The World of Codes

• 1980’s through 2006
  – Minimum codes were truly minimal
  – DOE pushed for marginal improvements (1% to 3% per cycle)
  – DOE proposed (successfully) a major rewrite of the IECC in 2004 (became the 2006 IECC)—emphasis was format, not stringency

• 2009 to Present…..
  – Things are getting more serious
Strategies

Model Energy Codes

• **50% Goal—for Increased Energy Savings**
  – Need to go beyond prescriptive approaches
  – Exploring performance-based options and alternative paths to compliance
  – Voluntary Codes: Submitted outcome and performance-based proposals

• **70% Initiative for Increased Adoption**
  – Comprehensive adoption strategy
  – Goal: 40 states to adopt ARRA target codes or most current model codes by 2015
  – Goal: 10 states to adopt the ARRA target codes or more efficient in FY2011

• **90% Compliance by 2017**
  – Continue technical and financial support to the states
  – Increase the number and availability of compliance guides and field measurement tools

**Adopted Code to be effective at a later date**

* * *

**States**

- American Samoa
- Guam
- N. Mariana Islands
- Puerto Rico
- U.S. Virgin Islands

**Codes**

- ASHRAE 90.1-2007/IECC 2009, equivalent or more stringent
- ASHRAE 90.1-2004/IECC 2006, equivalent
- ASHRAE 90.1-2001/IECC 2003, equivalent or less stringent
- No Statewide Code

As of April 28, 2011
Recent IECC Changes of Note

• 2009 IECC - Residential
  – Lighting added to IECC scope (at least 50% of lamps must be “high efficacy”)
  – Mandatory duct system pressure test
  – No equipment-envelope trade-offs

  – 12% to 15% better than 2006 IECC
• Approximately 30% more efficient than the 2006 IECC
• Now constitutes (by reference) the energy chapter of the International Residential Code (IRC)
• Retains 2009 IECC’s prohibition on envelope-equipment tradeoffs
• Scheduled for publication June 2011
• Contains a few major and many minor changes
• New mandatory whole-house pressure test (blower door) with stringent required leakage rates
  – Zones 1-3: \(\leq 5 \text{ ACH @50 Pa}\)
  – Zones 4-8: \(\leq 3 \text{ ACH @50 Pa}\)
• Domestic hot water piping must be either
  – Insulated to R3, or
  – Short and skinny (i.e., exempted lengths depend on diameter)
• Duct leakage rates lowered
  – Eliminated “leakage to outdoors” option
  – From 12 to 4 CFM/100sf CFA (after construction)
  – From 6 to 4 CFM/100sf CFA (at rough-in)
• Various R-value/U-factor/SHGC improvements
### 2012 IECC – Major Prescriptive Envelope Changes

<td></td>
</tr>
</tbody>
</table>
Implications of Wall Improvements

- 2x6 construction now “required” in some zones
  - Envelope trade-off options limited
  - Equipment trade-off options prohibited
- Log walls difficult to comply without large diameter logs or furred-in finish layer
- Insulating sheathing now “required” in some zones
  - Bracing options limited, especially with recent IRC changes

</table>
• Approximately 30% more efficient than the 2006 IECC
  – The reference standard in the 2012 IECC – ASHRAE Standard 90.1-2010, is about 30% more efficient than Standard 90.1-2004, the reference standard in the 2006 IECC.
  – DOE’s commercial energy code goals are expressed in terms of Standard 90.1, not the IECC.
• Scheduled for publication June 2011
• Contains a number of major changes
Commercial

Continuous Air Barriers

• Focused on reducing infiltration loads on the building.

• Can comply with one of three options:
  – Installing the correct air barrier materials.
  – Installing the correct air barrier assemblies.
  – Testing the building to meet maximum air leakage requirements.

From NIST: http://www.wbdg.org/resources/airbarriers.php
### 2012 IECC - Fenestration

**Commercial**

- Vertical glazing limited to 30% window-to-wall ratio.

NR = No requirement.
Commercial

- Minimum Skylight Fenestration Area:
  - For enclosed spaces greater than 10,000 ft² directly under a roof in CZ 1 to 5.
  - Total daylight zone ≥ 50% of the floor area.
  - All lighting required to be controlled by automatic multi-level lighting controls.

From Advanced Energy Design Guide for Small Warehouses and Self-Storage Buildings
Commercial

Lighting Controls

• Automatic lighting controls required for all buildings
  ‒ Automatic time switch
  ‒ Occupancy sensor
  ‒ Daylighting controls

• Additional controls required for spaces e.g., overnight rooms in hotels
  ‒ High-rise dwelling units
    ‒ 75% high efficacy lighting

• Functional testing required for all automatic lighting controls
2012 IECC - Interior Lighting Power

**Commercial**

- Added space-by-space lighting power density compliance approach
- Reduced LPD for
  - Office (10%)
  - Retail (7%)
- Reduced retail display lighting allowance
  - 1,000 Watts to 500 Watts

HVAC Commissioning

• Applies to buildings with a total building equipment capacity ≥:
  – 480,000 Btu/h cooling capacity, or
  – 600,000 Btu/h heating capacity

• Requires:
  – Commissioning plan
  – Systems adjusting and balancing
  – Functional performance testing
    • Equipment
    • Controls
    • Economizers
  – Preliminary commissioning report
  – Construction documents and O&M Manuals
  – Final commissioning report and air balancing report
Commercial

• One additional efficiency feature must be selected to comply with the IECC
  – More efficient lighting system (consistent with 90.1-2010), or
  – More efficient HVAC equipment
  – Installation of onsite renewables
    • 3% of the regulated energy
It is not clear that 50% improvement can be achieved prescriptively.

<table>

</tr>
</tbody>
</table>
• It is not clear that 50% improvement can be achieved prescriptively

• Several new approaches have been discussed
  – Prescriptive baseline with a performance requirement of X% better ("prescriptive plus")
  – Annual performance budget (Btu/ft²)
  – Annual performance budget (Btu...size matters)
  – Annual Carbon budget
  – Any of the above with post-occupancy metering
  – Required renewables (i.e., regardless of performance budgets, cost effectiveness, etc.)
  – Capacity constraints
  – Commercial modeling
  – Outcome based codes
• **Things are getting more serious**
  • If DOE (and others) are successful, the IECC will be as good or better than most current beyond-code programs
  • Calculating impacts in a way comparable with beyond-code programs is difficult
  • Creative changes to the code format and/or enforcement infrastructure will likely be needed
  • Development of a currently nonexistent (or at least inadequate) expert infrastructure will likely be needed
Washington State Department of Commerce

Washington State Energy Code – Opportunity for additional savings

(3) The utility shall count the total first year savings of a conservation measure in the year during which either the measure was installed or the utility paid for it.

(c) Savings from improved federal minimum energy efficiency standards or Washington state building energy code improvements or improved state appliance codes and standards in the biennium in which they become effective, as proportionate to the utility's service territory. After that biennium, a utility may no longer include savings from those specific codes and/or standards in its next ten-year potential.

Biennium 2010, 2011
Code effective date Jan, 2011
Construction – some months later

Net Plan, Remove the code measures from the potential
Enabling Legislation / Building Code Council

• 19.27A.160
2) The council shall adopt state energy codes from 2013 through 2031 that incrementally move towards achieving the seventy percent reduction in annual net energy consumption as specified in subsection (1) of this section. The council shall report its progress by December 31, 2012, and every three years thereafter.
Code Improvement Schedule
Energy Use Compared to 2006 Codes

2009
15-18% Reduction

Proportional Code Improvement Each Cycle
7-8%

- Residential
- Commercial

Year:

Oregon REACH Code

**What will it do?**

- Increase predictability
- Serve as a testing ground for new construction methods and technology
- Expedite permitting
- Align with certification and incentive programs
- Measure progress
Code Development

- **REACH Code Advisory Committee**
  - Formed in March 2010
  - Adapt national model code to Oregon
- **Technical sub-committee**
  - Vetted energy provisions with technical experts
  - Aligned with ‘draft’ IGCC and 2012 IECC
- **Construction Industry Energy Board**
  - Board recommends moving to rulemaking
- **Adopt code by rule**
  - Anticipated code adoption July 1, 2011
Code Development Process

- Based on *draft* International Green Construction Code (IGCC)
  - Proposed by coalition - US DOE, AIA, ASHRAE and US Green Building Council
  - Allows us to fulfill broad mandate of SB 79 – ‘reducing electricity and fossil fuel use’
  - Begin to address buildings as ‘integrated’ system
  - ‘Reserved’ sections of IGCC will allow code to grow
Reaching for Better Buildings

Focus is on High Performance

- Tight building envelope
- High performing windows
- Efficient heating and cooling systems
- Advanced lighting and controls
Project Electives - Secondary Energy Impacts that Increase Design Flexibility

Examples:

- Water conservation
- Material selection
- Post-occupancy commissioning
Reaching for Better Buildings

How do we get encourage use?

- Work with partners on training
- Develop a marketing strategy
Challenges Ahead

*Energy Impacts NOT Regulated by Codes*

- Plug Loads
- Occupant Behavior
- Ongoing Maintenance
