to capture the equipment performance as well as interior conditions and total energy performance. The research will take place over 24 months, including a full year of data collection.

The field study will assess long-term performance in low-load homes spanning the region’s three heating zones, and gather responses from installers, builders and home occupants. The space and water heating energy use will be compared to other Next Step homes with separate dedicated water and space heaters.

The lab tests will determine the Coefficient of Performance (COP) of each function, the overall system performance and the interaction of the loads at various simulated outside air temperatures ranging from 0°F to 95°F. Results will be compared to previous lab tests of dedicated equipment.

The project partners have committed over $553,000 of match to support this research and will be directly engaged as part of an Advisory Task Force.

The overall tasks involved in this project are:

- Interview installers, builders and home occupants, analyze data, and report.
- Conduct lab tests, analyze data, and report.

**Why It Matters**

This project marries two cutting-edge applied research projects. The first is the exploration of the performance and demand response potential of split system, CO₂ refrigerant heat pump water heaters that the WSU Energy Program and its partners are doing under BPA sponsorship. The second is NEEA’s Next Step Homes project to develop, implement and monitor a practical high performance standard with heating energy loads in the one kWh per square foot per year range.

Bringing prototypes of this technology to the region for lab and field testing provides crucial information supporting development of a commercially viable product. It will also give visibility to the concept that will encourage future development.

**Goals and Objectives**

The main goal of the project is to determine the performance of the prototype for both space and water heating through a wide range of temperatures and use patterns.

Secondary goals include exploring the interaction between space and water loads and the impact on system performance, as well as logistical findings such as HVAC installer, builder and home occupant response to the systems.

**Deliverables**

Project deliverables include:

- Lab test report, field test report and final project report;
- Presentations to BPA and NEEA about the project, its goals and findings;
- A peer-reviewed paper by the researchers.
TIP 326: Combined Space and Water CO₂ Heat Pump System Performance Research

**Project Start Date:** October 1, 2014

**Project End Date:** September 30, 2016

**Funding**

- **Total Project Cost:** $915,072
- **BPA Share:** $362,000
- **External Share:** $553,072
- **BPA FY2015 Budget:** $227,000

**For More Information Contact:**

- **BPA Project Manager:** Janice Peterson, jcpeterson@bpa.gov

- **Washington State University Principle Investigator:** Ken Eklund, WSU Energy Program eklundk@energy.wsu.edu

**Participating Organizations**

- Washington State University, WSU Energy Program, Olympia, WA
- Avista
- Energy Trust of Oregon
- Puget Sound Energy
- Northwest Energy Efficiency Alliance
- Sanden International U.S.A. Inc.
- Tacoma Power
