BONNEVILLE POWER ADMINISTRATION

2020-2021 Implementation Manual

This document is available online at www.bpa.gov/Energy/N/implementation.cfm.
Measure information effective Oct. 1, 2019.
TABLE OF CONTENTS

October 2019 Changes and Corrections Summary ..................................................... VI
Rate Period Implementation Manual Revision Timeline ......................................... XXX

Definitions .................................................................................................................. XXXI

Section 1: Introduction ............................................................................................... 1
  1.1 Overview ............................................................................................................. 1
  1.2 Reliability ........................................................................................................... 1
  1.3 Cost Effectiveness ............................................................................................... 2
  1.4 Payment ............................................................................................................. 2
  1.5 Policy for Measure Changes/Additions .............................................................. 3
  1.6 Official Interpretations ....................................................................................... 3

Section 2: BPA Funding ............................................................................................. 4
  2.1 BPA Funding ..................................................................................................... 4
  2.1.1 Bilateral Funding ......................................................................................... 4
  2.1.2 Rules for Pooling Organizations ................................................................ 5
  2.1.3 Performance Payments ............................................................................. 6
  2.2 Funding Sources and Savings Allocation .......................................................... 7

Section 3: General Requirements ............................................................................. 8
  3.1 Documentation Requirements ........................................................................... 8
  3.2 Reporting Requirements .................................................................................... 8
  3.3 Oversight and Evaluation Review Process ......................................................... 9
  3.4 Third-Party-Operated Program Requirements .................................................. 10

Section 4: Custom Projects ....................................................................................... 11
  4.1 Custom Projects Payment Rate ....................................................................... 11
  4.2 Custom Projects Special Funding ................................................................... 13
  4.2.1 Progress Payments ...................................................................................... 13
  4.3 Custom Projects Overview ............................................................................. 13
    4.3.1 Custom Projects Process Option Overview and Enrollment .................. 13
    4.3.2 Custom Projects General Requirements ............................................... 14
  4.4 Option 1 Custom Projects ............................................................................... 15
    4.4.1 Custom Project Proposal .......................................................................... 15
    4.4.2 Custom Project Completion Report ......................................................... 15
    4.4.3 BPA Review .............................................................................................. 15
  4.5 Option 2 Custom Projects ............................................................................... 16
  4.6 Custom Projects Documentation Requirements ............................................. 17

Section 5: Custom Programs ..................................................................................... 18
  5.1 Custom Programs Payment Rate ..................................................................... 18
  5.2 Custom Programs Requirements ..................................................................... 19
  5.3 Custom Programs Approval and Modification Process .................................... 19
  5.4 Custom Programs Documentation and Reporting Requirements .................. 20
Section 6: Agricultural Sector

6.1 Payment Summary .................................................. 22
6.2 Freeze Resistant Stock Water Tanks/Fountains .................. 23
6.3 Thermostatically Controlled Outlets ................................. 24
6.4 Thermostatically Controlled Stock Tank De-icers ............... 25
6.5 Transformer De-Energization ...................................... 25
6.6 Irrigation Measures .................................................. 26
   6.6.1 Irrigation System Conversion: LESA/LEPA/MDI .............. 26
   6.6.2 Sprinkler Package Replacement ............................... 27
   6.6.3 Irrigation System Conversion: MESA ........................ 27
   6.6.4 Irrigation Hardware ............................................ 28
6.7 Agricultural Pumps and VFDs ..................................... 30
   6.7.1 Irrigation Pump Testing and System Analysis (BPA-Qualified) .................................................. 30
   6.7.2 Variable Frequency Drive for Centrifugal Agricultural Pumps (BPA-Qualified) .............................. 31
   6.7.3 Variable Frequency Drive for New Agricultural Pump Installations (BPA-Qualified) ..................... 32
   6.7.4 Variable Frequency Drives in Agricultural Turbine Pump Applications (BPA-Qualified) ................. 33
6.7.5 Agricultural New Pump Efficiency Upgrade (BPA-Qualified) .............................................. 34
6.8 New Agricultural Construction .................................... 35
6.9 Other Agricultural Measures ...................................... 35

Section 7: Commercial Sector ........................................... 36

7.1 Payment Summary .................................................. 36
7.2 Commercial Custom Projects - Retrofits and New Construction .................................................. 38
7.3 Nonresidential Lighting ............................................. 38
7.4 Commercial HVAC .................................................. 43
   7.4.1 Advanced Rooftop Unit Control (ARC) ...................... 43
   7.4.2 Connected Thermostat ......................................... 44
   7.4.3 Ductless Heat Pump Retrofit and Upgrade (BPA-Qualified) .................................................. 47
   7.4.4 Air-Source Heat Pump Retrofit and Upgrade (BPA-Qualified) ........................................... 49
   7.4.5 Variable Refrigerant Flow System Retrofit (BPA-Qualified) .............................................. 51
   7.4.6 Variable Frequency Drive on Air-Handling Unit Fan (VFD on AHU Fan) (BPA-Qualified) ............. 53
7.5 Commercial Shell Measures ....................................... 54
   7.5.1 Commercial Insulation ......................................... 54
   7.5.2 Commercial Windows (BPA-Qualified) ...................... 55
7.6 Commercial Refrigeration ......................................... 56
   7.6.1 Anti-Sweat Heater (ASH) Controls ......................... 56
   7.6.2 Walk-In or Display Case Evaporator Fan Motor – Shaded Pole to Electronically Commutated Motor (ECM) .............................................. 57
   7.6.3 Strip Curtains for Walk-In Coolers and Freezers ......... 57
7.7 Commercial Kitchen and Food Service Equipment ............... 59
   7.7.1 Demand Controlled Kitchen Ventilation (BPA-Qualified) .............................................. 59
   7.7.2 Electric Commercial Steam Cookers ....................... 60
   7.7.3 Hot Food Holding Cabinets .................................. 60
   7.7.4 Electric Combination Ovens .................................. 61
   7.7.5 Electric Convection Ovens .................................... 62
   7.7.6 Commercial Electric Fryers ................................. 63
   7.7.7 Pre-Rinse Spray Valves ....................................... 64
7.8 Additional UES Offerings ......................................... 65
   7.8.1 ENERGY STAR Commercial Clothes Washers .......... 65
   7.8.2 Smart Power Strips ........................................... 66
   7.8.3 Commercial Showerheads .................................... 67
   7.8.4 Generator Block Heaters (BPA-Qualified) ............... 67
   7.8.5 Vehicle Engine Block Heater Controls ...................... 68

# Changes and Corrections Summary for the 2020-2021 Implementation Manual

The following changes are effective Oct. 1, 2019.

<table>
<thead>
<tr>
<th>EFFECTIVE DATE (POSTED DATE)</th>
<th>LOCATION</th>
<th>DESCRIPTION</th>
<th>RATIONALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>October 2019</td>
<td>0.0</td>
<td>Manufactured Home. A dwelling that is transportable in one or more sections, is built on a permanent chassis (with or without a permanent foundation), and its wheels are removed when it is set up on-site. This definition does not include travel trailers. A new manufactured home once sited with an occupancy permit qualifies for existing manufactured home incentives, but also qualifies for new manufactured home incentives (see NEEM 10.9.1) if the occupant is the first home occupant.</td>
<td>The definition has been modified to clarify that a new manufactured home is treated as an existing manufactured home once it is sited for occupancy.</td>
</tr>
<tr>
<td>October 2019</td>
<td>0.0</td>
<td>Third-party implementers are companies that BPA has contracted with to support acquisition of energy efficiency services and savings for BPA and BPA Customers. Third-party implementers are sometimes referred to as “program vendors” or Contractors.</td>
<td>Added a definition for Third-party operated programs to describe these companies.</td>
</tr>
<tr>
<td>October 2019</td>
<td>0.1</td>
<td>SEM Annual Savings Achieved is the verified incremental savings measured in each year of a two year performance period.</td>
<td>Added definition to clarify the operation and reporting of the industrial SEM program</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Year 1 of the first performance period, or after the re-establishment of the SEM Baseline, it is measured as all savings achieved above the SEM Baseline.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Year 2 of any performance period, it is measured as the savings achieved over the savings achieved in Year 1 of the performance period.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Year 1 of subsequent performance periods (as a result of re-enrollment), it is measured as all savings achieved above Year 2 of the previous performance period.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Should there be zero or negative savings verified from prior year, SEM Annual Savings Achieved is zero. SEM Annual Savings Achieved is used to determine allowable Performance Payment.</td>
<td></td>
</tr>
<tr>
<td>October 2019</td>
<td>0.2</td>
<td>SEM Baseline is the energy use established prior to enrollment in a SEM program. SEM Baseline can be reestablished after a significant operational change or at customer request as outlined in the ESI MT&amp;R Reference Guide. Re-enrollment in additional two year performance periods resets the reference point for the purposes of calculating savings and payment, but does not change the SEM Baseline.</td>
<td>Added definition to clarify the operation and reporting of the industrial SEM program</td>
</tr>

<td>DESCRIPTION</td>
<td>RATIONALE</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------</td>
<td>-------------</td>
<td>-----------</td>
</tr>
<tr>
<td>October 2019</td>
<td>0.3</td>
<td>Verified annual energy savings measured from establishment of SEM Baseline to current performance period year. SEM Cumulative Verified Savings is not used by BPA to calculate reportable savings or any payment, but will be provided to customers for their own reporting purposes.</td>
<td>Added definition to clarify the operation and reporting of the industrial SEM program</td>
</tr>
<tr>
<td>October 2019</td>
<td>0.4</td>
<td>SEM Participation Payment is the EEI payment made during each year of an SEM Performance Period. Payment is based on SEM Verified Savings.</td>
<td>Added definition to clarify the operation and reporting of the industrial SEM program</td>
</tr>
</tbody>
</table>
| October 2019                | 0.5      | Verified total energy savings measured from the start of the current performance period. SEM Verified Savings are calculated at the end of Year 1 and at the end of Year 2.  
  • In Year 1 of the first performance period, it is measured as all savings achieved above the SEM Baseline.  
  • In Year 2 of any performance period, it is measured as the savings achieved in Year 1 and adjusted for any additional savings achieved in Year 2.  
  • In Year 1 of subsequent performance periods (as a result of re-enrollment), it is measured as all savings achieved above Year 2 of the previous performance period.  
  • Should there be zero or negative savings verified from the start of the performance period, SEM Verified Savings achieved is zero.  
  SEM Verified Savings is used to determine EEI incentive payment | Added definition to clarify the operation and reporting of the industrial SEM program |

<th>DESCRIPTION</th>
<th>RATIONALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>October 2019</td>
<td>2.1.3</td>
<td>Added clarification that any performance payments claimed on savings achieved in Industrial SEM Programs would be based on SEM Annual Savings Achieved (i.e., incremental savings).</td>
<td>Provided clarification to reflect program intent.</td>
</tr>
<tr>
<td>October 2019</td>
<td>2.2</td>
<td>Effective Oct. 1, 2019, customers may no longer submit non-reportable savings in the same submission as reportable savings. Customers may continue to submit non-reportable savings to BPA in a separate submission.</td>
<td>This change increases efficiencies in invoice review and oversight activities.</td>
</tr>
</tbody>
</table>

**General Requirements**

<table>
<thead>
<tr>
<th>EFFECTIVE DATE (POSTED DATE)</th>
<th>LOCATION</th>
<th>DESCRIPTION</th>
<th>RATIONALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>October 2019</td>
<td>3.2</td>
<td>The nonresidential lighting and custom project sections have the expiration date for each version of a calculator. Clarifying sentence added to the reporting timeline for measures: “For standard protocol measures, customers must use the calculator in effect at the time of submission.”</td>
<td>Added this sentence to clarify that if the completion date is in a previous rate period, the reporting needs to be done on the calculator version in effect on the date of submission.</td>
</tr>
<tr>
<td>EFFECTIVE DATE LOCATION</td>
<td>DESCRIPTION</td>
<td>RATIONALE</td>
<td></td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
<td>-----------</td>
<td></td>
</tr>
<tr>
<td>October 2019 3.4</td>
<td>Third-Party Operated Program Requirements. This change updates the list of third-party programs: Energy Smart Industrial, Technical Service Providers, Simple Steps, Smart Savings Retail Promotion, PTCS, the Green Motors Rewind Initiative and Trade Ally Network NW.</td>
<td>This change reflects the program removal of Air Northwest and Northwest Trade Ally Network and adds Trade Ally Network NW and PTCS as Third-Party Programs.</td>
<td></td>
</tr>
<tr>
<td>Custom Projects</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>October 2019 4.1</td>
<td>Payment Summary. Payment rates for select Commercial sector custom projects updated. Increased payment for Commercial HVAC custom projects by 15%; decreased payment for Nonresidential lighting custom projects to ensure consistency with Lighting Calculator 5.0 series.</td>
<td>Updated payment rates to reflect current rate period levels.</td>
<td></td>
</tr>
<tr>
<td>October 2019 4.3.1</td>
<td>Custom Projects Process Option Overview and Enrollment: Option 2: Updated language to clarify that implementation assistance is not available unless provided by third-party implementation contractors as part of a program that offers that service (e.g., Cascade Energy through Energy Smart Industrial or the Trade Ally Network NW).</td>
<td>Updated language for clarity and to reflect the third-party program name change from Northwest Trade Ally Network to Trade Ally Network NW.</td>
<td></td>
</tr>
<tr>
<td>October 2019 4.3.2</td>
<td>Custom Project General Requirements. The requirements for custom projects have been revised to include Nonresidential Lighting Projects. Note: Lighting projects submitted as custom projects must use a comprehensive M&amp;V plan.</td>
<td>Added language to describe current requirements.</td>
<td></td>
</tr>
<tr>
<td>Custom Programs</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>October 2019 5.0</td>
<td>Custom programs will be placed on hold for the Rate Period 2020-2021. During this time new submissions will not be accepted, however EE staff will continue to work with customers on existing custom programs.</td>
<td>Program is on hold to allow EE to work with customers and internal staff to evaluate the future of custom programs.</td>
<td></td>
</tr>
<tr>
<td>Agricultural Sector</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>October 2019 6.0</td>
<td>The agricultural section has been renumbered due to the integration of new measures. These new measures were identified in section 13 of the April 2019 IM.</td>
<td>Renumbered to integrate new measures, a standard step in IM development at the beginning of a new rate period.</td>
<td></td>
</tr>
<tr>
<td>October 2019 6.1</td>
<td>Payment Summary. Updated the table to reflect current measure offerings.</td>
<td>Updated the table to include new measures and changes to payment amounts for existing measures.</td>
<td></td>
</tr>
<tr>
<td>October 2019 6.5</td>
<td>Increased the payment for Transformer De-Energization from $0.025 to $0.03 per kWh of busbar savings.</td>
<td>Updated the table to reflect the current rate period payment. The current payment rate creates issues within the IS2.0 reporting system that are very difficult to fix. Increasing the payment eliminates the need for software changes.</td>
<td></td>
</tr>

<td>----------</td>
<td>-------------</td>
<td>-----------</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.3</td>
<td>New Measure: Irrigation System Conversion to MESA for center pivots and linear move systems</td>
<td>At the March 28, 2018 RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018, affected savings for most irrigation hardware measures.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Modified the documentation requirements to simplify required information.</td>
<td>This change simplified documentation requirements.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Updated the payment table to reflect current offerings.</td>
<td>Updated the table to reflect current measure offerings.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Expired the following measures: New drop tube for low-pressure pivot sprinklers (minimum three feet length); New, gooseneck elbow for new drop tubes (to convert existing sprinkler equipment mounted on top of the pivot to low-pressure sprinkler package, LEPA or LESA); New multitrajectory sprays that replace impact sprinklers; New multitrajectory sprays that replace low-pressure sprinklers; New multiple configuration nozzles for low-pressure pivot sprinklers; Replace worn nozzle with new flow-controlling type nozzle for impact sprinklers; New nozzle for impact sprinkler, replacing existing worn nozzle of same flow rate or less; New, low-pressure regulators.</td>
<td>Eliminated measures deactivated by the RTF. At the March 28, 2018, RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Savings and payment decreased for the following measures: New, rotating type sprinklers that replace impact sprinklers; New rotating-type sprinklers that replace low-pressure models; Replace leaking impact sprinkler with rebuilt or new impact sprinkler.</td>
<td>At the March 28, 2018, RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018, affected savings for most irrigation hardware measures.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Reduced savings for New nozzles for center pivot and lateral moves.</td>
<td>At the March 28, 2018, RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018, affected savings for most irrigation hardware measures.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Increased the payment for replacing a leaking pipe section and riser cap gaskets or a portable mainline gasket from $2.75 to $4.00.</td>
<td>Increased payment since measure savings justify a higher incentive than was previously offered.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Reduced savings and increased payment for Drain/Drain Gasket.</td>
<td>Increased payment since measure savings justify a higher incentive than was previously offered. At the March 28, 2018, RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018, affected savings for most irrigation hardware measures.</td>

<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Savings will go up and payment increased for the following measures: Replace leaking center pivot base boot gasket with new gasket; Rebuild or replace leaking or malfunctioning leveler with new or rebuilt wheel line leveler; Pipe repair of leaking hand lines, wheel lines and portable mainline.</td>
<td>At the March 28, 2018, RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018, affected savings for most irrigation hardware measures.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.6.4</td>
<td>Irrigation Hardware. Updated the payment table for section 6.6.4 to include Tower/Span/ Pivot Flex Gaskets</td>
<td>At the March 28, 2018, RTF meeting, the RTF approved significant updates to the Irrigation Hardware UES measure savings methodology, measure applications, savings, and costs. These changes, outlined in an RTF memo dated April 25, 2018, affected savings for most irrigation hardware measures.</td>
</tr>
<tr>
<td>October 2019</td>
<td>6.7.4</td>
<td>Increased the payment for Variable Frequency Drives in New Agricultural Pump Installations, (BPA-Qualified) from $60/HP to $80/HP for Turbine pumps.</td>
<td>Updated payment to be consistent with the VFD measures added in October 2018.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Commercial Sector</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>October 2019</td>
<td>7.0</td>
<td>Updated Commercial Sector definition for clarity and to reflect building types that align with RTF definitions and the commercial project information forms.</td>
<td>Updated language for clarity</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.0</td>
<td>Added clarification regarding multisector applicability. Unless otherwise noted, all Commercial Sector measures are available for the commercial, industrial and agricultural sectors. Utilities shall report these measures as commercial when reporting to BPA.</td>
<td>Updated to clarify measure availability.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.0</td>
<td>Updated Documentation Requirements for Direct Install and By Request measures (7.7.7, 7.8.2, 7.8.3)</td>
<td>Simplified documentation requirements.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.1</td>
<td>Payment Summary Table. Updating the table to reflect additional multisector offerings.</td>
<td>Updated the table to reflect updated offerings.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.10</td>
<td>Multisector Opportunities. Added three (3) new BPA-Qualified Measures to the list. - Battery Charger Upgrade, BPA-Qualified Measure - Welder Upgrade, BPA-Qualified Measure - Water System Leak Abatement, BPA-Qualified Measure</td>
<td>Updated the list to reflect current rate period offerings.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.3</td>
<td>Nonresidential Lighting. Restructured and renumbered section; updated implementation language to promote consistency and clarity. Updates include: Remove unnecessary baseline tables; update Basis for Energy Savings for clarity; add clarification related to nonstandard measures, new construction projects, and 100% calculated projects. Updated “BPA Lighting Team” to “BPA”. Updated specific exterior HID measure explanation and wattage rounding options for clarity. Added clarification regarding Option 2 utility use of the BPA lighting calculator.</td>
<td>Renumbered and restructured this section to clearly and accurately convey implementation requirements.</td>
</tr>
<tr>
<td>EFFECTIVE DATE (POSTED DATE)</td>

<td>DESCRIPTION</td>
<td>RATIONALE</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------</td>
<td>-------------</td>
<td>-----------</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.3</td>
<td>Nonresidential Lighting. References to Lighting Calculator 3.3 have been removed.</td>
<td>Removed references to Lighting Calculator 3.3 retired on September 30, 2019</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.3</td>
<td>Nonresidential Lighting. Removed the 'Lighting Calculator 4.0 and 5.0 Lighting Promotions’ section.</td>
<td>There are no promotions planned at this time.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.3</td>
<td>Nonresidential Lighting. Requirements related to Custom lighting projects have been moved from this section to 4.0 Custom Projects.</td>
<td>Moved this information to the Custom Project section to reflect Custom Lighting project requirements.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.3</td>
<td>Nonresidential Lighting. Added new documentation for new construction projects. Nonresidential lighting new construction projects now require submittal of an invoice.</td>
<td>Added a project invoice requirement to ensure consistency in documentation requirements across nonresidential lighting projects.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.4.1</td>
<td>Advanced Rooftop Unit Control (ARC). BPA adopted this RTF approved measure. There is a payment for ARC Retrofit-Lite, and a payment for ARC Retrofit-Full. BPA will continue to maintain a QPL for this measure.</td>
<td>Updated the description and requirements to reflect the measure adopted by the RTF. This measure replaces the previous BPA-qualified measure (now expired).</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.4.2</td>
<td>Connected Thermostat. This measure was approved by the RTF and replaces the previous BPA-qualified measure. Measure language has been updated and requirements include a PIF. The measure includes payments for: 1) the initial install and 2) verification of thermostat programming, BPA will continue to maintain a QPL for this measure.</td>
<td>Updated the description and requirements to reflect the measure adopted by the RTF. This measure replaces the previous BPA-qualified connected thermostat.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.4.3</td>
<td>Ductless Heat Pump Retrofit and Upgrade (BPA-Qualified). The Ductless Heat Pump Retrofit measure and the new Ductless Heat Pump Upgrade measure were combined into one set of measure requirements. Ductless Heat Pump Upgrades are for the following applications: 1) replaces an existing DHP with a more efficient DHP (e.g., replacing a code minimum DHP) or 2) is an efficient DHP installed as part of a building addition project, new construction project, or major renovation project.</td>
<td>Combined the measures and revised the name to simplify the IM and clarify the measure application.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.4.3</td>
<td>Ductless Heat Pump Retrofit and Upgrade (BPA-Qualified). BPA updated the efficiency specification based on the 75th percentile of performance for DHPs per the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) database as of January 2019. Energy savings have increased. There is one minimum HSPF for mini-splits and non ducted DHPs (11.0 HSPF) but a lower HSPF for ducted applications (10.0 HSPF).</td>
<td>Updated efficiency specification and savings methodology as part of a periodic BPA-Qualified measure update.</td>
</tr>
<tr>
<td>October 2019</td>
<td>7.4.3</td>
<td>Ductless Heat Pump Retrofit and Upgrade (BPA-Qualified). The following application was removed: Even if the space was previously conditioned by an air source, ground source, or ductless heat pump that is no longer working, and the space is conditioned by backup zonal or forced-air electric-resistance heat, the application is still eligible for a DHP. This application is now eligible under the new DHP Upgrade (BPA-Qualified) measure.</td>
<td>Updated the measure to reflect which measure should be used for this specific application.</td>

## Definitions

### Definitions and Acronyms

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AHRI</td>
<td>Air-Conditioning Heating and Refrigeration Institute is a North American trade association of manufacturers of air conditioning, heating and commercial refrigeration equipment. AHRI performs political advocacy on behalf of its member industries, maintains technical standards, certifies products, shares data, conducts research and awards scholarships.</td>
</tr>
<tr>
<td>aMW</td>
<td>Average megawatt of electricity or the average measure of the total energy delivered in one year; 8,760,000 kilowatt-hours per year.</td>
</tr>
<tr>
<td>ANSI</td>
<td>American National Standards Institute administers, coordinates and promotes the United States public sectors’ cooperative efforts to develop a consensus of standards and conformity assessment systems. ANSI accreditation signifies the procedures used by the standards’ body — in connection with the development of American National Standards — meet the Institute’s essential requirements for openness, balance, consensus and due process.</td>
</tr>
</tbody>
</table>

### Available Implementation Budget

The amount available for BPA to purchase energy savings from a specific program participant at a given time, equal to the program participant’s initial implementation budget, plus any applicable rollover amount, plus or minus any applicable implementation budget transfers, minus any applicable approved invoice payment amounts, as defined in the ECA.

### B/C

Benefit/cost ratio. The B/C ratio equals the total benefits over the life of the project, divided by the installation costs.

### Basis for Energy Savings

Detail of inputs, interactive effects and analysis to describe how the energy efficiency savings is estimated for Unit Energy Savings (UES) measures that are currently active on the BPA UES Measure List.

(Note: Measures on the BPA UES Measure List may not yet reflect updated savings and assumptions from the RTF, due to BPA's notice requirements. They are provided to help readers understand how savings for UES measures are estimated or modeled. The Basis for Energy Savings supports, but does not replace or supersede, the BPA Requirements and Specifications.)

### Bilateral Transfer

The transfer of implementation budget between customers.

### BPA

Bonneville Power Administration is a nonprofit federal power marketing administration based in the Pacific Northwest. Although part of the U.S. Department of Energy, BPA is self-funding and covers its costs by selling its products and services. BPA markets wholesale electrical power from 31 federal hydroelectric projects in the Northwest, one nonfederal nuclear plant, and several small, non-federal power plants. BPA also operates and maintains about three-fourths of the high-voltage transmission in its service territory.

### BPA-Qualified

A measure not approved by the RTF on which BPA is collecting data and performing analysis, with the eventual goal of securing RTF approval.

### BPA Willingness to Pay

The maximum amount BPA will pay for a measure.

### BTU

British thermal unit: A unit of energy equal to about 1,055 joules, which is the amount of energy needed to cool or heat one pound of water by 1 degree Fahrenheit.

### Busbar Energy Savings

Energy that did not have to be produced at the generator. The site energy savings, plus any transmission and distribution losses, that would have occurred had the energy been generated. The site and busbar relationship depends upon the particular measure being implemented and its associated load shape. For UES measures, the site-to-busbar savings factor varies by measure. For site-specific calculators, the site-to-busbar savings factor currently in use is 1.09056. BPA provides payment for energy savings calculated from the busbar.

### CEE

Consortium for Energy Efficiency is an EPA Climate Protection award-winning consortium of efficiency program administrators from the United States and Canada. Members work to unify program approaches across jurisdictions to increase the success of efficiency in markets.
<p>| <strong>DEFINITIONS AND ACRONYMS</strong> | <strong>CBSA</strong> | Commercial Building Stock Assessment is a comprehensive assessment of energy efficiency that provides critical information about energy use in the Northwest’s commercial buildings. The CBSA database includes more than 250 variables for each site, including building type and functional use, building size, building envelope details, fenestration, lighting and HVAC equipment. |
| ———— | ——— | ——— |
| <strong>Completed Unit</strong> | Properly installed and operating measures that have met the specifications and requirements set forth in the IM. |
| <strong>Conditioned Space (Residential)</strong> | Any residential building cavity or space that is directly heated and/or cooled by an HVAC system that provides conditioned air. It is typically a space inside the residence’s thermal shell. |
| <strong>Conservation</strong> | Any reduction in electric power consumption as a result of increases in the efficiency of energy use, production or distribution, as defined in section 3(3) of the Northwest Power Act, and includes actual and planned conservation, as defined in the ECA. |
| <strong>COP</strong> | Coefficient of Performance: A ratio of useful heating or cooling provided to work required by a heat pump, refrigerator, or air conditioning system. |
| <strong>COTR</strong> | Contracting Officer’s Technical Representative: A BPA employee who performs the management/oversight of the Energy Conservation Agreement (BPA/utility contract). |
| <strong>Customer</strong> | A utility or other regional entity that purchases power from BPA. |
| <strong>Custom Program</strong> | Energy-savings work performed under the IM’s Custom Program section. |
| <strong>Custom Project</strong> | Energy-savings work performed under the IM’s Custom Project section. |
| <strong>Custom Project Completion Report</strong> | A document submitted at the completion of a custom project (under Custom Project Process, Option 1) that includes information on project costs, verified energy savings and information on changes to the approved measurement and verification (M&amp;V) plan. |
| <strong>Custom Project Proposal</strong> | A proposal for energy savings work made under the IM’s Custom Project section (under Custom Project Process, Option 1). |
| <strong>CZ</strong> | Cooling Zone. |
| <strong>Deemed Measure</strong> | This definition has been changed to Unit Energy Savings (UES). Please see the definition below. |
| <strong>Desuperheater</strong> | A heat exchanger inside a geothermal heat pump that heats a home’s hot water (this is in addition to water being heated with the home’s water heater). The desuperheater, like a heat pump water heater, reduces the energy used to heat water. |
| <strong>DHP</strong> | Ductless Heat Pump: A UES measure performed under the IM’s Commercial and Residential sections. |
| <strong>Dollar-for-Dollar Payment up to</strong> | A payment for the total cost of the installed measure, as long as the cost is less than the indicated cap. |
| <strong>DSM</strong> | Demand-Side Management: The strategies that focus on influencing when and how customers use electricity, with an emphasis on reducing or leveling load peaks. These include conservation measures and rate incentives for shifting peak loads; and energy storage schemes for reducing, redistributing, shifting or shaping electrical loads. |
| <strong>EASA</strong> | Electrical Apparatus Service Association, Inc., is an international trade organization of more than 1,900 electromechanical sales and service firms in 62 countries. Through its many engineering and educational programs, EASA provides members with a measure of keeping up-to-date materials, equipment and state-of-the-art technology. |
| <strong>ECA</strong> | Energy Conservation Agreement. |
| <strong>EEI</strong> | Energy Efficiency Incentive: The aggregate program cost established by BPA for purchasing energy savings from all program participants within a rate period, as defined in the ECA. |
| <strong>EER</strong> | Energy Efficiency Representative. |</p>

## DEFINITIONS AND ACRONYMS

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Improper Payment</td>
<td>Congress has defined “improper payment” to mean any payment made for an incorrect amount (including overpayments and underpayments) under statutory, contractual, administrative or other legally applicable requirements. It also includes any payment to an ineligible recipient, any payment for an ineligible good or service, any duplicate payment, any payment for a good or service not received (except for such payments where authorized by law) and any payment that does not account for credit for applicable discounts. BPA has an obligation to try and recover an improper payment.</td>
</tr>
<tr>
<td>Incremental Cost</td>
<td>Energy efficiency costs for work beyond that required by standard practice or code. May be the full cost of measures, especially in retrofit situations.</td>
</tr>
<tr>
<td>Initial Implementation Budget</td>
<td>The portion of an EEI established by BPA and effective at the beginning of a rate period to purchase energy savings from a specific program participant during that rate period, as defined in the ECA.</td>
</tr>
<tr>
<td>Invoice</td>
<td>A report of measures claimed and/or savings achieved under the IM. It may or may not include a request for payment.</td>
</tr>
<tr>
<td>kW</td>
<td>Kilowatt; 1,000 watts (units of electric power).</td>
</tr>
<tr>
<td>kWh</td>
<td>Kilowatt-hour; 1,000 watts of electric power supplied to or taken from an electric circuit over one hour.</td>
</tr>
<tr>
<td>LED</td>
<td>Light-emitting diode.</td>
</tr>
<tr>
<td>LEPA</td>
<td>Low-Energy Precision Agricultural: Low-energy precision agriculture for center pivot and linear move irrigation systems uses hoses that drag on the surface of the soil. This application reduces water evaporation, can provide more uniform water application, lower pressure requirements and reduce energy use.</td>
</tr>
<tr>
<td>LESA</td>
<td>Low-Elevation Sprinkler Application: The low-elevation sprinkler application for center pivot and lateral-move irrigation systems places the sprinkler within 3 feet of the soil surface.</td>
</tr>
<tr>
<td>Limited Change</td>
<td>A limited change refers to a type of correction made to Energy Efficiency’s programmatic forms and calculators. These are changes that do not affect payment, savings or requirements. Examples include: administrative changes (e.g., language corrections, minor edits, fixing typos) and BPA’s Energy Efficiency Management Team-approved changes. Such edits to the applicable documentation can be made at any time.</td>
</tr>
<tr>
<td>Low-Income</td>
<td>Low-income household eligibility is defined in the Federal Weatherization Assistance Program as 200 percent of poverty income levels. Approved statewide definitions substitute for federally established, low-income levels, if provided.</td>
</tr>
<tr>
<td>M&amp;V</td>
<td>Measurement and verification: The process for quantifying savings delivered by an energy conservation measure (ECM) to demonstrate how much energy use was avoided. It enables the savings to be isolated and fairly evaluated.</td>
</tr>
<tr>
<td>Major Renovation</td>
<td>A renovation to an existing structure that requires a building permit, and where multiple systems are impacted while a structure is repurposed, expanded or repositioned.</td>
</tr>
<tr>
<td>Manufactured Home</td>
<td>A dwelling that is transportable in one or more sections, is built on a permanent chassis (with or without a permanent foundation), and its wheels are removed when it is set up on site. This definition does not include travel trailers. A new manufactured home once sited with an occupancy permit qualifies for existing manufactured home incentives, but also qualifies for new manufactured home incentives (see NEEM 10.9.1) if the occupant is the first home occupant.</td>
</tr>
<tr>
<td>Market Transformation</td>
<td>Working in a market to improve products and behaviors. For example, BPA collaborates with the Northwest Energy Efficiency Alliance (NEEA) for the achievement of market transformation, which entails working with manufacturers.</td>
</tr>
<tr>
<td><strong>DEFINITIONS AND ACRONYMS</strong></td>
<td></td>
</tr>
<tr>
<td>-------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Measure</strong></td>
<td>Any material, equipment or activity identified in the IM that a program participant may install or implement within its service area to achieve conservation, as defined in the ECA. The term is used broadly in this document to mean one or more changes in system configuration, equipment specifications or operating practices to reduce electric power consumption. The reduction can be a result of increases in the efficiency of energy use, production or distribution. “Measure” covers all savings types, such as unit energy savings, calculators or custom projects.</td>
</tr>
<tr>
<td><strong>Measurement</strong></td>
<td>Readings taken to establish energy use or improvements in energy use, such as testing duct leakage or measuring loading factors and run time in factories. Large end users often measure to make sure that they are getting what they pay for or to better understand their system operations. BPA requires some level of measurement and verification for projects in which the payment is established by the energy savings achieved.</td>
</tr>
<tr>
<td><strong>MESA</strong></td>
<td>Mid Elevation Spray Application: A type of sprinkler application for center pivots and lateral move irrigation systems that place the sprinkler below the top of the span, generally between 5 and 7 feet off the soil surface.</td>
</tr>
<tr>
<td><strong>Modular Home</strong></td>
<td>A sectional, factory-built dwelling in the single-family home category, which is designed to be transported to the building site and affixed to a permanent foundation, with no chassis.</td>
</tr>
<tr>
<td><strong>Momentum Savings</strong></td>
<td>Cost-effective energy savings resulting from energy efficiency measures, which are above the Northwest Power and Conservation Council baseline and are not included in program savings.</td>
</tr>
<tr>
<td><strong>MT&amp;R</strong></td>
<td>Monitoring, targeting and reporting, a technique (based on statistical process control) to monitor and control a system. For the purpose of the Energy Smart Industrial Program, “system” may be a whole facility or a subsystem within an industrial facility.</td>
</tr>
<tr>
<td><strong>Multifamily Low-Rise</strong></td>
<td>Five or more dwelling units within the same structure that is no more than three stories high.</td>
</tr>
<tr>
<td><strong>Multifamily Mid/High-Rise</strong></td>
<td>Five or more dwelling units within the same structure that is more than three stories high.</td>
</tr>
<tr>
<td><strong>MW</strong></td>
<td>Megawatt; 1,000,000 watts (units of electric power).</td>
</tr>
<tr>
<td><strong>MWh</strong></td>
<td>Megawatt-hour; 1 megawatt over the period of 1 hour.</td>
</tr>
<tr>
<td><strong>NEEA</strong></td>
<td>Northwest Energy Efficiency Alliance: An alliance of more than 140 Northwest utilities and energy efficiency organizations working on behalf of more than 13 million energy consumers. NEEA works to mobilize the market to view energy efficiency as the most cost-effective way to meet the region's future energy needs. Through collaboration and pooling of resources, the region's utilities and stakeholders have harnessed their collective influence to drive market adoption of energy efficiency products, services and practices for the benefit of utilities, consumers and the region.</td>
</tr>
<tr>
<td><strong>NFRC</strong></td>
<td>National Fenestration Rating Council: A nonprofit organization that establishes objective window, door and skylight energy-performance ratings to help consumers compare products and make informed purchase decisions in multiple ways.</td>
</tr>
<tr>
<td><strong>NWPCC</strong></td>
<td>Northwest Power and Conservation Council: A nonprofit entity authorized through the Northwest Power Act to develop and maintain a regional power plan, and a fish and wildlife program, to balance the Northwest’s environmental and energy needs. The Northwest Power and Conservation Council develops a 20-year regional power plan that is updated no less than every five years. BPA leverages the findings of the Power Plan to determines its energy savings goals. Also known as the Council.</td>
</tr>
<tr>
<td><strong>Oversight</strong></td>
<td>A contract management activity, designed to ensure that the government is getting what it pays for with some level of certainty.</td>
</tr>
<tr>
<td><strong>Payment</strong></td>
<td>A term representing monetary incentive levels for the installation of energy efficiency measures.</td>
</tr>
<tr>
<td><strong>Performance Payment</strong></td>
<td>The application of funds to cover internal customer administrative costs incurred in support of energy-savings activities described in this IM. All performance payments are intended to help cover the customer expenses associated with achieving conservation savings. This includes paying for conservation staff, printing marketing and education materials, providing enduser rebates, performing audits, assessing conservation potential and other activities.</td>
</tr>
<tr>
<td><strong>DEFINITIONS AND ACRONYMS</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Primary Residential Heating System</td>
<td>A heating system that serves 50 percent or more of the conditioned living area of a residence.</td>
</tr>
<tr>
<td>Programmatic Savings</td>
<td>Energy savings paid for and directly attributed to BPA, utility and NEEA programs.</td>
</tr>
<tr>
<td><strong>PTCS®</strong></td>
<td>Performance Tested Comfort Systems: A certification for duct sealing and heat pump commissioning.</td>
</tr>
<tr>
<td>PTCS Commissioning, Controls and Sizing</td>
<td>Refers to the PTCS installation procedures of commissioning an air source heat pump or a variable speed heat pump. It guides the proper sizing of the unit, the refrigerant charge, the control of auxiliary heat, thermostat and air flow to ensure that the system is installed to operate efficiently. Also refers to the PTCS Commissioning, Controls and Sizing measure (CC&amp;S), which includes heat pumps that meet federal minimum standards, but not the other remaining PTCS air source heat pump efficiency requirements. See PTCS in the Residential section.</td>
</tr>
<tr>
<td>PTS</td>
<td>Performance Tracking System: An online tracking of real-time energy use (kW) to document the baseline and post tune-up energy use for ESI Program’s Strategic Energy Management projects. It is also used to track any number of key variables to develop a meaningful, normalized energy use profile.</td>
</tr>
<tr>
<td>Qualified Applications List</td>
<td>A list of BPA installation applications for a specific technology that clarifies whether the installation application is approved for a BPA payment. For example, the commercial and residential DHP measures use this approach.</td>
</tr>
<tr>
<td>Qualified Product List</td>
<td>A list of products, such as equipment and appliances, that meet a specification for qualification.</td>
</tr>
<tr>
<td>Rate Period</td>
<td>A period of time during which a specific set of rates established by BPA pursuant to a rate-case process are in effect (currently two-year periods). Defined in BPA’s Tiered Rate Methodology, as amended.</td>
</tr>
<tr>
<td>RTF</td>
<td>Regional Technical Forum: An advisory committee established in 1999 to develop standards to verify and evaluate energy conservation. Its committee members are experienced in conservation program planning, implementation and evaluation, and are appointed by the NWPCC.</td>
</tr>
<tr>
<td>RBSA</td>
<td>Residential Building Stock Assessment: A comprehensive survey of more than 1,850 sites across the Northwest, including more than 1,400 single-family homes. The RBSA was designed to develop a characterization of the residential sector that takes into account the diverse climates, building practices and fuel choices across the region.</td>
</tr>
<tr>
<td>RESNET</td>
<td>Residential Energy Services Network of Certified Raters: It uses the Home Energy Rating System (HERS) Index. The HERS Index score can be used to measure the energy efficiency performance of residential, single-family new construction. It is one of the means of certifying if a single-family home meets the Northwest ENERGY STAR Certified Homes standards.</td>
</tr>
<tr>
<td>Retail Program Delivery Mechanisms</td>
<td>Residential retail delivery mechanisms and program models include downstream incentives delivered directly to the end user, usually through a rebate; midstream incentives that go through the retailer; and upstream program activity that goes through the manufacturer.</td>
</tr>
<tr>
<td>RSAT</td>
<td>Retail Sales Allocation Tool: A tool for use in residential retail midstream and upstream programs where site information (i.e., home address) is not available. This tool provides evaluated, research-based percentage allocations for all Northwest utilities (public and investor-owned) for a select list of energy efficiency products in an easy-to-use, Excel-based tool. This tool is used by the Simple Steps, Smart Savings program and is available from an EER.</td>
</tr>
<tr>
<td>ROC</td>
<td>Refrigerator Operator Coaching: An Industrial Strategic Energy Management feature that provides classroom and webinar training, and on-site technical support. ROC is designed to help industrial sites with ammonia refrigeration systems general electrical energy savings, while getting the most out of their systems. The energy savings are calculated by site-specific energy models, following the M&amp;V requirements addressed in the ESI MT&amp;R Reference Guide.</td>
</tr>
<tr>
<td>Rollover Amount</td>
<td>The calculated amount of a program participant’s remaining budget at the end of a given rate period that may carry forward to increase the amount of that program participant's available implementation budget for the following rate period. Rollover is calculated as up to 10 percent of their initial implementation budget or $50,000, whichever is greater.</td>
</tr>
<tr>
<td><strong>DEFINITIONS AND ACRONYMS</strong></td>
<td></td>
</tr>
<tr>
<td>-------------------------------</td>
<td></td>
</tr>
<tr>
<td>SEEM</td>
<td>Simplified Energy Enthalpy Model: A tool used by the RTF to model residential building energy use.</td>
</tr>
</tbody>
</table>
| SEM Annual Savings Achieved | The verified incremental savings measured in each year of a two year performance period.  
• In Year 1 of the first performance period, or after the re-establishment of the SEM Baseline, it is measured as all savings achieved above the SEM Baseline.  
• In Year 2 of any performance period, it is measured as the savings achieved over the savings achieved in Year 1 of the performance period.  
• In Year 1 of subsequent performance periods (as a result of re-enrollment), it is measured as all savings achieved above Year 2 of the previous performance period.  
• Should there be zero or negative savings verified from prior year, SEM Annual Savings Achieved is zero.  
SEM Annual Savings Achieved is used to determine allowable Performance Payment. |
| SEM Baseline | Energy use established prior to enrollment in a SEM program. SEM Baseline can be reestablished after a significant operational change or at customer request as outlined in the ESI MT&R Reference Guide. Re-enrollment in additional two year performance periods resets the reference point for the purposes of calculating savings and payment, but does not change the SEM Baseline. |
| SEM Cumulative Verified Savings | Verified annual energy savings measured from establishment of SEM Baseline to current performance period year. SEM Cumulative Verified Savings is not used by BPA to calculate reportable savings or any payment, but will be provided to customers for their own reporting purposes. |
| SEM Participation Payment | EEI payment made during each year of an SEM Performance Period. Payment is based on SEM Verified Savings. |
| SEM Verified Savings | Verified total energy savings measured from the start of the current performance period. SEM Verified Savings are calculated at the end of Year 1 and at the end of Year 2.  
• In Year 1 of the first performance period, it is measured as all savings achieved above the SEM Baseline.  
• In Year 2 of any performance period, it is measured as the savings achieved in Year 1 and adjusted for any additional savings achieved in Year 2.  
• In Year 1 of subsequent performance periods (as a result of re-enrollment), it is measured as all savings achieved above Year 2 of the previous performance period.  
• Should there be zero or negative savings verified from the start of the performance period, SEM Verified Savings achieved is zero.  
SEM Verified Savings is used to determine EEI incentive payment |
<p>| SEER | Seasonal Energy Efficiency Ratio. |
| Self-Funded | Energy savings for which a utility chooses not to seek a payment from BPA. |
| SEM | Strategic Energy Management: As defined by CEE's Minimum SEM Elements, a holistic approach to managing energy use to continuously improve energy performance, by achieving persistent energy and cost savings over the long term. |
| Single-Family | Fewer than five dwelling units within the same structure, including duplexes, triplexes, accessory dwelling units and modular homes. Townhouse homes that share walls, but do not vertically overlap, may be considered single-family, regardless of the number of units connected side by side. Accessory dwelling units with separate plumbing systems or separate HVAC systems qualify for applicable measures even if they are on the same electrical meter. |
| Site Energy Savings | The ascribed, deemed, calculated, estimated, evaluated or verified conservation in first-year, kilowatt-hours attributable to completed units. |
| Thermostats – Connected | Thermostats that have Wi-Fi or wireless capabilities to connect to the internet. They allow users to control HVAC functions to maintain zone temperatures using the internet, and offer online alerts, monitoring, programming and control from a remote location. |
| Thermostats – Line Voltage | Line-voltage thermostats are most commonly used for electric space heaters such as a baseboard or wall heater. If a line-voltage thermostat is used, system power (120 or 240 volts) is directly switched by the thermostat. |</p>

Section 1: Introduction

Bonneville Power Administration pursues energy efficiency as a resource. This approach is stated in the 1980 Pacific Northwest Electric Power Planning and Conservation Act, and the Northwest Power and Conservation Council’s Northwest Power Plan.

The Energy Conservation Agreement (ECA) is the contractual mechanism for BPA to meet its statutory obligations. Customers may request an ECA by writing to their Energy Efficiency Representative. BPA shall review the request and, if accepted, will develop a draft ECA. BPA generally provides an opportunity for customer review. Once the ECA is final, the customer will receive a copy electronically.

The ECA, the Energy Efficiency Implementation Manual, or IM, and BPA’s Energy Efficiency Reporting System (currently Interim System 2.0) provide the implementation requirements for reporting measures to BPA.

The IM relies on the framework specified in the Long-Term Regional Dialogue Final Policy and the BPA Energy Efficiency Post-2011 Implementation Program. For additional guidance on the Post-2011 program, see BPA’s website.

1.1 Overview

Based on BPA’s Regional Dialogue policy, BPA commits to achieving the share of the Power Plan’s regional energy efficiency target that represents BPA’s public power customer load. BPA reports savings to its target from three major categories: programmatic, momentum and market transformation. The IM covers only programmatic savings that are reportable to BPA’s targets.

Prior to inclusion in this IM, BPA conducts planning efforts to ensure that funds expended on the offerings and programs are prudent and are expected to meet stated objectives and outcomes. Programmatic offerings are considered reportable when they are reliable, cost effective and meet eligibility and documentation requirements. Reportable measures are eligible for the BPA payments outlined in this document. Unless otherwise noted or written preapproval has been provided by a contracting officer’s technical representative (COTR), all equipment installed must be new to qualify for payment using a unit energy savings (UES) measure.

1.2 Reliability

BPA has a responsibility to ensure the reliability of its energy-savings achievements. The Act specifically calls on BPA to pursue cost-effective energy efficiency that is “reliable and available at the time it is needed.” For BPA’s Energy Efficiency organization, ensuring reliability is not a single action at a single point in time. Instead it is an ongoing process that includes planning, implementing and using evaluation and oversight to make improvements.

Reliability varies by savings type: unit energy savings (UES), custom projects and calculators. Custom projects require site-specific measurement and verification (M&V) to support reliable savings estimates. BPA M&V Protocols direct these activities and are the reference documents for reliable measurement and verification. For UES measures and calculators, measure specification and savings estimates must be approved by the Regional

Occasionally, BPA may negotiate a nonstandard agreement with a customer that contains variations from IM requirements, but only when there is a benefit to BPA (such as a reduction in the payment or staff time spent administering the agreement).

Bonneville Power Administration Long-Term Regional Dialogue Final Policy, pp. 30-31.

Power Act language summarized.

Protocols include: M&V Protocol Selection Guide; reference guides for sampling, regression and glossary; protocols on metering, indexing, engineering calculations with verification, energy modeling and existing building commissioning.
Technical Forum or meet the requirements to be “BPA-Qualified,” described below.

The Regional Technical Forum reviews and approves costs, savings, lifetime and specifications for measures, which are based on the reliability standards in the RTF guidelines. BPA reviews RTF-approved measures and decides whether to adopt them into its program offerings. The primary and preferred path for BPA’s measure and savings calculator development and maintenance is through RTF approval. The RTF has a well-developed public-review process, uniform quality standards and documentation, and the staff to conduct a review and to update UES measures.

To provide BPA and customers with additional UES measure flexibility, BPA may conduct an internal approval of costs, savings, lifetime and specifications; this is known as BPA-Qualified. It may only be used for structural purposes (e.g., to adjust specifications or granularity for a gap in offerings) or research purposes (e.g., to gain experience with new technology or improve savings estimates). BPA-Qualified measures are noted in the title of the measure. Documentation requirements may be higher for BPA-Qualified measures to support research efforts.

To assure portfolio-level reliability, impact evaluation is also required. Impact evaluations follow the RTF guidelines and are conducted on all savings types.

1.3 COST EFFECTIVENESS

BPA has a responsibility to ensure the cost effectiveness of its energy-savings achievements, as mandated in the Northwest Power Act.\(^5\)

BPA maintains a cost-effective energy efficiency portfolio with an aggregate total resource cost (TRC) benefit-to-cost ratio greater than or equal to one (TRC $> 1.0$). To maintain a cost-effective portfolio, BPA maintains TRC $> 1.0$ in each of the major savings types: UES, custom and calculators. BPA does not require that every measure or project is cost effective; instead it uses a combination of cost-effectiveness thresholds and measure bundling to ensure overall cost effectiveness, while providing flexibility.

1.4 PAYMENT

When BPA determines the appropriate payments, it assesses cost characteristics relative to established metrics and considers other factors. The cost metrics reviewed for payment are: the incremental cost, the first-year cost and the levelized cost of the measure. First, payments are measured as a percentage of incremental cost and are capped based on savings-type policies (e.g., custom projects capped at 70% of incremental cost). Next, BPA reviews the first-year cost\(^6\) with the goal of keeping each offering at or below the sector average cost goals. Finally, BPA compares the levelized cost of the payment against the Power Plan’s avoided costs to ensure that BPA’s payment does not exceed the resource value of the savings.

Other factors considered include: programmatic considerations, market maturity or conditions, payment influence and free ridership, TRC cost effectiveness and regional benefits.

---
\(^5\)Power Act language summarized
\(^6\)First-year cost is calculated as the ratio of the payment and first-year savings.
1.5 POLICY FOR MEASURE CHANGES/ADDITIONS

BPA reserves the right to make changes to policies, procedures, measure eligibility, specifications and requirements.

On Oct. 1, 2015, the Change-Notice Policy was changed to reflect the "Revised Energy Efficiency Post-2011 Implementation Program." BPA has published the IM annually since Oct. 1, 2015, but is now publishing it every two years in tandem with the rate period that began Oct. 1, 2017. Changes that require notice will be announced the previous April in a separate changes document. BPA’s new change-notice policy will be as follows:

<table>
<thead>
<tr>
<th>CHANGES TAKING EFFECT IN THE OCTOBER BI-ANNUAL IM WITH SIX-MONTHS’ NOTICE IN THE PRECEDING APRIL CHANGES DOCUMENT</th>
<th>CHANGES TAKING EFFECT IN OCTOBER AND IN THE APRIL CHANGES DOCUMENT WITHOUT NOTICE</th>
<th>CHANGES TAKING EFFECT AT ANY TIME WITHOUT NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Savings change: up or down</td>
<td>New measure</td>
<td>Corrections</td>
</tr>
<tr>
<td>Payment amount change: up or down</td>
<td>Optional calculators</td>
<td>Limited changes to calculators and forms</td>
</tr>
<tr>
<td>Adding or substituting a requirement</td>
<td>Removal of a requirement</td>
<td></td>
</tr>
<tr>
<td>Expiration of a measure</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note that changes are different from corrections. Corrections are introduced to fix ambiguous or incorrect language, or to align conflicting terms between BPA’s rules (e.g., the IM, the ECA, standards of conduct, spreadsheets, calculators, outside specifications and the BPA Energy Efficiency Reporting System). A clarification is a type of correction. Corrections may be implemented at any time to provide immediate clarification and alignment to customers and BPA. Limited changes are corrections made to EE’s supporting documents found in the IM Document Library that need to be implemented immediately. Off-cycle corrections (introduced outside of the April or October notice document) will be announced in the Updates/Revisions section at the end of the IM.

1.6 OFFICIAL INTERPRETATIONS

Only BPA Energy Efficiency’s Contract Administration manager may issue interpretations, determinations and findings related to the IM, unless delegated to other BPA staff, such as the contracting officer’s technical representative (COTR). Such interpretations, determinations and findings will be provided to the customer in writing. Only written statements (including email) by BPA officials acting within the scope of their authority are official BPA statements.
Section 2: Funding

2.1 BPA FUNDING

Pursuant to Section 6 of the Energy Conservation Agreement (ECA), BPA Energy Efficiency will pay customers for the costs of energy savings from in-region projects.¹ This section discusses (1) bilateral funding, (2) pooling organizations, and (3) performance payments.

2.1.1 Bilateral Funding

Bilateral funds may be used for all BPA-funded measures, unless otherwise specified in the IM or ECA. Bilateral funding is administered through the customer’s ECA and is referred to as the implementation budget (or, in certain instances, it is administered through a supplemental budget in a separate exhibit).

A customer’s rate-period implementation budget is based on its Tier One Cost Allocation (TOCA). Customers may pursue budget changes under the ECA, per the terms of that agreement according to the parameters detailed below for budget redistribution, reduction and increase (from the Unassigned Account). Pursuant to Section 5(c) of the ECA, BPA shall not pay amounts in excess of the implementation budget.

The following section discusses: (1) Energy Efficiency Incentive (EEI) allocation; (2) Inter-Rate-Period Budget Flexibility (Rollover); (3) EEI redistribution; (4) EEI Budget Reduction; and (5) EEI increase from the Unassigned Account.

1. EEI Allocation

After the rate case final proposal is published, BPA will calculate the EEI allocation for each customer and deliver this information in a letter or similar document. BPA will revise the customer’s ECA implementation budget to reflect the allocated funds, effective the first day of each rate period (i.e., Oct. 1), unless the customer indicates a different funding amount (not to exceed the EEI allocation) through the COTR Request and Acknowledgment Procedure. If the customer does not request a different funding amount, it commits to use or transfer its full EEI allocation for the acquisition of energy efficiency, per the requirements of the IM. EEI funds returned to BPA will be added to the Unassigned Account, which captures unclaimed EEI funds and unspent BPA programmatic funds.

2. Inter-Rate Period Budget Flexibility (Rollover)

Customers have the ability to move up to 10% of their initial implementation budget or $50,000, whichever is greater. The amount of funds remaining at the end of a given rate period, not to exceed the rollover cap, will be added to the customer’s EEI budget for the following rate period (and will be added to the total implementation budget for the purpose of calculating performance payments). There is no requirement that rollover funding be tied to specific projects or programs.

3. ECA Implementation Budget Redistribution (Bilateral Transfers and Pooling Organizations)

Customers may redistribute EEI funds among each other by forming a pooling organization or by sending a completed Bilateral Transfer Request and Attestation Form.

¹BPA will not pay for projects that have been or will be funded in part/full by another BPA funding source.
5. ECA Implementation Budget Reduction

Customers may reduce their implementation budget at any time by submitting a request through the COTR Request and Acknowledgment Procedure. BPA will revise the customer’s ECA implementation budget to reflect the reduction, and the unallocated funds will be added to the Unassigned Account.

5. ECA Implementation Budget Increase from the Unassigned Account

BPA may increase customer implementation budgets (1) at months 6, 12 and 18 of the rate period; (2) on a monthly basis, beginning the 19th month of the rate period; or (3) at BPA’s discretion as funding becomes available by distributing available EEI funds from the Unassigned Account.

Customers will have 10 working days to request an implementation budget increase after BPA provides an accounting of available funds. If a customer’s request is approved, funds will be allocated via a revision to the customer’s ECA implementation budget.

To request an implementation budget increase from funds in the Unassigned Account, customers must submit to BPA (email eedocs@bpa.gov) the Unassigned Account Funding Request Template (available in the IM Document Library).

Customers that reduce their implementation budgets within the first 12 months of a rate period will receive second-priority access (behind BPA, which has first priority for allocations, if applicable) to the unassigned funds up to the amount reduced. The priority is based on the date the funds were released, and carries through that rate period and the one immediately following. Once the customer has recovered all the reduced funds, priority access is removed.

### 2.1.2 Rules for Pooling Organizations

A pooling organization is two or more customers combining BPA funds to implement cost-effective conservation. A customer may put all or a portion of its BPA funding toward a pool and withdraw under terms and conditions agreed to by the pool. Pool membership can expand or contract as determined by the pool, but pooling organizations must provide written notice to BPA at least 30 days prior to membership formation, changes or dissolution.

A pooling organization must appoint a legally authorized representative (such as a customer or separate entity) to assume nontransferable liability for the organization. BPA will fund a pooling organization only after it has reviewed and approved documentation of pool status (e.g., pooling organization agreement, bylaws, articles of incorporation) submitted by requesting customers. If the authorized representative is not a BPA customer with an existing ECA, BPA will offer an ECA for signature. Savings must be allocated to the individual customer where the savings are located.
2.1.3 Performance Payments

BPA highly recommends that customers use performance payments to support implementation costs in support of the IM’s activities. Implementation costs may include (1) staff (direct labor and indirect overhead for the implementation and management of conservation activities); (2) marketing (market research, advertising, promotional material production and distribution); and (3) other operating costs and equipment (metering equipment, computer software/hardware, training, travel and program development).

Performance payments are taken out of the customer’s ECA implementation budget and are based on EEI-funded savings. Any SEM-related performance payment claimed shall be based on SEM Annual Savings Achieved (i.e., incremental savings); the payment shall not be based on SEM Verified Savings. The payment rate and cap depend on the customer’s classification as small, rural, residential (SRR), or none of these (non-SRR), as defined in the chart below.²

<table>
<thead>
<tr>
<th>SRR STATUS</th>
<th>DEFINITIONS</th>
<th>PAYMENT RATE $/KWH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>The customer’s forecast net requirement is less than 10 aMW</td>
<td>$0.08</td>
</tr>
<tr>
<td>Rural</td>
<td>The customer has fewer than 10 customers per line mile according to the Low-Density Discount calculation</td>
<td>$0.08</td>
</tr>
<tr>
<td>Residential</td>
<td>The customer’s load is greater than 66% residential, according to U.S. Energy Information Administration data²</td>
<td>$0.08</td>
</tr>
<tr>
<td>Non-SRR</td>
<td>The customer is not small, rural or residential</td>
<td>$0.04</td>
</tr>
</tbody>
</table>

Customers may claim payment at a rate up to the rate in the table above. The payment amount must be included on each invoice. If the performance payment is not claimed in an invoice or claimed only in part (e.g., at a rate less than the payment rate in the table above), then there is no opportunity to later collect money for the unclaimed payment. If the customer does not wish to claim a performance payment on invoices, it must submit the Performance Payment form (available in the Interim Solution 2.0 Files). BPA does not allow a performance payment to be claimed on self-funded activities.

The calculation of a performance payment is based on the program participant’s initial implementation budget plus any applicable rollover amount, plus or minus any applicable implementation budget transfers (known collectively as the implementation budget). This calculated amount can vary over the course of the rate period. The total of all performance payments available at any given time is capped at 30% of the implementation budget for SRR customers and at 20% of the implementation budget for non-SRR customers.

If the customer or BPA makes a classification or calculation mistake, the SRR status change becomes effective immediately upon discovery of the mistake. When a mistake is discovered, corrections to invoices for over- or under-payments will address the full time period impacted, but not to exceed the statute of limitations (six years). Availability of historical invoice details may be limited due to availability within the reporting system of record.

Pooling organizations may claim performance payments up to the aggregate of each pool participant’s allowance.

²BPA will notify customers of their rate period classification in the EEI allocation letter.
³BPA reserves the right to request additional documentation (such as an annual report) to verify a customer’s load.
When funds are redistributed among customers (e.g., via a bilateral transfer), BPA may restrict the performance payment that can be claimed on the transferred funds. An increase or decrease in a customer’s EEI budget will result in a corresponding increase or decrease in their performance payment budget. If a customer transfers enough of its EEI budget so that its calculated performance payment budget becomes less than or equal to zero, the utility will not be required to repay prior payments, but no additional performance payment will be allowed for the remainder of the rate period, unless the utility receives additional EEI funds.

### 2.2 FUNDING SOURCES AND SAVINGS ALLOCATION

When reporting savings to BPA, customers must select one or more of the following funding sources:

<table>
<thead>
<tr>
<th>FUNDING SOURCE</th>
<th>BPA ENERGY EFFICIENCY REPORTING SYSTEM TITLE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementation Budget</td>
<td>EEI</td>
<td>BPA payment in the form of EEI funding; ECA funded activities that are accepted by BPA</td>
</tr>
<tr>
<td>BPA-Accepted, Non-BPA Funds</td>
<td>Self-Funding</td>
<td>Activities generating energy savings for which a utility chooses not to seek payment from BPA</td>
</tr>
<tr>
<td>Not-BPA-Accepted, Non-BPA Funds?</td>
<td>Non-Reportable</td>
<td>Non-BPA-funded activities that are not accepted by BPA.</td>
</tr>
</tbody>
</table>

Customers are credited for all savings (except non-reportable) that are achieved in their service territory. Savings may be allocated to either the EEI or the customer depending on the amount of BPA payment requested by the customer.

<table>
<thead>
<tr>
<th>BPA PAYMENT AMOUNT REQUIRED</th>
<th>AVAILABLE APPLICATIONS</th>
<th>SAVINGS ALLOCATED TO EEI</th>
<th>SAVINGS ALLOCATED TO CUSTOMER</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>All</td>
<td>100%</td>
<td>0%</td>
</tr>
<tr>
<td>None</td>
<td>All</td>
<td>0%</td>
<td>100%</td>
</tr>
<tr>
<td>Partial</td>
<td>Custom Projects</td>
<td>EEI and self-funded savings are allocated in proportion to the EEI and self-funding shares of BPA's willingness to pay.</td>
<td></td>
</tr>
</tbody>
</table>

*This restriction reduces the risk that BPA will overpay because performance payments are paid on a $/kWh basis, independent of payment amount (i.e., a customer could use all of its performance payment, receiving little payment, and then transfer its remaining implementation budget to another customer that similarly uses all of the performance payment).*

*To claim less than the calculated performance payment, use the Performance Payment calculator located on the Interim Solutions 2.0 Files webpage.*

*This includes, but is not limited to, 100% of industrial strategic energy management (SEM) verified energy savings for each reporting year (i.e., year one of the SEM engagement and each subsequent reporting year).*

*Customers are allowed, but not required, to include non-reportable savings to BPA. BPA will not review the non-reportable data and customers will not be credited for the energy savings. Non-reportable savings must be reported separately.*
Section 3: General Requirements

3.1 DOCUMENTATION REQUIREMENTS

Each measure contains documentation requirements. All documentation must be retained in the customer’s file (which may be in hard copy or electronic form) and certain documentation must be submitted to BPA via email to eedocs@bpa.gov or or sent through BPA’s Energy Efficiency Reporting System.

Unless otherwise noted, utility-created forms can be substituted for forms provided by BPA to fulfill the stated documentation requirements. Utility created forms must contain at a minimum all fields found in the BPA-provided form in order to qualify as acceptable documentation.

Customers must retain required information for a minimum of four years after the measure has been invoiced through the reporting system. Information must be made available to BPA upon request.

If a customer agent or contractor was used for some or all of the measure development, implementation or verification, the customer must also retain documentation that IM requirements have been met.

3.2 REPORTING REQUIREMENTS

Reports (invoices) must include supporting documentation required by the IM. This documentation must prove that measures were available for implementation during the claimed period, were properly installed and are operating. BPA may reject measures that do not meet these requirements.

Should there be a disagreement regarding a report, BPA will work with the customer to correct errors and make agreed-upon revisions.

For each submitted report, customers must establish and maintain files and supporting documentation.

The files must clearly identify the corresponding invoice and meet the documentation requirements of the IM.

Until BPA Energy Efficiency procures a long-term reporting system, customers must use Interim Solution 2.0 (IS2.0), available through the BPA Customer Portal, to report energy efficiency achievements to BPA — with and without requests for payment. Customers may report any energy savings at any time, as long as the completion dates are in the current or previous rate period. For nonresidential lighting, customers must use the calculator in effect at the time of submission.

The following describes the reporting steps. All referenced documents are available in the IM Document Library or the Interim Solution 2.0 Files websites.

Gather invoice-package documents that may include, but are not limited to, the following:

- **UES Measure Upload Template** (Use this to report specific measures that have been completed. Look up the specific reference number that applies to the end user’s situation in the UES Measure List posted to the Interim Solution 2.0 Files website.)
- **Performance Payment Form** (Only if requesting less than the total available performance payment on an invoice.)
- **Progress Payment Request Form** (Only if requesting custom project progress payments.)
• Calculators
  • **Option 1 Custom Project Calculator** (After COTR approval of project completion report, one calculator file for each COTR-approved completed project.)
  • **Option 2 Custom Project Calculator** (Available for bulk reporting of multiple projects; can be found as an Additional Document in the Energy Efficiency section of the BPA Customer Portal for eligible Option 2 customers.)
  • **RTF-Approved Small Compressed Air Calculator**
  • **Energy Management Calculator** (Energy Project Manager, Track and Tune, and High-Performance Energy Management)
  • **Lighting Calculator**
  • **Custom Program Calculator**

Use the **File Naming Tool** to name all invoice package documents. Improperly named documents will not be processed by the system and may result in the customer having to resubmit the entire invoice package.

Use the **Summarizer Tool** (optional) to estimate the total invoice package payment and savings. This tool can also give preliminary indications of potential invoice package errors and warnings.

Upload invoice package documents (named using the File Naming Tool) to the BPA Energy Efficiency Reporting System.

BPA will review the submitted documents and create an invoice report showing the amount to be paid. BPA will work with the customer to resolve any errors in the invoice package and will determine the acceptable payment for measures reported.

### 3.3 OVERSIGHT AND EVALUATION REVIEW PROCESS

As a part of the oversight review process, BPA shall (1) perform end-user site and record reviews, and (2) conduct impact and process evaluations.

#### Site and Record Reviews

BPA may conduct oversight inspections of all measures, contact end users to verify reported measures, monitor or review the customer’s procedures and records, conduct site visits to verify claimed energy savings and oversee implementation. The number, timing and extent of inspections is decided by BPA and coordinated with the customer. BPA shall normally provide written notice not less than 30 days prior to an inspection and inspections will occur at BPA expense. BPA may contact appropriate federal, state or local jurisdictions regarding health, safety or environmental matters related to any activity under this IM.

If, at any time, BPA finds noncompliance with the requirements of the IM or the customer’s ECA, it may make adjustments to the customer’s invoices and/or payments to achieve compliance.

#### Impact and Process Evaluations

BPA may evaluate measures to assess the amount, cost effectiveness and reliability of conservation. BPA will determine the timing, frequency and type of evaluations with input from the customers on the evaluation plan.

BPA may also require customers to provide billing data and contact information for participants. If so, billing data must be linked to the reported measure (e.g., through a unique identification) to allow BPA to assess savings by measure.

BPA and/or regional participants will pay for evaluations initiated by BPA. In some cases, another party will manage the evaluation on behalf of BPA. BPA recognizes that customers participating in the evaluation provide some
resource/cost, but the cost is not eligible for BPA payment. When reporting savings for evaluation, customers should not apply realization rates to individual measure savings estimates in order to avoid embedded realization rates. BPA's recommended best practice is to apply realization rates to the total savings for a portfolio, rather than to the individual measure savings data.

3.4 THIRD-PARTY OPERATED PROGRAM REQUIREMENTS

It is unlikely, but unforeseeable contract circumstances could result in the termination or change of third-party-operated programs without prior notice. If BPA is forced to change a third-party-operated program, BPA will strive to minimize disruptions to delivery of program services through an alternate third-party provider or with BPA's own staff resources. BPA will give customers as much notice as possible if there are terminations or changes, and it will work with customers to wrap up and/or transition any work in progress.

The following programs are operated by third parties: Energy Smart Industrial, Trade Ally Network Northwest, Technical Service Providers, Simple Steps, Smart Savings Retail Promotion and the Green Motors Rewind Initiative.
Section 4: Custom Projects

4.1 CUSTOM PROJECTS PAYMENT RATE

</tr>
</tbody>
</table>

In all instances of site-specific calculations (Option 1 Custom Project Calculators, Option 2 Custom Project Calculators, Lighting Calculators, etc.), the current site-to-busbar savings factor being used is 1.09056.

BPA’s willingness to pay for a custom project is equal to the lesser of (1) the BPA payment rate ($/kWh), or (2) the project cost cap.

The applicable BPA payment rate ($/kWh) is the rate in place when the custom project proposal was approved or the project start date if no custom project proposal was submitted. The BPA payment rate is calculated according to the table below:
### Custom Projects Payment Table

</tbody>
</table>

Project cost cap: Payment for all sectors is capped at 70% of the incremental project cost. If incremental cost data is not available for commercial new-construction projects, incremental cost may be calculated as 2.86 percent of the whole building.

Customers may request less than the BPA’s willingness to pay and will receive partial self-funding credit, as discussed in Section 2.2: Funding Sources and Savings Allocation.

Customers must pass through the entire BPA payment received to their end users if the payment is for a progress payment.
4.2 CUSTOM PROJECTS SPECIAL FUNDING

All utilities are eligible to request special funding (e.g., progress payments).

4.2.1 Progress Payments

Customers requesting progress payments must use the Progress Payment Calculator to request approval. The customer must request progress payments in the proposal, and the request must include a schedule with estimated progress payments that coincide with incurred costs and measurable milestones.

Progress payments will be made after project milestones are achieved and verified, in accordance with the BPA-approved Custom Project Proposal. The customer must document project milestone achievements (e.g., ordered, delivered or installed equipment) prior to receiving a progress payment.

The full progress payment amount paid by BPA must be passed through to the end user, and the customer must retain proof of payment. Customers will be required to repay BPA if the project is not completed within six months of the expected completion date (the expected completion date may be revised with BPA approval).

To qualify for progress payments, the project must have the following attributes:

- The time period from the BPA Custom Project Proposal approval date to the completion report submittal date meets or exceeds 12 months.
- The amount of each progress payment is $100,000 or greater.
- The estimated incentive for the project is $250,000 or greater.
- The sum of the progress payments does not exceed the lower of (a) 70 percent of actual expenditures of the project incurred, up to the date of the progress payment invoice to BPA, or (b) 50 percent of the estimated total project incentive.

For projects seeking the use of progress payments, the Custom Project Proposal and completion report must be approved prior to submission of the completion report into the BPA Energy Efficiency Reporting System. There is no required minimum time between the date of BPA's acceptance of a Custom Project Proposal and the date of completion report submission.

4.3 CUSTOM PROJECTS OVERVIEW

4.3.1 Custom Projects Process Option Overview and Enrollment

There are two paths available for custom projects: Option 1 and Option 2. Customers, by default, are enrolled in Option 1, but may elect Option 2 by using the COTR Request and Acknowledgment Procedure at the start of each rate period. They must submit/renew their application no later than Sept. 1, preceding the new rate period.

A request to follow the Option 2 path must include the customer’s proposed custom project-delivery approach (including, but not limited to, documentation of rules, processes and staffing capability) to meet the custom project requirements. The request must also provide any internal M&V protocols used for custom projects for BPA review. BPA may request additional information before notifying the customer of its approval/disapproval of Option 2 status. Option 2 customers may switch to Option 1 through the COTR Request and Acknowledgment Procedure (1) for any reason at the start of a new rate period, or (2) if customer circumstances change, making Option 2 unworkable.

Option 2 customers may request progress payments for a project only if they use the Option 1 Custom Project Process to secure BPA's approval.

Customers wishing to return to Option 1 at the start of a new rate period must submit their request no later than Sept. 1, immediately preceding the new rate period.
Option 1: BPA manages the project performance and cost-effectiveness of the bundle of energy savings from Option 1 custom projects. Option 1 customers may request technical support from BPA or BPA program implementers (i.e., Energy Smart Industrial) to develop projects and complete M&V regardless of the size of the project, or the requirement for review and comment.

Option 2: Customers manage the project performance and cost-effectiveness of the bundle of energy savings from their custom projects. The customer conducts all aspects of M&V and custom project quality control (e.g., project proposal and project completion documentation review) internally. Technical assistance is available in relation to IM clarifications and consultations regarding M&V methods and protocols, as they apply to a single project or the customer’s portfolio of projects. Project-implementation assistance is not available unless provided by third-party implementation contractors as part of a program (e.g., Cascade Energy through Energy Smart Industrial, or Trade Ally Network Northwest). Option 2 customers that request special BPA funding (such as progress payments, or those performing Limited-Availability Emerging Technology Field Test projects) must follow the Option 1 Custom Project Process.

4.3.2 Custom Projects General Requirements

1. It must not result in fuel switching.

2. The measures must be designed to result in improvements in the energy efficiency of electricity distribution or use, and must have a savings life of at least one year.

3. Custom projects are limited to one sector each.

4. Unit Energy Savings (UES) measures and calculated projects may be included in custom projects, on their own or in a project with other measures/projects, but must either (1) be included in the custom project M&V and not use the UES/calculated savings value; or (2) be reported separately through the UES/calculated path and the savings must not be included in the custom project savings.

5. Option 1 Custom Projects must meet the following B/C ratio requirements:
   - If the project savings are 200,000 kWh or less, no cost-effectiveness screen is applied.
   - If the project savings are over 200,000 kWh, and the project has a BPA-approved proposal, the proposal must demonstrate that the project has a B/C ratio ≥ 0.5 based on proposed costs and savings. No additional screen will be applied at the completion report.
   - If the project savings are over 200,000 kWh, and the project does not have a BPA-approved proposal, the completion report must demonstrate that the project has a B/C ratio ≥ 0.5.

6. Option 2 Custom Projects must have a minimum B/C ratio of 1.0 at the invoice level, based on verified costs and savings, when invoiced.

7. Any nonresidential lighting project (See 7.3 Nonresidential Lighting) may be submitted as a custom project. Lighting projects submitted as custom projects must use a comprehensive M&V plan per the BPA M&V Protocol Selection Guide and are not eligible to use a BPA engineering calculation with verification plan.

8. The BPA M&V Protocol Selection Guide (available in the IM Document Library) for custom projects must be used to select an appropriate M&V plan and be documented in the customer file. The implemented plan will be either (1) engineering calculations with a verification plan, or (2) a comprehensive M&V plan.
Engineering calculations with a verification plan
Detailed guidance on preparing engineering calculations with a verification plan is included in the BPA Engineering Calculations with Verification Protocol. As directed in the BPA M&V Protocol Selection Guide, engineering calculations with a verification plan may be used for projects with an expected annual energy savings of less than 200,000 kWh per year, which qualify under the BPA Engineering Calculations with Verification Protocol.

Comprehensive M&V Plan
Detailed guidance on preparing a comprehensive M&V plan is in the BPA M&V Protocols and Guidelines.

4.4 OPTION 1 CUSTOM PROJECTS

4.4.1 Custom Project Proposal
Option 1 Custom Project Proposals (a component of the Option 1 Custom Project Calculator) are not required unless the customer is applying for Progress Payments, or is performing a Limited-Availability Emerging Technology Field Test project.

Customers may, but are not required to, submit proposals to manage (1) energy-savings risks (i.e., if BPA approves the M&V plan at the proposal stage, and the M&V is carried out as stated in the plan, then BPA will accept the savings) and (2) cost-effectiveness risks (i.e., customers can secure assurance of project eligibility based on proposed values, rather than on completion report values). The customer may submit the Option 1 Custom Project Calculator to BPA via email to eedocs@bpa.gov, with the following tabs completed: Project Information, Proposal and Measure Input (all fields are labeled “required for proposals”).

When a proposal is approved, BPA will notify the customer and email the approved Option 1 Custom Project Calculator to the customer with the BPA-assigned project ID. This file must be saved and used by the customer for submittal of the completion report.

4.4.2 Custom Project Completion Report
Option 1 customers must submit a completion report (located in BPA’s Option 1 Custom Project Calculator) to BPA via email to eedocs@bpa.gov. It must include the following completed documents: project information, measure input and any supporting documentation for all custom projects.

When a completion report is approved, BPA shall notify the customer and email the approved Option 1 Custom Project Calculator to the customer. The customer must submit the BPA-approved calculator in the BPA Energy Efficiency Reporting System when requesting payment or reporting self-funding.

Note: Option 1 customers electing to submit non-reportable projects must do so using the Option 2 Custom Project Calculator.

4.4.3 BPA Review
Within 10 business days of receiving an Option 1 Custom Project Proposal or completion report, BPA will review the proposal or report and either (1) accept the submittal, (2) return the submittal for modification and resubmittal, or (3) reject the submittal. BPA determination of acceptability of a completion report is based on the following criteria:

a. Whether the Option 1 Custom Project Calculator and supporting documentation contain all required information;

b. Whether the project meets all the requirements; and
c. Whether verified energy savings are reliable (i.e., M&V was implemented per the approved M&V plan or M&V was appropriate for the project and consistent with BPA M&V Protocols).

For Option 1 projects without BPA-approved proposals and insufficient M&V, BPA will work with customers to adjust completion report savings, where appropriate and feasible. If it is not possible to make appropriate adjustments, the project will be rejected and will be ineligible for reporting to BPA.

4.5 OPTION 2 CUSTOM PROJECTS

For Option 2 projects, BPA does not require or review proposals or completion reports. Option 2 customers may apply for special BPA funding such as Progress Payments using the Custom Project Proposal Process for Option 1 custom projects. If special BPA funding is approved, the projects are treated the same as Option 1 projects and must meet all requirements of Option 1 custom projects.

For all Option 2 projects, the customer must review and approve the completion report prior to customer submission of savings into the BPA Energy Efficiency Reporting System. The completion report itself does not need to be submitted to BPA, but it must be retained by the customer for oversight and evaluation. The completion report should also contain any information on additional quality control conducted on the project. To receive payment for a custom project, the customer must submit the Option 2 Custom Project Calculator through the BPA Energy Efficiency Reporting System.

BPA may reject Option 2 projects that do not (1) have a completion report that contains all required information and demonstrates that the project is consistent with the custom project requirements, and (2) have verified energy savings that are reliable (i.e., M&V was implemented per the approved M&V plan or M&V was appropriate for the project and consistent with BPA M&V Protocols).
### 4.6 CUSTOM PROJECTS DOCUMENTATION REQUIREMENTS

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>
Section 5: Custom Programs

Custom programs are on hold for the 2020–2021 Rate Period. During this time new submissions will not be accepted; However, Energy Efficiency staff will continue to work with customers on existing custom programs. To qualify as an existing custom program, a program proposal must have been submitted on or before September 30, 2019.

Custom programs are a combination of similar projects, measures and/or end users that have the same measurement and verification (M&V) or evaluation plan across the entire program. The scope of a custom program is multiple installations that may include one or more measures, or sectors,¹ and that may occur at one or more end-user sites.

5.1 CUSTOM PROGRAMS PAYMENT RATE

The total BPA willingness to pay for an Evaluated Custom Program, or project within an M&V Custom Program, is equal to the lesser of (1) the BPA payment rate ($/kWh), or (2) the project cost cap.

The applicable BPA payment rate ($/kWh) is the rate in place at the time of Evaluated Custom Program approval or the start date for a project within an M&V Custom Program. BPA payment rate is calculated according to the table below:

<table>
<thead>
<tr>
<th>PROGRAM MEASURE TYPE</th>
<th>MEASURE LIFE (YEARS)</th>
<th>SECTOR</th>
<th>PAYMENT RATE ($/kWh)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nonresidential Lighting</td>
<td>All</td>

<tr>
<td>New Construction</td>
<td>45+</td>
<td>Residential</td>
<td>$0.45</td>
</tr>
</tbody>
</table>

¹Savings must be reported separately for each sector.
Payment for all sectors is capped at 70% of the incremental cost. Eligible costs include measure costs (incremental measure costs, operations and maintenance costs) and program costs (implementation, evaluation and M&V).

Customers may request less than the BPA willingness to pay and will receive partial self-funding credit, as discussed in Section 2.2: Funding Sources and Savings Allocation.

### 5.2 CUSTOM PROGRAMS REQUIREMENTS

Both Option 1 and Option 2 customers are eligible for custom programs, and both must meet the same requirements and follow the same process with BPA. Option 2 customers must use the custom program path when the BPA M&V Protocols are insufficient to provide direction, including use of an impact evaluation to estimate savings or where the M&V protocols do not cover a specific measure/application/method.

Custom Programs must meet the following criteria:

- Not result in fuel switching; and
- Contain only measures with a savings life of one year or more.

UES measures and calculated projects may be included in custom programs on their own, or in a program with other measures/projects. However, they must (1) be included in the custom program M&V or evaluation, and not use the UES/calculated savings value, or (2) be reported through the UES/calculated path and be netted out from the custom program savings.

There are two types of custom programs:

1. **M&V Custom Program**: Savings are estimated for individual sites based on M&V methodologies. M&V methods are based on the BPA M&V Protocol Selection Guide.
   
   M&V Custom Programs must be total resource cost-effective (TRC>1.0) at a calculator level.

2. **Evaluated Custom Program**: Savings estimation follows an impact evaluation plan, which may include a census or sample of the participants. Evaluation methods are known and tested for the specific measure/application. Evaluations must be, at a minimum, consistent with RTF Guidelines Section 5 (Impact Evaluation).
   
   Evaluated Custom Programs must be cost-effective at the program level (impact evaluation level) with TRC of 1.0 or greater, based on verified costs and savings at the time of completion report and invoicing.

### 5.3 CUSTOM PROGRAMS APPROVAL AND MODIFICATION PROCESS

The customer must secure BPA’s approval of its custom program or any modifications (including cancellation) to it (e.g., new measures, measure exclusion and M&V approach change).

Custom Program proposals must, at a minimum, contain the following information:

- Basic program information, including:
  - Program name;
  - Contact information: customer name and proposer contact information; and
  - Program summary: existing system and proposed system descriptions.
- Documentation of baseline conditions.
- A site-specific M&V plan or impact evaluation plan.
- Proposed measure costs and savings.
- Proposed program costs.
- Estimated project-level cost-effectiveness.
- For M&V Custom Program, completion report submission requirements (e.g., approved reports prior to submission for all projects, some projects or no projects).

The customer’s request for approval must be sent to BPA eedocs@bpa.gov by submitting a Custom Program Calculator available in the IM Document Library.

The customer may cease its custom program participation at any time using the COTR Request and Acknowledgment Procedure. BPA shall have no obligation for costs incurred for unreported savings.

Evaluation requirements differ for Evaluated and M&V Custom Programs, but each evaluation plan must be customer-funded, unless otherwise directed by BPA.

BPA may ask the customer clarifying questions during the approval process. Within 10 working days of the receipt of all documents (as listed below), BPA will email the customer with its decision or a time frame for a decision.

### 5.4 CUSTOM PROGRAMS DOCUMENTATION AND REPORTING REQUIREMENTS

<table>
<thead>
<tr>
<th>DOCUMENTATION DESCRIPTION</th>
<th>RETENTION/SUBMITTAL LOCATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>BPA ENERGY EFFICIENCY REPORTING SYSTEM</td>
</tr>
<tr>
<td>Custom Program Calculator</td>
<td>X</td>
</tr>
<tr>
<td>Evaluation Plan</td>
<td></td>
</tr>
<tr>
<td>Evaluation Report for completed evaluated program</td>
<td></td>
</tr>
<tr>
<td>Completion reports for M&amp;V Custom Program projects, as defined in the proposal</td>
<td></td>
</tr>
<tr>
<td>For M&amp;V Custom Programs, documentation of basic project information, baseline conditions, efficient measure conditions, description of M&amp;V procedures used for the project (e.g., protocol used for estimating savings, calculations used, metering equipment, sampling) and deviations from planned M&amp;V, detailed savings model including calculations and raw data if applicable, verified savings</td>
<td></td>
</tr>
</tbody>
</table>

Savings may be reported from projects that were completed prior to proposal approval, as long as those savings meet the savings estimation and reporting requirements.
The reporting requirements differ depending on whether the custom program is (1) M&V, or (2) evaluated.

1. **M&V Custom Program**
   The customer must conduct M&V in accordance with its approved M&V plan, and must document the type and quantity of measures installed.

   Completed projects may be submitted for payment using the Custom Program Calculator for each project (including measure-specific results) no later than the reporting period immediately following project completion (i.e., when the project is installed and energy savings measured according to its M&V plan). The calculator will estimate the payment, consistent with the start date of each individual project.

   BPA will define M&V Custom Program completion report requirements at the proposal stage. Prior to customer submission in the BPA Energy Efficiency Reporting System, BPA must approve the completion report to ensure alignment with the requirements given at proposal.

2. **Evaluated Custom Program**
   Prior to reporting in the BPA Energy Efficiency Reporting System, the customer must submit a completed Custom Program Calculator and an evaluation report consistent with the previously approved evaluation plan.

   Payment is based on evaluated savings per the evaluation report.

   Upon conclusion of the program and approval of the final Custom Program Calculator and evaluation report, the COTR will direct the customer how to report the program savings to BPA.
Section 6: Agricultural Sector

Please check the changes and corrections summary to see if revisions were made to any of the measures in this sector.

The Agricultural Sector includes electric energy used (1) by a farm or business where the primary purpose is applying water for food production or vegetation growth (e.g., pumping and irrigation), and (2) by a ranch or aquaculture (aqua farming) business where the primary business is breeding or raising domestic livestock, poultry, game animals, fish, oysters, etc.

Storing and processing farm products, including the homogenizing, dehydrating and bottling of milk and its derivatives, is considered industrial. Dairies and milk storage at a milking facility are considered agricultural. A facility may have a mix of both agricultural and industrial measures at the same location (e.g., a winery operation with a processing facility where the vineyard irrigation is considered agricultural and the grape-processing facility is considered industrial).

Unless otherwise noted, all Agricultural Sector measures are available for the Agricultural Sector, as well as the Commercial and Industrial sectors where applicable. Utilities shall report these measures as Agricultural when reporting to BPA.

### 6.2 FREEZE-RESISTANT STOCK WATER TANKS/ FOUNTAINS

**Basis for Energy Savings**

The baseline for freeze-resistant tanks/fountains that replace a tank heated with an electrically resistive element is called the electrically heated tank consumption estimate. The efficient case is zero electric heating. Savings are calculated by taking the difference between the baseline and efficient case. The annual consumption from a submersible electric resistant tank heater is estimated by using monitored results from site metering studies. Baseline consumption is adjusted from the metering period to the full heating season using heating degree days (HDD) as a scaling factor. Savings are computed for each of the primary heating zones (HZ) by using the weighted average number of HDD of each heating zone. Electric-resistance stock water tank heaters must be removed or permanently disabled. The new tank/fountain must be sized in accordance with manufacturer’s specifications for the type and number of animals where it will be used, and the water supply must be hard-piped underground and stubbed up into the insulated portion of the fountain.

More information can be found on the Regional Technical Forum (RTF) website.

**Requirements and Specifications**

Freeze-resistant stock water tanks/fountains are available as a measure in heating zones 1, 2 and 3. The new freeze-resistant stock water tanks/fountains must meet all of the following qualifications:

- New (i.e., not home- or kit-made).
- Enclosed, fully foam or dead-air-space insulated, with the opening completely sealed in impact-resistant polyurethane.
- Possess elliptical or flap closures that tip easily so animals can drink without resistance.
- Contain no electric heat.
- Possess a minimum five-year manufacturer defect warranty.

6.3 THERMOSTATICALLY CONTROLLED OUTLETS

Basis for Energy Savings
This measure requires the addition of a thermostatically controlled outlet or controller to control the heating load in a pump house or utility shed to prevent piping and other equipment from freezing. The base case for this measure is an electric-resistance heater operating in a pump house or utility room to provide freeze protection to piping and other equipment. The more efficient case for this measure adds thermostatically controlled outlets that provide power in specific temperature bands. The thermostatically controlled outlet shall be able to turn on when the building ambient temperature is below 35 degrees Fahrenheit, and shall stop providing power at a temperature no higher than 50 degrees Fahrenheit.

Requirements and Specifications
This measure is available to all sectors, but it must be reported under the Agricultural program. Thermostatically controlled outlet should turn on to prevent freezing conditions and turn off at temperatures no higher than 50 degrees Fahrenheit. Only one outlet per pump house or utility room is eligible.

Documentation Requirements

</tr>
</tbody>
</table>
6.4 THERMOSTATICALLY CONTROLLED STOCK TANK DE-ICERS

**Basis for Energy Savings**

This measure is for the installation of a stock tank de-icer that is thermostatically controlled. The base case for this measure is an uncontrolled stock tank de-icer. This includes, but is not limited to, floating, submersible and drain-plug de-icers. The efficient case is a stock tank de-icer that is thermostatically controlled to prevent both freezing and continuous operation in non-freezing conditions.

**Requirements and Specifications**

This measure is available to all sectors, but it must be reported under the Agricultural program. The de-icer must be thermostatically controlled to prevent freezing and to prevent continuous operation after the threat of freezing has passed. Only one thermostatically controlled tank de-icer per tank is eligible.

**Documentation Requirements**

<td>X</td>
</tr>
</tbody>
</table>

6.5 TRANSFORMER DE-ENERGIZATION

**Basis for Energy Savings**

Transformer de-energization is disconnecting a transformer and downstream loads from the utility power supply during extended periods of agricultural inactivity and reconnecting prior to the irrigation season start-up. The base case for this measure assumes that irrigation loads are seasonal and the utility transformers serving the pump station are left energized all year. These energized transformers consume energy even when not serving any irrigation load. The efficient case is to de-energize the transformers during the non-irrigation season.

More information can be found on the Regional Technical Forum’s (RTF) [website](#).
Requirements and Specifications
Transformer de-energization is eligible for systems that serve only an agricultural load.

6.6 IRRIGATION MEASURES

6.6.1 Irrigation System Conversion: LESA/LEPA/MDI

Basis for Energy Savings
The base case for this measure is a center-pivot or linear-move system with high-pressure sprinklers on top or a Mid Elevation Sprinkler Application (MESA) configuration. High pressure means an irrigation system that delivers 35 psi to the critical sprinkler. The efficient case for this measure converts the system, or portion of the system, to Low Energy Precision Agriculture (LEPA), Low Elevation Spray Application (LESA), or Mobile Drip Irrigation (MDI). This measure was approved as a planning measure at the RTF on March 28, 2018.

Requirements and Specifications
This measure requires conversion of a center-pivot or linear-move system, or a portion of the system, from high-pressure sprinklers on top or MESA to LESA, LEPA or MDI configuration, including one gooseneck and drop tube, a low pressure regulator, sprinkler assembly and nozzle, or drip tubing per drop. This measure may be combined with sprinkler package replacement measures, but may not be combined with any other irrigation hardware measures.

### 6.6.2 SPRINKLER PACKAGE REPLACEMENT

**Basis for Energy Savings**

Savings estimates are based on the installation of sprinkler packages as a maintenance measure, the replacement of leaky components or as part of an entire system upgrade.

The efficient case improves the application efficiency, and the energy savings is based on a weighted average of the RTF-approved, region-specific energy savings for each measure. These measures were approved March 28, 2018, and are outlined in an RTF memo posted online and dated April 25, 2018.

**Requirements and Specifications**

This measure is a replacement sprinkler package, either for maintenance or as part of an irrigation system conversion, for center-pivot or lateral-move systems. There are three types of eligible packages. The LESA/LEPA/MDI sprinkler package and the MESA sprinkler package include a low-pressure regulator, nozzle, and rotating or multi-trajectory sprinkler. The High-Pressure Sprinkler Package includes a nozzle and an impact sprinkler.

### 6.6.3 IRRIGATION SYSTEM CONVERSION: MESA

**Basis for Energy Savings**

The base case for this measure is a center-pivot or linear-move system in a high-pressure configuration. The efficient case for this measure converts the center-pivot or linear-move system, or a portion of the system, to a Mid Elevation Sprinkler Application (MESA) configuration. This measure was approved at the RTF on March 28, 2018.
Requirements and Specifications

This measure requires conversion of a center pivot or linear move system from a high-pressure to a MESA configuration, including one gooseneck and drop tube per drop. This measure may be combined with sprinkler package replacement measures, but may not be combined with any other irrigation hardware measures.

6.6.4 IRRIGATION HARDWARE

Basis for Energy Savings

The base case is an inefficient, pressurized irrigation system with potential for improvements in application efficiency. The efficient case improves the application efficiency, and the energy savings is based on a weighted average of the RTF-approved energy savings for each measure. The RTF-approved energy savings was based on regional location (irrigation system run-time and water-pumping lift are the primary drivers) and identified improvements in overall application efficiency and leak reduction. BPA has simplified each Unit of Energy Savings (UES) offering.

More information can be found on the RTF website.

Requirements and Specifications

Irrigation hardware measures each have specific requirements, as provided below:

- Replace leaking impact sprinkler with new or rebuilt impact sprinkler: Eligible systems include wheel-lines, hand-lines, lateral moves and center pivots. Brass impact sprinklers shall be rebuilt by an established repair shop and shall meet or exceed manufacturer’s specifications. Limited to two units per sprinkled acre for solid set sprinklers.
- Replace Nozzle: Eligible systems include wheel-lines or hand-lines.
- Upgrade impact sprinkler to rotating type sprinkler: Eligible systems include wheel-lines, hand-lines, lateral moves and center pivots. Limited to two units per sprinkled acre for solid set sprinklers.
- Upgrade low-pressure sprinklers to rotating type sprinklers: Eligible systems include center pivots or lateral moves. Limited to two units per sprinkled acre for solid-set sprinklers.
• Replace leaking drain gaskets with new gaskets: Eligible systems include wheel-lines, hand-lines, lateral moves and center pivots.
• Replace Thunderbird wheel line hubs: Eligible for wheel-line systems.
• Replace leaking base boot gasket with new gasket: Eligible systems include center pivots or lateral moves.
• Repair leaking pipes: Eligible systems include wheel-lines, hand-lines and portable mainline systems.
• Rebuild or replace leaking or malfunctioning leveler with new or rebuilt leveler: Eligible for wheel-line systems.
• Replace tower/span/pivot-flex gasket: Eligible systems include center pivots or lateral moves.
• Replace pipe section gasket: Eligible systems include wheel-lines, hand-lines or portable main-lines, including mainline riser cap gaskets or portable mainline section gaskets.

6.7 AGRICULTURAL PUMPS AND VFDS

6.7.1 Irrigation Pump Testing and System Analysis (BPA-Qualified)

Basis for Energy Savings

This BPA-Qualified measure is intended to help the irrigator determine irrigation system health and identify potential energy-efficiency improvements. Ideally, the pump test will be performed on systems that are inefficient as determined by the Irrigation Pump Testing and System Analysis BPA Screening Tool (available in the IM Document Library). The results of the pump test could be used in developing the custom project proposal. There is no energy savings associated with this reimbursement.

Requirements and Specifications

- The irrigation pump must be electrically powered, 20 horsepower or greater and must not have been tested through BPA-sponsored pump testing services within the past five years.
- The irrigation pump must have been in operation for the two previous years.
- The irrigation pump test must be performed by an individual possessing pump testing knowledge and experience.
- Customers and qualified vendors must use the Irrigation Pump Testing and System Analysis BPA Screening Tool (available in the IM Document Library) to limit the amount of dry holes (i.e., pump tests that do not result in a BPA-approved custom project).
- The customer may choose from the following tests:
  - Simple System Evaluation: Measure pump discharge pressure and evaluate the condition of the sprinkler nozzles.
  - Simple System Irrigation Pump Test (e.g., open discharge): Perform irrigation pump test.
  - Irrigation Pump Test and System Analysis: Perform irrigation pump test and evaluate mainlines and critical sprinklers.
- Customers must deliver printed recommendation reports to the end user.

## 6.7.2 VARIABLE FREQUENCY DRIVE FOR CENTRIFUGAL AGRICULTURAL PUMPS (BPA-QUALIFIED)

### Basis for Energy Savings

The base case for this measure is a centrifugal-style pump used for irrigation purposes, which operates at a fixed speed but has a variation of flow or head requirements. The more efficient case for this measure would have a variable frequency drive (VFD) to better match pump performance to system requirements. BPA has collected data from custom project completion reports to determine energy savings, but is collecting additional data on these upgrades to help support the RTF analysis of this measure.

BPA recommends that all new VFD installations meet the IEEE 519 harmonics standard. This measure provides an annual energy savings of 10% of the calculated annual energy usage of the centrifugal pump.

### Requirements and Specifications

This measure requires the addition of a VFD to an existing, fixed-speed, centrifugal-style irrigation pump. This measure applies to pumping operations that deliver, distribute or transport irrigation water with qualifying VFDs from 20 to 500 horsepower. Eligible installations are limited to pumps with substantial variation in head pressure requirements (20% variation or more).

Customers must use the Agricultural Centrifugal Pump Deemed Savings Tool to estimate savings (available in the IM Document Library).

6.7.3 VARIABLE FREQUENCY DRIVES IN AGRICULTURAL TURBINE PUMP APPLICATIONS (BPA-QUALIFIED)

**Basis for Energy Savings**

The base case for this measure is a turbine-style pump used for irrigation purposes, which operates at a fixed speed but has a variation of flow or head requirements. The efficient case for this measure would have a variable frequency drive (VFD) to better match pump performance to system requirements.

BPA is collecting data on these retrofits to support the RTF analysis of this measure. BPA recommends that all new VFD installations meet the IEEE 519 standard. This measure provides an annual energy savings of 20% of the average of the previous three operating years’ annual energy usage of the pump.

**Requirements and Specifications**

This measure applies to pumping operations that deliver, distribute or transport irrigation water with qualifying VFDs from 20 to 500 horsepower. Eligible installations are limited to turbine pumps with substantial variation in flow rates (20% variation or more) or discharge pressure requirements (10% variation or more).

Customers must use the Variable Frequency Drives in Agricultural Turbine Pump Applications – VFD Calculator to estimate savings (available in the IM Document Library).

6.7.4 VARIABLE FREQUENCY DRIVE FOR NEW AGRICULTURAL PUMP INSTALLATIONS (BPA QUALIFIED)

**Basis for Energy Savings**

The base case for this measure is a turbine- or centrifugal-style pump used for irrigation purposes, which operates at a fixed speed but has a variation of flow or head requirements. The efficient case for this measure would have a variable frequency drive (VFD) to better match pump performance to system requirements. BPA has collected data from custom project completion reports to determine energy savings, but is collecting additional data on these upgrades to support the RTF analysis of this measure. BPA recommends that all new VFD installations meet the IEEE 519 harmonics standard. This measure provides an annual energy savings of 20% of the estimated annual energy usage for turbine pumps and savings of 10% for centrifugal pumps.

**Requirements and Specifications**

This measure requires the addition of a VFD to a new turbine- or centrifugal-style irrigation pump. This measure applies to new pumping plants that deliver, distribute or transport irrigation water with qualifying VFDs from 20 to 500 horsepower.

Eligible installations are limited to pumps designed for substantial variation in flow rates (20% variation or more for turbine pumps) or discharge pressure requirements (10% variation or more for turbine pumps, or 20% variation or more for centrifugal pumps).

Customers must use the New Construction Turbine or Centrifugal Pump VFD Savings Tool to estimate savings (available in the IM Document Library).

6.7.5 AGRICULTURAL NEW PUMP EFFICIENCY UPGRADE (BPA-QUALIFIED)

**Basis for Energy Savings**

The base case for this measure is a turbine- or centrifugal-style pump that is used for irrigation purposes. On a few custom projects, it has been observed that routine rebuilding of pumps can lead to thin impellers that are inefficient or can fail, or with other system changes is operating outside the optimum performance area of the pump curve. BPA has collected data from custom project completion reports to determine energy savings, but will be collecting additional data on these new pumps to support the BPA and RTF analysis of this measure. BPA assumes that the pumps will be at least 10 years old and have been rebuilt a number of times, and that a new pump will be more efficient.

**Requirements and Specifications**

This measure is installation of a new turbine- or centrifugal-style irrigation pump to replace an existing pump. This measure applies to pumping operations that deliver, distribute or transport irrigation water. The pump must range from 20 to 500 horsepower. The existing pump being replaced must be centrifugal, turbine or submersible turbine. The new replacement pump must have the same or lower horsepower rating, unless it is coupled with a VFD. A change from a turbine pump to a centrifugal pump or centrifugal to a turbine is allowable. This measure may be used alone, or in combination with the retrofit measures Variable Frequency Drive for Centrifugal Agricultural Pumps or Variable Frequency Drive for Turbine Agricultural Pumps. If there is no nameplate, contact your Energy Efficiency engineer to help you convert utility kW readings to horsepower.

6.8 NEW AGRICULTURAL CONSTRUCTION

**Basis for Energy Savings**
The base case and efficient case are determined through the custom project process.

**Requirements and Specifications**
New agricultural construction projects must be submitted as custom projects. Standardized M&V protocols must be provided for certain measures prior to project implementation.

**Documentation Requirements**
See the Custom Projects Documentation Requirements.

**Payment**
See the Custom Projects Payment Table.

6.9 OTHER AGRICULTURAL MEASURES

**Requirements and Specifications**
The following measures must be submitted as custom projects:

- Low-pressure conversion with associated pump work.
- Change to 40-foot spacing on hand and wheel lines to enable conversion.
- Turf irrigation applications in landscaping, golf courses, government and municipalities, and other areas (including standard sprinkler measures, motor/pumping/VFD controls and weather-station-driven irrigation scheduling).
- Nursery and greenhouse project improvements in irrigation, air handling, temperature and humidity controls for facilities using less than 1 aMW (if usage is above 1 aMW, projects at the facility are considered industrial).

**Documentation Requirements**
See the Custom Projects Documentation Requirements.

**Payment**
See the Custom Projects Payment Table.
Section 7: Commercial Sector

Please check the changes and corrections summary to see if revisions were made to any of the measures in this sector.

The Commercial Sector includes electrical energy used in service-providing, nonmanufacturing businesses and building facilities. These business types include federal, state and local governments, as well as other private and public organizations. The Commercial Sector building types include: office, retail, grocery, food service, lodging, hospital/healthcare, assembly, residential care, and educational institutions.

Unless otherwise noted, all Commercial Sector measures are available for the Commercial Sector, as well as the Industrial and Agricultural sectors where applicable. Utilities shall report these measures as Commercial when reporting to BPA.

**Additional Multisector Opportunities**

Some Agricultural, Industrial, or Residential measures may be applicable to Commercial projects. Measures eligible for installation in multiple sectors are identified where applicable in the body of the IM in the primary sector.

* The payment levels described in this table are a summary. Complete details of the payment levels and associated requirements may be found in the corresponding text of the IM. Please see the Table of Contents.
7.2 COMMERCIAL CUSTOM PROJECTS – RETROFUNTS AND NEW CONSTRUCTION

Many Commercial Sector energy efficiency opportunities are complex. They involve site-specific installations, and there may be interactive effects between energy-consuming systems in a building. These opportunities include, but are not limited to: new construction, HVAC, shell measures, existing building commissioning, strategic energy management, and, in rare circumstances, lighting projects.

Requirements and Specifications
Custom projects must follow all requirements per 4.0 Custom Projects.

Documentation Requirements
See 4.0 Custom Projects.

Payment
See 4.1 Custom Projects Payment Rate.

7.3 NONRESIDENTIAL LIGHTING

Basis for Energy Savings
Site-specific calculators are used to determine energy savings when there is too much variability in the range of savings associated with a given technology and/or application. In the case of nonresidential lighting, the unique hours of operation by space use type and the wide variety of building types and applications require the use of a site-specific BPA lighting calculator instead of a suite of lighting UES measures.

BPA’s lighting calculator seeks to align with the Regional Technical Forum (RTF) Nonresidential Lighting Protocol around such factors as baseline determination, control savings fractions and HVAC interactive effects. These factors are built into the lighting calculator, so the user only needs to enter information specific to the project, such as hours of operation by space, existing technology, and proposed technology. Information about baselines and interactive effects are documented within the lighting calculator.

The lighting calculator additionally generates utility and customer project reports, which provide a summary of all energy savings values.

More information on the RTF nonresidential lighting protocol can be found on the Regional Technical Forum website.

Requirements and Specifications
Nonresidential Lighting measures are available via a BPA lighting calculator for the following:

1. Retrofit lighting projects and new construction projects.
2. Projects within commercial, industrial and agricultural sectors.
3. The only eligible residential application using these measures applies to retrofits of existing High-Intensity Discharge (HID) lighting (metal halide, high-pressure sodium, low-pressure sodium and mercury vapor) in exterior applications. Customers shall report this measure as commercial when reporting to BPA.

A. Lighting Calculator Versions
Option 1 customers must use an eligible BPA lighting calculator. Option 2 customers may, but are not required to, use a BPA lighting calculator.
The table below shows the planned effective dates and retirement dates for lighting calculators that are in use. BPA will periodically release new lighting calculators with improved functionality and other changes necessary to respond to an evolving lighting market. New lighting calculators may be released and retirement dates may be modified due to BPA business requirements. Customers will be informed no less than six months in advance of any new lighting calculator release or adjustment to retirement dates.

</tbody>
</table>

*L“Lighting Calculator Retirement Date” is defined as the last date that customers may submit a completed lighting calculator to BPA.

B. Measure Types and Approval Procedures

The lighting calculator includes two types of measures: deemed and calculated, and which are submitted as projects, as outlined below:

1. Deemed Lighting Measures

Deemed lighting measures have been pre-approved by BPA and do not require review by BPA. Available deemed lighting measures are in the Program Offerings section of the lighting calculator.

2. Calculated Lighting Measures

If a proposed measure is not on the Deemed Measure List, it may be submitted as a calculated lighting measure. No BPA approval is required for decommissioning, fixture increase or auto-calculated measures; for these measures, the lighting calculator will automatically apply a calculated payment.

Calculated measures must achieve a minimum payment of at least $5 and a net energy savings of at least 10% per measure, as determined by the lighting calculator. The lighting calculator offers four types of calculated lighting measures, defined as follows:

a. **Decommissioning**: The number of proposed fixtures is less than the number of existing fixtures.

b. **Fixture Increase**: The number of proposed fixtures is greater than the number of existing fixtures.

c. **Auto-Calculated**: The lighting calculator offers Signage and LED Linear measures with an auto-calculated incentive.

d. **Nonstandard**: The measure is not deemed, decommissioning, fixture increase or auto-calculated. For these measures, approval by BPA is required using the following procedure:

   1. To request a nonstandard measure, the user should select the “nonstandard” option from the Measure Type drop-down menu.
   2. The lighting calculator will highlight the measure in red to indicate the measure is nonstandard and requires BPA approval.
   3. The customer sends the lighting calculator and any applicable product documentation requested by BPA such as cut sheets, product specification sheets or third-party tests (e.g., LM-79) to lighting@bpa.gov for review and acceptance.
4. BPA will review the nonstandard measures and notify the customer whether the measures were accepted. Once the measures are accepted, the red highlighting will disappear. No further documentation is required for nonstandard measures.

5. The following types of measures may, at the Customer’s discretion, be submitted to BPA for review as a nonstandard measure using the procedure noted above:

- Measures with hours of operation of at least 18 hours per day/seven days per week or 6,570 total annual hours.
- Measures that earn a lower incentive as a nonstandard measure compared to the deemed measure incentive.

As the lighting market continues to evolve, new wattage options may emerge that are not included in the lighting calculator drop-down menus. In the event the lighting calculator does not include an option for the exact proposed wattage, a Customer may choose one of two options:

1. Round the selected wattage in the lighting calculator to the nearest available value in the drop-down menu. Customers may not round more than 10 watts; or

2. Ensure the “nonstandard” option is selected in the Measure Type drop-down menu, and manually enter the exact wattage. Note that this option requires the measure be submitted to BPA for review as a nonstandard measure using the procedure noted above.

C. Project Types and Requirements

The lighting calculator includes two types of projects: (1) new construction and (2) retrofit. Requirements and specifications are shown below.

1. New Construction Projects

   a. Eligibility

   A nonresidential lighting project is considered new construction under any of the following conditions:

   1. The facility or exterior lighting system is newly constructed.
   2. The facility is a newly constructed addition to an existing facility.
   3. There is a change in occupancy type as part of the lighting project (e.g., the occupancy type changes from retail to office, or library to retail, etc.).
   4. The project is considered a major renovation for reasons other than lighting. A project is considered a major renovation whenever a whole building permit is required. In other words, if the only reason building energy codes are triggered is the lighting project itself, the project may be classified as a retrofit. However, if the project encompasses any other major building systems, such as HVAC, the project shall be considered new construction.

   b. Requirements and Specifications

   1. New Construction projects must achieve at least a 20% kWh reduction from the lighting power allowance, as determined by the lighting calculator.
   2. Customers with new construction projects with hours of operation differing from what is available in the lighting calculator may provide the specific hours of operation to BPA at lighting@bpa.gov, and request that the lighting calculator for that particular project be updated.
3. Enter the lighting power allowance (i.e., the total watts allowed) into the lighting calculator as determined by one of the following:
   - Applicable code compliance form; or
   - Calculation using applicable state or local energy code (when using energy code to determine lighting power allowance, users may apply either the whole-building approach or the sum of the space-by-space approach); or
   - When a code compliance form is not available or a project is exempt from code, the lighting power allowance may be determined by using a common practice calculation. Common practice refers to the lighting technology and wattage commonly associated with a particular building type and/or application.

4. Enter the proposed lighting power (i.e., total proposed watts) into the lighting calculator as determined by either:
   - Applicable code compliance form; or
   - Calculation of total installed watts.

5. For nonresidential new construction lighting projects, the incremental project cost must be entered into the Estimated Project Cost field of the lighting calculator. Nonresidential new construction lighting project incremental cost is defined as the difference in cost of materials between what must be installed to meet code (fixtures, lamps and/or controls), and what is actually being installed. This excludes all other lighting-related project costs (e.g. labor). Incremental cost may be documented by using one of two methods:
   - Provide detailed documentation that shows the project-specific incremental cost for the lighting project materials; or
   - Calculate incremental cost as 25% of the cost of the installed lighting project materials.

2. Retrofit Projects for Existing Buildings
   a. Eligibility
      1. Nonresidential lighting projects that do not meet the criteria for new construction are eligible as retrofit projects.
      2. Batch projects are a type of retrofit that targets a specific technology and application type across a customer service territory (such as streetlights or area lights).
         - Batch lighting projects may be submitted in a single lighting calculator and may include multiple measures.
   b. Requirements and Specifications
      1. Project must achieve at least a 25% kWh reduction, as determined by the lighting calculator.
      2. For calculated measures, the minimum payment to the end user is $5 per measure, and the fully adjusted savings, as determined by the lighting calculator, must be at least 10% per measure.
      3. Projects saving 200,000 kWh or more, as determined by the lighting calculator, may, at the customer’s discretion, be submitted to BPA at lighting@bpa.gov to request the project be converted to a 100% calculated incentive.
4. Batch retrofit projects have the following additional requirements:

- The location of individual installations shall be documented using one of the following available methods:
  - The customer may enter the site addresses in the “notes” section of the Measures tab for each measure within a lighting calculator; or
  - The customer may create a separate spreadsheet, to be kept in its customer file, which documents the site address for each installation site.
- For measures in batch lighting projects which do not have a physical address, the nearest intersection, utility pole identifier or geographic coordinates may be submitted as documentation.

7.4 COMMERCIAL HVAC

7.4.1 Advanced Rooftop Unit Control (ARC)

Basis for Energy Savings

Advanced Rooftop Control (ARC) retrofits add a variable frequency drive (VFD) and controls to existing, constant-speed HVAC rooftop unit (RTU) supply fans. Energy savings are predominantly achieved by reducing the operation of the supply fan. For this reason, the measure applies to both electric and gas systems. For the purposes of this measure, there are two types of ARCs, defined as follows:

ARC Retrofit – Lite

ARC-Lite products add one of the following equipment options to the existing RTU:

- A VFD and controller for variable speed fan operation; or
- A multispeed motor and controller for multispeed fan operation.

ARC Retrofit – Full

Full-ARC products add one of the following equipment options to the existing RTU:

- A VFD and controller for variable speed fan operation; or
- A multispeed motor and controller for multispeed fan operation.

Full-ARC products also add a controller with all of the following enabled:

- Digital, integrated economizer control with either differential dry-bulb, or differential enthalpy with fixed dry-bulb high-limit shutoff; and
- Demand Control Ventilation with proportional control, based on CO2 sensor reading.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure is available for retrofits only.
- ARC projects are not eligible for a Connected Thermostat payment. See Section 7.4.2 for Connected Thermostats.

Preconditions:

- RTU heating fuel type may be electric or gas.
- Existing RTU has the following characteristics:
  - A cooling capacity equal to or greater than five tons;
  - A unitary system (split systems are not eligible); and
  - A constant-speed supply fan (RTUs with variable speed fans are not eligible).

Post-conditions:

- Be installed on an existing rooftop unit; and
- Be listed on the ARC Qualified Products List (QPL) in the IM Document Library.

Required Documents

Advanced Rooftop Control Qualified Products List
Advanced Rooftop Control Project Information Form
If a product or combination of products meets a definition listed in the Basis for Energy Savings, but is not on the Qualified Products List, please use the COTR Request and Acknowledgement Procedure for approval to use the product.

</tbody>
</table>

**Payment**

Project reporting to BPA is based on whole tons of outdoor cooling capacity and shall be calculated at a project level using one of the following methods:

1. Sum the tons from all retrofitted RTUs installed and then round to the nearest whole ton; or
2. Round each individual retrofitted RTU to the nearest whole ton, then sum all rounded tons.

Two methods are provided in order to accommodate different types of equipment configurations and capacities.

**7.4.2 Connected Thermostat**

**Basis for Energy Savings**

Connected thermostats save energy by controlling HVAC usage in single-zone HVAC systems. These thermostats connect to the internet and have features that include online alerts, monitoring and programming and/or control. Energy savings are associated with reduced heating and fan energy, primarily through scheduled temperature setbacks and setting the fan to auto mode during unoccupied hours.

Although the thermostat capabilities are an important part of realizing energy savings, correct programming and subsequent verification of these features help ensure persistence of energy savings.

While a connected thermostat product may include additional features as noted above, for the purpose of this measure, connected thermostat products are defined as meeting all of the following specifications:

1. Capable of being connected to the web.
2. Support multiple temperature set-back schedules.

Required Documents

- [Connected Thermostat Project Information Form](#)
- [Connected Thermostat Qualified Products List](#)
3. Support fan-mode scheduling (continuous-on versus auto mode).
4. Support limited-duration overrides (e.g., reverts to programming after 24 hours).
5. Automatically restore programmed settings after power outage.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

**Requirements and Specifications**

- This measure is available for retrofits only.
- This measure is not eligible for lodging, 24/7 occupancy, or semi-conditioned spaces.
- Connected Thermostat projects are not eligible for an ARC payment. See Section 7.4.1 for Advanced Rooftop Unit Control (ARC).
- This measure provides for both initial installation and verification of programming for eligible connected thermostats and cannot be used for enabling feature sets on existing thermostats.
- A building is eligible to receive payments for more than one thermostat.

**Preconditions:**

- Heating fuel type of system to be controlled by new thermostat may be electric or gas; and
- The existing thermostat is not web-enabled.

**Post-conditions:**

**Initial Install:**

- The installed thermostat controls an existing HVAC supply fan and serves a single zone. “Invisible zones” are permitted (e.g., separate rooftop units serving different portions of a large retail space).
- The installed connected thermostat must be listed on the Connected Thermostat Qualified Products List (QPL) in the IM Document Library.
- The thermostat must be programmed as follows:
  1. Thermostat is connected to the web.
  2. Temperature setback is used for unoccupied hours (heating and/or cooling, as applicable).
  3. Fan schedule uses auto mode for unoccupied hours (e.g., during unoccupied hours or holidays, the fan will only run when there is a demand for heating or cooling).
  4. Override duration set to three hours or less.
  5. For heat pumps, auxiliary resistance heat lock-out is enabled with appropriate temperature set point.
  6. In cases where two or more systems serve spaces that are not separated by physical barriers (e.g., “invisible zones”), simultaneous heating and cooling is eliminated (e.g. by having identical temperature set points and schedules with appropriate dead-bands, or through having network-coordinated controls).
Verification:

A thermostat is eligible for programming verification payments as follows:

1. The thermostat received a payment for the initial install and was installed after Oct. 1, 2019.
2. The thermostat is eligible for up to four verification payments within two years of the initial install.
3. A verification payment can be claimed in same year as the initial install, provided verification takes place at least three months after the initial install.
4. The thermostat is programmed to meet the initial install programming requirements as described above under Initial Install Post-Conditions.
5. The thermostat is eligible for a verification payment twice within one calendar year. Verification may not be less than three months apart.
6. Verification must occur in different seasons (e.g., one in summer and one in winter, or one in fall and one in spring). Verification may not be less than three months apart.
7. Verification is not required to be conducted at regular intervals. The thermostat is eligible for a verification payment even if there has been a gap in verification activities.
8. There is no restriction on who can complete verification.

If a connected thermostat product meets the product definition listed in the Basis for Energy Savings, but is not on the Qualified Products List, please use the [COTR Request and Acknowledgement Procedure](#) for approval to use the product.

#### 7.4.3 Ductless Heat Pump Retrofit and Upgrade (BPA-Qualified)

**Basis for Energy Savings**

Ductless Heat Pumps (DHPs, also commonly referred to as mini-splits) save energy using variable speed compressors to continuously match the heating and cooling load and avoid the on/off cycling of conventional heating systems. DHPs eliminate over-cooling and over-heating of spaces that is common with central air systems. By moving heat instead of creating it, DHPs are two to three times more efficient than electric-resistance heaters.

A DHP Retrofit replaces the existing zonal or forced-air electric-resistance heating system with a DHP.

A DHP Upgrade either: 1) replaces an existing DHP with a more efficient DHP (e.g., replacing a code minimum DHP); or 2) is an efficient DHP installed as part of a building addition project, new construction project or major renovation project.

For the purposes of this measure, DHP equipment types are defined as follows:

- **Mini-Split**: Systems that have a single outdoor compressor and one or more indoor heads. Multi-head (or multi-zone) systems are considered mini-splits as long as they are served by a single outdoor compressor.
- **Non-ducted**: An indoor unit which directly heats or cools air within the conditioned space without attached distribution ductwork. The following types of indoor units are considered non-ducted: Wall-mounted, Floor-mounted, Ceiling Suspended, and Ceiling Cassette (standard and compact).
- **Ducted**: An indoor unit which heats or cools air within the conditioned space through the use of distribution ductwork. Though ducted indoor units can be ceiling-suspended, they are typically ceiling-concealed and consist of short duct runs serving multiple zones from the single indoor unit.
- **Mixed**: A combination of ducted and non-ducted indoor units served by a single outdoor section.

Energy savings were calculated based on analysis of a sampling of heat pump projects completed in BPA territory with the BPA heat pump calculator tool, and which included a whole building billing analysis.

- For DHP Retrofits, the base case heating system is an electric-resistance heating system. The base case cooling system is a 2015 Washington code-compliant cooling system for the purposes of calculating savings above the baseline.
- For DHP Upgrades, the base case is a 2015 Washington code-compliant heat pump for both the cooling and heating savings analysis.
- For both DHP Retrofits and Upgrades, the efficient case used to calculate energy savings is based on an anticipated average project installation representing the 88th percentile of efficiency.

### Required Documents

- Ductless Heat Pump Qualified Products List
- Ductless Heat Pump Project Information Form
Efficiency requirements listed below are based on the 75th percentile of performance for ductless heat pumps per the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) as of January 2019.

**Requirements and Specifications**
- These measures cannot be used to retrofit packaged terminal air conditioning (PTAC) units.

**Preconditions – DHP Retrofit:**
- The space is conditioned by zonal or forced-air, electric-resistance heat as the primary heating source. No other heating sources are eligible.

**Preconditions – DHP Upgrade:**
- The space is conditioned by an operational or failed DHP; or
- The space is part of a building addition, new construction, or major renovation project

**Post-conditions:**
- The installed DHP must be listed on the DHP Qualified Products List (QPL) located in the IM Document Library; and
- The DHP outdoor condenser must meet BPA’s efficiency requirements per the table below.
- The efficiency requirements apply to both single and multi-head systems.

<table>
<thead>

As of April 1, 2018, this measure utilizes a Qualified Applications List to document installation applications that are not addressed directly in the Implementation Manual but which were approved or disapproved by BPA following the publication of this document.

Eligible products are listed on the DHP Qualified Products List (QPL) in the IM Document Library. If a product meets the requirement, but is not on the QPL, please use the COTR Request and Acknowledgement Procedure for approval to use the product.

Project reporting to BPA is based on whole tons of outdoor cooling capacity and shall be calculated at a project level using one of the following methods:

1. Sum the outdoor unit cooling capacity from all DHPs installed, then round to the nearest whole ton; or

2. Round the outdoor unit cooling capacity of each individual outdoor unit to the nearest whole ton, then sum all rounded tons.

The two methods are provided to accommodate different types of equipment configurations and capacities.

7.4.4 Air-Source Heat Pump Retrofit and Upgrade (BPA-Qualified)

Basis for Energy Savings

An Air-Source Heat Pump Retrofit replaces an existing electric-resistance heating system with an efficient electric air source heat pump (e.g., adds an electric air source heat pump to a system where one did not previously exist).

An Air-Source Heat Pump Upgrade either: 1) replaces an existing electric air source heat pump with a more efficient electric air source heat pump (e.g., replacing a code minimum heat pump that meets BPA's heat pump efficiency requirements); or 2) is an efficient electric air source heat pump installed as part of a building addition project, new construction project or major renovation project.

Energy savings were calculated based on analysis of a sampling of heat pump projects completed in BPA territory with the BPA heat pump calculator tool, and which included a whole building billing analysis.

- For Heat Pump Retrofits, the base case heating system is an electric-resistance heating system. The base case cooling system is a 2015 Washington code-compliant cooling system for the purposes of calculating savings above the baseline.
- For Heat Pump Upgrades, the base case is a 2015 Washington code-compliant heat pump for both the cooling and heating savings analysis.
- For both Heat Pump Retrofits and Upgrades, the efficient case used to calculate energy savings is based on an anticipated average project installation representing the 88th percentile of efficiency.

Efficiency requirements listed below are based on the 75th percentile of performance for air source heat pumps per the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) as of January 2019.

Requirements and Specifications

- These measures cannot be used to retrofit packaged terminal air conditioning (PTAC) units.

Preconditions – Heat Pump Retrofit:

- The space is conditioned by zonal or forced-air, electric-resistance heat as the primary heating source. No other heating sources are eligible.

Preconditions – Heat Pump Upgrade:

- The space is conditioned by an operational or failed air source heat pump; or

Required Documents

Heat Pump Upgrade Project Information Form
The space is part of a building addition, new construction, or a major renovation project.

Post-conditions:
The installed heat pump must:
- Be an air-to-air heat pump;
- Have an AHRI certificate of product rating; and
- Meet BPA’s efficiency requirements for both heating and cooling per the table below:

### 7.4.5 Variable Refrigerant Flow System Retrofit (BPA-Qualified)

#### Basis for Energy Savings

Variable Refrigerant Flow (VRF) heat pumps have similar applications as Ductless Heat Pumps (DHP), though they are more commonly used for multi-zone commercial HVAC applications and are available in larger tonnages. A VRF system cools or heats a space more efficiently than standard systems by moving variable amounts of refrigerant through a piping system to each space independently. Compared with other heat pump systems, VRF systems save energy with better part-load performance, zone control and heat recovery options.

Energy savings were calculated based on analysis of a sampling of heat pump projects completed in BPA territory with the BPA heat pump calculator tool, and which included a whole building billing analysis.

- For VRF Retrofits, the base case heating system is an electric-resistance heating system. The base case cooling system is a 2015 Washington code-compliant cooling system for the purposes of calculating savings above the baseline.

- For VRF Retrofits, the efficient case used to calculate energy savings is based on an anticipated average project installation representing the 88th percentile of efficiency.

Efficiency requirements listed below are based on the 75th percentile of performance for variable refrigerant flow equipment per the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) as of January 2019.

#### Requirements and Specifications

- This measure applies to retrofits only.

**Preconditions:**

- The space is conditioned by zonal or forced-air, electric-resistance heat as the primary heating source. No other heating sources are eligible.

**Post-conditions:**

The installed VRF system must:

- Have an AHRI certificate of product rating.
- Meet BPA’s efficiency requirements for both heating and cooling per the table below.

The installed VRF system is eligible even if it operates in tandem with a ventilation system that uses any fuel for heating ventilation air.

7.4.6 Variable Frequency Drive on Air Handling Unit Fan (VFD on AHU Fan) (BPA-Qualified)

**Basis for Energy Savings**
A variable frequency drive (VFD) on an air handling unit (AHU) fan adds a VFD on a single-speed AHU. A typical building application for a VFD on an AHU fan is a multistory facility, such as a hospital, school or office building. These types of HVAC systems are typically located in the building’s mechanical room, and not on the roof.

With this technology, the VFD varies the speed of the fan to meet the conditions of the air handling system. As the fan motor slows down, it draws less power than at constant speed, resulting in energy savings.

Energy savings are based on BPA's analysis of historical custom project installations completed between 2011 and 2016.

**Requirements and Specifications**
- This measure applies to retrofits only.
- **Preconditions:**
  - Building heating fuel type may be either electric or gas;
  - VFD must be installed on existing AHU single-speed fan.
- **Post-conditions:**
  - Retrofit adds a VFD to control the fan with variable-speed operation;
  - Any existing AHU throttling or bypass devices (e.g., inlet guide vanes, dampers, etc.) must be removed or permanently disabled.

**Documentation Requirements**

7.5 COMMERCIAL SHELL MEASURES

7.5.1 Commercial Insulation

Basis for Energy Savings
The base case used to calculate energy efficiency savings for commercial insulation is based on precondition wall, roof and attic levels with very little (defined as R-0 to R-5) insulation value. The efficient case used to calculate savings is based on wall, roof and attic insulation value ranges that are shown in the payment table below. Energy savings are dependent on the building type, heating zone and heating system types.

Attic insulation is defined by insulation that is installed in the attic crawl space, typically on a horizontal surface. Roof insulation is defined by insulation that is installed in direct contact with the building’s roof, typically a flat or slightly pitched surface.

Requirements and Specifications
• This measure applies to retrofits only.

Preconditions:
• The building is electrically heated; and
• The existing insulation value is between R-0 and R-5.

Post-condition:
• Installation of insulation in wall or attic/roof spaces per the levels shown in the Payment table below.
• Installation of insulation in floor or crawl spaces is not eligible.

7.5.2 Commercial Windows (BPA-Qualified)

Basis for Energy Savings
Savings estimates for commercial windows are based on an analysis of efficient windows in small commercial buildings. Energy savings vary by heating zone and heating system type.

Requirements and Specifications
• This measure applies to retrofits only.

Preconditions:
This measure is eligible in commercial buildings with the following characteristics:
• Electrically heated;
• A total floor area under 20,000 square feet; and
• Pre-existing windows that are single-pane, single-pane with storms, or double-paned metal-frame windows.

Post-conditions:
• Installation of replacement window assemblies that have a National Fenestration Rating Council-rated U-value of 0.30 or lower.

7.6 COMMERCIAL REFRIGERATION

7.6.1 Anti-Sweat Heater (ASH) Controls

Basis for Energy Savings
Anti-sweat heater (ASH) controls reduce the energy consumption of anti-sweat heaters on reach-in doors. This measure applies to cooler and freezer reach-in glass door cases in a commercial building.

This measure only applies to technologies that reduce energy consumption of anti-sweat heaters based on sensing humidity. It does not apply to doors equipped with low/no anti-sweat heat.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications
- This measure is applicable to retrofits and new construction.

Preconditions:
- Cooler Case: Any uncontrolled ASH that uses greater than 0.20 amps/ft. of case (door rail, glass and/or frame heating element combined); or
- Freezer Case: Any uncontrolled ASH that uses greater than 0.39 amps/ft. of case (door rail, glass and/or frame heating element combined).

Post-conditions:
- Cooler Case: Installation of a controller with settings that reduce the ASH run time by at least 50%. Includes any heating element in a door rail, glass and/or frame; or
- Freezer Case: Installation of a controller that reduces the ASH run time by at least 50%. Includes any heating element in a door rail, glass and/or frame.

7.6.2 Walk-In or Display Case Evaporator Fan Motor – Shaded Pole to Electronically Commutated Motor (ECM)

Basis for Energy Savings
This measure is for existing, shaded pole evaporator fan motors in refrigerated reach-in display cases, walk-in coolers and walk-in freezers that are replaced by electronically commutated motors (ECMs).

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications
- This measure applies to retrofits only.
- For walk-in coolers and freezers: Motors must have fans that are 10 inches in diameter or larger.
- For refrigerated display cases: All fan sizes are eligible.

Precondition:
- Shaded pole evaporator motor in a refrigerated display case, walk-in cooler or freezer.

Post-condition:
- Replace a shaded pole evaporator fan motor with an ECM.

7.6.3 Strip Curtains for Walk-In Coolers and Freezers

Basis for Energy Savings
Strip curtains and plastic doors on walk-ins keep cool air from escaping, and warm air from entering the unit. This measure is for the installation of new strip curtains or plastic swinging doors on qualifying walk-in cooler and freezer doorways.
More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

**Requirements and Specifications**

- This measure applies to retrofits only.

**Preconditions:**

- Eligible applications include grocery walk-in freezers and coolers, convenience store walk-in freezers and restaurant walk-in freezers where there are no existing curtains or plastic doors.
- The following applications are not eligible: Walk-in freezers located inside of walk-in coolers; walk-in coolers in restaurants, drug or convenience stores; replacement of existing strip curtains; or strip curtains on display cases.

**Post-conditions:**

- Installation of strip curtains or swinging doors ≥ 0.06-inches thick; and
- Low-temperature strip curtains or doors must be used on low-temperature applications.

7.7 COMMERCIAL KITCHEN AND FOOD SERVICE EQUIPMENT

7.7.1 Demand Controlled Kitchen Ventilation (BPA-Qualified)

**Basis for Energy Savings**

Demand-controlled kitchen ventilation (DCKV) automatically reduces kitchen hood and make-up air fan speed during times of low activity or demand. Energy savings are achieved as a result of reduced fan power and reduced make-up air heating requirements.

**Requirements and Specifications**

- This measure applies to retrofits and new construction.

**Preconditions:**

- For existing applications, the ventilation system has a constant-speed exhaust fan.
- For new construction applications, there are no preconditions.

**Post-conditions:**

Installed demand-controlled kitchen ventilation equipment that:

- Controls the primary ventilation and make-up air units in the zone; and
- Utilizes one or more control sensors to modify the fan speeds.

**Documentation Requirements**

7.7.2 Electric Commercial Steam Cookers

Basis for Energy Savings

Savings for electric commercial steam cookers occur from (1) reduced idle energy consumption from improved insulation and gaskets, and (2) the use of connectionless or closed-system design. Additional benefits include up to 90% water reduction for connectionless models.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure applies to both retrofits and new construction.
- Installed equipment must be minimum ENERGY STAR v1.2 qualified.

7.7.3 Hot Food Holding Cabinets

Basis for Energy Savings

Savings for hot food holding cabinets occur from reduced idle energy consumption due to improved thermal characteristics and may include other advanced features such as auto-door closers and magnetic door gaskets. ENERGY STAR defines the following equipment sizes:

- Half Size: < 13 cu. ft.
- Full Size: ≥ 13 and < 28 cu. ft.
- Double Size: ≥ 28 cu. ft.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.
Requirements and Specifications
- This measure applies to both retrofits and new construction.
- Installed equipment must be minimum ENERGY STAR v2.0-qualified.

7.7.4 Electric Combination Ovens

Basis for Energy Savings
Combination ovens provide three functions: convection, steam and combination cooking. In the convection mode, the oven circulates dry heat – suitable for pastries and breads. The steam mode injects water into the oven to poach fish, rice and vegetables. In the combination mode, both dry heat and steam are used to maintain exact humidity levels. Savings occur from (1) reduced idle energy consumption from improved insulation and gaskets, and (2) the use of infrared heating.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications
- This measure applies to both retrofits and new construction.
- Installed equipment must be minimum ENERGY STAR v2.2-qualified.
7.7.5 Electric Convection Ovens

Convection ovens use fans to circulate hot air within the cabinet. Savings occur from (1) reduced idle energy consumption from improved insulation and gaskets, and (2) the use of infrared heating. Convection oven sizes are defined as follows:

- Half Size: 18” x 13” x 1” pan size
- Full Size: 18” x 26” x 1” pan size

More detailed information is available on the Regional Technical Forum (RTF), Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure applies to both retrofits and new construction.
- Installed equipment must be minimum ENERGY STAR v2.2-qualified.

7.7.6 Commercial Electric Fryers

Basis for Energy Savings

Fryers are used to deep-fry food. Savings occur from (1) reduced idle energy consumption from improved insulation, (2) more accurate thermostats and, (3) advanced heater and heat exchanger design. Additional user benefits may also include continuous production capacity, higher pound-per-hour production rates, and improved oil conservation and management enabled by quicker recovery times. There are multiple sizes of electric fryers. A Large Vat Size is defined as a fryer with a vat that measures between 18 inches and 24 inches wide, and a shortening capacity of greater than 50 pounds.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure applies to both retrofits and new construction.
- Installed equipment must be minimum ENERGY STAR v3.0-qualified.
- This measure is available for large-vat-size electric fryers only.

7.7.7 Pre-Rinse Spray Valves

Basis for Energy Savings

This measure is for the installation of reduced flow pre-rinse spray valves in commercial kitchens. Savings are achieved as a result of reduced hot water use.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure applies to retrofits only.

Preconditions:

- The pre-rinse spray valve must use hot water heated with an electric water heater.

Post-conditions:

- Valve must be EPA WaterSense-qualified or have a minimum spray force of 4.0 ounces-force; and
- A new spray valve with a maximum flow rate of one gallon per minute.

Documentation Requirements

Pre-rinse spray valves are available through the following channels:

- By Request
- Direct Install

7.8 ADDITIONAL UES OFFERINGS

7.8.1 ENERGY STAR Commercial Clothes Washers

Basis for Energy Savings

Energy savings assumes that the volume of water used is for commercial purposes, such as laundry in laundromats or the service industry. Savings vary by fuel used for water heating and drying.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure applies to both retrofits and new construction.

Preconditions:

Eligible existing equipment to be replaced includes:

- Electric or gas water heating; and
- Electric or gas drying.

Post-conditions:

- Installed equipment must be minimum ENERGY STAR v2.2-qualified.

Documentation Requirements

7.8.2 Smart Power Strips

Basis for Energy Savings

The base case used to calculate energy savings for commercial smart power strips are commercial office-related plug-loads that remain on even when not in use.

Energy savings assume that smart power strips are used in accordance with the manufacturer’s instructions on equipment not previously controlled by a smart power strip.

More detailed information is available on the Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

- This measure applies to both retrofits and new construction.

Preconditions:
- No smart power strip was in place.

Post-conditions:
- Power strip turns off power to control office equipment not in use.
- Control mechanism may be any of the following:
  - Load sensor (controlled outlets power down when idle power level is detected in the master outlet); or
  - Motion sensor (controlled outlets powered down when no motion has been detected in the area for a set period of time); or
  - Timer (controlled outlets powered down for user-programmed periods of the day).

Documentation Requirements

Smart Power Strips are available through the following channels:
- By Request
- Direct Install

7.8.3 Commercial Showerheads

Requirements and Specifications
Savings for commercial showerheads vary based on gallons per minute, fuel used for water heating, type of commercial building and distribution method (direct install or by request). Common applications include fitness centers, hospitality buildings (hotels/motels), health care facilities (including hospitals) and small commercial facilities (including office showers).

More detailed information is available on the [Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage](#).

Requirements and Specifications
- This measure is available for retrofits only

Preconditions:
- Any commercial building; and
- Any water-heating type.

Post-conditions:
- Showerhead must have a rated flow of 2.0 gallons (or fewer) per minute.

Documentation Requirements
Commercial showerheads are available through the following channels:
- By Request
- Direct Install

Documentation Requirements

<table>

7.8.4 Generator Block Heaters (BPA-Qualified)

Basis for Energy Savings
The following two generator block heater sizes were used to calculate energy savings:
- Less than three kW; and
- Greater than or equal to three kW.

The generator engine block heater base case used to calculate energy savings is thermosiphon heaters, which are electric-resistance heaters.

Required Documents

[Generator Block Heater Project Information Form](#)
without a pump. The efficient case used forced-circulation heaters, which are electric-resistance heaters with a pump. The measure savings for the two block heater sizes are based on weighted averages of the base and efficient case energy usage from a BPA emerging technology pilot. The pilot found that in addition to energy savings, forced-circulation heaters provide better overall block temperature control and reduce extreme temperature swings, possibly extending hose lifetimes, reducing maintenance costs and improving generator reliability. Savings vary by size of heater.

**Requirements and Specifications**

- Retrofit of existing installations and new equipment are both eligible.
- **Preconditions:**
  - The forced-circulation generator engine block heater must replace a thermosiphon, electric-resistance block heater or be a new block heater; and
  - The generator or engine must be stationary and fixed.
- **Post-condition:**
  - Installed generator engine block heaters must be forced-circulation heaters.

**7.8.5 Vehicle Engine Block Heater Controls**

**Basis for Energy Savings**

Vehicle engine block heater controls use a combination of temperature sensing and heater cycling to save energy. Studies confirmed energy savings for all heating zones associated with controls that keep block heaters off when the ambient air temperature is above the temperature setting, and deliver only as much heat as necessary when the temperature drops below the setting. Savings assume the factory-default temperature setting. Good candidates include any vehicle that uses block heaters during cold months.

More detailed information is available on the [Regional Technical Forum (RTF) Unit Energy Savings (UES) Measures webpage](https://www.epa.gov/sites/production/files/2017-03/documents/form.pdf).
**Requirements and Specifications**

- Retrofit of existing installations and new equipment are both eligible.

**Preconditions:**

- Wall outlet must be a single uncontrolled outlet with one or two plugs.
- Large centralized wall plug systems designed for many vehicles are not eligible.
- Systems that are portable, such as extension cord models, are not eligible.

**Post-conditions:**

Installation of a vehicle engine block heater control that is:

- A hard-wired outlet or engine-mounted type;
- Thermostatically-controlled; and
- Compatible with 110-volt, single-phase resistance immersion heaters.

Section 8: Federal Sector

Unlike other sectors, the Federal Sector does not have a unique set of measures. Rather, this sector incorporates the offerings of all other sectors. As such, a federal project is any energy efficiency project (available elsewhere in this IM) installed in a qualifying federal facility.

A qualifying federal facility is one that meets the following requirements:

1. The site is (a) owned or leased by the federal government or (b) uses electric energy paid for by the federal government;

2. The site is (a) utility served; or (b) direct served:
   - Utility served: The site uses electricity purchased from a BPA customer.
   - Direct served: The site uses electricity purchased directly from BPA.

Federal projects must follow the requirements of the section under which they are offered. Customers must report new projects under “federal,” and customers, rather than BPA, must provide incentive payments to end users.
Section 9: Industrial Sector

Please check the changes and corrections summary to see if revisions were made to any of the measures in this sector.

The BPA Energy Efficiency Industrial Sector includes Energy Smart Industrial (ESI) and Multisector opportunities. Without ESI enrollment, industrial custom project incentives and technical services must be customer-funded, as BPA funding is available only for Multisector measures and initiatives.

The Industrial Sector includes electrical energy used by fixed pieces of equipment, buildings or complexes to produce, manufacture or store goods in connection with, or as part of, any process or system. This includes those related to food production, transportation, and rail infrastructure.¹

These processes and systems also include, but are not limited to: Electric distribution system hardware, voltage optimization, water/wastewater production and treatment, and data centers/server farms.² In general, Industrial Sector activities must not devote the majority of energy use within a facility to nonprocess-related HVAC or potable hot water.

Unless otherwise noted, all Industrial Sector measures are available for the Commercial and Agricultural sectors, where applicable. Utilities shall report these measures as Industrial when reporting to BPA.

</table>

Some Commercial and Agricultural Sector measures may be applicable to Industrial Sector projects. Measures eligible for installation in multiple sectors are identified where applicable in the body of the IM in the primary applicable sector.

* The payment levels described in this table provide a summary only. Complete details of the payment levels and associated requirements may be found in the corresponding text of the IM. Please see the Table of Contents.

1 This does not include loading dock systems or facilities associated with the Commercial Sector.
2 This does not include Commercial Sector data centers/server farms, such as those integrated into a commercial building that serve the information technology needs of the business.

9.2 ENERGY SMART INDUSTRIAL

Customers must enroll in the ESI Program to receive BPA funding for custom project incentives and technical services.

The bulk of industrial program offerings are located in ESI, which is managed by a third-party contractor (ESI program partner). ESI participants are assigned an ESI Partner (ESIP) and are offered the following program components:

- Energy Management: Energy Project Managers
- Strategic Energy Management: Strategic Energy Management Projects
- Industrial Custom Projects
- Small Industrial Projects
- Technical Service Providers (TSP)

Requirements and Specifications

1. **Enrollment**: A customer must request enrollment in ESI using the COTR Request and Acknowledgment Procedure. BPA acceptance of the request is discretionary.

2. **ESI program partner**: The customer must meet with the ESI program partner (in person or over the phone) to outline its intended level of program engagement and end user communication expectations for the ESI program partner. The customer may engage the ESI program partner on any other pertinent topic, including the customer’s industrial load, savings goals and desired program component rollout. The ESI program partner will email an acknowledgment to the customer documenting the decisions made during the meeting.

3. **ESIP**: An Energy Smart Industrial Partner (ESIP) (provided by the ESI program partner) is assigned to the customer and is the single point of contact to help customers understand and implement ESI. The customer ultimately determines the level of ESIP engagement, but, generally, the ESIP performs the following:
   - Serves as an industrial technical resource to customers;
   - Works closely with the customer to develop an action plan for its end users;
   - Manages and reviews technical work products, including technical analysis of custom project submittals; and
   - Helps the customer identify custom projects and secure BPA approval.

Supporting Content

- Nonresidential Lighting Program
- COTR Request & Acknowledgment Procedure
Requirements and Specifications
Industrial Lighting Specialists (Nonresidential Lighting Program) are also available:

Lighting specialists can help industries save energy and increase profitability by providing a variety of services, including:

- Perform and deliver lighting audits
- Review lighting design and installation proposals
- Offer guidance on the best lighting technology for an industry’s specific application
- Complete the BPA Lighting Calculator

BPA’s Trade Ally Network Northwest is a community of lighting distributors, electrical contractors, and manufacturers who play a critical role in the market adoption of efficient lighting technologies, as well as develop and implement industrial lighting projects.

Please see Commercial section 7.3 Nonresidential Lighting for specific requirements and specifications, documentation requirements, etc.

9.2.1 Energy Management: Energy Project Manager (Optional ESI Component)

The Energy Project Manager uses a structured process to help industrial customers overcome the lack of staffing resources by providing co-funding and support. BPA will co-fund EPMs, end user employees or contractors who manage energy efficiency custom projects at the end users’ facilities. If applicable, EPMs may manage Strategic Energy Management (SEM) projects and Unit of Energy Savings (UES) lighting at the end users’ facilities.

Requirements and Specifications

Required documents to be submitted by the customer to BPA in support of ESI Energy Management efforts must be sent to eedocs@bpa.gov as an email attachment or by including a secure link from the online ESI HUB. A customer may request EPM co-funding by sending the EPM agreement between itself and the end user to eedocs@bpa.gov. The agreement must, at a minimum, identify an energy-savings goal of at least 1,000,000 kWh of verifiable annual busbar energy savings per year, and specify the end user’s obligation to employ a qualified EPM.

Year 1 commencement date is the date the final of the following actions have occurred: (1) the customer submits the EPM agreement to eedocs@bpa.gov, gov as an email attachment or by including a secure link from the ESI HUB; (2) an EPM is hired or designated by the end user; and (3) BPA approves the EPM. The customer must ensure that the end user meets the following requirements:

- The end user must hire or designate an EPM to identify, evaluate and implement industrial electrical energy efficiency projects (e.g., SEM and UES lighting). The EPM must be familiar with, and have experience in, industrial electric energy efficiency and the end user’s type of business.
- The EPM must manage electrical energy efficiency projects that deliver 1,000,000 kWh or greater in verifiable annual busbar energy savings within one year of the commencement date (but is allowed up to 18 months). These savings must be verified, i.e., the savings must be reportable to and approved by BPA.
- The end user may replace the EPM; However, the customer must inform BPA in writing within 30 days of replacement, and the replacement EPM must meet the requirements of this IM.

Required Documents

EPM Calculator
ESI HUB
• No later than 90 days after the commencement date, the EPM must submit the EPM Comprehensive Plan to the customer and BPA to eedocs@bpa.gov as an email attachment or by including a secure link from the ESI HUB. They must be approved by BPA and include, at a minimum, the following:

  • Projected verifiable annual busbar energy savings (at least 1,000,000 kWh). Eligible project status shall precede completion of post-project measurement and verification (M&V) on the commencement date;

  • Name of the EPM;

  • Total annual cost of the EPM, which includes base salary, benefits and associated direct costs (e.g., travel and training\(^3\)), if known;\(^4\)

  • Itemized summary of planned electrical-energy projects (including participation in SEM\(^5\)) that will make up the verifiable annual busbar energy savings, including estimates of the energy savings, cost savings and implementation costs;

  • Schedule for project development, implementation and completion; and

  • Project implementation schedule showing energy savings or energy-savings progress expected at (a) six months after the commencement date, and (b) over the life of the plan.

• The EPM must submit status reports to the customer and BPA to eedocs@bpa.gov as an email attachment or by including a secure link from the ESI HUB. It must describe (1) the energy savings achieved and projected; and (2) projects completed, in process, or planned. Status reports are due no later than six months and also one year from the commencement date.

• No later than six months after the commencement date, the end user must achieve, to BPA’s satisfaction, the six-month verified annual busbar energy savings or energy-savings progress described in the six-month status update section of the EPM Comprehensive Plan. Examples include BPA-approved custom project proposals (Option 1), customer-approved custom projects (Option 2), or in-progress SEM projects. If energy-savings achievements differ significantly from savings predictions, BPA may revise the savings goal and use the revised goal for payment calculations.

• Upon completion of the EPM agreement, the customer may elect to extend the agreement for an additional 12–18 months by sending the EPM agreement between the customer and end user to eedocs@bpa.gov as an email attachment or by including a secure link from the ESI HUB. The EPM agreement must, at a minimum, identify an additional energy-savings goal of at least 1,000,000 kWh of verifiable annual busbar energy savings and the end user’s obligation to employ a qualified EPM. The customer must repeat the same process for the ensuing contract period, including creating a new EPM Comprehensive Plan.

• A customer must send a request to BPA (email eedocs@bpa.gov) for consideration of BPA directly contracting with its end user to provide EPM co-funding. The request must include the following:

  • Documentation of the direct contract qualification, either because (1) the customer is prevented by charter or policy from contracting with its end users; or (2) the EPM will be assigned to multiple facilities served by multiple customers;

\(^3\)EPM training costs must be pre-approved by BPA based on the customer’s budget, EPM costs and the relevancy of the training. EPM costs include only qualifying costs incurred between the EPM commencement date and the date of the last project in the EPM Comprehensive Plan as approved by BPA. BPA will not pay customers for EPM time in a custom or SEM project if it was included in the EPM Comprehensive Plan.

\(^4\)The total EPM co-funding amount may not exceed the total annual EPM costs as specified in the EPM Comprehensive Plan. Documentation of actual EPM costs must accompany the final EPM Status Report, which precedes the final payment. Where an EPM term is less than 12 months, the eligible EPM costs must be based on pay records from the period between the EPM commencement date and BPA acceptance of the final project. A customer may include a performance incentive as a portion of the EPM’s salary.

\(^5\)SEM project first-year savings and subsequent years’ incremental savings may be applied toward the EPM savings goal.
• End-user information (name, address and contact information); and

• The allocated amount must be capped at the lesser of: (1) $0.025 per kWh of the energy-savings goal; (2) the total annual cost of the EPMs as described in the EPM Comprehensive Plan not to exceed (NTE) $250,000 per EPMs contracted; or (3) an amount specified in the EPM agreement.

• If a customer’s request is approved, BPA will (1) reduce the customer’s ECA implementation budget by the allocated amount, (2) hold the funds to pay the EPM payment to the end user, and (3) execute a contract with the end user to pay for an EPM. The allocation may not be changed without approval from BPA, the customer and the end user. At the end of the EPM contract period, if the customer’s allocation exceeds the amount BPA paid the end user, the remaining budget will be returned to the customer’s ECA implementation budget.

Documentation Requirements

</table>

Payment

To receive payment, the customer must invoice BPA once it reaches the milestones in the chart below. If the customer elects to renew the EPMs for an additional period, the payment schedule repeats with the first payment starting with payment number two. Customers are not obligated to return money already received.

Use the EPM Calculator (available in the Interim Solutions 2.0 Files) to calculate payment amounts.

<table>
<thead>
<tr>
<th>PAYMENT NO.</th>

<td>BPA approves the EPM Comprehensive Plan</td>
</tr>
<tr>
<td>3</td>
<td>2/3 of the funding(^{\text{ii}}) less previous payments</td>
<td>End user achieves, to BPA’s satisfaction, the six-month energy savings, or energy-savings progress described in the project implementation schedule of the EPM Comprehensive Plan</td>
</tr>
<tr>
<td>4</td>
<td>The lesser of: (1) $0.025 per kWh of verified busbar energy savings; (2) the total annual cost of the EPMs as described in the EPM Comprehensive Plan, NTE $250,000 per EPMs contracted; or (3) an amount specified within the EPM agreement, less previous payments</td>
<td>End user meets, exceeds or fails to meet (as certified by BPA) the EPM Comprehensive Plan projected verified energy savings</td>
</tr>
</tbody>
</table>

\(^{\text{i}}\) Payment number one is issued in the first year of an EPM engagement to address initial recruiting and placement costs. In subsequent years of the engagement, the payment schedule begins with payment number two. Funding beyond this payment will not be provided unless the verified energy-savings goal or actual savings achieved is greater than 1,000,000 kWh.

\(^{\text{ii}}\) Funding is based on the lesser of (1) $0.025 per kWh of the verified energy-savings goal; (2) the total annual cost of the EPMs as described in the EPM Comprehensive Plan, NTE $250,000 per EPMs contracted; or (3) an amount specified within the EPM agreement.
9.2.2 Strategic Energy Management: Strategic Energy Management Projects (Optional ESI Component)

SEM Projects are an optional component of the ESI Program. SEM is designed to acquire energy savings by improving facilities’ energy intensity through custom projects, and operations and maintenance improvement.

Basis for Savings

Strategic Energy Management (SEM) Projects are an optional component of the ESI Program. SEM is designed to acquire energy savings over the course of a two year performance period by improving facilities’ energy intensity through custom projects, and operations and maintenance improvement. SEM participants are enrolled in two-year performance periods. The customer may enroll end-users in consecutive performance periods.

The following definitions and terms are applicable to SEM program savings measurement and reporting:

SEM Baseline

Energy use established prior to enrollment in a SEM program. SEM Baseline can be reestablished after a significant operational change or at customer request as outlined in the ESI MT&R Reference Guide. Re-enrollment in additional two year performance periods resets the reference point for the purposes of calculating savings and payment, but does not change the SEM Baseline.

SEM Annual Savings Achieved

The verified incremental savings measured in each year of a two year performance period.

- In Year 1 of the first performance period, or after the re-establishment of the SEM Baseline, it is measured as all savings achieved above the SEM Baseline.
- In Year 2 of any performance period, it is measured as the savings achieved over the savings achieved in Year 1 of the performance period.
- In Year 1 of subsequent performance periods (as a result of re-enrollment), it is measured as all savings achieved above Year 2 of the previous performance period.
- Should there be zero or negative savings verified from prior year, SEM Annual Savings Achieved is zero.

SEM Annual Savings Achieved is used to determine allowable Performance Payment.

SEM Verified Savings

Verified total energy savings measured from the start of the current performance period. SEM Verified Savings are calculated at the end of Year 1 and at the end of Year 2.

- In Year 1 of the first performance period, it is measured as all savings achieved above the SEM Baseline.
- In Year 2 of any performance period, it is measured as the savings achieved in Year 1 and adjusted for any additional savings achieved in Year 2.
- In Year 1 of subsequent performance periods (as a result of re-enrollment), it is measured as all savings achieved above Year 2 of the previous performance period.
- Should there be zero or negative savings verified from the start of the performance period, SEM Verified Savings achieved is zero.

SEM Verified Savings is used to determine EEI incentive payment.

Required Documents

- ESI MT&R Reference Guide
- Strategic Energy Management Calculator
**SEM Cumulative Verified Savings**

Verified annual energy savings measured from establishment of SEM Baseline to current performance period year. SEM Cumulative Verified Savings is not used by BPA to calculate reportable savings or any payment from BPA, but will be provided to customers for their own reporting purposes.

**Requirements and Specifications**

Required documents to be submitted by the customer to BPA in support of SEM Projects must be sent to eedocs@bpa.gov as an email attachment or by including a secure link from the ESI HUB. Option 1 and Option 2 customers must follow the measurement and verification requirements addressed in the current ESI Monitoring, Targeting and Reporting Reference Guide (available in the IM Document Library). The tables below describe the requirements for (1) enrollment and staffing; (2) performance period; (3) component implementation; and (4) SEM savings reports.

**Enrollment and End User Staffing**

To enroll in the SEM component, a customer must meet these enrollment requirements and ensure that end user staffing requirements have also been met, as outlined below:

<table>
<thead>
<tr>
<th>ACTIVITY</th>
<th>REQUIREMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enroll</td>
<td>Send a SEM enrollment agreement to <a href="mailto:eedocs@bpa.gov">eedocs@bpa.gov</a> as an email attachment or by including a secure link from the ESI HUB</td>
</tr>
<tr>
<td>End user appoints Energy Champion</td>
<td>The Energy Champion is a key contact person for the energy-management continuous-improvement process, who implements energy-efficiency measures</td>
</tr>
<tr>
<td>End user appoints executive sponsor</td>
<td>The executive sponsor is the management-level supporter of the energy management system</td>
</tr>
<tr>
<td>End user engagement</td>
<td>Attend energy management training. Classroom and on-site training develops the end user’s energy management system. End users must present their energy efficiency implementation. BPA recommends two employees attend training sessions during the performance period. The length and frequency of the training sessions will vary based on the type of engagement (e.g., formerly High Performance Energy Management (HPEM), Track &amp; Tune, Refrigerator Operator Coaching and Small Industrial HPEM) or Implement action items Tune-up site or subsystem through no-cost or low-cost operations and maintenance (O&amp;M) action items</td>
</tr>
<tr>
<td>Re-Enrollment</td>
<td>Send an executed/amended SEM enrollment agreement to <a href="mailto:eedocs@bpa.gov">eedocs@bpa.gov</a> as an email attachment or by including a secure link from the ESI HUB</td>
</tr>
</tbody>
</table>

**Performance Period**

SEM participants are enrolled in two-year performance periods. The customer may enroll end-users in consecutive performance periods. Customers can claim up to the full SEM Verified Savings for each reporting year (i.e., year 1 of the SEM engagement and again in each subsequent reporting year).

**Component Implementation**

SEM generates energy savings by using continuous-improvement practices to identify and implement energy-efficiency measures. To develop SEM savings, implementation may include site-specific and/or group training. Examples of on-site engagements include Energy Management Assessments, energy team coaching and technical support identifying efficiency opportunities. Group training includes participation in peer network group-training workshops.
### Optional – Performance Tracking System

<table>
<thead>
<tr>
<th>PERFORMANCE TRACKING SYSTEM (PTS)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>The PTS is metering hardware and/or electric-energy data collection software that tracks key variables to develop a meaningful, normalized energy-use profile</td>
</tr>
<tr>
<td>The PTS is installed and owned by the end user and is eligible for BPA co-funding</td>
</tr>
</tbody>
</table>

| **Requirements** |
| 1. Collect key process energy-performance indicators sufficient to predict energy consumption, or track performance at a facility or system level |
| 2. Provide data frequently to measure changes in energy performance |

| **PTS Design Approval** |
| Prior to installing the PTS, BPA approval may be requested by the customer to ensure collected baseline data will be useful for M&V, or otherwise serve to promote project implementation |

| **Verification** |
| Prior to beginning implementation activities, BPA will verify the PTS and collected baseline data sufficiently models baseline energy consumption |

### Savings Reports

| **REQUIREMENT** |
| **M&V Protocol** |
| Both Option 1 and Option 2 customers must calculate Verified SEM Savings following the M&V prescribed in the current ESI Monitoring, Targeting & Reporting Reference Guide (available in the IM Document Library) |
| SEM savings do not include energy savings from other ESI program components or BPA programs (e.g., custom projects or UES measure projects) |
| SEM Verified Savings are relative to the SEM Baseline or the savings achieved in year two of the previous performance period. If re-baselining was necessitated by the current ESI Monitoring, Targeting & Reporting Reference Guide or customer request it will reset the SEM Baseline. |

| **Performance Period** |
| The SEM performance period starts: |
| 1. No earlier than the SEM kick-off workshop or tune-up event, whichever is applicable |
| 2. No later than the date determined by BPA and the customer |

For re-enrolled SEM participants, a continuous performance period is recommended, or customers may opt to delay the start of the performance period

| **Annual Completion Reports** |
| Customers are required to send an annual Completion Report documenting energy savings over the previous year to eedocs@bpa.gov as an email attachment or by including a secure link from the ESI HUB. The annual Completion Report documents SEM Annual Savings Achieved, energy efficiency measures implemented, SEM systems and practices implemented, and optional: Energy efficiency measure implementation costs (invoices). |

</tr>
</tbody>
</table>

### 9.2.4 Small Industrial Projects (Optional ESI Component)

Small Industrial (SI) Projects provide a cost-effective approach for managing custom projects with a limited scope and repeatable analysis method. SI Projects often involve trade-ally support, and annual energy savings are typically less than 200,000 kWh.

Simplified analysis tools may be available to assist with project development.

Projects of this size justify a simple, streamlined analytical approach, including M&V, due to the small scale of energy savings and incentive. An ESIP is closely involved with SI Projects.

### Requirements and Specifications

See section 4.3.2 Custom Projects General Requirements

### Documentation Requirements

See section 4.6 Custom Projects Documentation Requirements.

### Payment

<table>
<thead>

</tr>
</tbody>
</table>

### 9.2.5 BPA-Funded Technical Service Providers (Optional ESI Component)

BPA funding, through the ESI program partner, is available for eligible technical services necessary to develop and complete custom projects and SEM projects.

TSP consultants can be utilized for scoping, project assessments, completion reports (M&V), SEM training and miscellaneous consulting.

BPA funding of technical services is based on the cost-effectiveness of the proposal and the likelihood that the end user will implement it.
9.3 VARIABLE FREQUENCY DRIVES (VFD) FOR FANS IN POTATO AND ONION STORAGE FACILITIES

Basis for Energy Savings

The base case used to calculate this measure is a fixed-speed fan that is used to blow air at 100% airflow, year-round. The efficient case would have a variable speed drive to better match the airflow necessary for winter season performance.

Requirements and Specifications

Ventilation fan VFD installations in potato and onion storage facilities have a UES of 1,193 kWh per horsepower. BPA recommends that all new VFD installations meet the IEEE 519 standard.

Documentation Requirements

<table>
<thead>
<tr>
<th>DOCUMENTATION DESCRIPTION</th>
<th>RETENTION/SUBMITTAL LOCATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

9.4 SMALL COMPRESSED AIR SYSTEMS

Basis for Energy Savings

The base case for this measure is an air compressor that operates at a fixed speed, with some variation in compressed airflow requirements. The efficient case would have a variable frequency drive to better match compressor performance to compressed air-system requirements.

Required Documents

RTF-Approved Small Compressed Air Savings Calculator
**Requirements and Specifications**

- VFDs applied to a single air compressor or installation of cycling refrigerated air dryers of 75 horsepower or less must use the RTF-approved Small, Compressed Air Savings Calculator (available in the Interim Solutions 2.0 Files).
- Each VFD compressor must be submitted as an individual project (i.e., compressors may not be combined or divided).
  - The calculator will determine energy savings.

This measure is available for the agricultural, commercial and industrial sectors. Utilities shall report this measure to the applicable sector when reporting to BPA.

**9.5 HIGH FREQUENCY BATTERY CHARGER UPGRADE (BPA-QUALIFIED)**

**Basis for Energy Savings**

The base case for this measure is an existing, transformer-based (ferroresonant or silicon-controlled rectifier) battery charger that is commonly used to charge indoor equipment such as fork trucks and lifting equipment. The efficient case would be a new, high frequency, inverter-based battery charger that requires far less standby power and improves the AC to DC conversion efficiency.

The Battery Charger Calculator estimates energy savings based on user-entered inputs of energy per charge and charges per year for the baseline and retrofit cases.

BPA will collect data on these retrofits to help support Regional Technical Forum analysis.

**Requirements and Specifications**

- New construction projects are not eligible
- This measure does not apply to small, household-type chargers for products such as cell phones, toothbrushes or power tools
- This measure applies to the retrofit of existing ferroresonant or silicon-controlled rectifier (SCR) chargers

**Required Documents**

Battery Charger Calculator
• Installation of a new, high frequency inverter-based battery charger, with rated input power of more than 2 kW and that uses 10W or less of standby power
• BPA recommends the power conversion efficiency be no less than 89%
• Customers must use the current version of the Battery Charger Calculator (available in the IM Document Library) to calculate savings and associated incentives
• Energy savings and incentive amounts must be entered manually into the BPA UES Measure Upload Template (available on the Interim Solutions 2.0 Files) in the calculator results fields and uploaded onto the BPA EE Reporting System
• The Battery Charger Calculator and electronic copies of the invoice(s) must be submitted to eedocs@bpa.gov for program oversight

This measure is available for the agricultural, commercial and industrial sectors. Utilities shall report this measure to the applicable sector when reporting to BPA.

9.6 WELDER UPGRADE (BPA-QUALIFIED)

Basis for Energy Savings

The base case is an existing transformer-based welder that is used for manufacturing and repair operations. The efficient case is an inverter-based welder. The majority of the savings comes from a reduction in standby power. Energy savings will be calculated based on equipment data and site operational data for the baseline and retrofit cases.

The Welder Upgrade Calculator estimates energy savings based on user-entered inputs of operational data and specific equipment information including standby power and the power used during the welding process. From this information the baseline and retrofit energy use is calculated.

BPA will collect data on these retrofits to help support Regional Technical Forum analysis.

Requirements and Specifications

• New construction projects are not eligible
• Installation of an inverter-based welder retrofit rated for a minimum of 200
• Customers must use current version of the Welder Upgrade Calculator (available in the IM Document Library) to calculate savings and associated incentives

• Energy savings and incentive amounts must be entered manually into the BPA UES Measure Upload Template (available on the Interim Solutions 2.0 File) in the calculator results fields and uploaded onto the BPA EE Reporting System

• The Welder Upgrade Calculator and electronic copies of the invoice(s) must be submitted to eedocs@bpa.gov for program oversight

This measure is available for agricultural, commercial and industrial sectors. Utilities shall report this measure to the applicable sector when reporting to BPA.

**9.7 WATER SYSTEM LEAK ABATEMENT (BPA-QUALIFIED)**

**Basis for Energy Savings**

The base case is a large water distribution system, such as municipal water district, golf course or irrigation distribution system (not above-ground sprinklers). The efficient case proactively addresses losses using leak-detection system surveys. An audit must be conducted to detect leaks, and they must be repaired in accordance with the American Water Works Association’s (AWWA) methodology.

BPA will collect data on these retrofits to help support Regional Technical Forum analysis.

**Requirements and Specifications**

• Visible or known water-line breaks or leaks are not eligible

• This measure involves surveys to identify and repair leaks using ultrasonic sound checks or other specialized equipment

  • These surveys are typically conducted by specialty companies, but may be conducted by water system staff.

• Savings are calculated using the Leak Abatement Tool that is based on the AWWA’s methodology which calculates the rate of water loss from

Required Documents

Leak Abatement Tool
various leaks

- Energy and Water production data will be collected from the pumping system providing water to the leak location, to arrive at the energy intensity (kWh per gallon pumped)
- Energy savings will be estimated by multiplying the energy intensity by the annualized volume of the leaks repaired (determined by the pipe diameter, system pressure and energy used to distribute the water in the system)
- Customers must use the current version of the Leak Abatement Tool (available in the IM Document Library) to calculate savings and associated incentives
- Energy savings and incentive amounts must be entered manually into the BPA UES Measure Upload Template (available on the Interim Solutions 2.0 Files) in the calculator results fields and uploaded onto the BPA EE Reporting System
- The Leak Abatement Tool and electronic copies of the invoice(s) must be submitted to eedocs@bpa.gov for program oversight

This measure is available for the agricultural, commercial and industrial sectors. Utilities shall report this measure to the applicable sector when reporting to BPA.

Section 10: Residential Sector

Please check the changes and corrections summary to see if revisions were made to any of the measures in this sector.

The Residential Sector includes electrical energy used in a residential setting* (e.g., single-family residences, multifamily structures and manufactured homes). Multifamily housing that is three stories or fewer above ground is a multifamily low-rise. Multifamily housing that is four stories or more above ground is a multifamily mid/high-rise. For central heating in multifamily mid/high-rise buildings and common area lighting in all multifamily buildings, refer to the appropriate commercial measure. Excluded from the Residential Sector are temporary residences such as hotels, motels, nursing homes, dorms and other generally temporary quarters, which are commercial building types.

*Installations of high-intensity discharge lighting in residential settings must be reported as Commercial Sector measures. See the Nonresidential Lighting Program.

10.2 LIGHTING

10.2.1 ENERGY STAR Solid-State Lighting/Light-Emitting Diodes Lamps and Fixtures

Basis for Energy Savings

The base case for LEDs factors in current socket saturation and Energy Independence and Security Act (EISA) compliance, and uses a weighted average of incandescent, halogen and CFL lamps.

Savings estimates also include deductions for the storage factor, HVAC interactions and assumptions on hours of use. The storage factor attempts to predict if any lamps went into storage rather than into an available socket. For example, Direct Install has no storage factor, Retail has a low storage factor, and By Request or Mailed Non-Request have the highest storage factors. HVAC interaction accounts for the increased heating load requirement from more efficient lamps producing less heat. Hours of use are estimates taken from a California study conducted by Keuring van Elektrotechnische Materialen te Arnhem (KEMA).

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

These measures are available for all types of residential buildings (single-family, manufactured and multifamily).

LED lamps are available through the following channels:

- Retail
- By Request
- Mailed Non-Request
- Direct Install

Mailed Non-Request lamps are limited to four LEDs per household per fiscal year.

LED fixtures are available through the following channels:

- Retail
- Direct Install

Please note: Items distributed in any distribution channel through Simple Steps or a successor BPA program will have separate refnos from those used for utility run programs.

Direct Install measures are also categorized by the RTF using the Residential Building Stock Assessment as Exterior, Moderate/High-Use Interior or Low-Use Interior. Use the following table to select the proper measure for Direct Install lamps.

LED fixtures must be ENERGY STAR-Qualified at the time of purchase, with corresponding measures on the UES Measure List in the IM Document Library.

</tbody>
</table>

*Savings are determined by LED lamp type and lumen categories. See the UES Measure List in the IS2.0 files page for details.

**Additional Information**

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try an efficient LED?” By Request may also be used to supplement Direct Install if there are fixtures that an installer is unable to retrofit with an efficient lamp, such as an antique lamp.

Program support materials, including BPA lighting materials, use the terms bulb and lamp interchangeably. They are intended to mean the same thing.
10.2.2 TLEDs

**Basis for Energy Savings**

The base case used to calculate energy efficiency savings for the BPA residential tubular light emitting diode (TLED) lamp measures is a T8 linear fluorescent lamp, with an RBSA-weighted average hours of use based on the location distribution of T8 lamps found in RBSA homes.

Savings estimates also include HVAC interactions and assumptions on hours of use. HVAC interaction accounts for the increased heating load requirement from more efficient lamps producing less heat. Hours of use are estimates taken from the 2011 RBSA metering study.

Use the following table to select the proper measure for Direct Install TLED lamps.

<table>
<thead>

</tbody>
</table>

**Requirements and Specifications**

This measure is available for all types of residential buildings (single-family, manufactured and multifamily).

TLEDs are available through the following channels:

- Retail
- Direct Install

Please note: Items distributed in any distribution channel through Simple Steps or a successor BPA program will have separate refnos from those used for utility run programs.

TLEDs must meet the Design Lights Consortium’s standard of 100 lumens per watt and be on the Design Lights Consortium’s Qualified Product List.

### 10.3 ADVANCED POWER STRIPS

#### 10.3.1 Advanced Power Strips — Load Sensing (Home Entertainment Centers)

These measures are also referred to as Tier 1 Advanced Power Strips. BPA, however, uses the Load Sensing (Home Entertainment Centers) name.

**Basis for Energy Savings**

The base case used to calculate energy efficiency savings for the BPA Residential Load Sensing Advanced Power Strip (APS) measures is the estimated annual electric usage of home entertainment centers and their peripheral audiovisual (AV) devices. It is based on RTF analysis which uses several relevant metering studies from 2016–2018 to estimate savings. Efficient case savings include the reduction of loads from master/peripheral load sensing strips that are capable of shutting off power to controlled devices when not in use. Other inputs include the prevalence of different peripherals (DVD, VCR, video games, stereo, speakers, etc.) and each peripheral’s hours of use.

These measures are currently deemed as planning measures by the RTF Guidelines, requiring the completion of a research plan to provide more data on the inputs.

BPA documentation requirements consider these factors. More detailed information is available on the RTF's UES Measures [webpage](#).

**Requirements and Specifications**

This measure is available for all types of residential home entertainment centers only (a TV with any combination of peripherals).

Advanced Power Strips — Load Sensing (Home Entertainment Centers) measures are available through the following channels:

- Retail
- By Request
- Direct Install

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs. When an installer is unable to install the APS, the APS may be left with the homeowner and claimed as a “By Request” measure.

Qualified products can be found on the Advanced Power Strip Qualified Products List (if a customer believes a product should be on the list, and is not, the customer should use the COTR Request and Acknowledgment Procedure to request approval to use the product).
Load Sensing Home Entertainment Advanced Power Strips must meet the following qualifications:

- Load sensing
- Consume less than 1W of energy;
- One-year warranty and any length warranty for connected devices;
- Surge protection to 740 joules;
- UL1449-listed or BPA approved equivalent;
- Rated for 15 amps; and
- Resettable circuit breaker

Additional Information

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try a load sensing advanced power strip on your home entertainment center?”

10.3.2 Advanced Power Strips — Infrared Sensing (Home Entertainment Centers)

These measures are also referred to as Tier 2 Advanced Power Strips. BPA, however, uses the Infrared Sensing (Home Entertainment Centers) name.

Basis for Energy Savings

The base case used to calculate energy efficiency savings for the BPA Residential Infrared Sensing Advanced Power Strip (APS) for Home Entertainment Center measures is the estimated annual electric usage of home entertainment centers and their peripheral audiovisual (AV) devices. It is based on RTF analysis which uses several relevant metering studies from 2016–2018 to estimate savings. Efficient case savings include the reduction of loads from master/peripheral Infrared Sensing (IR) strips that are capable of shutting off power to controlled devices when not in use. Other inputs include the prevalence of different peripherals (DVD, VCR, video games, stereo, speakers, etc.) and each peripheral’s hours of use.

Supporting Content

- Advanced Power Strip Qualified Products List
- COTR Request and Acknowledgment Procedure
- Measure Distribution Multisector
These measures are currently deemed as planning measures by the RTF Guidelines, requiring the completion of a research plan to provide more data on the inputs.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

This measure is available for all types of residential home entertainment centers only (a TV with any combination of peripherals).

Advanced Power Strips — Infrared Sensing (Home Entertainment Centers) measures are available through the following channels:

- Retail
- By Request
- Direct Install

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

When an installer is unable to install the APS, the APS may be left with the homeowner and claimed as a “By Request” measure.

Qualified products can be found on the Advanced Power Strip Qualified Products List (if a customer believes a product should be on the list, and is not, the customer should use the COTR Request and Acknowledgment Procedure to request approval to use the product).

Infared Sensing Home Entertainment Advanced Power Strips must meet the following qualifications:

- Infrared remote sensing;
- Consume less than 1W of energy;
- One-year warranty and any length warranty for connected devices;
- Surge protection to 740 joules;
- UL1449-listed or BPA approved equivalent;
- Rated for 15 amps; and
- Resettable circuit breaker

<td>RETENTION/SUBMITTAL LOCATIONS</td>
</tr>
<tr>
<td>BPA ENERGY EFFICIENCY REPORTING SYSTEM</td>
</tr>
<tr>
<td>See Measure Distribution Processes (Section 12.2) for Documentation Requirements for each channel listed above</td>
</tr>
</tbody>
</table>
**Additional Information**

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try an advanced power strip on your home entertainment center?”

Utilities may claim Infrared Sensing Advanced Power Strip measures with zero payment.

Infrared Sensing Advanced Power Strip products may have additional, optional layers of control over IR including occupancy sensing and connectivity.

**10.3.3 Advanced Power Strips — PC Interaction Sensing (Personal Desktop Computers)**

These measures are also referred to as Tier 2 Advanced Power Strips. BPA, however, uses the PC Interaction Sensing (Personal Desktop Computers) name.

**Basis for Energy Savings**

The base case used to calculate energy efficiency savings for the BPA Residential PC Interaction Sensing Advanced Power Strip for Personal Desktop Computer measures is the estimated annual electric usage of home personal computers and selected peripheral devices. It is based on RTF analysis which uses a metering study from 2018 to estimate savings. Efficient case savings include the reduction of loads from master/peripheral PC Interaction Sensing strips that are capable of shutting off power to controlled devices when not in use. Other inputs include the prevalence of different peripherals (keyboard, mouse, speakers, etc.) and each peripheral’s hours of use.

These measures are currently deemed as planning measures by the RTF Guidelines, requiring the completion of a research plan to provide more data on the inputs.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures [webpage](#).

**Requirements and Specifications**

This measure is available for all types of residential desktop computers only; laptop applications do not qualify.

Advanced Power Strips — PC Interaction Sensing (Personal Desktop Computers) measures are available through the following channels

- Retail
- By Request
- Direct Install

---

<table>

**Supporting Content**

- Advanced Power Strip Qualified Products List
- COTR Request and Acknowledgment Procedure
- Measure Distribution Multisector
Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

When an installer is unable to install the APS, the APS may be left with the homeowner and claimed as a “By Request” measure.

Qualified products are on the Advanced Power Strip Qualified Products List (if a customer believes a product should be on the list, and is not, the customer should use the COTR Request and Acknowledgment Procedure to request approval to use the product).

Personal Desktop Computer Advanced Power Strips must meet the following qualifications:

- PC Interaction sensing;
- Consume less than 1W of energy;
- One-year warranty and any length warranty for connected devices;
- Surge protection to 740 joules;
- UL1449-listed or BPA approved equivalent;
- Rated for 15 amps; and
- Resettable circuit breaker

**PAYMENT LEVELS FOR EACH DELIVERY CHANNEL APPLY TO BOTH BPA RUN PROGRAMS (SUCH AS SIMPLE STEPS) AND UTILITY OPERATED PROGRAMS.**

### Additional Information

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try an advanced power strip on your home desktop computer?”

Utilities may claim PC Interaction Sensing Advanced Power Strip measures with zero payment.
10.4 APPLIANCES

Basis for Energy Savings

The base case used to calculate energy efficiency savings for new appliance measures is the average annual energy consumption of appliances meeting the Federal Standard. If a standard has been updated recently, BPA examines the potential prevalence of equipment not meeting the standard remaining in the marketplace. Energy savings are calculated as the difference between the annual energy consumption of the baseline case and the energy efficient case.

Clothes washers have additional characteristics for savings based on the associated water heater fuel type (for their use of heated water) and dryer fuel type (for the electric savings on drying time). Note: A slight deduction of dryer savings for the very small percentage of more efficient electric dryers was included in the last update to the clothes washer measure.

Clothes dryers have additional characteristics for the efficient case, depending on the efficiency level of the new equipment from electric-resistance to a heat pump dryer, and whether the dryer is vented or ventless. The savings for dryers are discounted by the portion of savings assigned to clothes washers.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

These measures are available for all types of residential buildings (single-family, manufactured, multifamily, and multifamily common areas).

Clothes washers and electric clothes dryer measures are available through the following channels:

- Retail
- By Request
- Direct Install

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

- Clothes washers must be ENERGY STAR-Qualified and top loaders must be rated CEE Tier 1 or above.
- Clothes dryers must be electric and ENERGY STAR-Qualified. BPA measures include three different tiers of clothes dryers. BPA tiers are provided on the BPA Clothes Dryer Qualified Product List on the BPA Energy Efficiency ENERGY STAR Appliances webpage.

As ENERGY STAR specifications change, BPA will continue to accept pre-existing models that were ENERGY STAR-Qualified at the time they were manufactured. A copy of the product information insert or packaging that includes the ENERGY STAR logo and the model number can be used to document qualification.

Current and archived ENERGY STAR-Qualified appliance lists may be found on the BPA Energy Efficiency ENERGY STAR Appliances webpage.

The “any” appliance measures assume a weighted average of reported measures. Utilities that report appliances using the tiered measures should not also use the “any” measures on the same invoice submitted to BPA. Utilities may switch to the “any” measures if reporting to the tier-specific measures delivers little benefit.

## 10.5 ELECTRIC WATER HEATING

### 10.5.1 Showerheads

**Basis for Energy Savings**

The base case used to calculate energy efficiency savings for the current BPA residential showerhead measures is the RTF current practice baseline. Savings from the efficient replacement are based on the nominal flow rates of 2.0, 1.75 and 1.5-gallons per minute (GPM) showerheads for all types of residences. Savings inputs also include an average for the number of persons per residence type and the number of showers per day.

The fuel type impacts water heating savings. Because of this, Direct Install measures contain precise savings estimates as the fuel type can be identified. Retail measures are averaged across all fuel types as the fuel type is unknown. For all measures, the shower type is restricted to “any” in order to collapse shower location. BPA documentation requirements consider these factors. More detailed information is available on the RTF’s Unit Energy Savings (UES) Measures webpage.

**Requirements and Specifications**

These measures are available for all types of residential buildings (single-family, manufactured and multifamily).

Showerhead measures are available through the following channels:

- Retail
- By Request
- Direct Install

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

Showerheads must have a GPM flow rate of 2.0 or less.

By Request and Direct Install showerheads are limited to two showerheads per residence.
Direct Install showerheads are only eligible in homes with electric water heaters.

By Request claims must document water heater fuel type, if using fuel specific measures.

**Documentation Requirements**

<table>

</tr>
</thead>
<tbody>
<tr>
<td>All Showerhead measures</td>
<td>$15</td>
<td>$15</td>
<td>n/a</td>
<td>$23</td>
</tr>
</tbody>
</table>

**Additional Information**

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try an efficient showerhead?” If for any reason the homeowner refuses the contractor-installed measure, the installer can default to By Request.

**10.5.2 Thermostatic Shut-Off Valves (TSV)**

**Basis for Energy Savings**

Electric savings are the result of avoided behavioral waste of hot water. Savings inputs also include the number of showers per person, per year, and people per household per shower. These devices may be installed by themselves or in conjunction with an efficient, lower-GPM showerhead.

A thermostatic shut-off valve (TSV) is a device installed between a shower arm and the showerhead fixture. It places a hold on water flow once it reaches 95 degrees Farenheit (35 Celsius) to reduce hot water waste while waiting for water warm-up. Products reduce the showerhead’s flow to a trickle when a water temperature of 95 degrees Farenheit (35 Celsius) or greater reaches the fixture. The reduced trickle continues until normal flow is restored manually. Once restored, water flows at its normal rate until being shut off. The unit automatically resets itself for the next use.

The fuel type impacts water heating savings. Because of this, Direct Install and By Request measures contain precise savings estimates as the fuel type can be identified. Retail measures are averaged across all fuel types as the fuel type is unknown.

Savings assume that installations adhere to manufacturer recommendations.

**Supporting Content**

- [Thermostatic Shut-Off Valves (TSVs)](#)
- [Qualified Products List](#)
- [Measure Distribution Processes](#)
- [RTF Unit Energy Savings (UES) Measures](#)
for minimum static water pressure. For example, many units are recommended to have a minimum of 30 PSI water pressure.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

**Requirements and Specifications**

These measures are available for all types of residential buildings (single-family, manufactured and multifamily).

TSV measures are available through the following channels:

- Retail
- By Request
- Direct Install

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

By Request claims must document water heater fuel type, if using fuel-specific measures.

Direct Install TSVs are only eligible in homes with electric water heaters.

There are two TSVs available as measures; one is stand-alone, and the other is a combination unit with an efficient showerhead built in.

### Additional Information

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try a thermostatic shut-off valve?” If for any reason the homeowner refuses the contractor-installed measure, the installer can default to By Request.
10.5.3 Aerators

**Basis for Energy Savings**

The base case used to calculate energy efficiency savings for the current BPA residential faucet aerator measures is the RTF current practice baseline. The definition of each unit in this measure and subsequent energy savings from the efficient replacement for all types of residences is based on two installed aerators. BPA’s aerator measure includes two aerators for each unit that can be reported: one for the kitchen and one for the bathroom. The nominal flow rates are 1.0 gallons per minute (GPM) for bathroom faucet aerators and 1.5 GPM for kitchen faucet aerators.

The fuel type impacts water heating savings. Because of this, Direct Install measures contain precise savings estimates as the fuel type can be identified. The By Request measures are averaged across all fuel types and faucet location for greater simplicity. BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

**Requirements and Specifications**

This measure is available for all types of residential homes.

Aerator measures are available through the following channels:

- By Request
- Direct Install

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

By Request aerators are restricted to “any water heater” fuel type and must be requested either directly or as part of a kit.

Direct Install aerators are only eligible in homes with electric water heaters, and the water heater fuel type must be documented.

- A single measure reported to BPA includes two aerators. These aerators must be rated for the following flows: 1.0 GPM or less for bathroom faucets.
- 1.5 GPM or less for kitchen faucets.

</tbody>
</table>

### Payment Levels for Each Delivery Channel

Payments for measures apply to both BPA run programs (such as Simple Steps) and utility run programs.

### Additional Information

Measures eligible for By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try efficient faucet aerators?” If for any reason the homeowner refuses the contractor-installed measure and wants to install the measure themselves, these measures should be claimed as By Request.

**10.5.4 Unitary Heat Pump Water Heater**

Unitary heat pump water heaters combine the tank and compressor in a single unit.

### Basis for Energy Savings

The base case used to calculate energy efficiency savings for new Heat Pump Water Heaters (HPWHs) is the average annual energy consumption of electric water heaters meeting the RTF’s current practice baseline. If a standard has been updated recently, BPA examines the potential prevalence of equipment not meeting the standard remaining in the marketplace.

Energy savings are calculated as the difference between the annual energy consumption of the base case and the energy efficient case of the HPWH. Additional factors include draw profiles (water consumption) and interaction with the home HVAC system.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures [webpage](#).

In existing homes, the Unitary HPWH must replace an electric storage water heater on a one-to-one basis.

Unitary HPWHs must be (1) listed on [BPA’s HPWH Qualified Products List](#); and (2) installed according to manufacturer’s specifications. (If a customer believes a product should be on the list, and it is not, the customer should use the [COTR Request & Acknowledgment Procedure](#) to request approval to use the product.)

A maximum of one Unitary HPWH measure may be claimed per home. Accessory dwelling units with separate plumbing systems qualify for this measure even if they are on the same electrical meter.

### Requirements and Specifications

These measures are available for new and existing single-family homes and manufactured homes. This measure is also applicable to commercial sector installations.

Unitary HPWH measures are available through the following channels:

- Retail
- Standard Rebate

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

10.5.5 Split-System Heat Pump Water Heater

Split-system Heat Pump Water Heaters have interior storage tanks and outdoor compressors installed outside the house.

Basis for Energy Savings

The base case used to calculate energy efficiency savings for new Heat Pump Water Heaters (HPWHs) is the average annual energy consumption of electric water heaters meeting the RTF’s current practice baseline. If a standard has been updated recently, BPA examines the potential prevalence of equipment not meeting the standard remaining in the marketplace.

Energy savings are calculated as the difference between the annual energy consumption of the base case and the energy efficient case of the HPWH. Additional factors include draw profiles (water consumption) and interaction with the home HVAC system.

The RTF recently reviewed savings assumptions associated with ducting HPWHs. There was no savings benefit from ducting Tier 2 HPWH.

Split-System HPWHs must meet the following qualifications:

- Listed on BPA’s HPWH Qualified Products List;
- Installed according to manufacturer’s specifications;
- All water or refrigerant lines connecting the tank and outdoor units shall be insulated with minimum R-4;
- If domestic hot water pipes outdoors are freeze-protected with heat cable, the cable shall be installed per manufacturer’s instructions, underneath the insulation, and shall be thermostatically controlled to prevent the tape from operating above 38 degrees Farenheit;
- No resistance heating is allowed (except heat tape for freeze protection); and
- System plumbed with a thermal mixing valve, which is equipped with internal check valves on the hot and cold water lines connecting to it.
- If a customer believes a product should be on the list, and it is not, the customer should use the COTR Request and Acknowledgment Procedure to request approval to use the product.
- A maximum of one Split-System HPWH measure may be claimed per home. Accessory dwelling units with separate plumbing systems or separate HVAC systems qualify for applicable measures even if they are on the same electrical meter.

Required Documents

- HPWH Qualified Products List

Supporting Content

- Installation training
- COTR Request & Acknowledgment Procedure
- Measure Distribution Processes
BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

**Requirements and Specifications**

These measures are available for new and existing single-family homes and manufactured homes. This measure is also applicable to commercial sector installations.

Split System Heat Pump Water Heater measures are available through the following channels:

- Retail
- Standard Rebate

Please note: Items distributed in any distribution channel through a BPA program (e.g., Simple Steps) will have separate refnos from those used for utility run programs.

**10.5.6 Pipe Insulation Short and Whole House (BPA-Qualified)**

**Basis for Energy Savings**

The base case used to calculate energy efficiency savings for Short and Whole House pipe insulation are both uninsulated hot and cold water pipes connected to an electric water heater. Energy savings are calculated on the reduction of standby losses in the pipes, reducing warm-up times from cold starts, a reduction in tank thermostat set point and savings from wastewater treatment (resulting from reducing the amount of water wasted from cold starts). Energy savings are provided for two measures: Short: insulating the first 6 feet of both hot and cold water pipes; and Whole House: insulating all accessible water pipes. BPA documentation requirements for this BPA-Qualified measure consider these factors.

**Requirements and Specifications**

This measure is available for single-family, manufactured and multifamily low-rise buildings with an electric water heater. This measure is not available for multifamily mid/high-rise buildings.

The Short and Whole House pipe insulation measures may only be rebated by the utility and are not available to be claimed as Retail, By Request, Mailed Nonrequest or Direct Install.

Customers may claim only one measure per water heater.

The Whole House insulation measure requires that insulation must be installed on all accessible hot water pipes. If hot water pipes (trunk and branch lines) are already covered with floor or attic insulation, the project is not eligible.

**Additional Information**

- Hot and cold pipes should be insulated with a minimum of R-3 closed-cell, foam insulation for at least the first 3 feet past the water heater and, if accessible, up to 6 feet adjacent to the water heater
- Insulation material, jackets or facing, and adhesive (if used) should have a flame spread/smoke density rating in accordance with ASTM E-84
- Pipe insulation should not cover pressure-relief valves, handles, safety drain valves or any other safety control device
- All pipe elbows and joints should be mitered to ensure coverage at the same thickness as straight runs
- Pipe insulation should be secured with twine, corrosion resistant wire or plastic compression ties every 12 inches and within 3 inches of the ends

**10.6 BPA SIMPLE STEPS, SMART SAVINGS RETAIL PROMOTION**

**Basis for Energy Savings**

The basis for energy savings for measures promoted in the Simple Steps, Smart Savings promotion is found in each of the measure sections for the corresponding measures.

**Requirements and Specifications**

The BPA Simple Steps, Smart Savings retail promotion is implemented by a third-party Simple Steps contractor. Current contact information may be found on the Residential Lighting webpage. The contractor provides regional coordination of the delivery of retail linear fluorescent fixtures, LED lamps and fixtures, tubular LED lamps, home entertainment center advanced power strips, personal desktop advanced power strips, clothes washers and clothes dryers, showerheads, thermostatic shut-off valves, unitary heat pump water heaters and split-system heat pump water heaters.

**Supporting Content**

[Simple Steps, Smart Savings ECA Implementation Budget Release Form]
[Residential Lighting Website]
[COTR Request and Acknowledgment Procedure]
Other Retail measures may be added at the request of the utilities. The program also offers bulk purchase, direct mail and Direct Install delivery options.

The Retail Sales Allocation Tool (RSAT) is used to allocate program savings to customers. Participating customers receive credit for savings achieved in their service territory. Customers may participate by either signing a contract directly with the contractor or by allocating Energy Conservation Agreement (ECA) funds to the promotion through BPA.

The Simple Steps, Smart Savings program results in energy efficiency savings that are distributed among the utility participants using the RSAT. In addition, because the program model requires a commitment to all sales of efficient products in active stores (including those that would be attributed to nonparticipating utilities), the program acquires savings from these unclaimed sales. These nonparticipating/unclaimed sales are reported by BPA for credit toward regional self-funding goals to be consistent with the IM requirements and utility ECA agreements.

To limit volatility in nonparticipating utility savings while preserving the flexibility of participating in Simple Steps, the retroactive purchase of nonparticipating/unclaimed sales by a new program participant will be limited to the current quarter within which the customer joins. For more information on joining the program, contact your EER.

<table>
<thead>
<tr>
<th>PARTICIPATION OPTION</th>
<th>REQUIREMENTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signing a contract directly with the Simple Steps contractor</td>
<td>Customers must sign a Promotion Services Agreement with the contractor and pay the contractor directly for sales under that agreement. Interested customers must contact the contractor. Contact information is available on the Residential Lighting webpage. Customers may use any funding source available under this option and may invoice BPA for eligible measures.</td>
</tr>
<tr>
<td>Allocating ECA funds to the promotion through BPA</td>
<td>Customers must send BPA (1) a completed Simple Steps, Smart Savings ECA Implementation Budget Release Form (available in the IM Document Library); and (2) a sales projection provided by the contractor. It must be sent by email at <a href="mailto:eedocs@bpa.gov">eedocs@bpa.gov</a>. Customers must commit to a funding period of a minimum of six months, or be approved for participation by the contractor. The funding period may not exceed the rate period. BPA reduces the customer’s ECA implementation budget by the allocated amount in the budget release form and pays the contractor for program incentives using these funds. BPA tracks savings and the contractor sends the customer monthly savings reports. If actual sales are below the sales projection at the midpoint of the customer’s selected funding period, BPA, the contractor and the customer may work together to recommend corrective action. If sales are still below the sales projection at the third quarter of the funding period, at the customer’s request, BPA will return the unused funds to the ECA implementation budget. If allocated funds have not been spent at the conclusion of the rate period, they will be returned to the customer’s ECA implementation budget. If actual sales are above the sales projection at the midpoint or at the third quarter of the customer’s funding period, the customer may elect to add funds by submitting a new budget release form. If no funds are added, work in the customer’s service territory may be subject to curtailment. If the contractor fails to deliver according to its projection, the customer may terminate participation with 30 days’ notice to BPA using the COTR Request and Acknowledgment Procedure.</td>

Payment

Customers are paid according to the established payment levels noted in each of the measure sections for the corresponding measures.

Additional Information

The current Simple Steps contract is scheduled to end in 2020. The program may not continue beyond that time. BPA will update customers when more information is available.

Program support materials, including materials for the Simple Steps program use the terms bulb and lamp interchangeably. They are intended to mean the same thing.

10.6.1 Energy Saver Kits

Basis for Energy Savings

The base case used to calculate energy efficiency savings for the BPA Residential Energy Saver Kits measures are explained in each measure section relevant to the component. The aggregate of the total components in the kit make up the measure savings.

These measures are an aggregate of the individual RTF UES measures for each kit component. More detailed information on energy-savings assumptions is available on the RTF’s Unit Energy Savings (UES) Measures webpage.

RTF Unit Energy Savings (UES) Measures
### Requirements and Specifications

This measure is available for all types of residential homes (single-family, manufactured and multifamily).

Energy Saver Kits are available through the following channels:

- **By Request**

  Kits other than the configurations listed here created out of individual refnos for each component continue to be available through Simple Steps or assembly by utilities or their vendors.

Participation in the Simple Steps program is not required to order kits. Utilities can use the Simple Steps infrastructure to order kits, or purchase the kits through other vendors. The Simple Steps infrastructure is dependent on a third-party program contract, and as such may not be available during an entire rate period.

Please note: Items distributed in any distribution channel through Simple Steps or a successor BPA program will have separate refnos from those used for utility run programs.

Energy Saver Kits must meet the following qualifications:

- Lamps must be ENERGY STAR qualified.
- Individual products must meet the requirements outlined in their sections in the current IM.
- Limited to one kit type per household.

**Additional Information**

Measures that can be distributed By Request may be distributed at events such as trade shows, annual meetings or community events after asking attendees a question such as, “Would you like to try an Energy Saver Kit?”
10.7 HEATING, VENTILATION, AIR CONDITIONING (HVAC)

10.7.1 Ductless and Ducted Mini-Split Heat Pump(s)

10.7.1.1 Ductless and Ducted Mini-Split Heat Pump(s)

Basis for Energy Savings

The base case (pre-existing state) used to calculate energy efficiency savings for Ductless and Ducted Mini-Split Heat Pumps (DHP) in existing homes is single-family and manufactured homes with electrical zonal or electric forced-air furnace HVAC. The base case (pre-existing state) used to calculate energy efficiency savings for DHP in new, single-family homes is single-family homes with electric zonal HVAC. The base case (pre-existing state) used to calculate energy efficiency savings for DHP in new manufactured homes is new manufactured homes with electric forced-air furnace HVAC. The calculation of energy efficiency savings for DHP utilized multiple runs of the Simplified Energy Enthalpy Model (SEEM) simulation engine, calibrated with results from a study of the performance of DHPs in actual homes, in combination with Prototype House Weightings, to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis. The basis for energy savings for ducted mini-splits is based on the SEEM model with adjustments made to:

- System capacity from the SEEM DHP default size of 1.5, up to 2.5 tons;
- SEEM modeling used to approximate the performance in a multi-head system; and
- DHP input power curve.

Assumptions were made to the fraction of heating load provided by the DHP versus auxiliary resistance heat.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s Unit Energy Savings (UES) Measures [webpage](#).

* New single-family homes in all states except Washington. This measure is not available in new construction in Washington.
**Zonal includes zonal hydronic systems. For electric hydronic upgrades, claim as zonal if heat distribution is through in-floor radiant or wall radiators, and claim as an existing forced-air furnace if distribution is through a duct system.
***Existing single-family residential additions where the primary electric or nonelectric system’s duct work has not been extended to the addition and/or where the current heating source in the addition is electric zonal are eligible for a DHP. Otherwise this measure is not available.

Required Documents

- COTR Request & Acknowledgment Procedure
- Best Practices for Installing Ductless Heat Pumps
- Qualified Applications List
- NEEP Cold Climate Website
Requirements and Specifications

This measure is for ductless or ducted mini-split heat pumps in homes supplied by one or more outdoor compressors when the previous heating system was electric zonal heat or an electric forced-air furnace (for homes with a previously installed ductless heat pump, see 10.7.1.2 Ductless Heat Pump Upgrade). This measure is for configurations with: (a) single or multiple ductless indoor heads; (b) single or multiple ducted indoor heads; (c) combination of ductless and ducted indoor head(s); or (d) multiple ductless indoor heads, multiple ducted indoor head(s), or combination indoor head(s) and multiple outdoor compressors.

Ducted Mini-Split does not include whole-home centrally ducted systems; see sections 10.7.2.1 or 10.7.2.2 for Performance Tested Comfort Systems (PTCS) Air Source Heat Pumps or 10.7.4 and 10.7.5 for Air Source Heat Pump Conversions (without PTCS) for further information on whole-home centrally ducted systems.

Qualifying applications for existing homes include:

- Existing homes where plug-in electric heaters are the primary heating system in the home qualify for DHP Payment. Determine if a weather-related heating signature exists that demonstrates electric-resistance heating use.

- Single-family residential additions where the primary electric or nonelectric system’s duct work has not been extended to the addition and/or where the current heating source in the addition is electric zonal.

Qualifying equipment/installation requirements:

- Heating seasonal performance factor (HSPF): DHPs or Ducted Mini-Split must be a split-system heat pump employing an inverter-driven outdoor compressor, with inverter-driven or variable-speed indoor blower, rated with a minimum of 9.0 HSPF.

- DHPs or Ducted Mini-Split must be listed on BPA’s DHP Qualified Product List or Northeast Energy Efficiency Partnership (NEEP) Cold Climate Specification List. If a customer believes a product should be on BPA’s Qualified Product List, and it is not, the customer should use the COTR Request and Acknowledgment Procedure.

- DHPs must be installed on a dedicated electrical circuit, according to manufacturer’s specifications and the Best Practices for Installing Ductless Heat Pumps Guide.

- Only one DHP may be claimed per home, regardless of the number of outdoor or indoor units installed, and regardless of the home’s square footage. For homes 4,500 sq. ft or larger, the home is also eligible for a PTCS or non-PTCS air source heat pump (ASHP) incentive.

- For DHPs in new single-family homes, BPA incentives may not be used to meet building code requirements.

- The DHP must be installed by a licensed contractor. The customer must use the COTR Request and Acknowledgment Procedure to consider payment for a partial self-install; these will only be considered when a contractor has installed the fittings and refrigerant.

</table>

### Additional Information

- At this time Variable Refrigerant Flow (VRF) technologies (also known as VRV) do not qualify for the residential DHP measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential DHP configuration.
- Mini-splits with a multi-position ducted indoor air handler should be invoiced as an air source heat pump even when the air handler and ductless heads are served by the same outdoor compressor.
- Existing homes with electric forced air furnaces are eligible for PTCS or Prescriptive Duct Sealing.

### 10.7.1.2 Ductless Heat Pump Upgrade

#### Basis for Energy Savings

The calculation of energy efficiency savings for DHPs utilized multiple runs of the SEEM simulation engine, calibrated with results from a study of the performance of DHPs in actual homes, in combination with Prototype House Weightings, to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis.

### Requirements and Specifications

Measure includes upgrading an existing DHP for existing single-family and manufactured homes in all states.

- DHP must be a split-system heat pump employing an inverter-driven outdoor compressor, with inverter-driven or variable speed indoor blower(s), rated with a minimum of **11.0 HSPF or greater**.

- DHP must be listed on BPA's DHP Qualified Product List or Northeast Energy Efficiency Partnership (NEEP) Cold Climate Specification List. If a customer believes a product should be on BPA's Qualified Product List, and it is not, the customer should use the COTR Request and Acknowledgment Procedure.

- Ductless heat pump must be installed on a dedicated electrical circuit, according to manufacturer’s specifications and the Best Practices for Installing Ductless Heat Pumps Guide.

- The DHP must be installed by a licensed contractor. The customer must use the COTR Request and Acknowledgment Procedure to consider payment for a partial self-install; these will only be considered when a contractor has installed the fittings and refrigerant.

- Only one DHP may be claimed per home, regardless of the number of outdoor or indoor units installed, and regardless of the home’s square footage. For homes 4,500 sq. ft or larger, the home is also eligible for a PTCS or non-PTCS air source heat pump (ASHP) incentive.

### Additional Information

- Mini-splits with a multi-position ducted indoor air handler should be invoiced as an air source heat pump even when the air handler and ductless heads are served by the same outdoor compressor.
- At this time, Variable Refrigerant Flow (VRF) technologies (also known as VRV) do not qualify for the residential DHP measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential DHP configuration.

### 10.7.2 HVAC PTCS

This section covers:

- 10.7.2.1 Air Source Heat Pumps
- 10.7.2.2 Variable Speed Heat Pumps;
- 10.7.2.3 Commissioning, Controls and Sizing;
- 10.7.2.4 Ground-Source Heat Pumps; and
- 10.7.2.5 PTCS Duct Sealing

#### 10.7.2.1 PTCS Air Source Heat Pumps

**Basis for Energy Savings**

The base case (pre-existing state) used to calculate energy efficiency savings for air source heat pump upgrades are the heat pumps determined by RTF data to be current practice (8.5 HSPF and 14.0 SEER). The base case (pre-existing state) for air source heat pump conversions is an electric forced-air furnace (with or without central air conditioning). The base case (pre-existing state) for air source heat pump upgrades include nonelectric heating savings represented as a cost savings.

### Required Documents

- PTCS Heat Pump and Central Air Conditioner Sizing Calculator

### Supporting Content

- IM Document Library
- PTCS Air Source Heat Pump Form
- PTCS Air Source Heat Pump Specifications
- PTCS Online Registry
- PTCS Program Requirements
- Residential HVAC Website
- RTF Unit Energy Savings (UES) Measures
Energy savings are calculated using multiple runs of the calibrated SEEM simulation engine in combination with the prototype house weightings. This is in order to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis, for the efficient case of 9.0 HSPF/14.0 SEER. Savings for the efficient case include a Performance Tested Comfort Systems (PTCS) installation with commissioning, controls and sizing.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s Unit Energy Savings (UES) Measures webpage.

*If home is hydronically heated, an electric water heater serving a forced-air hydronic coil is considered equivalent to an electric furnace.
**Replacing a PTCS ducted air source heat pump that is no longer functioning with a new PTCS certified heat pump would qualify for an upgrade.
***Zonal is including zonal hydronic systems that do not utilize a duct system for distribution.

**Requirements and Specifications**

Measures include PTCS air source heat pump upgrades and conversions.

- Rated as having at least 9.0 HSPF and 14 SEER (for ducted systems with an HSPF below 9.0, see section 10.7.2.3);
- Equipment must be AHRI-tested and certified; manufacturer claims of “equivalent to AHRI-certified equipment” will not be accepted;
- PTCS work must be performed by a PTCS technician listed in the online site registry and certified according to the PTCS Program Requirements;
- Commissioned and installed according to the current PTCS Air Source Heat Pump Specifications available in the IM Document Library;
- Eligible installations must be entered in the online site registry.
Applicable to whole-home centrally ducted systems (for ducted mini-split heat pumps (DHPs), see section 10.7.1; for PTCS Variable Speed Heat Pumps, see section 10.7.2.2).

At this time, VRF technologies (also known as VRV) do not qualify for the residential PTCS Air Source Heat Pump measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential PTCS Air Source Heat Pump configuration.

Applicable Home Types:
- New construction single-family;
- Existing construction single-family;
- Existing manufactured homes (including new manufactured homes once on site for occupancy)

Heat Pump Upgrade applies to the following situations:
- Replacing an existing heat pump;
- Installing an air source heat pump in single-family new construction;
- Installing an air source heat pump in an existing single-family or existing manufactured home without any previously existing primary heating system;
- Adding a heat pump to a nonelectric heating system (i.e., gas, oil, propane or wood);
- Upgrading from zonal (including zonal hydronic systems that do not utilize a duct system for distribution) to air source heat pump;
- Replacing a ductless mini-split heat pump;
- Replacing a PTCS air source heat pump that is no longer functioning with a new PTCS-certified heat pump

All upgrades can be claimed as Any Electric or Non-Electric Heating System.

Heat Pump Conversion applies to the following situations:
- Converting an electric forced-air furnace to a high-efficiency heat pump;
- Converting from a hydronically heated system with an electric resistance water heat serving a forced air hydronic coil

PTCS forms and specifications are available in the IM Document Library and on the BPA Residential HVAC webpage.

Homes with less than 4,500 square feet of heated floor area may qualify for only one heat pump payment. This may be one ducted (PTCS or non-PTCS) or one ductless heat pump, but not both. There are two exceptions to this rule:

1. When the home has two entirely separate duct systems, the home is eligible for two air source heat pump payments but no more, even if there are more than two duct systems;

2. When the home’s ductwork has not been extended to an addition, a DHP may be installed to service the area of the home that does not contain ducts. In this scenario, the home may be eligible for a ducted air source heat pump (PTCS or non-PTCS) and one DHP payment.

Homes with greater than 4,500 square feet of heated floor area may qualify for up to two heat pump measures and no more, provided all other program requirements are met.

### Additional Information

PTCS air source heat pumps are subject to quality assurance inspection by a BPA-approved quality assurance inspector.

#### 10.7.2.2 PTCS Variable Speed Air Source Heat Pumps

### Basis for Energy Savings

The base case (pre-existing state) used to calculate energy efficiency savings for variable speed heat pump upgrades are the heat pumps determined by RTF data to be current practice (8.5 HSPF and 14.0 SEER). The base case (pre-existing state) for variable speed heat pump conversions is an electric...
forced-air furnace (with or without central air conditioning). The base case (pre-existing state) for variable speed heat pump upgrade includes nonelectric heating savings represented as a cost savings.

Energy savings are calculated using multiple runs of the calibrated SEEM simulation engine in combination with the prototype house weightings. This is in order to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis, for the efficient case of 9.0 HSPF/14.0 SEER. Savings for the efficient case includes a Performance Tested Comfort Systems (PTCS) installation with commissioning, controls and sizing.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

### Requirements and Specifications

Measures include PTCS variable speed heat pump upgrades and conversions.

- Rated as having at least 9.0 HSPF and 14 SEER (for ducted systems with an HSPF below 9.0, see section 10.7.2.3);

- Equipment must be AHRI-tested and certified; manufacturer claims of “equivalent to AHRI certified equipment” will not be accepted;

- Outdoor compressor must be variable speed or inverter-driven;

- PTCS work must be performed by a PTCS technician listed in the online site registry and certified according to the PTCS Program Requirements;

- Commissioned and installed according to the current PTCS Air Source Heat Pump Specifications available in the IM Document Library;

- Eligible installations must be entered in the online site registry.
Applicable to whole home centrally ducted systems (for ducted mini-split heat pumps, see section 10.7.1; for non-variable speed PTCS Air Source Heat Pumps, see section 10.7.2.1).

At this time, Variable Refrigerant Flow (VRF) technologies (also known as VRV) do not qualify for the residential PTCS Variable Speed Air Source Heat Pump measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential PTCS Variable Speed Air Source Heat Pump configuration.

Applicable Home Types:

- New construction single-family;
- Existing construction single-family;
- Existing manufactured homes (including new manufactured homes once on site for occupancy).

Variable Speed Heat Pump Upgrade applies to the following situations:

- Replacing an existing heat pump;
- Installing a variable speed heat pump in single-family new construction (only the upgrade measure applies);
- Installing a variable speed heat pump in an existing single-family or existing manufactured home (including new manufactured homes once on site for occupancy) without any previously existing primary heating system;
- Adding a variable speed heat pump to a nonelectric heating system (i.e., gas, oil, propane or wood);
- Upgrading from zonal (including zonal hydronic systems that do not utilize a duct system for distribution) to air source heat pump;
- Replacing a PTCS variable speed heat pump that is no longer functioning with a PTCS heat pump;
- Replacing a ductless mini-split heat pump

All upgrades can be claimed as Any Electric or Non-Electric Heating System.

Variable Speed Heat Pump Conversion applies to the following situations:

- Converting an electric forced-air furnace to a high-efficiency variable speed heat pump.
- Converting from a hydronically heated system with an electric resistance water heat serving a forced air hydronic coil.

PTCS forms and specifications are available in the IM Document Library and on the BPA Residential HVAC webpage.

Homes with less than 4,500 square feet of heated floor area may qualify for only one heat pump payment. This may be one ducted (PTCS or non-PTCS) or one ductless heat pump, but not both. There are two exceptions to this rule:

1. When the home has two entirely separate duct systems, the home is eligible for two air source heat pump payments but no more, even if there are more than two duct systems.
2. When the home’s ductwork has not been extended to an addition, a DHP may be installed to service the area of the home that does not contain ducts. In this scenario, the home may be eligible for a ducted air source heat pump (PTCS or non-PTCS) and one DHP payment.

Homes with greater than 4,500 square feet of heated floor area qualify for up to two heat pump measures and no more, provided all other program requirements are met.

### Additional Information

PTCS variable speed heat pumps are subject to a quality assurance inspection by a BPA-approved quality assurance inspector.

Access is available to the Northeast Energy Efficiency Partnership (NEEP) Cold Climate Specification List for air source heat pumps (including ductless heat pumps). This is an optional resource. Utilities are not required to utilize models on this list for program implementation.

See section 10.7.2.1 for information about PTCS Air Source Heat Pumps.

### 10.7.2.3 PTCS Commissioning, Controls and Sizing

#### Basis for Energy Savings

The base case (pre-existing state) used to calculate energy efficiency savings for PTCS commissioning, controls and sizing is determined by RTF data to be current practice (8.5 HSPF and 14.0 SEER). The base case (pre-existing state) for PTCS commissioning, controls and sizing is an electric forced-air furnace (with or without central air conditioning). The base case (pre-existing state) for PTCS commissioning, controls and sizing includes nonelectric heating savings represented as a cost savings.

### Required Documents

- PTCS Heat Pump and Central Air Conditioner Sizing Calculator

### Supporting Content

- IM Document Library
- NEEP Cold Climate Website
- PTCS Air Source Heat Pump Form
- PTCS Air Source Heat Pump Specifications
- PTCS Program Requirements
- PTCS Online Registry
- Residential HVAC Website
- RTF Unit Energy Savings (UES) Measures
Energy savings are calculated using multiple runs of the calibrated SEEM simulation engine in combination with the prototype house weightings. This is in order to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis, for the efficient case of current code minimum HSPF and SEER. Savings for the efficient case includes a PTCS installation with commissioning, controls and sizing.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

</tbody>
</table>

*If home is hydronically heated, an electric water heater serving a forced-air hydronic coil is considered equivalent to an electric furnace.

**Zonal includes zonal hydronic systems that do not utilize a duct system for distribution.

### Requirements and Specifications

- Any new ducted air source and variable speed heat pumps;
- Rated as having an HSPF below 9.0 that meets the federal minimum standard. (For systems with an HSPF of 9.0 or above, see sections 10.7.2.1 and 10.7.2.2);
- Equipment must be AHRI-tested and certified; manufacturer claims of “equivalent to AHRI certified equipment” will not be accepted;
- PTCS work must be performed by a PTCS technician listed in the online site registry and certified according technician to the PTCS Program Requirements;
- Commissioned and installed according to the current PTCS Air Source Heat Pump Installation Specification available in the IM Document Library;
- Eligible installations must be entered in the online site registry;
- Cannot be claimed in combination with any other heat pump measure applicable to whole-home centrally ducted systems (for ducted mini-splits, see section 10.7.1).
At this time, VRF technologies (also known as VRV) do not qualify for the residential PTCS Air Source Heat Pump measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential PTCS Air Source Heat Pump configuration.

Applicable Home Types:
- New construction single-family;
- Existing construction single-family;
- Existing manufactured homes (including new manufactured homes once on site for occupancy)

Commissioning, Controls and Sizing (for air source and variable speed heat pumps) applies to commissioning any new air source heat pump with an HSPF below 9.0 when replacing any heating system type, adding an air source heat pump to an existing single-family or existing manufactured home without any previously existing primary heating system, or installing a new heat pump in single-family new construction.

PTCS forms and specifications are available in the IM Document Library and on the BPA Residential HVAC webpage.

Homes with less than 4,500 square feet of heated floor area may qualify for only one heat pump payment. This may be one ducted (PTCS or non-PTCS) or one ductless heat pump, but not both. There are two exceptions to this rule:

1. When the home has two entirely separate duct systems, the home is eligible for two air source heat pump payments but no more, even if there are more than two duct systems;

2. When the home’s ductwork has not been extended to an addition, a DHP may be installed to service the area of the home that does not contain ducts. In this scenario, the home may be eligible for a ducted air source heat pump (PTCS or non-PTCS) and one DHP payment.

Homes with greater than 4,500 square feet of heated floor area qualify for up to two heat pump measures and no more, provided all other program requirements are met.

### Additional Information

PTCS commissioning, controls and sizing installations are subject to quality assurance inspection by a BPA-approved quality assurance inspector.

Beginning Oct. 1, 2019, BPA will begin offering access to the Northeast Energy Efficiency Partnership (NEEP) Cold Climate Specification List for variable speed air source heat pumps (including ductless heat pumps) that retain their efficiency at lower operating temperatures. This is an optional resource. Utilities will not be required to utilize models on this list.

### 10.7.2.4 PTCS Ground Source Heat Pumps

#### Basis for Energy Savings

The base case (pre-existing state) used to calculate energy efficiency savings for ground source heat pump upgrades are the heat pumps determined by RTF data to be current practice (8.5 HSPF and 14.0 SEER). The base cases (pre-existing state) for ground source heat pump conversions are an electric forced-air furnace (with or without central air conditioning).

Energy savings are calculated using multiple runs of the calibrated SEEM simulation engine, in combination with the prototype house weightings. This generates heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis, for the efficient case of an ENERGY STAR Ground Source Heat Pump. Additional savings are added in the case of a desuperheater. Savings for the efficient case includes a PTCS and International Ground Source Heat Pump Association (IGSHPA) installation with commissioning, controls and sizing.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

*Projects that replace only the compressor portion of an existing ground source heat pump system may be eligible for an upgrade measure. See details under Requirements and Specifications.

### Requirements and Specifications

Measures include PTCS ground source heat pump upgrades or conversions with or without a de-superheater and must meet the following requirements and specifications:

- Systems must be ENERGY STAR-Qualified as determined by the PTCS call center personnel;
- PTCS work must be performed by a PTCS technician(s) listed in the online site registry and certified according to the PTCS Program Requirements and IGSPHA. Multiple technicians may be employed to meet these certification requirements, but they must have been present during the installation to qualify;
- Commissioned and Installed according to according to the IGSPHA specifications available at the time of installation and one of the two Ground Source Heat Pump Specifications listed below, which are available in the IM Document Library:
  - Closed-loop ground source heat pumps installed according to the current Ground Source Closed Loop Heat Pump System Installation Standards;
  - Open-loop ground source heat pumps installed according to the current PTCS Ground Water Source Open Loop Heat Pump Installation Specification
- Eligible installations must be entered in the online site registry;
• All system components must be newly installed. The replacement of an existing ground source heat pump thermal exchange loop does not qualify for an incentive.

Applicable home types in heating zones (HZ) 2 and 3 only:
• New construction single-family;
• Existing construction single-family

Ground Source Heat Pump Upgrade applies to the following situations:
• Replacing an existing air source heat pump;
• Replacing zonal electric;
• Replacing a ductless heat pump (considered a zonal system);
• Replacing a nonelectric heating system (i.e. gas, oil or propane);
• Replacing the compressor portion only (compressor portion includes the compressor, a heat exchanger, expansion and reversing valves, piping connections and control connections) of an existing ground source heat pump system is eligible for an upgrade measure when the compressor portion is ENERGY STAR-Qualified and the measure is claimed using the ground source heat pump compressor portion only upgrade measure in the UES Measure List;
• Installing a ground source heat pump in a new construction single-family home;
• Installing a ground source heat pump in an existing single-family home (HZ 2 & 3) without any previously existing primary heating system

Ground Source Heat Pump Conversion applies to the following situations:
• Replacing an electric furnace;
• Replacing an electric boiler used for forced-air hydronic heating or zonal radiant heat

Ground source heat pump forms and specifications are available in the IM Document Library and on the BPA Residential HVAC webpage.

Only one ground source heat pump per home qualifies for BPA payment, provided all other program requirements are met. Ground source heat pumps may be connected to hydronic heating systems in residential end-use applications if all PTCS and IGSHPA specifications are met.

Additional Information
PTCS ground source heat pumps are subject to quality assurance inspection by a BPA-approved quality assurance inspector.

10.7.2.5 PTCS Duct Sealing

Basis for Energy Savings
Multiple runs of the calibrated SEEM simulation engine are used in combination with the prototype house weightings. This generates heating energy use for baseline and efficient cases for each heating system type and heating zone, within the analysis for the PTCS duct sealing measure. Primary parameters are the key SEEM inputs and factors in differences in average duct leakage to the exterior of the home with variations for basement, crawlspace and/or slab homes, as provided by the RBSA.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

### Payment

**MEASURE CATEGORY** | **PAYMENT**
--- | ---
Prescriptive Duct Sealing, Existing Manufactured Homes (including new manufactured homes once on site for occupancy) | $200
Prescriptive Duct Sealing, Existing Single-family Homes | $250

### Additional Information

Prescriptive duct sealing is subject to quality assurance inspection by a BPA-approved quality assurance (QA) inspector.

The prescriptive duct sealing measure utilizes some of the PTCS infrastructure, including training and QA inspections. See section 10.7.2.5 for more information about PTCS Duct Sealing.

**10.7.4 Air Source Heat Pump Conversion from Electric Forced-Air Furnace to Air Source Heat Pump (without PTCS)**

**Basis for Energy Savings**

The base case (pre-existing state) for air source heat pump conversions are an electric forced-air furnace (with or without central air conditioning).

Energy savings are calculated using multiple runs of the calibrated SEEM simulation engine in combination with the prototype house weightings. This is in order to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis, for the efficient case of 9.0 HSPF and 14.0 SEER.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures [webpage](#).

</tr>
</tbody>
</table>

Requirements and Specifications

- This measure is available for existing single-family and existing manufactured homes with whole-home centrally ducted systems. For ducted mini-splits, see section 10.7.1.
- This measure is a conversion from an electric forced-air furnace to a high-efficiency ducted heat pump without installing to PTCS specifications.
- New heat pumps must be rated as having at least 9.0 HSPF and 14 SEER.
- Equipment must be AHRI-tested and certified; manufacturer claims of “equivalent to AHRI certified equipment” will not be accepted.

Customers may not claim payments for this measure and PTCS Air Source Heat Pumps for the same equipment.

At this time, VRF technologies (also known as VRV) do not qualify for the residential Conversion from Electric Forced-Air Furnace to Air Source Heat Pump (without PTCS) measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential Conversion from Electric Forced-Air Furnace to Air Source Heat Pump (without PTCS) configuration.

Homes with less than 4,500 square feet of heated floor area may qualify for only one heat pump payment. This may be one ducted (PTCS or non-PTCS) or one ductless heat pump, but not both. There are two exceptions to this rule:

1. When the home has two entirely separate duct systems, the home is eligible for two air source heat pump payments but no more, even if there are more than two duct systems;
2. When the home’s ductwork has not been extended to an addition, a DHP may be installed to service the area of the home that does not contain ducts. In this scenario, the home may be eligible for a ducted air source heat pump (PTCS or non-PTCS) and one DHP payment.

Homes with greater than 4,500 square feet of heated floor area qualify for up to two heat pump measures and no more, provided all other program requirements are met.

</thead>
<tbody>
<tr>
<td>Heat Pump Conversion from Electric Forced-Air Furnace to Air Source Heat Pump</td>
<td>$800</td>
</tr>
</tbody>
</table>

### Additional Information

This measure is for air source heat pumps installations that do not follow the PTCS installation specification. Air source heat pumps installed according to PTCS installation specifications and requirements qualify for higher energy savings and payments. For PTCS air source heat pumps and PTCS variable speed air source heat pumps, please refer to sections 10.7.2.1 and 10.7.2.2.

Homes with zonal heating must utilize section 10.7.2.1 for PTCS air source heat pumps and section 10.7.2.2 for PTCS variable speed air source heat pumps.

PTCS or Prescriptive Duct Sealing may be completed and claimed in addition to this measure; however duct sealing is not required for completion of this measure.

**10.7.5 Air Source Heat Pump Conversion from Electric Forced-Air Furnace to Variable Speed Air Source Heat Pump (without PTCS)**

**Basis for Energy Savings**

The base case (pre-existing state) for air source heat pumps conversions are an electric forced-air furnace (with or without central air conditioning).

Energy savings are calculated using multiple runs of the calibrated SEEM simulation engine in combination with the prototype house weightings. This is in order to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis, for the efficient case of 9.0 HSPF and 14.0 SEER.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s Unit Energy Savings (UES) Measures [webpage](#).

</tr>
</tbody>
</table>

#### Requirements and Specifications

- This measure is available for existing single-family and existing manufactured homes with whole-home centrally ducted systems. For ducted mini-splits, see section 10.7.1.

- This measure is a conversion from an electric forced-air furnace to a high-efficiency ducted variable speed heat pump without installing to PTCS specifications.

- New heat pumps must be rated as having at least 9.0 HSPF and 14 SEER.

- Equipment must be AHRI-tested and certified; manufacturer claims of “equivalent to AHRI certified equipment” will not be accepted.

- The outdoor compressor must be variable speed or inverter-driven and documentation must be provided demonstrating that.

Customers may not claim payments for this measure and PTCS Air Source Heat Pumps for the same equipment.

At this time, VRF technologies (also known as VRV) do not qualify for the residential Conversion from Electric Forced-Air Furnace to Variable Speed Air Source Heat Pump (without PTCS) measure. BPA understands that the cost and energy savings for VRFs differ significantly from a standard residential Conversion from Electric Forced-Air Furnace to Variable Speed Air Source Heat Pump (without PTCS) configuration.

Homes with less than 4,500 square feet of heated floor area may qualify for only one heat pump payment. This may be one ducted (PTCS or non-PTCS) or one ductless heat pump, but not both. There are two exceptions to this rule:

1. When the home has two entirely separate duct systems, the home is eligible for two air source heat pump payments but no more, even if there are more than two duct systems.

2. When the home’s ductwork has not been extended to an addition, a DHP may be installed to service the area of the home that does not contain ducts. In this scenario, the home may be eligible for a ducted air source heat pump (PTCS or non-PTCS) and one DHP payment.

Homes with greater than 4,500 square feet of heated floor area qualify for up to two heat pump measures and no more, provided all other program requirements are met.

### Additional Information

This measure is for variable speed air source heat pump installations that do not follow the PTCS installation specification. Variable speed air source heat pumps installed according to PTCS installation specifications and requirements qualify for higher energy savings and payments. Please refer to section 10.7.2.1 for PTCS air source heat pumps and section 10.7.2.2 for PTCS variable speed air source heat pumps.

Homes with zonal heating must utilize section 10.7.2.1 for PTCS air source heat pumps and section 10.7.2.2 for PTCS variable speed air source heat pumps.

Access is available to the Northeast Energy Efficiency Partnership (NEEP) Cold Climate Specification List for air source heat pumps (including ductless heat pumps). This is an optional resource. Utilities are not required to utilize models on this list for program implementation.

For installations without a variable speed outdoor compressor or air source heat pumps where it cannot be confirmed that the outdoor compressor is variable speed, please refer to 10.7.4, Air Source Heat Pump Conversion from Electric Forced-Air Furnace to Air Source Heat Pump (without PTCS).

PTCS or Prescriptive Duct Sealing may be completed and claimed in addition to this measure; however, duct sealing is not required for completion of this measure.
10.8 THERMOSTATS

10.8.1 Line-Voltage Thermostats

Basis for Energy Savings

The base case (pre-existing state) is a home with electric-resistance zonal heat (baseboards or wall heaters) with line-voltage, bi-metal thermostats. The energy savings for line-voltage thermostats uses a weighted average of heating loads multiplied by a percent reduction of heating load. This savings arises from the line-voltage thermostats maintaining temperature closer to the set temperature on the dial (smaller hysteresis) than do older, bi-metal thermostats. The hysteresis, also known as dead band, refers to the temperature difference range between a thermostat coming on and shutting off.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s Unit Energy Savings (UES) Measures webpage.

Requirements and Specifications

This measure is claimed on a per-thermostat basis and is available for existing and new single-family and multifamily low-rise and mid-/high-rise homes. Customers must replace thermostats in existing, electrically heated single-family or multifamily homes with line-voltage electronic thermostats. All thermostats must meet the following requirements:

- Have a digital display
- Be electronically line-voltage type
- Have a thermistor temperature sensing element that is accurate to within 1.5 degrees or better
- Be UL- or CSA-listed for use with their application (i.e., fan-forced, baseboard, wall or ceiling radiant)

In addition, line voltage thermostats that are programmable must maintain temperature and program settings during power failures, and have a temporary override feature.

10.8.2 Advanced Smart Thermostats — BPA-Qualified

Basis for Energy Savings

The base case used to calculate energy efficiency savings for advanced smart thermostats are single-family, manufactured and multifamily homes with existing forced-air furnaces, or air and ground source heat pumps. The calculation of energy efficiency savings for smart thermostats utilized multiple runs of the Simplified Energy Enthalpy Model (SEEM) simulation engine, calibrated with results from a study of the performance of advanced smart thermostats in actual homes. It was combined with prototype house weightings to generate heating energy use for baseline and efficient cases for each heating system type and heating zone within the analysis.

BPA does not recommend smart thermostats be installed to control variable speed heat pumps as savings and compatibility are at this point uncertain.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

Measures include smart thermostats for homes with electric forced-air furnace, air source heat pumps and ground source heat pumps as their primary system.

Advanced Smart thermostat measures are available through the following channels:

- Retail
- By Request
- Coupon or Instant Discount
- Direct Install
- Standard Rebate Payment

Please note: Items distributed in any distribution channel through Simple Steps or a successor BPA program will have separate refnos from those used for utility run programs.

These measures are available for existing and new construction single-family, manufactured, multifamily low-rise and multifamily mid/high-rise homes. Advanced smart thermostats (other than those claimed through the direct install distribution channel) can be installed by any individual. Advanced smart thermostats claimed through the direct install channel must meet installation requirements as listed in the Multisector Chapter.

Qualifying advanced smart thermostats must:

- Be listed on BPA’s Smart Thermostat Qualified Products List;
- Have occupancy detection set to “on”; and
- Be set to the geographic location where the thermostat is located.

Required Documents

Smart Thermostat Project Information Form

Supporting Content

RTF Unit Energy Savings (UES) Measures
BPA’s Smart Thermostat Qualified Products List
Measure Distribution Log
In addition to the requirements above, thermostats controlling air source heat pumps must be programmed to recognize the existing heat pump system.

Thermostats that control cooling-only systems or dual-fuel heating systems (gas furnace and electric heat pump) are not eligible for an incentive.

**10.9 NEW CONSTRUCTION**

**10.9.1 New Northwest Energy Efficient Manufactured Housing (NEEM)**

**Basis for Energy Savings**
The base case (pre-existing state) is a current manufactured home built in the Pacific Northwest, which tend to be slightly better than HUD code. The base case considers individual components including envelope, HVAC, lighting, appliances and water heating. Energy savings for a new, NEEM manufactured home are based on multiple analyses using the Simplified Energy Enthalpy Model (SEEM) simulation engine for baseline and efficient cases for a weighted average of five cities (to represent the Northwest). This is based on a prototype and heating/cooling system type for single prototype square footage. The output of this analysis is then divided into three heating/cooling zones, based on a weighted average of SEEM run results for the five locales. The SEEM model also accounts for interaction with the lighting power reduction of this measure.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures [webpage](#).

**Requirements and Specifications**
Manufactured homes must be electrically heated, new and certified by the Northwest Energy Efficient Manufactured Housing Program (NEEM).

**Documentation Requirements**

<td>NEEM 1.1 All Heating Zones</td>
<td>$1,200 per home</td>
</tr>
<tr>
<td>NEEM 2.0 All Heating Zones</td>
<td>$1,400 per home</td>
</tr>
</tbody>
</table>

**Additional Information**
New NEEM 1.1 or 2.0 Home payments are available for NEEM 1.1 and 2.0 versions.

Beginning in 2018, NEEM marketing materials will be updated to refer to NEEM 1.1 as ENERGY STAR and NEEM 2.0 as ENERGY STAR with NEEM+. Certification documents for both efficiency levels will continue to display the NEEM 1.1 or NEEM 2.0 nomenclature necessary for BPA compliance and reporting. However, market-facing materials may use the ENERGY STAR or ENERGY STAR with NEEM+ designation.

NEEM has an online tracking and certification system operated by Northwest Energy Works. Contact Northwest Energy Works at (888) 370-3277, ext. 102, for current information.
10.9.2 Replacement of Pre-1976 Manufactured Home with New Northwest Energy Efficient Manufactured Housing (NEEM) Certified Home

**Basis for Energy Savings**
The base case (pre-existing state) is a manufactured home built before the 1976 HUD Manufactured Housing Code. Energy consumption estimates for the pre-1976 home are based on Residential Building Stock Assessment (RBSA) data and individual components including envelope, HVAC, lighting, appliances and water heating. Energy savings for a New Northwest Energy Efficient Manufactured Housing (NEEM) Manufactured Home are based on multiple analyses using the SEEM simulation engine for baseline and efficient cases for a weighted average of five cities (to represent the Northwest) based on prototype and heating/cooling system type for single prototype square footage. Output of this analysis is then divided into three heating/cooling zones based on a weighted average of SEEM run results for the five locales. The SEEM model also accounts for interaction with the lighting power reduction of this measure. Total energy savings is based on the difference between the estimated energy use of the pre-1976 home and the new NEEM 1.1 or NEEM 2.0 home. BPA documentation requirements consider these factors. More detailed information is available on the RTF’s [webpage](#).

**Requirements and Specifications**
Existing manufactured homes must have been built prior to 1976, be electrically heated and be occupied as a residence. The existing pre-1976 home must be decommissioned and disposed of and cannot be used as a dwelling unit once the new NEEM home is sited.

Replacement manufactured homes must be electrically heated, new and certified by the Northwest Energy Efficient Manufactured Housing (NEEM) program as a New NEEM 1.1 or 2.0 Home.

**Documentation Requirements**

<table>
<thead>

</tr>
<tr>
<td>Replacement of Pre-1976 Manufactured Home with an electrically heated new NEEM 2.0 home. All heating zones.</td>
<td>$2,500 per home</td>
</tr>
</tbody>
</table>
Customers may claim high efficiency heating and thermostat measures in addition to this measure, but may not claim residential UES measures that could be found within the NEEM 1.1 or NEEM 2.0 specifications.

NEEM has an online tracking and certification system operated by Northwest Energy Works. Contact Northwest Energy Works (888) 370-3277, ext. 102, for current information.

Additional Information
Manufactured home replacement often occurs through the collaborative efforts of many organizations and is often not directly led by utilities or their agents. Customers may replace Pre-1976 Manufactured Homes with a new NEEM Certified Home themselves, or through a third-party, but must retain responsibility for compliance with measure requirements.

In addition to NEEM 1.1 and 2.0, and Replacement of Pre-1976 Manufactured Home with a New NEEM Certified Home, the following are available as alternative stand-alone measures in New Manufactured Homes. For requirements, specifications and payment levels, see the referenced section. Stand-alone measures may not be claimed in addition to NEEM 1.1 or 2.0 with the exception of high efficiency heating and thermostat measures.

10.9.3 Single-Family New Construction Performance Path

Basis for Energy Savings
The base case (pre-existing state) is a code minimum home for Idaho, Montana, Oregon or Washington. Energy savings for the Single-Family New Construction Performance Path is based on RTF-Approved New Homes Standard Protocol, BPA requirements also integrate the NW Modeling Requirements and RTF Unit Energy Savings (UES) Measures through the AXIS Database.

When state energy codes are updated, base case homes for each state will be updated, which may result in a reduction in potential energy savings and payment.

Required Documents
Axis Database generated
Performance Path Calculator
Summary Report
Supporting Content
RTF Unit Energy Savings (UES) Measures
Performance Path Website
The Single-Family New Construction Performance Path utilizes REM/Rate, RTF UES Measures, and the NEEA-maintained AXIS database to compare the modeled energy consumption of a new home to the modeled energy consumption of a typical code-built home. This will allow a customer to request a payment based on the energy savings of the new home, compared to the code home. Calculations are performed by the AXIS database, which provides a report with required documentation to customers.

Requirements and Specifications

Homes must be new, single-family homes. Individual dwelling units in buildings that meet the BPA definition of single-family, which contain more than one dwelling unit, must be modeled separately and will receive a payment for each individual dwelling unit. This measure is available for all heating zones in all states.

Homes must be modeled in REM/Rate according to the NW Modeling Requirements, and uploaded to the AXIS database for calculation and addition of energy savings from RTF UES measures.

In order to qualify for payment, the total combined energy savings of the home as reported in AXIS must be a minimum of 10% more efficient than the code-built reference home.

The AXIS-reported energy savings must be documented through the Performance Path Calculator Summary Report, and the savings and associated payment from the calculator must be entered manually into the BPA UES Measure Upload Template in the calculator results fields.

Customers may not request payments for individual UES Measures, or the Montana House Specification and the Single-Family New Construction Performance Path in the same new home.

Documentation Requirements

<td></td>
</tr>
</tbody>
</table>

Payment

BPA shall pay for Single-Family New Construction Performance Path on a kilowatt-hour-saved basis according to the table below:

<table>
<thead>
<tr>
<th>ENERGY SAVINGS CATEGORY</th>
<th>PAYMENT PER KWH SAVED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shell Upgrades, including Windows</td>
<td>$0.45</td>
</tr>
<tr>
<td>HVAC and Water Heating Upgrades</td>
<td>$0.27</td>
</tr>
<tr>
<td>Appliance Upgrades</td>
<td>$0.27</td>
</tr>
<tr>
<td>Lighting Upgrades, including Fixtures, Showerheads and Smart Thermostats</td>
<td>$0.10</td>
</tr>
</tbody>
</table>
**Additional Information**

For the Single-Family New Construction Performance Path, the permit date is the date to be used to determine code compliance for construction.

The Performance Path Calculator Summary Report is generated by the AXIS database that has fields similar to the BPA UES Measure Upload Template and contains specific reporting information necessary for savings reliability as well as additional information necessary for measure evaluation. AXIS-generated energy savings must be entered manually into the “Calculator Results” columns within the BPA UES Measure Upload Template. Please contact NEEA for more information on accessing the Summary Report. For more information on how to access this report, visit betterbuiltnw.com.

This measure is supported by NEEA. For assistance or questions on REM/Rate, becoming a rater or AXIS, visit betterbuiltnw.com.

**10.9.4 Montana House (v 2.0)**

**Basis for Energy Savings**

The base case (pre-existing state) is a code-minimum home for Montana. Energy savings for the Montana House is based on the upgrades over a code-minimum home based on the Montana House v 2.0 Program Specifications (RTF, 2015). It was modeled through multiple runs with the SEEM simulation engine for baseline and efficient cases for homes with and without basements. SEEM analysis was performed for each foundation type, and takes into account the interaction with lighting and ventilation components. Upgrades to HVAC efficiency are additive for the Montana House new construction measures.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

**Requirements and Specifications**

Homes must be new, electrically heated and compliant with the Montana House v 2.0 specification (available in the IM Document Library). This measure is available only for single-family new construction homes built in Montana, and Heating Zones 2 and 3 in Idaho, Wyoming and Nevada.

Air Source Heat Pump, Variable Speed Heat Pump, Ground Source Heat Pumps (with or without desuperheater), Ductless Heat Pumps and Commissioning and Controls may be combined with the shell upgrade measures for the Montana House. See the appropriate measure section for requirements. Note that the Commissioning, Controls and Sizing measures may not be claimed in combination with any other heat pump measure.

**Documentation Requirements**

10.9.5 BPA Energy Efficient New Multifamily Construction (BPA-Qualified)

Basis for Energy Savings
The base case (pre-existing state) is a representative sample of dwelling units built to the 2015 Washington Energy Code. Energy savings for this measure is based on SEEM analysis of efficiency improvements needed to exceed the code by at least 10% resulting in a dwelling unit that is a minimum of 10% more efficient than code. Energy savings for each state is adjusted for the applicable state code and climate zones. This model takes into account interaction with lighting and ventilation components, and whole house energy savings specific to electric components.

Requirements and Specifications
BPA maintains a Qualified Programs List of certification programs and pathways that qualify for BPA Energy Efficient New Multifamily Construction payments, which have been pre-approved by BPA as reliably achieving a minimum of 10 percent energy savings over the 2015 Washington Energy Code. When state energy codes are updated, certification programs that no longer achieve 10% energy savings over the new energy code will be removed from the Qualified Programs List. Programs and pathways must be on the Qualified Programs List in order to qualify for this payment, and remain a minimum of 10% above Washington Energy Code to remain on the List for any state.

This measure is for individual dwelling units in new, multifamily low-rise and mid/high-rise construction in all states. Not all certifications and pathways on the BPA Energy Efficient New Multifamily Construction Qualified Programs List may be utilized for both low-rise and mid/high-rise multifamily construction. Consult the individual certification program or pathway requirements to determine each program’s eligibility. Customers may claim one incentive per dwelling unit. For BPA Energy Efficient New Multifamily Construction, the permit date is the date to be used to determine code compliance for construction.

10.9.6 BPA Zero Energy Ready New Multifamily Construction (BPA-Qualified)

Basis for Energy Savings

The base case (pre-existing state) is a representative sample of dwelling units built to the 2015 Washington Energy Code. Energy savings for this measure is based on SEEM analysis of efficiency improvements needed to exceed the code by at least 25% resulting in a dwelling unit that is a minimum of 25% more efficient than code. Energy savings for each state is adjusted for the applicable state code and climate zones. This model takes into account interaction with lighting and ventilation components, and whole house energy savings specific to electric components.

Requirements and Specifications

BPA maintains a Qualified Programs List of certification programs and pathways that qualify for BPA Zero Energy Ready New Multifamily Construction payments, which have been pre-approved by BPA as reliably achieving a minimum of 25% energy savings over the 2015 Washington Energy Code. When state energy codes are updated, certification programs that no longer achieve 25% energy savings over the new energy code will be removed from the Qualified Programs List. Programs and pathways must be on the Qualified Programs List in order to qualify for this payment and remain a minimum of 25% above Washington Energy Code to remain on the List for any state.

This measure is for individual dwelling units in new, multifamily low-rise and mid/high-rise construction in all states. Not all certifications and pathways on the BPA Zero Energy Ready New Multifamily Construction Qualified Programs List may be utilized for both low-rise and mid/high-rise multifamily construction. Consult the individual certification program or pathway requirements to determine each program’s eligibility. Customers may claim one incentive per dwelling unit. For BPA Zero Energy Ready Multifamily Construction the permit date is the date to be used to determine code compliance for construction.

*Note: Not all weatherization measures are available in manufactured homes and/or both low-rise and mid/high-rise multifamily housing. Refer to individual measure sections for more detail.

For the purposes of section 10.10 and associated weatherization measures, an electric heating system includes an air source heat pump, ground source heat pump, electric forced-air furnace, ductless or ducted mini-split heat pump, zonal electric-resistance heat or plug-in space heaters.

Weatherization measures include insulation, prime window replacement, Low-E storm windows, exterior insulated doors and air sealing. All weatherization measures in single-family and manufactured homes must be installed according to the 2016 BPA Residential Weatherization Specifications in the [IM Document Library](#).

Weatherization measures must be installed in homes with an electric heating system as the primary system (serving 50% or more of the conditioned living area of a residence) or the homes must have one of the following as an existing heating system:

1. A permanently installed electric heating system with either a wood stove, pellet stove, fireplace, fireplace insert (wood or pellet) or wood furnace

### Supporting Content

- [2016 BPA Residential Weatherization Specifications](#)
- [IM Document Library](#)
- [RTF Unit Energy Savings (UES) Measures](#)
- [Interim Solution 2.0 Files - UES Measure List](#)
- [Optional Weatherization Data Collection Form](#)
2. A wood or pellet stove with no other nonelectric space heating system, accompanied by the current usage of plug-in electric space heaters

3. An electric heat pump system integrated with a nonelectric heating system (e.g., natural gas, propane or wood supplementary/backup system)

4. An electric heat system and a separate nonelectric space heating system (i.e., oil, natural gas or propane furnace) with the entire functional or nonfunctional nonelectric space heating system decommissioned, removed, all penetrations sealed and all fuel (electric, gas or oil) connections to the decommissioned heating system disconnected. System equipment includes furnace, air-handler, fuel lines and fuel tanks (abated in compliance with local code). If, however, construction limitations prevent the removal of the entire nonelectric system (or other portions of the space heating equipment), then the remainder of the system must be decommissioned, removed, all penetrations sealed and all fuel (electric, gas or oil) connections to the decommissioned heating system disconnected.

10.10.1 Insulation

Basis for Energy Savings

The base case (pre-existing state) is defined as a range of R-values for a building component before insulation is installed. The efficient case for insulation measures is defined as meeting a minimum insulation R-value in that building component. Energy savings for insulation measures are estimated using SEEM, an energy modeling software calibrated to real world energy consumption using prototype homes representative of Northwest construction, assuming that all other weatherization measures have been installed in the home. “Any Electric Heat” measures are a weighted average of homes with an electric furnace, electric zonal or a heat pump based on the RBSA. Savings are reduced by the percentage of heat supplied by supplemental fuels for an average home.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

Insulation measures in single-family and manufactured homes must be installed according to the 2016 BPA Residential Weatherization Specifications found in the IM Document Library. Final installed R-values for a reportable measure must meet the required final R-value at a minimum, unless a physical barrier prevents the full depth of insulation from being installed.

Note that the sloped surface of an A-frame home (the entire roof structure) must be insulated and invoiced as an unvented attic (see section 4.6 Unvented Attics in the BPA Residential Weatherization Specifications).

Payment

Payments and busbar energy savings for specific measures are available in the UES Measure List in the Interim Solution 2.0 Files. Payments are available for HVAC-specific primary heat types or by reporting Any Electric Heat.

Additional Information

The Any Electric Heat measures assume a weighted average of reported measures. Utilities that report single-family insulation to the Any Electric measures should not also use the HVAC-specific measures on the same invoice submitted to BPA. Utilities may switch to Any Electric if reporting to the HVAC-specific measures delivers little benefit or they would like to claim higher payments.

10.10.2 Prime Window and Patio Door Replacement

Basis for Energy Savings

The base case (pre-existing state) is a single-pane window or patio door with any frame type, or a double-pane window or patio door with a metal frame. The efficient case for prime window replacement measures is the U-factor for the efficient replacement window. Energy savings for prime window replacement measures are estimated using SEEM, an energy modeling software calibrated to real world energy consumption using prototype homes representative of Northwest construction, assuming that all other weatherization measures have been installed in the home. “Any Electric Heat” measures are a weighted average of homes with an electric furnace, electric zonal or a heat pump based on the RBSA. Savings are reduced by the percentage of heat supplied by supplemental fuels for an average home.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.
Requirements and Specifications

- Pre-existing windows and patio doors must be: (1) single-pane with/without storms, any frame type (e.g., metal, wood or vinyl) or (2) double-pane, metal frame only.

- The weighted average of replacement windows must have a National Fenestration Rating Council (NFRC) minimum U-value of 0.30 or 0.22 for windows, and 0.35 or 0.30 for patio doors.

- Multifamily mid/high-rise buildings are not eligible for patio door replacement.

- Window and patio door measures in single-family and manufactured homes must be installed according to the 2016 BPA Residential Weatherization Specifications found in the IM Document Library.

### Additional Information

The Any Electric Heat measures assume a weighted average of reported measures. Utilities who report single-family windows to the Any Electric measures should not also use the HVAC-specific measures on the same invoice submitted to BPA. Utilities may switch to Any Electric if reporting to the HVAC-specific measures delivers little benefit or they would like to claim higher payments.
10.10.3 Low-E Storm Windows

Basis for Energy Savings

The base case (pre-existing state) is a single-pane window with any frame type, or a double-pane window with a metal frame without existing storm windows. The efficient case for the replacement Low-E storm and prime window system is the combined U-factor for the combined storm window and pre-existing window. ENERGY STAR certified storm windows must meet the emissivity, solar transmittance (Tsol), and air leakage requirements based on climate zone. Energy savings for Low-E storm window installation measures are estimated using SEEM, an energy modeling software calibrated to real world energy consumption using prototype homes representative of Northwest construction. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

This measure is not available for mid/high-rise multifamily buildings.

Pre-existing windows must be either (1) single-pane, any frame type (e.g., metal, wood or vinyl) without existing storm windows; or (2) double-pane, metal frame only without existing storm windows. The new Low-E storm window must be an ENERGY STAR certified product.

The Low-E storm window must have the same opening type as the existing prime window (i.e., single/double hung, casement, slider, etc.) to facilitate summertime ventilation and egress. If installed with an existing metal frame window, the storm window frame must not be in direct contact with the metal frame (attach using framing lumber or furring strips). The Low-E storm window must be installed per manufacturer’s specification, fastened by screws, not designed for seasonal removal, and with the Low-E coating facing toward the home’s interior.

Documentation Requirements

<table>
<thead>
<tr>

<tbody>
<tr>
<td>ENERGY STAR certified Low-E Storm Window</td>
<td>$2 per Square Foot</td>
</tr>
<tr>
<td>Single-pane any frame type, or double-pane metal frame</td>
<td></td>
</tr>
</tbody>
</table>

Additional Information

Installing Low-E storm windows with windows of the same opening type can be difficult when the prime window is a casement or awning style. For these prime window types, installation of a new prime window may be preferable over the addition of a Low-E storm window.

10.10.4 Exterior Insulated Doors (BPA-Qualified)

Basis for Energy Savings

The base case (pre-existing state) is a substandard exterior door, such as one that does not contain an insulating material or one where the weather stripping has degraded by at least 50%. The efficient case for an Insulated Exterior Door is a prehung, ENERGY STAR door. Energy savings come from the improvement to the building envelope and the reduction of infiltration. BPA documentation requirements consider these factors for this BPA-Qualified measure.

Requirements and Specifications

This measure is not available for multifamily mid/high-rise.

The door must be a pre-hung, ENERGY STAR-Qualified door, include replacement of the threshold, and replace an uninsulated or otherwise substandard (from a thermal perspective) exterior door.

If the door is not ENERGY STAR certified, or the ENERGY STAR list is not accessible, utilities may comply by documenting that the door meets ENERGY STAR specifications:

<table>

**10.10.5 Whole House Air Sealing and Testing**

**Basis for Energy Savings**

Whole House Air Sealing is an incremental improvement in leakage of a home, measured with a blower door. Energy savings for Whole House Air Sealing are estimated using SEEM, an energy modeling software calibrated to real world energy consumption, assuming all other weatherization measures have been installed in the home. “Any Electric Heat” measures are a weighted average of homes with an electric furnace, electric zonal or a heat pump based on the RBSA. Savings are reduced by the percentage of heat supplied by supplemental fuels for an average home.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

**Requirements and Specifications**

This measure is not available in multifamily homes.

Whole house air sealing requires the use of a blower door to measure and identify air leakage locations in the home. Mechanical ventilation may be required.

If Performance Tested Comfort System (PTCS) duct sealing is performed at the same time as air sealing, the baseline blower door CFM50 reading for the whole house air sealing and testing measure must be taken with all the supply and return duct registers temporarily sealed off, so that house air leakage can be measured independently from duct leakage.

If combustion appliances are present (e.g., fireplace, wood or gas stove, gas range, gas water heater), a UL- or CUL-approved carbon monoxide detector must be present or be installed.

Payment

BPA payment is based on the reduction in air infiltration per reduction in CFM50, rounded to the nearest whole number. Payments and busbar energy savings are available in the UES Measure List in the Interim Solution 2.0 Files.

Total Payment = Quantity x Payment

Quantity = Difference between pre-and-post CFM50

10.10.6 Prescriptive Air Sealing

Basis for Energy Savings

Prescriptive Air Sealing is an incremental improvement in the leakage of a home. Leakage reductions are based on the attic or crawlspace portion of an average Whole House Air Sealing project. Energy savings for Prescriptive Air Sealing are estimated using SEEM, an energy modeling software calibrated to real world energy consumption, assuming that all other weatherization measures have been installed in the home. “Any Electric Heat” measures are a weighted average of homes with an electric furnace, electric zonal or a heat pump based on the RBSA. Savings are reduced by the percentage of heat supplied by supplemental fuels for an average home.

BPA documentation requirements consider these factors. More detailed information is available on the RTF’s UES Measures webpage.

Requirements and Specifications

This measure is not available for multifamily or manufactured homes.

Prescriptive air sealing must be performed according to the BPA Residential Weatherization Specifications in the IM Document Library.
If combustion appliances are present (e.g., fireplace, wood or gas stove, gas range, gas water heater), a UL- or CUL-approved carbon monoxide detector must be present or be installed.

### Documentation Requirements

<table>

<td></td>
</tr>
<tr>
<td>Documentation of square footage of area air sealed (attic and/or crawlspace) and the age of home</td>
<td></td>
</tr>
</tbody>
</table>

**Payment**

Payments and busbar energy savings are available in the UES Measure List in [Interim Solutions 2.0 Files](#) are based on the square footage of the area where prescriptive air sealing is performed.

### 10.10.7 Low-Income Energy Efficiency Measures

Low-income household eligibility is defined in the Federal Weatherization Assistance Program as **200 percent of the poverty income levels**. Approved, statewide eligibility definitions may substitute for federally established low-income levels, if provided.

At least 50% of households in two-, three- and four-unit dwellings must income qualify (one household in a two-unit dwelling, two households in a three-unit dwelling, two households in a four-unit dwelling) in order for the weatherization of the entire building to qualify for low-income payments. Utilities, however, may set more stringent requirements at their discretion.

For multifamily properties with five or more units, a minimum of 50% of the households must income qualify in order for the weatherization of the entire building or complex to qualify for low-income payments. Utilities, however, may set more stringent requirements at their discretion.

Customers shall retain documentation of the total number of individuals in the household and proof that the end user’s income eligibility was reviewed from a verifiable source. Verifiable refers to any documentation that can be verified by another source, such as a pay stub, copies of IRS form 1040, Section 8 eligibility, certification by a CAP agency, certification by LIHEAP administrator, etc.

Customers may use the eligible measures listed below to run low-income weatherization programs themselves, through an implementation firm or Community Action Agency, but must retain responsibility for and control over the program.

**Basis for Energy Savings**

The basis for energy savings for measures can be found in each of the measure sections above for the corresponding measures.
Requirements and Specifications

All existing housing types (single-family, manufactured and multifamily) are eligible for low-income measures, although not all measures are applicable to each housing type. See the table below for available measures.

Low-income weatherization measures include insulation, prime windows and patio doors, Low-E storm windows, exterior insulated doors, ductless and air source heat pumps, heat pump water heating, smart thermostats, PTCS or prescriptive duct sealing and whole house air sealing. Requirements and specifications for each measure can be found in each of the measure sections above for the corresponding measures. When a BPA-Qualified products list applies to the measure, the technology must be on the BPA-Qualified products list to qualify for payment.

All weatherization measures in single-family and manufactured homes must be installed according to the 2016 BPA Residential Weatherization Specifications in the IM Document Library and follow the specification, requirements and documentation requirements as listed under the appropriate sections (Standard Income) above.

Payment

BPA allows customers to report costs directly attributable to the installation of the measure as eligible for dollar-for-dollar payment (except as noted in the table below, not to exceed 100% of the actual cost). This includes any cost incurred for meeting requirements and specifications (e.g., verification of income, attic and crawl space ventilation, removal of knob and tube wiring and underfloor moisture barriers).

Customers may also report costs related to repair work that is directly associated with the installation of the measure required for health and safety, or to ensure the efficacy of the measure (e.g., replace rotting wood in window frame, or repair a hole in the roof). Repair costs must be documented on contractor invoices and reported separately.

Customers may combine funding sources within a residence, but may not combine funding from multiple BPA sources for the same measure.

### 10.11 RESIDENTIAL CUSTOM PROJECTS

#### Requirements and Specifications

Residential custom projects may be submitted using the custom projects process.

#### Documentation Requirements

See the [Custom Projects Documentation Requirements](#).

#### Payment

See the [Custom Projects Payment Table](#).
BPA acquires Utility Distribution Sector energy savings through Energy Smart Utility Efficiency (ESUE), which includes Voltage Optimization (VO) and Electrical Distribution System Improvements (SI). VO is a technique for improving the efficiency of the electrical grid by reducing voltage on the feeder lines running from substations to retail loads, while SI improves the energy efficiency of the electrical distribution system.

Customers must submit VO and SI as custom projects. They may combine SI and VO in one custom project when SI increases the amount of voltage that can be reduced or improves the monitoring of reduced voltage.

**Requirements and Specifications**

The requirements of VO and SI are discussed below:

1. **Voltage Optimization**
   - BPA developed the Simplified Voltage Optimization Measurement & Verification Protocol (M&V), available in the IM Document Library to assist utilities with implementing VO projects. In developing the project M&V plan, the customer has the option to use a custom M&V plan or the Simplified Protocol. The Simplified Protocol requires analytics from load-flow studies and is based on Regional Technical Forum (RTF) guidelines and focuses on residential and small commercial end-use loads, and requires that specific system stability thresholds be met prior to lowering service voltages.

2. **Electrical Distribution System Improvements**
   - SI may include the following measures:
     - Power transformer replacement;
     - Service conductor replacement;
     - Higher distribution primary voltage, including insulator additions and replacement;
     - Transformer load management (replacement of improperly sized transformers for loss improvements);
     - Balancing loads and phases;
     - Adding parallel feeders;
     - Operation improvement (recognition and phase balancing);
     - Power factor improvement to reduce line losses;
     - Volt-Amperes-Reactive (Reactive Power) Management;
     - Fixed and switched capacitors; and
     - Service distribution transformer:
       - Replacing an existing or proposed transformer with a higher-efficiency transformer;
       - Multiple transformers versus a single transformer based on system analysis; and
       - Voltage management.

**Documentation Requirements**

See the Custom Projects Documentation Requirements.

**Payment**

See the Custom Projects Payment Table.
Section 12: Multisector

Please check the changes and corrections summary to see if revisions were made to any of the measures in this sector. This section contains general information applicable across the sectors.

12.1 PAYMENT SUMMARY

Payments associated with measures eligible for installation in multiple sectors are identified in the body of the IM in the primary applicable sector.

12.2 PROCESSES

12.2.1 COTR Request and Acknowledgment Procedure

Under the COTR Request and Acknowledgment Procedure, customers must send a written request to their Contracting Officer’s Technical Representative to participate or make changes to participation in certain programs and processes. If the procedure is required, it will be listed in the specific section. The specific section may also require the customer to include supporting information with the request.

If approved, the COTR shall confirm the request by written notice. A customer request is not effective until the COTR approves the request in writing.

12.2.2 Measure Distribution Processes

Many efficiency measures can be delivered through more than one channel. Allowable distribution methods are listed in the specific measure section. The Requirements and Specifications section for each measure contains the applicable distribution channels. Descriptions for each channel and associated documentation are listed below. Individual measures may have additional measure-specific requirements which can be found in the Documentation Requirements section associated with the individual measure.

If a customer believes a product should be on the list, and it is not, the customer should use the COTR Request and Acknowledgment Procedure to request approval to use the product.

<table>
<thead>
<tr>
<th>MEASURE DISTRIBUTION CHANNELS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retail</td>
</tr>
<tr>
<td>Retail distribution of eligible items provides pricing discounts to energy-saving technologies sold through a physical or digital retailer.</td>
</tr>
<tr>
<td>Retail distribution can occur through a BPA-provided retail program (such as Simple Steps or any successor program), or through a utility-run program in a either traditional retail environment or at utility facilities or other utility-operated venues. Eligible items distributed through Simple Steps or a successor BPA program will have separate Refnos.</td>
</tr>
<tr>
<td>By Request</td>
</tr>
<tr>
<td>Eligible items provided to end users at their request either through the mail or direct distribution (such as at a county fair).</td>
</tr>
<tr>
<td>The By Request channel would apply to items given to end users in a number of circumstances such as:</td>
</tr>
<tr>
<td>- Over the counter in the utility office;</td>
</tr>
<tr>
<td>- At events (such as county fairs or an annual utility meeting);</td>
</tr>
<tr>
<td>- Customer redemption of a utility coupon or postcard for a free item;</td>
</tr>
<tr>
<td>- Reimbursing the customer for a qualified purchase.</td>
</tr>
<tr>
<td>By request measures may be fulfilled through a utility program or a BPA program like Simple Steps. Eligible items distributed through Simple Steps or a successor BPA program will have separate Refnos.</td>
</tr>
<tr>
<td>Mailed Nonrequest</td>
</tr>
<tr>
<td>Eligible items mailed to end users without a request (only applies to LED lamps).</td>
</tr>
<tr>
<td>Mailed Nonrequest measures may be fulfilled through a utility program or a BPA program like Simple Steps. Eligible items distributed through Simple Steps or a successor BPA program will have separate Refnos.</td>
</tr>
</tbody>
</table>
MEASURE DISTRIBUTION CHANNELS

<table>
<thead>
<tr>
<th>Channel</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct Install</td>
<td>Eligible items that the utility or its agent provide and install for the end user at no cost. Direct install measures must be 1) installed by customer or agent; 2) witnessed by customer or agent; or 3) visually inspected by a representative sample after installation by another party. Direct install measures may be fulfilled through a utility program or a BPA program like Simple Steps. Eligible items distributed through Simple Steps or a successor BPA program will have separate Refnos.</td>
</tr>
<tr>
<td>Coupon or Instant Rebate</td>
<td>An instant discount applied to an eligible item at a physical or digital retailer. This discount can be based on a physical coupon, digital discount code or other digital coupon. Note: This channel would not apply to utility flyers or mailers asking customers to return a form for free light lamps, or similar promotions. These would be classified as By Request.</td>
</tr>
<tr>
<td>Standard Rebate Payment</td>
<td>Eligible items that are distributed or acquired outside of the channels above. Typically an end user will purchase and install a qualifying measure on their own and seek a rebate through their serving utility by providing a receipt, invoice and any necessary documentation. These measures are addressed simply as &quot;payment&quot; or as &quot;standard rebate payment&quot; in the body of IM and will not have any distribution-specific designators in the Unit Energy Savings (UES) measure list.</td>
</tr>
</tbody>
</table>

Documentation Requirements By Channel

Many channels (currently Mailed Nonrequest, By Request, Retail, and Direct Install) are available through Simple Steps, and may be available through any successor program. Whether utility-run, or provided through a BPA program like Simple Steps, Documentation Requirements will be consistent, but measures offered through a BPA program will have a separate Refno.

### 12.3 MULTISECTOR MEASURES AND INITIATIVES

#### 12.3.1 Eligible Multisector Measure

Measures eligible for installation in multiple sectors are identified where applicable in the body of the IM in the primary applicable sector.

#### 12.3.2 Green Motors Rewind Initiative

**Basis for Energy Savings**

The base case is induction motors between 15 and 5,000 horsepower that require motor repair and rewinding, and are repaired and rewound by motor service centers that use methods and equipment that do not meet the ANSI/EASA Standard AR100-2010 requirements. The efficient case is to test and verify each motor to be sure there is no permanent motor core damage, then repair and rewind by a Green Motors Initiative-certified motor service center that follows the ANSI/EASA Standard AR100-2010. Energy savings are based on the Unit of Energy Savings (UES) approved by the RTF for this set of measures.

More details on the testing and motor service center requirements, and a list of certified motor service centers, can be found at: [http://www.greenmotors.org/](http://www.greenmotors.org/)

**Requirements and Specifications**

The Green Motors Rewind Initiative uses direct acquisition. The incentives paid through the Green Motors Rewind Initiative are paid by BPA as part of the third-party program and are not counted against customer’s EEI budget. No payments are required to BPA, the program implementer, or the participating end user. Customers receive credit for all energy savings achieved by the program in their service territory.

Qualified motors include National Electric Manufacturers Association (NEMA) standard horsepower-rated motors between 15 and 5,000 horsepower (either NEMA premium or other) that are rewound via certified Green Motors Initiative-certified motor service centers. Customers may enroll using the [COTR Request and Acknowledgment Procedure](http://www.greenmotors.org/).

A monthly report and annual report is created and sent to participating customers with end user names, total horsepower rewound, energy savings and incentives paid. Monthly reports will only be created and sent to customers with end-user participation in their service territory.
Customers may be contacted by the program implementer to verify an end users’ eligibility to receive incentives through the program.

### 12.3.3 Limited-Availability Emerging Technology Field Test Projects

**Requirements and Specifications**

Limited-Availability Emerging Technology Field-Test Projects allow BPA to collect detailed data to more accurately estimate savings and potential performance to create future Unit of Energy Savings (UES) and BPA-Qualified measures. BPA may contract with third-parties to deploy the emerging technology, evaluate performance and verify energy savings.

On the **BPA Emerging Technologies website**, BPA maintains a list of available emerging technology projects with defined eligibility requirements, the number of installations targeted, participation obligations, savings and payment.

If a customer is eligible and wishes to participate in a project, it must follow the Option 1 Custom Project Process and submit a custom project proposal (a component of the Option 1 Custom Project Calculator) that uses the Engineering Calculations with Verification Protocol for measurement and verification. BPA will provide the information necessary to complete the custom project documentation and will provide staff assistance in the development of the proposal and completion report.

BPA may require metering to continue after project completion and may require customers to perform additional duties to support the research efforts (e.g., customers may be asked to provide access to end-user billing history and contact information). If additional metering is required, it will not change customers’ payment or savings.

**Documentation Requirements**

Customers must follow the Option 1 Custom Project Documentation Requirements and may be required to provide end-user billing information and contact information.

**Payment**

Section 13: Updates and Revisions

Section 13 is reserved for revisions to the implementation manual made after Oct. 1, 2019. Revisions are released per section 1.5 Policy for Measure Changes/Additions, and will include the description of the change, effective date and location.
