REPLY TO  
ATTN OF: KEC-4

SUBJECT: Supplement Analysis for the Watershed Management Program (DOE/EIS-0265/SA-226)

TO: Jay Marcotte  
Fish and Wildlife Project Manager – KEWU-4

**Proposed Action:** Satus Creek Watershed Restoration Project

**Project No:** 1999-053-01

**Watershed Management Techniques or Actions Addressed Under This Supplement Analysis  
(See App. A of the Watershed Management Program EIS):**

1.2 Prohibit Further Channelization; 1.3 Restoration of Channelized River and Stream Reaches; 1.5 Install Grade Control Structures and Check Dams; 1.8 Bank Protection Through Vegetation Management; 1.9 Structural Bank Protection Using Bioengineered Methods; 1.10 Structural Bank Protection Using Engineered Structures, 1.17 Rearing Habitat Enhancements; 2.1 Maintain Healthy Riparian Plant Communities; 4.24 Protect Springs; 6.10 Access: Fencing.

**Location:** Satus Creek Watershed, Yakama Reservation, Yakima Subbasin, Washington

**Proposed by:** Bonneville Power Administration (BPA) and the Yakama Nation

**Description of the Proposed Action:** Yakama Nation Tribal biologists will collect data on existing conditions within the Satus Watershed in order to identify factors limiting production of salmonids. Satus Creek Watershed Restoration Project (Project) activities will occur within the Yakama Nation boundaries. The collected data will be used in planning efforts to prioritize effective habitat restoration activities, changes in current land management practices, and vegetation management activities.

Habitat restoration measures that will be implemented include reconnecting floodplains through restoration of channelized river and stream reaches; measures to prohibit further channelization; installation of grade control structures; structural bank protection; installation of habitat complexity structures; enhancement of fish passage; and enhancement of spawning and rearing habitat. Sensitive riparian areas will be identified in order to manage them to promote and enhance wildlife habitat.

Changes will be made to existing land management practices to minimize adverse effects to wildlife and fish habitat, including fencing riparian areas in order to restrict cattle access and planting vegetation and straw bales in areas recovering from wildfire to minimize erosion.

Measures will be implemented to promote healthy native plant communities in riparian areas and floodplains. Revegetation practices include seeding and planting in riparian and floodplain areas to

protect and stabilize banks and minimize erosion and sedimentation. Vegetation management will include control of invasive plant species that are considered noxious weeds.

**Analysis:** The compliance checklist for this project was completed by Brandon Rogers, Yakama Nation Fisheries Biologist II (reviewed on December 16, 2004, attached). The Project meets the standards and guidelines for the Watershed Management Program Environmental Impact Statement (EIS) and Record of Decision (ROD).

Pursuant to its obligations under the Endangered Species Act (ESA), BPA requested a list of listed and proposed species with the potential to occur in the project area from the U.S. Fish and Wildlife Service (USFWS). The letter from the USFWS (dated March 12, 2004, attached) states that habitat for bald eagle, bull trout, Canada lynx, gray wolf, grizzly bear, marbled murrelet, northern spotted owl, and Ute ladies'-tresses may occur within the project area. Yakama Nation Tribal biologists confirmed that only bald eagle may occur in the project area, using the area for foraging. Because there are no eagle nests near project areas, BPA made a determination of no effect to bald eagle as a result of project activities and did not initiate informal consultation.

One listed anadromous fish species occurs in the project area. Middle Columbia Steelhead, a threatened species under the jurisdiction of NOAA fisheries, occurs in most of the project area waterways. Some project activities may adversely affect this species. An Endangered Species Act Section 7 Consultation using the BPA Fish and Habitat Improvement Program (HIP) Biological Opinion (BO) has been completed (approval email dated 8/16/04 attached). This programmatic consultation also encompasses consultation with NOAA for Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act. Identified projects must be conducted in accordance with the applicable terms and conditions identified in the HIP BO. Applicable terms and conditions are attached.

A cultural resource review of the portions of the proposed project sites that will be subject to ground disturbance will be completed prior to implementation of those activities. This review will include a literature search and a field survey by a qualified cultural resource specialist. The project area is located on the Yakama Reservation and the Yakama Nation Cultural Resources Program will determine if the project will have an effect on cultural or historic resources. If cultural deposits are found during any phase of the proposed project or if the nature of the undertaking changes, ground-disturbing work will cease and a Yakama Nation cultural resource specialist will be contacted immediately.

Standard protection measures for activities in or near streams and wetlands will be followed during the implementation of the Project. The necessary permit approvals for this project have either been obtained or are in the process of being obtained. No construction will be authorized to begin until the applicant has obtained all required permits and approvals. In particular, approval is required from BPA staff to work within the high voltage right-of-way of the North Bonneville-Midway #1 line on the side-channel reconnect project. Coordination and approval of the proposed access and project engineering drawings should be attained from BPA Realty (Mari Rosales @ 509-321-2226) and BPA Spokane Region Natural Resource specialist, Tom Murphy, phone 509-358-7439. The work should not proceed without these approvals.

Public involvement has taken place as part of the Project. The Project will be implemented on Tribal land by Tribal members and Tribal staff. Tribal members are kept aware of the activities of the Fisheries Resource Management Program through the Natural Resources Quarterly Bulletin, which is made available to the public. Information is also disseminated through

announcements on the Tribal radio station, and announcements and articles in the local newspaper. Non-tribal members have access to these sources of information. Students at the local college, Heritage College, are exposed to the project through some of the curriculum.

**Findings:** The project is generally consistent with the Northwest Power Planning Council's Fish and Wildlife Program, as well as BPA's Watershed Management Program EIS (DOE/EIS-0265) and ROD. This Supplement Analysis finds that: 1) implementing the proposed action will not result in any substantial changes to the Watershed Management Program that are relevant to environmental concerns; and 2) there are no significant new circumstances or information relevant to environmental concerns and bearing on the Watershed Management Program or its impacts. Therefore, no further NEPA documentation is required.
