# **Wetland Modeling and Analysis**

*Herrera Environmental Consultants, Inc.*

**Memorandum**

*To* Tish Eaton  
*cc* Nancy Wittpenn  
*From* Herrera Environmental Consultants/Golder Associates Inc.  
*Date* March 5, 2012  
*Subject* BPA I-5 Corridor Reinforcement Project, GIS Modeling Methods Used to Update Wetland Boundary Maps and Assess Wetland Functions

Bonneville Power Administration (BPA) requested development of a geographic information system (GIS) model to accomplish two objectives:

- Improve accuracy of wetland boundary maps in a systematic, automated, and detailed manner in the I-5 Corridor Reinforcement Project study area
- Evaluate wetland functions for those wetlands

This memo includes descriptions of methods used to develop and apply the GIS models to accomplish BPA's objectives.

Existing mapping resources used for these analyses included:

- Broad coverage aerial photography (USDA 2009)
- Project corridor high-resolution aerial photograph (0.5-foot pixels) and LiDAR (3-foot pixels) (BPA 2011)
- LANDSAT imagery (USGS 2001)
- National Wetlands Inventory (NWI) (USFWS 2010)
- Hydrography data (stream locations) for Cowlitz County and Clark County (WDNR 2006)
- Clark County and Cowlitz County soil surveys (NRCS 2009)
- Hydric soils list for Washington (NRCS 2010)
- Washington Department of Fish and Wildlife (WDFW) Priority Habitats and Species (PHS) data (WDFW 2010)

## Update Wetland Boundary Maps

The GIS model analyzed several spatial datasets strongly correlated with wetland presence to generate a map showing the relative aggregate potential (High, Medium, or Low) for a given area to contain wetlands. This model and the parameters used in its development are described in detail in the following section.

The model was run in six test sites: Test Site 1 is along the Cowlitz River (Segment 3); Test Site 2 includes the Coweeman River crossing (Segment 9), Test Site 3 includes the East Fork of the Lewis River (Segment 25), Test Site 4 is near Chilatchie (Segment 28), Test Site 5 is the Casey Substation site, and Test Site 6 is the Baxter Road Substation site. Wetlands at test sites 1 through 4 had been mapped previously using existing available information including hydric soil and wetland inventory maps, topographic maps, and recent aerial photographs, and had not been delineated on the ground. Wetlands at the Casey and Baxter Road Substation sites (test sites 5 and 6) had been mapped previously by wetland delineations conducted on those sites.

Following model output and map generation, Herrera wetland scientists compared the results of the GIS model to previous mapping results. Wetland scientists visited the four test sites that had not been previously delineated to compare wetland conditions on the ground to the model output and the wetland mapping completed previously. These site visits were completed on November 9 and 10, 2011. The results of the GIS model mapping effort and comparisons to previously mapped wetlands at the six test sites are described in the section of this memo titled *Compare Results of Original Wetland Mapping and GIS Wetland Potential Model*.

### GIS Mapping Model

BPA acquired LiDAR data and high-resolution aerial imagery (BPA 2011) within 400 feet of the four proposed project alternatives to support its design process. Herrera, Golder, and BPA discussed options for using this data to improve the accuracy of the predicted wetland acreage in the discipline reports prepared in 2010. LiDAR data were not available when the wetland report was written. Applying LiDAR to the same alternatives allows additional information to be applied to the wetland mapping and assumptions.

One limitation of relying primarily on aerial photography to map wetland boundaries is that canopy cover makes it difficult to identify wetlands in forested areas. LiDAR data that penetrates canopy and detects bare-ground depressions is a valuable addition to a wetland boundary analysis, because it provides the potential for detecting more forested wetland and confirming the presence of previously mapped wetlands. Herrera incorporated the new LiDAR data into a wetland prediction GIS model intended to refine the previous wetland mapping conducted in 2010. The GIS model is a matrix-based analysis approach for identifying wetland presence potential through the following steps:

- Identify available spatial datasets that are most predictive of wetland presence

- Apply scientific expertise to rank each dataset into low-to-high categories based on correlation with wetland presence
- Overlay and add the ranked datasets together to obtain an overall assessment of wetland presence potential

The following sections describe these steps in more detail, including data sources used and model methodology.

### *Spatial Datasets*

The following five data sets were identified by Herrera biologists and the GIS analyst as having a strong correlation with on-the-ground wetland presence and were used to develop the wetland prediction GIS model.

#### *National Wetland Inventory (NWI) Wetland Boundaries*

NWI wetlands mapped by USFWS are a very useful dataset for predicting wetland presence. This data was obtained from the original GIS mapping effort for incorporation into the model.

#### *Hydric Soils*

Soil data classified as non-hydric, hydric, or partially hydric was obtained from NRCS for incorporation into the model. Both hydric and partially hydric soil types are correlated with wetland presence.

#### *LiDAR Topographic Depressions*

A percentage of topographic depressions in LiDAR indicate areas that may flood such as lakes and wetlands. Although some topographic depressions may not be wetlands and may be data anomalies or other types of graded areas, using topographic depression information can help to determine whether a specific location in the overall aggregate model is likely to be a wetland.

#### *LiDAR Topographic Wetness Index (TWI)*

The Topographic Wetness Index is derived from LiDAR data and combines slope and upslope contributing drainage area on a pixel-by-pixel basis to determine where water is most likely to accumulate when it is present in the landscape. TWI is not a direct measure of on-the-ground wetness, but instead indicates overall potential for wetness.

#### *Landsat Band 5 Spectral Data*

Band 5 (near-infrared spectral band) of remotely sensed Landsat satellite is extremely sensitive to water presence. Herrera extracted this data for the month of March for multiple years from data with 30-meter pixel resolution. The March timeframe was selected because it represent the

early part of the growing season in western Washington and Oregon, when wetland plants are growing and water presence is detectable. Several known wetland areas were mapped, and the Band 5 data was used to run statistical analysis on minimum, maximum, and standard deviation brightness values correlated with each wetland. The results of this analysis were used to extract the brightness values most strongly correlated with on-the-ground wetland presences.

### *Ranking and Matrix Development*

Herrera biologists prepared a scoring scheme for each spatial dataset based on potential for wetland presence. Each dataset is scored on a scale of ‘0’ to ‘3’. A value of ‘0’ indicates a low probability of wetland presence for that variable, while a value of ‘3’ indicates a high probability. The spatial datasets used for this analysis and their associated scores are provided in Table 1.

**Table 1. Analysis scores and scoring criteria for each spatial dataset used in the wetland presence GIS model.**

Spatial Dataset	Analysis Score			
	0	1	2	3
NWI Wetlands	Not present			Present
Hydric Soil Classification	Non-hydric	Partially-hydric		Hydric
LiDAR Topographic Depressions	Not present			Present
LiDAR Topographic Wetness Index (wetness probability)	No wetness indicated	< 25%	25 - 50%	> 50%
Landsat Band 5 Wetlands	Not present			Present

### *Process and Analyze Data*

Each spatial dataset was processed by the GIS analyst as a separate map layer and every pixel in each spatial dataset was assigned an analysis score of ‘0’ to ‘3’ based on the scoring criteria shown in Table 1. The map layers were combined and the analysis scores for each pixel were added together to determine the aggregate potential wetland presence score for each pixel. The range of aggregate scores was then mapped using a color gradient to depict low-to-high probability of wetland presence and that was overlaid on aerial photography to aid the visual assessment of wetland boundaries. These results were then compared against on-the-ground field observations to determine if the GIS wetland potential model would provide sufficiently improved wetland mapping accuracy for BPA. This is discussed in more detail in the next section.

### **Compare Results of Original Wetland Mapping and GIS Wetland Potential Model**

Test sites 1, 2, 3, and 4 were visited on November 9 and 10, 2011, because these sites had not been visited during the original mapping phase for the project and delineations had not been conducted at these sites. Reconnaissance-level analysis of the test sites was conducted from

public roadways. Within parcels where property access was provided, hydrologic, vegetation, and soil conditions were studied in detail. In all areas, previously mapped wetlands and GIS model output were compared to on-site conditions. The results for each study area are presented below.

### ***Test Area 1: Cowlitz River***

Overall, previously-mapped wetlands that had been mapped via aerial photo interpretation, NWI data and soil type coincided well with ground conditions. On-site wetlands occur in roughly the same pattern as the mapped wetlands, although the actual wetland areas are more extensive than previously mapped. There are small areas where wetlands occur that were not previously mapped (typically in irregular vegetation patches isolated by roadways).

The GIS model output coincided very well with the on-site conditions and identified wetlands in areas (as noted above) that were not detected using only the soil mapping, NWI and aerial photos used during initial mapping. The model's sensitivity to subtle topographic features and flow concentrations makes it an excellent tool in identifying wetlands in most areas.

In one area (a sand and gravel quarry), the model output indicated major topographic depressions as having a high potential for being wetland. In fact, the soils in this area are so coarse and well-drained that wetland conditions do not occur. Integration of soil moisture data from raw LiDAR data could help reduce these anomalous areas.

### ***Test Area 2: Coweeman River Crossing and Vicinity***

Previously-mapped wetlands coincided well with ground conditions. On-site wetlands occur in roughly the same pattern as the mapped wetlands, with the actual wetland areas slightly more extensive than previously mapped.

The GIS model output coincided very well with the on-site conditions and identified wetlands in areas that were not detected used during initial mapping. The model's sensitivity to subtle topographic features and upslope contributing drainage area makes it an excellent tool in identifying wetlands in most areas.

The model output was limited in its ability to detect *slope* wetlands, especially forested wetlands.

The model output indicated a moderate likelihood of wetlands in some developed residential areas. Overall flat topography and drainage concentration results due to small topographic features in yards may have contributed to this result. Integration of soil moisture data from raw LiDAR data could help reduce these anomalous areas.

### ***Test Site 3: East Fork of Lewis River***

Overall, previously-mapped wetlands coincided well with ground conditions. On-site wetlands occur in roughly the same pattern as the mapped wetlands, with the actual wetland areas more

extensive than previously mapped. One exception to this trend is the extent of wetlands in forested ravines appears to be less than the previously mapped polygons. Rather, these polygons contain 30 to 40 percent wetland areas consisting of *riverine* wetlands, *slope* wetland in the ravines, and wetlands that flow into the ravines from surrounding terraces.

The GIS model output coincided very well with the on-site conditions and identified wetlands in areas that were not detected during initial mapping. The model's sensitivity to subtle topographic features and flow concentrations makes it an excellent tool in identifying wetlands in most areas. It does an excellent job of identifying wetland area in pastures in which subtle topographic features distinguished wetland from non-wetland areas. It also identified wetlands in shallow topographic features on the glacial terraces that are the highest elevations in this area.

The model output was limited in its ability to detect *slope* wetlands, especially forested wetlands. Integration of soil moisture data from raw LiDAR data could help reduce these anomalous areas.

#### ***Test Site 4: Segment 28***

Overall, previously-mapped wetlands coincided well with ground conditions. On-site wetlands occur in roughly the same pattern as the mapped wetlands, with the actual wetland areas more extensive than previously mapped.

The GIS model output coincided very well with the on-site conditions and identified wetlands in areas that were not detected used during initial mapping. The model's sensitivity to subtle topographic features and flow concentrations makes it an excellent tool in identifying wetlands in most areas. It does an excellent job of identifying wetland area in pastures in which subtle topographic features distinguished wetland from non-wetland areas. It also provided accurate information on wetland conditions on a series of valley-floor terraces.

Much of this study area was forested land without property access. Therefore this analysis was restricted to the two valleys that occur in the test site and immediately adjacent areas.

#### ***Test Site 5: Casey Road Substation***

In this area, the model output was reflective of wetland distribution. The overall pattern of modeled wetland potential coincided well with the location of the delineated wetlands. There is some wetland potential noise in the model output in the extensive forested areas. Re-examining these areas with the model recalibrated, both by class breaks, as well as by integrating soil moisture LiDAR data may increase resolution in these areas.

#### ***Test Site 6: Baxter Road Substation***

This area is an excellent example of the challenges in using remote sensing data to identify wetlands, particularly *slope* and *riverine* wetlands with a forested canopy. The model output confirmed the presence of surface flow patterns, but did not highlight the areas previously delineated on the ground.

## Revisions to Wetland Mapping Based on Model Output

Following the field ground-truthing of the model output, the model was revised by:

- Calibrating extracted Landsat brightness values to account for geographic variations in the project area
- Overlaying land use data to help refine criteria for identifying topographic depressions that are truly wetlands

The model was then run for the entire project area that was covered by the LiDAR mapping. Using this model output, the previously mapped wetlands were re-evaluated throughout the project study area.

Within the portion of the study area for which LiDAR data was collected (and therefore where the wetland model was run), wetland boundaries were refined to more closely match anticipated ground conditions, based on the model output and understanding of the model's strengths and limitations, based on the field verification. The high-resolution aerial photos (collected within the LiDAR data area) were also used to identify features that would indicate wetland boundaries (vegetation patterns, evidence of surface water, etc.). These revised wetland boundaries were then extrapolated to cover the entire study area (i.e., those areas outside of the LiDAR coverage). The criteria for extrapolation were: vegetation signatures, other evidence resolved on the aerial photos (e.g., surface water), and topographic features that extended from within the LiDAR coverage to the remainder of the study area. Using these criteria, the wetland boundaries throughout the study area were re-evaluated, and refined where appropriate.

## Evaluate Wetland Functions

The U.S. Army Corps of Engineers requested an evaluation of wetland functions within the BPA I-5 Corridor Reinforcement Project study area. This assessment was based entirely on existing information sources and not field assessments. To accommodate this approach, *The Washington State Rating System for Western Washington* (Hruby 2004) was used as a foundation that was modified for this assessment. This approach (Hruby 2004) is commonly referred to in Washington as “the state rating system” and is the established method for evaluating wetland functions in Washington State. A copy of the state rating system data form is included at the end of this memorandum (see Attachment A). Modifications to the state rating system methods used for this functional assessment and the results of the functional assessment are discussed below.

## Determine Wetland Rating Units

The state rating system requires that the functional assessment be conducted on what are considered “functional units.” This is to create consistency in evaluations by establishing the appropriate limits for evaluation. Otherwise, a “wetland” could theoretically extend from headwaters to tidelands, severely limiting the ability of the state rating system to evaluate

functional processes of different portions of the watershed. As such, a set of wetland functional unit determination criteria are provided in the system. Those relevant to this project are: Wetland units do not extend through culverts or bridges where water surface elevations are different between the two sides. In addition, *riverine* wetland units are broken at waterfalls and major tributary confluences (for the wetlands along the smaller tributary).

### **Determine HGM Classification**

The initial step in the state rating system is to determine the hydrogeomorphic (HGM) classification of the wetland. The HGM classification system describes wetlands based on their landscape position, water source, and hydrodynamics. The HGM classes relevant to the wetlands in the project study area are: *depressional* (wetlands located in topographic depressions), *riverine* (wetlands whose water source is flooding from adjacent streams), and *slope* (wetlands such as seeps and springs where water flows through the site but is not stored). The other HGM classes in the state rating system (*lacustrine fringe*, *flats*, and *tidal fringe*) do not occur in the study area.

The state rating system also recognizes the common situation in which multiple HGM classes are included in one wetland system (e.g., *slope* wetlands on the hillslopes above a stream join *riverine* wetlands in the floodplain). In these situations, the state rating system establishes a dominant HGM class on which to base the remainder of the evaluation. This is primarily relevant to the project with regards to *slope* wetlands which, in complexes with other HGM classes, is the subordinate HGM class (the other HGM class in the complex is used for evaluation criteria). Given the nature of the wetlands within the four alternatives and access roads, *slope* wetlands abutted other HGM wetland classes in almost every location. Therefore, for the purposes of this evaluation, all *slope* wetlands were assumed to be in complexes with either *depressional* or *riverine* HGM classes, and those classes were used for evaluation criteria, eliminating the need to apply the *slope* wetland evaluation criteria.

The HGM classification of each wetland as either *depressional* or *riverine* was evaluated first by the Herrera GIS analyst to determine the intersection of wetland polygons with streams, as well as reviewing LiDAR features for topographic depressions. Herrera wetland biologists then reviewed the initial HGM classification and confirmed or modified the class based on features evident in aerial photographs and other data sets.

### **Assess Wetland Functions**

The State's rating system assesses wetland functions using a series of questions related to functional categories including water quality, hydrology, and habitat, and generates a score for each function category based on the wetland's potential and opportunity for providing the function. Herrera wetlands scientists evaluated each question on the state rating form to determine the feasibility of answering the question using available information (including the LiDAR data) and without conducting site visits. Several questions could not be answered without visiting the wetland and were not included on the modified rating form developed for this project. The modified rating form questions and scoring criteria (see Attachment B) includes:

- List of questions from the state rating system for *depressional* and *riverine* wetlands
- Analysis method to answer each question (“automated” GIS process or “manual” review of wetland and datasets visually by wetland scientists), or indication that analysis was not feasible (NF)
- Variable to be assessed
- Datasets used in the evaluation
- Description of the scoring criteria and the scoring associated with each answer

With the HGM class for each wetland established and the modified rating form developed, the functions of each wetland were assessed through automated GIS and manual processes.

### ***Automated GIS Processes***

Seven questions from the rating system were answered using automated methods for riparian (R.1.1, R.1.2, R.3.1), *depressional* (D.1.2), and habitat (H.1.1, H.2.3, H.2.4) (see Attachment B).

R.1.1 evaluates the potential for the wetland to improve water quality based on the presence of topographic depressions in the floodplain that could slow water velocities, sequestering sediment and the pollutants that bind to sediment. LiDAR coverage was used to determine the extent of topographic depressions. The score is based on the percent cover of depressions in the wetland. Since LiDAR data was only available within 400 feet of each alternative centerline, the functional assessment wetland polygons were clipped to the LiDAR extent prior to calculating percentage of area with topographic depression presence.

R.1.2 evaluates the potential of the wetland to improve water quality based on the complexity of woody vegetation in the wetland. This assessment used the project wetland basemap (which is broken into vegetation types: forested, scrub/shrub, etc.). Wetlands with over 66 percent cover of forest or scrub/shrub vegetation received the highest score (8). Wetlands with between 33 and 66 percent cover of forest or scrub/shrub vegetation or over 66 percent emergent vegetation received an intermediate score (6). Wetlands with over 33 percent vegetation cover, but without any of these characteristics received the lowest score (3). There were no wetlands with less than 33 percent vegetation cover in the study area.

R.3.1 evaluates the potential for the wetland to improve hydrology to downstream systems. In order to increase the fidelity of this portion of the assessment, an initial estimate of wetland width compared to stream width was conducted in GIS, followed by a visual review by wetland scientists to confirm or modify this value. The ratio of wetland width expected to flood (perpendicular to the stream) to estimated stream width determines the score (20:1 or more = 9 points; 10-20:1 = 6 points; 5-10:1 = 4 points, 1-5:1 = 2 points; 1:1 or less = 1 point).

D.1.2 evaluates the potential for the wetland to improve water quality based on soil characteristics. Organic soils and fine-textured mineral soils have a large surface area per unit volume and therefore have a large surface for the microbial processes that reduce nutrients and pollutants. As such, wetlands with these soils have a greater capacity to provide these functions. The wetlands were compared to mapped NRCS soil types. Those that occurred within mapped soil types that met the parameters dictated by the state rating system received a score of 4. Those that did not received a score of zero (0).

H.1.1 evaluates vegetation structure. Points are assigned for each Cowardin (1979) vegetation class that is represented in the wetland. Those points are aggregated for each wetland.

H.2.3 evaluates the proximity of Priority Habitats and Species (PHS) as defined by WDFW within 100 meters of the wetland boundary. Mature forests mapped for this project, as well as PHS spatial data sets were used to determine proximity.

H.2.4. evaluates connectivity with other wetlands. Wetlands along riparian corridors were assumed to have good connectivity. These wetlands, and *depressional* wetlands with three or more wetlands within 0.5 mile, received the highest score (5). *Depressional* wetlands with one or two wetlands within 0.5 mile scored 2 points. No wetlands within 0.5 mile received zero (0) points.

### ***Manual Assessments***

Seven questions from the rating system were answered using manual methods (R.2, R.4, D.2, D.3.3, D.4, H.1.4, H.2.1, and H.2.2) (see Attachment B).

R.2 and D.2 evaluate the opportunity for the wetland to provide water quality improvements. To provide this function, there must be pollution, stormwater and/or sediment sources from an upgradient origin or adjacent source. If land uses that could generate these inputs were determined to be present in a location that could convey these materials into the wetland, then it was assumed that the wetland had the opportunity to provide a water quality improvement function. Having this opportunity doubles the score assigned to the wetland for water quality improvement potential (see questions R.1.2 and D.1.2 above).

D.3.3 evaluates the potential for the wetland to provide hydrologic functions based on the relative size of the wetland compared to its upstream watershed. The watershed extents were estimated based on topographic features and roughly measured to place the watershed/wetland/ratio into one of these categories: less than 10:1 (5 points); between 10:1 and 100:1 (3 points); and 100:1 or greater (zero (0) points).

R.4 and D.4 evaluate the opportunity for the wetland to provide hydrologic (flood attenuation and groundwater recharge) functions. Having this opportunity doubles the score assigned to the wetland for hydrologic potential (see questions R.3.1 and D.3.3 above). To provide this function in *riverine* wetlands, there must be human development or natural resources downstream that could be affected by flooding or erosion. To provide this function in *depressional* wetlands there

cannot be any flood attenuation structures (e.g., dams operated for flood control) within 2,500 feet downstream.

H.1.4 evaluates the complexity of the habitat by assessing the interspersions of different vegetation types as well as vegetation with water and gravel bar features. The scale was simplified to provide two levels of habitat complexity: “high” and “low”. Wetlands were considered highly complex (score of 3) if they met any of the following criteria: Forested (an understory was assumed), Riparian (based on typical riparian configurations), or composed of multiple vegetation (Cowardin 1979) classes. Typical wetlands that scored “low” were wetlands in fields and other structurally simple vegetation types (score of 1).

H.2.1 evaluates the condition of the buffer surrounding the wetland. The buffer evaluation area is 100 meters from the wetland boundary. If the vegetation within 95 percent of the buffer was considered intact and unlikely to receive daily human visits (no roads, except old logging spurs; no golf courses, farms, houses, etc.), then the wetland received the highest possible score (5). If there was minimal intact buffer (perimeter of the wetland largely developed, or surrounded by roads), the wetland received the minimum score (zero [0]). Intermediate buffer conditions received a score of 2.

H.2.2 evaluates wildlife passage corridors between the wetland and relatively large patches (greater than 25 acres) of vegetation. Aerial photos were reviewed to determine if corridors greater than 50 feet wide, with over 30 percent vegetation cover, connected the wetland to the large vegetation patches. If a corridor exists, a score of 4 was assigned. If not, the wetland received a score of zero (0).

### **Score Compilation and Ranking**

Wetland function scores were calculated for each wetland (see Attachment C). The maximum potential wetland function value was calculated for both *riverine* and *depressional* wetlands. Functional scores derived for each wetland were divided by the maximum potential functional score for the HGM type of the wetland. This value represents the proportion of the maximum possible function provided by each individual wetland. This process also normalizes the results from the two HGM types, allowing for a direct comparison of functional impacts, regardless of HGM type. The functional value, multiplied by impact acreage, provides an estimate of the wetland functional loss that would result from the proposed actions.

The overall trends that resulted from this analysis include:

- Wetlands in less-developed forested areas tended to have higher habitat functions, as a result of more intact buffers and connected wildlife corridors.
- Wetlands in less-developed forested areas that were located in the upper portions of the watersheds in some cases provided lower levels of water quality improvements, based on lack of opportunity if the contributing watershed was roadless.

- Wetlands in developed areas tended to have lower habitat functions due to compromised buffers and lack of connected wildlife corridors.
- Wetlands in pastures and other simplified plant communities tended to have lower water quality, hydrologic, and habitat functions due to the lack of complex vegetation that filters water, reduces floodwater velocities, and provide varied habitat niches.

Wetland name or number \_\_\_\_\_

**Does the wetland unit being rated meet any of the criteria below?**

If you answer YES to any of the questions below you will need to protect the wetland according to the regulations regarding the special characteristics found in the wetland.

<b>Check List for Wetlands That May Need Additional Protection (in addition to the protection recommended for its category)</b>	<b>YES</b>	<b>NO</b>
<p>SP1. <i>Has the wetland unit been documented as a habitat for any Federally listed Threatened or Endangered <b>animal or plant</b> species (T/E species)?</i>                      For the purposes of this rating system, "documented" means the wetland is on the appropriate state or federal database.</p>		
<p>SP2. <i>Has the wetland unit been documented as habitat for any State listed Threatened or Endangered <b>animal</b> species?</i>                      For the purposes of this rating system, "documented" means the wetland is on the appropriate state database. Note: Wetlands with State listed plant species are categorized as Category I Natural Heritage Wetlands (see p. 19 of data form).</p>		
<p>SP3. <i>Does the wetland unit contain individuals of Priority species listed by the WDFW for the state?</i></p>		
<p>SP4. <i>Does the wetland unit have a local significance in addition to its functions?</i>                      For example, the wetland has been identified in the Shoreline Master Program, the Critical Areas Ordinance, or in a local management plan as having special significance.</p>		

*To complete the next part of the data sheet you will need to determine the Hydrogeomorphic Class of the wetland being rated.*

The hydrogeomorphic classification groups wetlands into those that function in similar ways. This simplifies the questions needed to answer how well the wetland functions. The Hydrogeomorphic Class of a wetland can be determined using the key below. See p. 24 for more detailed instructions on classifying wetlands.

## Classification of Wetland Units in Western Washington

**If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.**

1. Are the water levels in the entire unit usually controlled by tides (i.e. except during floods)?  
NO – go to 2                      **YES** – the wetland class is **Tidal Fringe**

If yes, is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)? **YES – Freshwater Tidal Fringe**    **NO – Saltwater Tidal Fringe (Estuarine)**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is rated as an **Estuarine** wetland.* Wetlands that were called estuarine in the first and second editions of the rating system are called Salt Water Tidal Fringe in the Hydrogeomorphic Classification. Estuarine wetlands were categorized separately in the earlier editions, and this separation is being kept in this revision. To maintain consistency between editions, the term “Estuarine” wetland is kept. Please note, however, that the characteristics that define Category I and II estuarine wetlands have changed (see p. ).

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.  
NO – go to 3                      **YES** – The wetland class is **Flats**

If your wetland can be classified as a “Flats” wetland, use the form for **Depressional** wetlands.

3. Does the entire wetland unit **meet both** of the following criteria?

\_\_\_ The vegetated part of the wetland is on the shores of a body of permanent open water (without any vegetation on the surface) at least 20 acres (8 ha) in size;  
\_\_\_ At least 30% of the open water area is deeper than 6.6 ft (2 m)?

NO – go to 4                      **YES** – The wetland class is **Lake-fringe (Lacustrine Fringe)**

4. Does the entire wetland unit **meet all** of the following criteria?

\_\_\_ The wetland is on a slope (*slope can be very gradual*),  
\_\_\_ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.  
\_\_\_ The water leaves the wetland **without being impounded?**

NOTE: *Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3ft diameter and less than 1 foot deep).*

NO - go to 5                      **YES** – The wetland class is **Slope**

Wetland name or number \_\_\_\_\_

**5. Does the entire wetland unit meet all of the following criteria?**

\_\_\_\_\_ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river

\_\_\_\_\_ The overbank flooding occurs at least once every two years.

*NOTE: The riverine unit can contain depressions that are filled with water when the river is not flooding.*

NO - go to 6      **YES** – The wetland class is **Riverine**

**6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year. This means that any outlet, if present, is higher than the interior of the wetland.**

NO – go to 7      **YES** – The wetland class is **Depressional**

**7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding. The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.**

NO – go to 8      **YES** – The wetland class is **Depressional**

**8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within your wetland. NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.**

<i>HGM Classes within the wetland unit being rated</i>	<i>HGM Class to Use in Rating</i>
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake-fringe	Lake-fringe
Depressional + Riverine along stream within boundary	Depressional
Depressional + Lake-fringe	Depressional
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE under wetlands with special characteristics

If you are unable still to determine which of the above criteria apply to your wetland, or if you have more than 2 HGM classes within a wetland boundary, classify the wetland as **Depressional** for the rating.

<b>D Depressional and Flats Wetlands</b>		<b>Points</b> (only 1 score per box)
<b>WATER QUALITY FUNCTIONS</b> - Indicators that the wetland unit functions to improve water quality

<b>These questions apply to wetlands of all HGM classes.</b>	<b>Points</b> (only 1 score per box)												
<b>HABITAT FUNCTIONS - Indicators that unit functions to provide important habitat</b>													
<b>H 1. Does the wetland unit have the <u>potential</u> to provide habitat for many species?</b>													
<p><b>H 1.1 Vegetation structure (see p. 72)</b>            Check the types of vegetation classes present (as defined by Cowardin)- Size threshold for each class is ¼ acre or more than 10% of the area if unit is smaller than 2.5 acres.</p> <p> <input type="checkbox"/> Aquatic bed  <input type="checkbox"/> Emergent plants  <input type="checkbox"/> Scrub/shrub (areas where shrubs have &gt;30% cover)  <input type="checkbox"/> Forested (areas where trees have &gt;30% cover)            If the unit has a forested class check if:  <input type="checkbox"/> The forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the forested polygon            Add the number of vegetation structures that qualify. If you have:</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td>4 structures or more</td> <td>points = 4</td> </tr> <tr> <td>3 structures</td> <td>points = 2</td> </tr> <tr> <td>2 structures</td> <td>points = 1</td> </tr> <tr> <td>1 structure</td> <td>points = 0</td> </tr> </table> <p style="margin-left: 20px;">Map of Cowardin vegetation classes</p>	4 structures or more	points = 4	3 structures	points = 2	2 structures	points = 1	1 structure	points = 0	<b>Figure</b> ____				
4 structures or more	points = 4												
3 structures	points = 2												
2 structures	points = 1												
1 structure	points = 0												
<p><b>H 1.2. Hydroperiods (see p. 73)</b>            Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ acre to count. (see text for descriptions of hydroperiods)</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td><input type="checkbox"/> Permanently flooded or inundated</td> <td>4 or more types present</td> <td>points = 3</td> </tr> <tr> <td><input type="checkbox"/> Seasonally flooded or inundated</td> <td>3 types present</td> <td>points = 2</td> </tr> <tr> <td><input type="checkbox"/> Occasionally flooded or inundated</td> <td>2 types present</td> <td>point = 1</td> </tr> <tr> <td><input type="checkbox"/> Saturated only</td> <td>1 type present</td> <td>points = 0</td> </tr> </table> <p> <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland  <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland  <input type="checkbox"/> <b>Lake-fringe wetland = 2 points</b>  <input type="checkbox"/> <b>Freshwater tidal wetland = 2 points</b> </p> <p style="text-align: right; margin-right: 20px;">Map of hydroperiods</p>	<input type="checkbox"/> Permanently flooded or inundated	4 or more types present	points = 3	<input type="checkbox"/> Seasonally flooded or inundated	3 types present	points = 2	<input type="checkbox"/> Occasionally flooded or inundated	2 types present	point = 1	<input type="checkbox"/> Saturated only	1 type present	points = 0	<b>Figure</b> ____
<input type="checkbox"/> Permanently flooded or inundated	4 or more types present	points = 3											
<input type="checkbox"/> Seasonally flooded or inundated	3 types present	points = 2											
<input type="checkbox"/> Occasionally flooded or inundated	2 types present	point = 1											
<input type="checkbox"/> Saturated only	1 type present	points = 0											
<p><b>H 1.3. Richness of Plant Species (see p. 75)</b>            Count the number of plant species in the wetland that cover at least 10 ft<sup>2</sup>. (different patches of the same species can be combined to meet the size threshold)            You do not have to name the species.            Do not include Eurasian Milfoil, reed canarygrass, purple loosestrife, Canadian Thistle</p> <p style="margin-left: 40px;">If you counted:</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td>&gt; 19 species</td> <td>points = 2</td> </tr> <tr> <td>5 - 19 species</td> <td>points = 1</td> </tr> <tr> <td>&lt; 5 species</td> <td>points = 0</td> </tr> </table> <p>List species below if you want to:</p>	> 19 species	points = 2	5 - 19 species	points = 1	< 5 species	points = 0							
> 19 species	points = 2												
5 - 19 species	points = 1												
< 5 species	points = 0												

Total for page \_\_\_\_\_

**H 1.4. Interspersion of habitats (see p. 76)**

Decide from the diagrams below whether interspersion between Cowardin vegetation classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, medium, low, or none.

NOTE: If you have four or more classes or three vegetation classes and open water the rating is always "high". Use map of Cowardin vegetation classes

Figure \_\_\_\_\_

**H 1.5. Special Habitat Features: (see p. 77)**

Check the habitat features that are present in the wetland. The number of checks is the number of points you put into the next column.

- Large, downed, woody debris within the wetland (>4in. diameter and 6 ft long).
- Standing snags (diameter at the bottom > 4 inches) in the wetland
- Undercut banks are present for at least 6.6 ft (2m) and/or overhanging vegetation extends at least 3.3 ft (1m) over a stream (or ditch) in, or contiguous with the unit, for at least 33 ft (10m)
- Stable steep banks of fine material that might be used by beaver or muskrat for denning (>30degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet turned grey/brown*)
- At least ¼ acre of thin-stemmed persistent vegetation or woody branches are present in areas that are permanently or seasonally inundated. (*structures for egg-laying by amphibians*)
- Invasive plants cover less than 25% of the wetland area in each stratum of plants

NOTE: The 20% stated in early printings of the manual on page 78 is an error.

**H 1. TOTAL** Score - potential for providing habitat  
Add the scores from H1.1, H1.2, H1.3, H1.4, H1.5

Comments

<p><b>H 2. Does the wetland unit have the opportunity to provide habitat for many species?</b></p>	
<p><b>H 2.1 Buffers</b> (<i>see p. 80</i>)  <i>Choose the description that best represents condition of buffer of wetland unit. The highest scoring criterion that applies to the wetland is to be used in the rating. See text for definition of "undisturbed."</i></p> <ul style="list-style-type: none"> <li>— 100 m (330ft) of relatively undisturbed vegetated areas, rocky areas, or open water &gt;95% of circumference. No structures are within the undisturbed part of buffer. (relatively undisturbed also means no-grazing, no landscaping, no daily human use) <b>Points = 5</b></li> <li>— 100 m (330 ft) of relatively undisturbed vegetated areas, rocky areas, or open water &gt; 50% circumference. <b>Points = 4</b></li> <li>— 50 m (170ft) of relatively undisturbed vegetated areas, rocky areas, or open water &gt;95% circumference. <b>Points = 4</b></li> <li>— 100 m (330ft) of relatively undisturbed vegetated areas, rocky areas, or open water &gt; 25% circumference, . <b>Points = 3</b></li> <li>— 50 m (170ft) of relatively undisturbed vegetated areas, rocky areas, or open water for &gt; 50% circumference. <b>Points = 3</b></li> </ul> <p style="text-align: center;"><b>If buffer does not meet any of the criteria above</b></p> <ul style="list-style-type: none"> <li>— No paved areas (except paved trails) or buildings within 25 m (80ft) of wetland &gt; 95% circumference. Light to moderate grazing, or lawns are OK. <b>Points = 2</b></li> <li>— No paved areas or buildings within 50m of wetland for &gt;50% circumference. Light to moderate grazing, or lawns are OK. <b>Points = 2</b></li> <li>— Heavy grazing in buffer. <b>Points = 1</b></li> <li>— Vegetated buffers are &lt;2m wide (6.6ft) for more than 95% of the circumference (e.g. tilled fields, paving, basalt bedrock extend to edge of wetland) <b>Points = 0.</b></li> <li>— Buffer does not meet any of the criteria above. <b>Points = 1</b></li> </ul> <p style="text-align: right;"><i>Aerial photo showing buffers</i></p>	<p><b>Figure</b> _____</p>
<p><b>H 2.2 Corridors and Connections</b> (<i>see p. 81</i>)</p> <p>H 2.2.1 Is the wetland part of a relatively undisturbed and unbroken vegetated corridor (either riparian or upland) that is at least 150 ft wide, has at least 30% cover of shrubs, forest or native undisturbed prairie, that connects to estuaries, other wetlands or undisturbed uplands that are at least 250 acres in size? (<i>dams in riparian corridors, heavily used gravel roads, paved roads, are considered breaks in the corridor</i>).</p> <p style="text-align: center;">YES = <b>4 points</b> (<i>go to H 2.3</i>)                      NO = go to H 2.2.2</p> <p>H 2.2.2 Is the wetland part of a relatively undisturbed and unbroken vegetated corridor (either riparian or upland) that is at least 50ft wide, has at least 30% cover of shrubs or forest, and connects to estuaries, other wetlands or undisturbed uplands that are at least 25 acres in size? <b>OR</b> a <b>Lake-fringe</b> wetland, if it does not have an undisturbed corridor as in the question above?</p> <p style="text-align: center;">YES = <b>2 points</b> (<i>go to H 2.3</i>)                      NO = H 2.2.3</p> <p>H 2.2.3 Is the wetland:</p> <ul style="list-style-type: none"> <li>within 5 mi (8km) of a brackish or salt water estuary OR</li> <li>within 3 mi of a large field or pasture (&gt;40 acres) OR</li> <li>within 1 mi of a lake greater than 20 acres?</li> </ul> <p style="text-align: center;">YES = <b>1 point</b>    NO = <b>0 points</b></p>	

Total for page \_\_\_\_\_

H 2.3 Near or adjacent to other priority habitats listed by WDFW (see new and complete descriptions of WDFW priority habitats, and the counties in which they can be found, in the PHS report <http://wdfw.wa.gov/hab/phslist.htm> )

Which of the following priority habitats are within 330ft (100m) of the wetland unit? *NOTE: the connections do not have to be relatively undisturbed.*

- Aspen Stands:** Pure or mixed stands of aspen greater than 0.4 ha (1 acre).
- Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report p. 152*).
- Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- Old-growth/Mature forests:** (Old-growth west of Cascade crest) Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 20 trees/ha (8 trees/acre) > 81 cm (32 in) dbh or > 200 years of age. (Mature forests) Stands with average diameters exceeding 53 cm (21 in) dbh; crown cover may be less than 100%; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80 - 200 years old west of the Cascade crest.
- Oregon white Oak:** Woodlands Stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158*).
- Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161*).
- Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report: pp. 167-169 and glossary in Appendix A*).
- Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- Cliffs:** Greater than 7.6 m (25 ft) high and occurring below 5000 ft.
- Talus:** Homogenous areas of rock rubble ranging in average size 0.15 - 2.0 m (0.5 - 6.5 ft), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 51 cm (20 in) in western Washington and are > 2 m (6.5 ft) in height. Priority logs are > 30 cm (12 in) in diameter at the largest end, and > 6 m (20 ft) long.

If wetland has **3 or more** priority habitats = **4 points**

If wetland has **2** priority habitats = **3 points**

If wetland has **1** priority habitat = **1 point**

No habitats = 0 points

*Note: All vegetated wetlands are by definition a priority habitat but are not included in this list. Nearby wetlands are addressed in question H 2.4)*

Wetland name or number \_\_\_\_\_

<p><b>H 2.4 Wetland Landscape</b> (<i>choose the <b>one</b> description of the landscape around the wetland that best fits</i>) (<i>see p. 84</i>)</p> <p>There are at least 3 other wetlands within ½ mile, and the connections between them are relatively undisturbed (light grazing between wetlands OK, as is lake shore with some boating, but connections should NOT be bisected by paved roads, fill, fields, or other development. <span style="float: right;">points = 5</span></p> <p>The wetland is Lake-fringe on a lake with little disturbance and there are 3 other lake-fringe wetlands within ½ mile <span style="float: right;">points = 5</span></p> <p>There are at least 3 other wetlands within ½ mile, BUT the connections between them are disturbed <span style="float: right;">points = 3</span></p> <p>The wetland is Lake-fringe on a lake <b>with</b> disturbance and there are 3 other lake-fringe wetland within ½ mile <span style="float: right;">points = 3</span></p> <p>There is at least 1 wetland within ½ mile. <span style="float: right;">points = 2</span></p> <p>There are no wetlands within ½ mile. <span style="float: right;">points = 0</span></p>	
<p><b>H 2. TOTAL Score</b> - opportunity for providing habitat <i>Add the scores from H2.1, H2.2, H2.3, H2.4</i></p>	
<p>TOTAL for H 1 from page 14</p>	
<p><b>Total Score for Habitat Functions</b> – add the points for H 1, H 2 and record the result on p. 1</p>	

<p><b>SC 2.0 Natural Heritage Wetlands</b> (<i>see p. 87</i>)          Natural Heritage wetlands have been identified by the Washington Natural Heritage Program/DNR as either high quality undisturbed wetlands or wetlands that support state Threatened, Endangered, or Sensitive plant species.</p> <p>SC 2.1 Is the wetland unit being rated in a Section/Township/Range that contains a Natural Heritage wetland? (<i>this question is used to screen out most sites before you need to contact WNHP/DNR</i>)          S/T/R information from Appendix D ___ or accessed from WNHP/DNR web site ___</p> <p>YES ___ – contact WNHP/DNR (see p. 79) and go to SC 2.2                      NO ___</p> <p>SC 2.2 Has DNR identified the wetland as a high quality undisturbed wetland or as or as a site with state threatened or endangered plant species?          YES = Category I    NO ___ not a Heritage Wetland</p>	<p><b>Cat. I</b></p>
<p><b>SC 3.0 Bogs</b> (<i>see p. 87</i>)          Does the wetland unit (<b>or any part of the unit</b>) meet both the criteria for soils and vegetation in bogs? <i>Use the key below to identify if the wetland is a bog. If you answer yes you will still need to rate the wetland based on its functions.</i></p> <ol style="list-style-type: none"> <li>1. Does the unit have organic soil horizons (i.e. layers of organic soil), either peats or mucks, that compose 16 inches or more of the first 32 inches of the soil profile? (See Appendix B for a field key to identify organic soils)? Yes - go to Q. 3    No - go to Q. 2</li> <li>2. Does the unit have organic soils, either peats or mucks that are less than 16 inches deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on a lake or pond?              Yes - go to Q. 3    No - Is not a bog for purpose of rating</li> <li>3. Does the unit have more than 70% cover of mosses at ground level, AND other plants, if present, consist of the “bog” species listed in Table 3 as a significant component of the vegetation (more than 30% of the total shrub and herbaceous cover consists of species in Table 3)?              Yes – Is a bog for purpose of rating                      No - go to Q. 4</li> </ol> <p>NOTE: If you are uncertain about the extent of mosses in the understory you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16” deep. If the pH is less than 5.0 and the “bog” plant species in Table 3 are present, the wetland is a bog.</p> <ol style="list-style-type: none"> <li>1. Is the unit forested (&gt; 30% cover) with sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Englemann’s spruce, or western white pine, WITH any of the species (or combination of species) on the bog species plant list in Table 3 as a significant component of the ground cover (&gt; 30% coverage of the total shrub/herbaceous cover)?</li> <li>2. YES = Category I    No ___ Is not a bog for purpose of rating</li> </ol>	<p><b>Cat. I</b></p>

<p><b>SC 4.0 Forested Wetlands (see p. 90)</b>                  Does the wetland unit have at least 1 acre of forest that meet one of these criteria for the Department of Fish and Wildlife’s forests as priority habitats? <i>If you answer yes you will still need to rate the wetland based on its functions.</i></p> <ul style="list-style-type: none"> <li>— <b>Old-growth forests:</b> (west of Cascade crest) Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/acre (20 trees/hectare) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 inches (81 cm) or more.</li> </ul> <p style="padding-left: 40px;">NOTE: The criterion for dbh is based on measurements for upland forests. Two-hundred year old trees in wetlands will often have a smaller dbh because their growth rates are often slower. The DFW criterion is and “OR” so old-growth forests do not necessarily have to have trees of this diameter.</p> <ul style="list-style-type: none"> <li>— <b>Mature forests:</b> (west of the Cascade Crest) Stands where the largest trees are 80 – 200 years old OR have average diameters (dbh) exceeding 21 inches (53cm); crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth.</li> </ul> <p>YES = Category I                      NO ___not a forested wetland with special characteristics</p>	<p><b>Cat. I</b></p>
<p><b>SC 5.0 Wetlands in Coastal Lagoons (see p. 91)</b>                  Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <ul style="list-style-type: none"> <li>— The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks</li> <li>— The lagoon in which the wetland is located contains surface water that is saline or brackish (&gt; 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>)</li> </ul> <p>YES = Go to SC 5.1                      NO ___ not a wetland in a coastal lagoon</p> <p>SC 5.1 Does the wetland meets all of the following three conditions?</p> <ul style="list-style-type: none"> <li>— The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of invasive plant species (see list of invasive species on p. 74).</li> <li>— At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</li> <li>— The wetland is larger than 1/10 acre (4350 square feet)</li> </ul> <p style="text-align: center;">YES = Category I                      NO = Category II</p>	<p><b>Cat. I</b></p> <p><b>Cat. II</b></p>

Wetland name or number \_\_\_\_\_

<p><b>SC 6.0 Interdunal Wetlands</b> (<i>see p. 93</i>)</p> <p>Is the wetland unit west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)?</p> <p>YES - go to SC 6.1                      NO __ not an interdunal wetland for rating</p> <p><b><i>If you answer yes you will still need to rate the wetland based on its functions.</i></b></p> <p>In practical terms that means the following geographic areas:</p> <ul style="list-style-type: none"> <li>• Long Beach Peninsula- lands west of SR 103</li> <li>• Grayland-Westport- lands west of SR 105</li> <li>• Ocean Shores-Copalis- lands west of SR 115 and SR 109</li> </ul> <p>SC 6.1 Is the wetland one acre or larger, or is it in a mosaic of wetlands that is once acre or larger?</p> <p>                                 YES = Category II                      NO – go to SC 6.2</p> <p>SC 6.2 Is the unit between 0.1 and 1 acre, or is it in a mosaic of wetlands that is between 0.1 and 1 acre?</p> <p>                                 YES = Category III</p>	<p style="text-align: center;"><b>Cat. II</b></p> <p style="text-align: center;"><b>Cat. III</b></p>
<p><b>Category of wetland based on Special Characteristics</b></p> <p><i>Choose the “highest” rating if wetland falls into several categories, and record on p. 1.</i></p> <p>If you answered NO for all types enter “Not Applicable” on p.1</p>

Hydrologic Opportunity	R.4	M	Opportunity to reduce flooding and erosion	<ul style="list-style-type: none"> <li>• Visual evidence of presence of downstream development or natural resources that could be impacted by flooding or erosion</li> <li>• <b>Yes:</b> multiplier of 2 [human development or natural resources downstream]</li> <li>• <b>No:</b> multiplier of 1</li> </ul>
<b>Depressional Wetlands - Water Quality Functions: Does the wetland unit have the potential and opportunity to improve water quality?</b>				
Water Quality Potential	D.1.1	NF	Surface water flows	Site visit required
Water Quality Potential	D.1.2	A	Soils characteristics	<ul style="list-style-type: none"> <li>• NRCS soils data (mucks/peats or clay loam or finer)</li> <li>• <b>Yes:</b> 4 pts [soil types are mucks, peats, clay loam or finer]</li> <li>• <b>No:</b> 0 pts</li> </ul>
Water Quality Potential	D.1.3	NF	Persistent vegetation	Site visit required
Water Quality Potential	D.1.4	NF	Seasonal ponding or inundation	Site visit required
Water Quality Opportunity	D.2	A + M	Development/water quality impairment in contributing basin	<ul style="list-style-type: none"> <li>• Within 150 feet of grazing/fields/orchards/residential/urban areas/golf courses?</li> <li>• Contributing basin – any development/logging/farming/roads upstream within basin?</li> <li>• <b>Yes:</b> multiplier of 2 [If wetland meets any of the parameters]</li> <li>• <b>No:</b> multiplier of 1</li> <li>[Biologist should review manually any wetland that gets a "1"]</li> </ul>

**Table 2. BPA I-5 Corridor Reinforcement Project Wetland Functions Assessment Questions and Scoring Criteria**

Rating Form Questions		Method (Automated Manual Not Feasible)	Variable	Datasets and Parameters	Scoring Criteria
<b>Depressional Wetlands - Hydrologic Functions: Does the wetland unit have the potential and opportunity to reduce flooding and erosion?</b>					
Hydrologic Potential	D.3.1	NF	Surface water flow	Site visit required	
Hydrologic Potential	D.3.2	NF	Storage depth during wet periods	Site visit required	
Hydrologic Potential	D.3.3	M	Contribution to wetland storage	Drainage basin ratio: area of upstream contributing drainage basin to area of wetland unit itself	<ul style="list-style-type: none"> <li>• <b>Ratio less than 10:</b> 5 pts</li> <li>• <b>10 to 100:</b> 3 pts</li> <li>• <b>More than 100:</b> 0 pts</li> </ul>
Hydrologic Opportunity	D.4	M	Opportunity to reduce flooding and erosion	<ul style="list-style-type: none"> <li>• Dam locations</li> <li>• Wetland unit helps protect downstream property and aquatic resources from flooding or excessive erosive flows.</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Yes:</b> multiplier of 2 [dam not immediately downstream]</li> <li>• <b>No:</b> multiplier of 1 [dam immediately downstream]</li> </ul>
<b>Habitat Functions - Does the wetland unit have the potential and opportunity to provide habitat for many species?</b>					
Habitat Potential	H.1.1	A	Vegetation structure	• Herrera-digitized wetland polygons with Cowardin class attributes	<ul style="list-style-type: none"> <li>• <b>PFO present:</b> 2 pts</li> <li>• <b>PSS present:</b> 1 pt</li> <li>• <b>PEM present:</b> 1 pt</li> <li>• <b>PAB present:</b> 1 pt</li> </ul> *sum the above for a given wetland unit (maximum score = 4 pts)
Habitat Potential	H.1.2	NF	Hydroperiods	Site visit required	
Habitat Potential	H.1.3	NF	Plant species richness	Site visit required	
Habitat Potential	H.1.4	M	Interspersion of habitats	• Visual assessment by biologist	<ul style="list-style-type: none"> <li>• <b>High:</b> 3 pts</li> <li>• <b>Low:</b> 1 pt</li> </ul>
Habitat Potential	H.1.5	NF	Special habitat features	Site visit required	
Habitat Opportunity	H.2.1	M	Buffers	• Visual assessment by biologist	<ul style="list-style-type: none"> <li>• <b>Buffer intact:</b> 5 pts</li> <li>• <b>Buffer compromised:</b> 2 pts</li> <li>• <b>Buffer highly altered:</b> 0 pts</li> </ul>
Habitat Opportunity	H.2.2	M	Corridors and Connections	• Visual assessment by biologist	<ul style="list-style-type: none"> <li>• <b>Corridor present:</b> 4 pts</li> <li>• <b>Corridor not present:</b> 0 pts</li> </ul>
Habitat Opportunity	H.2.3	A	Proximity to priority habitats	<ul style="list-style-type: none"> <li>• WDFW PHS data</li> <li>• Herrera-digitized polygons for riverine wetlands, mature forest, and oak woodland</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Riverine wetland:</b> PHS polygon within 100m = 4 pts</li> <li>• <b>Depressional wetland:</b> PHS polygon within 100m, tally number up to 4 points</li> </ul>
Habitat Opportunity	H.2.4	A	Wetland landscape	<ul style="list-style-type: none"> <li>• WDNR hydrography layer</li> <li>• Herrera-digitized wetland polygons</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Wetland connects to stream:</b> 5 pts</li> </ul> If wetland is <u>not</u> connected to stream, then: <ul style="list-style-type: none"> <li>• <b>3+ other wetlands within ½ mile of rated wetland:</b> 5 pts</li> <li>• <b>1 or 2 other wetlands within ½ mile:</b> 2 pts</li> <li>• <b>No other wetlands within ½ mile:</b> 0 pts</li> </ul>
